THE HISTORY
OF
Four-footed Beasts
AND
SERPENTS:
Describing at Large
Their True and Lively Figure, their several Names, Conditions,
Kinds, Virtues (both Natural and Medicinal) Countries of their Breed,
their Love and Hatred to Mankind, and the wonderful work of
God in their Creation, Preservation, and Destruction.
Interwoven with curious variety of Historical Narrations out of Scriptures,
Fathers, Philosophers, Physicians, and Poets: Illustrated with divers Hieroglyphicks
and Emblems, &c. both pleasant and profitable for Students in all Faculties and Professions.

Collected out of the Writings of Conradus Gesner
and other Authors,
By Edward Topsell.

Whereunto is now Added,
The Theater of Insects; or, Lesser living Creatures:
As Bees, Flies, Caterpillars, Spiders, Worms, &c. A most
Elaborate Work: By T. Moffett, Dr. of Physick.

The whole Revised, Corrected, and Inlarged with the Addition of Two
useful Physical Tables, by J. Re M.D.

London:
Printed by E. Cotes, for G. Sawbridge at the Bible on Ludgate-hill, T. Williams at
the Bible in Little-Britain, and T. Johnson, at the Key in Paul's Church yard. MDC LVIII.
HISTORY
OF
Pope Innocent-RE-
SERPENTIS
TO THE
RIGHT HONOURABLE
THE
Lord Marquess of
DORCHESTER,
Earl of KINGSTONE,
Vicount NEWARK &c.

My very Noble LORD,

Our Lordship well knows that Honour attends upon Virtue, as the shadow doth upon the substance; there is such a magnetick force in Goodness, that it draws the hearts of men after it. The world observes that Your Honour is a great Lover of the works of Learned Writers, which is an infallible argument of an excellent mind residing in You. Wherefore I here humbly offer unto Your Noble Patronage the most Famous and Incomparable History of CONRADUS GESNER, a great Philosopher and Physitian, who by his vast expences, and indefatigable pains, Collected and Digested into two Volumes, what ever be found scattered here and there in almost infinite Authors, concerning Four Footed Beasts and Serpents, adding also what he could possibly attain to by his own experience, and correspondence held with other famous Scholars every where. After him Mr. Edward Topfel a Learned Divine, Reviv'd and Augmented the same History; as it is not altogether so difficult to add something to what is first begun, and to build upon such a foundation which was before so artificially laid. He hath deferred well of our English Nation in so doing; and the more, that he doth with so much modestly attribute the praise of the whole work to the Master-workman to whom it was chiefly due. The same Gesner, after Mr. Edward Wotton had begun, undertook to compose the History of Insects, which as it is a business of more curiosity and difficulty to write exactly of; so all things considered, they serve as much to set forth the Wisdom and Power of God as the greatest Creatures he hath made, and are as beneficial to Mankind, not only for dainty Food, but for the many Physical uses that arise from them. John Baptist fed upon Locusts and...
The Epistle Dedicatory.

wilde Honey, and we read that our Saviour eat a piece of a Honey comb. These little Insects are not so contemptible as the World generally thinks they are, for they can do as much by their multitudes, as the other can by their magnitude, when as one Hornet shall be able suddenly to kill a Horse, and Gnats, Ants and Wasps to bid resistance to Bears, Lions and Elephants, and to depopulate whole Countries. The Frogs, Locusts, and Lice, were none of the least Judgements in the Land of Egypt. Mr. Thomas Perrius, another Physitian, lighting his Candle by the former lights, succeeded them in this great undertaking. But all these vigilant and painful Men never could bring it to perfection, being every one of them prevented by death. And indeed, things of deep search, and high concernment, are very seldom begun and ended by the same persons. Hippocrates gives the reason for it, that Art is long, Life short, Experience difficult, occasion precipitate, Judge- ment uncertain. I may say further, which he also comprehends in the close of that Aphorism, that all must perform their several offices: which is not often done, but ingenious men frequently labour under the want of means, and find small encoura- ment to proceed in their great designs, especially in this latter age of the World. Gefner makes a sad complaint in behalf of himself, and Topel doth the like, and so do all the rest who spent their Estates, and wafted their Spirits for the common good. Which is sufficient proof to convince many rich men of blindness and ingratitude, and confirms that truth the Poet speaks;

Haud facile emerguunt, quorum virtutibus obiñat
Res anguīta domi

Good and well meaning men cannot proceed,
Virtue is cruñt by want, opprest by need.

After the death of the forementioned four Worthy of their times, Mr. Thomas Muffet a noted English Physitian undertook the same task, and compleated it; whose Encomium is excellently well penned by the late Honourable Doctor of Physick Sir Theodore Mayerne, in his Epistle to Doctor William Paddy of famous mem- ory, premised to this Book; wherein to his own immortal praise, he hath so Anato- mically dissected many of the chiefest Insects, even to admiration, that he hath let the World understand by it, that he was a deep Philosopher, and a most accurate search- er into the secrets of Nature, and worthy of those places of Honour he enjoyed in Great Princes Courts. This large History is not, nor could possibly be the pro- duction of one Age; both able Divines, and Physitians contributed what they had, and employed their Talents, and greatest Studies, for many years in their several genera- tions, to bring it forth; whereby it may appear how necessary this Work is for the souls and bodies of Men, to teach them to know the Wisdom and Omnipo- tence of God in the Creation of these Creatures, and Goodness to bestow upon Man, both for profit and delight; and though many of them be Dangerous and Venomous, yet they were not so when God first made them. For the Wisedman faith, That God made not death, neither takes he pleasure in the destruction of the living, for he created all things that they might have their being, and the Generations of the World were healthful, and there was no poison of destruction in them, no Kingdom of death upon the earth, but ungodly men
The Epistle Dedicatory.

men by their wicked works and words, called it to them. This Book will plentifully furnish us with Remedies against most of these inconveniences, which is no small occasion to put us in mind how much we stand obliged to the memories of the learned Authors of it; who spared no cost nor pains that they might prove beneficil to the then present, and to succeeding Ages. And the same reason is very strong in behalf of those who now have been at this vast charge to Reprint and to perfect the same, that it never should be lost by time or casualties, which consume all things; and to supply the whole Work with a double Physical Index, to ease the Readers labour, that he might not wander up and down, and lose himself in this great wilderness of Beasts and Insects, searching after that he stands in need of, but may in an instant be provided with all those known remedies these several Creatures can afford him. Should such a Fabrique as this decay and come to ruine, the damage were unspeakable and irreparable; the Maulocean Sepulchre, the Colossus of Rhodes, or the Pyramids of Egypt might sooner be renewed and built again. Wherefore Men are bound in conscience by the Laws of God, of Nature, and of Nations, to confider of the great Expanse and Pains now taken in it, and to promote the Work to the best advantage of the present undertakers for the publick good, who have now brought it to this perfection, that they may joy of it, what Ovid did of his Metamorphosis;

Jamque opus exegi, quod nec Jovis ira, nec ignis,
Nec poterit ferrum, nec edax abolere vetustas.

The Work is ended, which can envies fume,
Nor Sword, nor Fire, nor wafting time conlude.

Never was there so compleat a History of the Creatures as this is since the daies of Solomon, who writ the story of Beasts and Creeping things: and indeed it requires a Kingly Treasure and Understanding to accomplish it. And Petrus Gillius writes, that in former Ages, all the Histories of Creatures were compiled by Kings, or Dedicated to them; who are best able to bear the charge of it, and most fit be honoured with it. What would the World now give for that Book of Solomon, which by the negligence of ungrateful men and length of time is utterly lost? How highly then ought we to esteem of this History of Gefner and Mufet, which is inferior to none but that? For what Arifklele set forth upon this subject at the appointment of Alexander the Great, and for which he received from him 400 Talents as a Kingly reward, is all comprehended in this, with the addition of many hundreds more that have travelled in the same way. Orpheus, whom the Poets so much magnifie for drawing the Beasts after him, could do no more with all his melodious harmony, then these famous and ingenious Men have done. And because I cannot but think, what the Poets fancied concerning him, was but an Hieroglyphical representation(according to the dim light they had) of all the Creatures coming to Noah into the Ark, this History seems to me to be like another Ark of Noah, wherein the several kinds of beasts are once again met together, for their better preservation in the understanding of Man; for however there were multitudes of Birds in the Ark which are not here(it may be because Aldrovandus and others have

written
written largely to that purpose; yet here are abundance of Insects that never were in Noah's Ark, and whereas we never had, or we can find extant, any compleat History until this was made; which is like to another Paradise, where the Beasts, as they were brought to Adam, are again described by their Names, and named in most Languages; which serves to make some preparation for the great loss of that excellent knowledge of the Creature, which our first Parents brought upon their posterity when they fell from God. We read in the 10th of the Acts, that when a vessel was let down from heaven, wherein there were all manner of Four-footed Beasts and Creeping things, that St. Peter wondered at it: who then can choose but admire to see so many living Creatures that Nature hath divided and scattered in Woods, Mountains and Vales, over the face of the whole earth, to come all together to a general muster, and to act their several parts in order upon the same Theater? I confess there are many Men so barbarous, that they make no account of this kind of learning, but think all charge and pains fruitless that is employed this way; shewing themselves herein more unreasonable and brutish than the irrational Beasts. For next unto Man are these Creatures rankt in dignity, and they were ordained by God to live upon the same earth, and to be Fellow-commoners with Man; having all the Plants and Vegetables appointed them for their food as well as Man had; and have obtained one privilege beyond us, in that they were created before Man was; and ever since they are obnoxious to the same casualties, and have the same coming into the World, and going out that we have; for that which befalls the Sons of Men befalls Beasts, even one thing befalls them both, as the one dyeth, so dyeth the other; so that Man hath no preeminence above the Beasts. All go unto one place, all are of the dust, and all return to dust again: Ecclef. 3. 19, 20. And the Prophet David doubts not to compare Man being in honour, and having no understanding, unto the Beasts that perish. As for Minerals they are yet another degree below Beasts, all the Gold, Jewels, and Diamonds in the World, are not comparable to any one of the meanest Creatures that hath within it the breath of life. God hath bountifully bestowed them all on Man, whom he hath advanced above them all, for food, and raiment, and other necessary uses; also for his pleasure and recreation: and so long as we use them with Sobriety and Thankfulness, we shall finde an infinite benefit and advantage by them; but when we prove ungrateful unto God, they become to many Instruments of his vengeance against Sinners, to make up that fourfold Judgement, with the Sword, Famine, and Pestilence, the Prophet threatens the Jews with. I fear to be tedious, therefore I beseech Your Honour to accept this History in good part from him, who humbly prayeth for Your Lordships temporal and eternal happiness, and who is

Your Honours most affectionately

humble Servant

JOHN ROYVALD.
To the Reverend and Right Worshipful
RICHARD NEILE, D. of Divinity,
Dean of Westminster, Master of the Savoy,
and Clerk of the King his most Excellent Majesties Closet;
all felicity Temporal, Spiritual, and Eternal.

The Library of English Books, and Catalogue of Writers, (Right Worthy and Learned Dean, my most respected Patron) have grown to the height, not only of a just number, but almost innumerable: and no marvel, for God himself hath in all ages preferred Learning in the next place to Life; for as Life is the Ministerial Governor and Mover in this World, so is Learning the Ministerial Governor and Mover in Life: As an Interpreter in a strange Country is necessary for a Traveller that is ignorant of Languages (or else he should perish,) so is Knowledge and Learning to us poor Pilgrims in this our Peri­gri­na­tion, out of Paradise unto Paradise; whereby confus’d tongues are again reduced to their significit Dialects, not in the builders of Babel to further and finish an earthly Tower, but in the builders of Jerusalem, to bring them all to their own Country, which they seek, and to the desired rest of souls. Litera ob­jec­tiv­es artium, qua­rum be­ne­ficio ab­in­ter­im vi­ndica­ti­ur. As Life is different and divers, according to the Spirit wherein it is seated, and by which it is nourished as with a current; so also is Learning, according to the taft, use, and præstte of Rules, Canons, and Authors, from whom as from a Fountain it taketh both beginning and end­ca­fe: even as the Spirit of a Se­pen is much quicker then the Spirit of an Ox, and the Learning of Aristotle and Pliny more lively and light­ome then the knowledge of other obscure Philosophers, unworthy to be named, which either through Envie or Non-proficiencie durst never write: Si cum hac ex­cep­tione de­tutur sapientia, et ilium in­clusum­num tene­t­am, ac e­num­tie­num, re­sc­t­am. Nullius boni sine loco jucunda est pos­se­sti. And therefore I lay with Petrus Blesen: Sed­e­na­ri­um genere­ra­pos­si­e­io in plures di­per­sa, non per­di­tur, & dis­tribua­ta per­parses, mi­norati­onis di­ver­si­tum non fe­nti: sed­co di­ius­tum per­posu­ta ­pos­se­sti, quo pu­blic­uta­fa­cun­du­sus se di­f­fun­di­t.

The greatest men stored with all helps of Learning, Nature and Fortune, were the first Writers, who as they did excell other men in Possessions and Worldly dignity, so they manifested their Virtues and Worth in the edition of excellent parts of knowledge, either for the delight or profit of the World, according to the Poets profession:

Anti­pro­­de­ses vo­lu­nat, an­t dele­ctare Po­e­tae,
An­sim­cal & ju­cu­nda & id­o­na­a di­ce­ere vi­ta.
Omne­cul­it pun­ctum, qui­ mis­cit­ mi­le dulci,
Lec­ti­orem dele­ctando, par­ter­que monendo.

Yet now of late dates this custom hath been almost discontinued to the infinite prejudice of sacred inviolable Learning and Science, for Turpis se­pe­sma da­tur­ mi­noribus, (as Au­foni­um wrote in his time,) for indeed the reason is pregnant:

Hand
The Epistle Dedicatory.

Haud facile emergunt, quorum virtutibus obstas
Res angusta domi.

But yet the great Rector and Chancellor of all the Academies in the World Jesus Christ, in whom are hid all the treasures of wisdom and knowledge, the Matter of that College wherein he was but a Servant or Steward, that was learned in all the learning of the Egyptians, (I mean Moses) the first writer, the first Author, the first commander of knowledge, and the first ordainer of a lawful Common-wealth, and Ruler of Church and State, hath not left our age without some monuments of great Princes, Earls, Lords, Knights, for the ornament and honour of Learning, who for general and particular caules and benefits have added their Names to the society of Writers, and divulged their works in Print, which are likely to be remembered till the Worlds end. Such are our most Temperate, Juft, Wife, and Learned King and Soveraign. The Right Noble, and Honourable Earl of Surrey, long ago departed out of this earthly Horizon. The now living Earls of Dorset, Northampton, Salisbury; and many Knights, Sir Philip Sidney, Sir George Moore, Sir Richard Bartlet, Sir Francis Hastings, and others. But of Aaron, and such as sit at the Helme of the Church, or are worthily advanced for their knowledge in Learning and State, I mean both Bishops and Doctors, almost innumerable, of all whom I can say no more, if I were worthy to say anything, then apply unto them particularly that which was said of one of the greatest Scholars and Divines that ever England had:

--

Then why should I presume, being every way the least and meanest of all other, now the third time to publish any part of my conceived studies for the age present and succeeding, and so to have my Name inrolled amongst the benefactors and Authors of Learning?

--

Alas Sir, I have never abounded in any thing, except wantand labour, and I thank God that one of these hath been prepared to feed the other, therefore I will not stand upon any mans objections, who like Horses as it is in the Fable being led empty, well fed, and without burden, do scorn the laden Ass, adding mirth to his load, till his back was broke, and then was all laid upon the pampered disdainful Horse: even so thefe proud displeasing spirits are eased by the labors of us that bear the burdens, and if they content not themselves with ease, but will also sit in the seat of the scornful, let them remember, that when our backs be broke, they must take up the carriage. But pardon me (I beseech you) if by way of Preface I open my heart unto your Worship, who is better able than ten thousand of the Muses, and more charitably generous in receiving such gifts with the right hand (as these are) although they were given with the left; for seeing I have chosen you the Patron of this Work, I will briefly declare and open my mind unto you concerning the whole Volum, sparing any other praises of your demerits then those which by Martial are ascribed to Regulus, which I will without flattery or fear of the envious thus apply unto you:

Cam sit Sophia par fama & cura deorum, [SSS. Trinitatis]
Ingenio Pietas nec minor ipsa tua.
Ignorat meritis dilecto munere, quia tua librum
Et qui matur [Neile] Thura datur.

So then leaving these perorations, I will endeavor to prove unto you that this Work which I now publish and divulge unto the world, under the Patronage of your Name, is Divine, and necessary for all men to know; True, and therefore without flander or suspicions
scandall to be received; and that no man ought rather to publish this unto the World, than a Divine or Preacher. For the first, that the knowledge of Beasts, like as the knowledge of the other creatures and works of God, is Divine, I see no cause why any man should doubt thereof, seeing that at the first they were created and brought to man as we may read Gen. 1. 24, 25. and all by theLord himself, so that their Life and Creation is Divine in respect of their Maker; their naming Divine, in respect that Adam out of the plenty of his own divine wisdom, gave them their several appellations, as it were out of a fountain of Prophesie, foreshowing the nature of every kind in one elegant and significant denomination, which to the great loss of all his children was taken away, lost and confounded at Babel. When I affirm that the knowledge of Beasts is Divine, I do mean no other then the right and perfect description of their Names, Figures, and Names, and this is in the Creator himself most Divine, and therefore such as is the Fountain, such are the streams issuing from the same into the minds of men. Now it is most clear in Genesis how the Holy Ghost remembereth the creation of all living creatures, and the Foursfooted next before the creation of Man, as though they alone were appointed the Utens, going immediately before the race of Men. And therefore all the Divines observe both in the Hebrew, in the Greek and Latin, that they were created of three several sorts or kinds. The first Suntmum, as Oxen, Horse, Affes and fuch like, quia hominum jwomenta. The second, Reptile, quia hominem medicina. The third, Bestias, a vandalia, for that they were wilde and depopulators of other their associates, rising also against Man, after that by his fall he had loft his first image and integrity. Now were it not a knowledge Divine, why should the holy Scriptures relate it, and divide the kinds? Yea, why should all holy Men take examples from the natures of Beasts, Birds, &c. and apply them to heavenly things, except by the ordinance of God they were both allowed and commanded so to doe and therefore in admiration of them the Prophet David cryeth out, Magna magna sunt opera tua Domine omnis in sapientia faciit. The old Manichees among other blathemies accused the creation of hurtful, venomous, raving, and destroying Beasts, affirming them to be made by an evil God, and also they accused the creation of Mice and other unprofitable creatures, because their dulness was no kinder to the Lord, but like cruel and covetous Mifers, made no account of those Beasts, which brought not profit to their purse. You know (Right Learned Dean) how that grave Father answered that calumny, first affirming that the same thing which seemed idle to Men, was profitable to God; and the same that appeared ugly to them, was beautiful to him, Quo omnibus natura ad guberrationem unversa. He therefore wisely compareth a fool that knows not the use of the creatures in this world, to one ignorant that cometh into the workhouse of a cunning Man, viewing a number of strange tools, and having no cunning but in an Axe or a Rake, thinketh, that all those rare inventions of a wise workman are idle toys and whilst thus he thinketh, wandering to and fro, not looking to his feet, suddenly falleth into some furnace in the same Work-house, or chance to take up some sharp tool whereby he is wounded, then he also thinketh that the same are hurtful and dangerous. Quorum tamem quae novi artix, insipientiam ejus irriset, & verba incepta non omnes officicum saeurn confunctor exercet. But we that are ashamed to deny the use of instruments in the shops of rare Artificers, but rather admire their invention, yet are not afraid to condemn in Gods workhouse of his Creatures, which are rare inventions, although though folly we be wounded or harmed by them, and therefore he concludes that all Beasts are either useful, and against them we dare not speak, or perniciosa, whereby we are terrified that we should not love this perilous life; or else they are superfusius, which to affirm were most ridiculous: for as in a great house all things are not for use, but fome for ornament, so is it in this World, the inferior Palace of God. Thus far Austin.

Therefore I will conclude this first part, that not only the knowledge of the profitable creature is divine, and was first of all taught by God, but also of the hurtful: For a wife Man, faith Solomon, feeth the Plague (by the revelation of God) and bideth himself from it. And John Baptist, Quia vos decus ob ira creaturae fugere: These things have I principally laboured in this Treatise, to shew unto Men what Beasts are their friends, and what their enemies, which to truft, and which we avoid, in which to find nourishment, and which to shun as poison. Another thing that perifheth me in the necessary use of this History, that it was divine, was the preservation of all creatures living, which are ingendred by copulation (except Fishes) in the Ark of Noah, unto whom it pleased the Creator at that time to infulre an instinct, and bring them home to man as to a fold: surely it was for that a man

ight
might gain out of them much Divine knowledge, such as is imprinted in them by nature, as a type or sparsk of that great wisdom whereby they were created. In Mice and Serpents a foreknowledge of things to come, in the Ant and Pismire a providence against old age: in the Bear the love of young, in the Lion his stately pace, in the Cock and Sheep, change of weather; as S. Basil in his Hexameron, Etiam in Bruttis quidem futuri sensus est, ut nos praebet victa non additii simus, sed de futuro sacro omnem habemus.

For this cause there were of beasts in holy Scripture three holy uses, one for Sacrifice, another in Vision, and a third for Reproof and Instrucion.

In Sacrifices were the clean beasts, which Men were bound first to know, and then to offer, for it is unreasonableness that those things should be sacred at the Lord's altar, which are refused willingly at private men's Tables. Now although we have no use of Sacrificing of Beasts, Nam fies bruta pro peccatis immolabantur, ita jam virtus pro corporibus; yet we have use of clean Beasts for food and nourishment, and therefore for the inriching of the minds and tables of men, it is necessary to know not only the liberty that we have to eat, but also the quality and nutriment of the Beast we eat, not for any Religion, but for health and corporal necessity. This point is also opened in this story, and the other of Sacrifice, wherein I have not omitted to speak of the Divine use of every Beast, both among the Jews and among the prophane Gentiles.

Now for the second holy use of Beasts in Visions, the Prophet Daniel's Visions, and Ezekiel's, and S. John's in the Revelation do testify of them, whereby the most Divines have observed how great Princes and Kingdoms after they have shaken off the praction of Justice and Piety, turn Tyrants and ravening Beasts. For so Man being in honour understanding not, but become like the Beasts that perish, and so as Dionysius faith by Visions of Beasts, Insima educundarum pur media in suprema. Now there were, as S. Augustine faith, three kinds of visions, Sensibles, intellectuales, or imaginarii: the first were most pregnant, because to the understanding and conceiving, a Man never look his senses, and therefore God did suddenly create savage Beasts both of natural and extraordinary shapes, whereby he showed to his servants the Prophets, the ruin or uprising of beably States and Kingdoms. And not only thus, but also in heaven (as St. John faith) there are 4 Beasts full of eyes before the throne of God; both which must needs magnifie the knowledge of these Quadrupedes; for seeing God hath used them as Sacraments or Mysteries to contain his will, (not only in monstris treble-headed, or seven-horned shapes, but also) in pure, ordinary, natural limbs and members, how shall we be able to ghesse at the meaning in the secret, that do not understand the revealed? And what use can we make of the invisible part of that Sacrament, where we know not the meaning of the visible? Doth the Lord compare the Devil to a Lion; evill Judges to Bears; false Prophets to Wolves; secret and crafty periculosus to Foxes; open enemies in hostilitie to wilde Boars; Heretickes and false Preachers to Scorpions; good men to the Fowles of heaven, and Martyrs to Sheep, and yet we have no knowledge of the nature of Lions, Wolves, Bears, Foxes, wilde Boars, or Scorpions? Surely when Solomon faith to the sluggard, Go to the Pismire, he willeth him to learn the nature of the Pismire, and then according thereto reform his manners: And so all the World are bid to learn the natures of all Beasts, for there is always something to be learned in them, according to this saying of St. Basil, A deo nihil non providam in natura relinquit, neque quicumque pertinentis ad secum expers, & si ipsas animaliam partes consideraveris, invenies quodque superflunium quid conditor opposuit, neque mettisquum dextritis. Then it being clear that every Beast is a natural Vifion, which we ought to see and understand, for the more clear apprehension of the invisible Majesty of God, I will conclude that I have not omitted this part of the use of Beasts, but have collected, expressed, and declared, what the Writers of all ages have herein observed.

Now the third and laft holy use that is made of Beasts in Scripture, is for Reproof and Instrucion; so the Lord in Job 38. & 39. mentioneth the Lion, the Raven, the wilde Goats, the Hinds, the Hind-Calves, the wilde Afses, the Unicorn, the Ostrich, the Stork, the pursuant Horie, the Hawke, the Eagle, the Vulture, the Whale, and the Dragon, that is, the Fowles, Fishes, Serpents, and Four-footed Beasts: All which he reckoneth as known things to Job, and discouereth of strange things in their natures as any we have inferred for truth in our History, as may appear to any man whatsover, that will look studiously into them.
The Epistle Dedicator.

Shall I add hereunto how Moses, and all the Prophets, St. John Baptist, our most bles-
sed Saviour, St. Paul, and all the Writers since his time (both ancient and liter,) have
made proof of this part of Divinity; so that he was an unskilful Divine and not apt
to teach, which could not at his fingers speak of these things: for (faith our Saviour)
If I tell you earthly things and ye believe not, how shall ye believe when I tell you heavenly
things?

Solomon, as it is witnessed in holy Scripture, wrote of Plants, of Birds, of Fishes, and
Beasts, and even then when he stood in good favour with God, therefore it is an exerci-
se of the highest Wisdom to travel in, and the Noblest minds to study in: for in it as I will
thou (with your good patience, for I have no other Preface) there is both the know-
ledge of God and Man. If any man object, Multa multi de musca, de apicula, de vermiculo,
panca de Deo: I will answyer with the words of Theodorus Caca, Pernulta enim de Deo
est tracheta, qui detrina eterum conditorum exquisitissima, conditionem ipsum declarat,
neque musca, neque vermiculus omitendas est ubi de mira solebitis agitur. Whereunto St. Austin
agreeth when he faith, Majestatem divinam aequo in formico membris atque magnam jumento
tranante flumum. And for the knowledge of man, many and most excellent rules for
publick and private affaires, both for preferring a good conscience, and avoiding an evil
danger, are gathered from Beasts: It were too long to run over all, let me (I beseech
you) be bold to reckon a few which descend from Nature, one common parent, and there-
fore are neither strained, counterfeit, inconflant, or deceitful; but free, full of power to
persuade, true, having the seal of the Highest for their evidence, confident and never alt-
ted in any age; faithful, such as have been tried at fire and touch-stone.

Were not this a good peroration against murder, to see all Beasts fo to maintain their
natures, that they kill not their own kind? Who is so unnatural and unthankful to his Pa-
rents, but by reading how the young Storkes and Wood-peckers do in their parents old age
feed and nourish them, will not repent, amend his folly, and be more natural? What man
is so void of compassion, that hearing the baying of the Bone-breaker Bird to the young
Eagles, will not become more liberal? Where is there such a flagguard and drone, that con-
sideth the labours, pains, and travels of the Emmet, little Bee, Field-moufe, Squirrel,
and such other that will not learn for shame to be more industrious, and let his fingers
work? Why should any man living fall to do evil against his Conscience, or at the tem-
pation of the Devil, seeing a Lion will never yield? Mori fat,vinci nesciat, and seeing the
little Wren doth fight with an Eagle, contending for Sovereignty? Would it not make all
men to reverence a good King set over them by God, seeing the Bees flock out their King
if he lose himself, and by a moft fagacious smelling fene, never caele till he be found out,
and then bear him upon their bodies if he be not able to fly, but if he die they all forfake
him? And what King is not invited to clemency, and dehorted from tyranny, seeing the
King of Bees hath a fpring, but never utter the fame?

How great is the love & faithfulness of Dogs, the meeknes of Elephants, the modfly or
shamefaltiness of the adulterous Lions, the neatnes and polliure of the Cat and Peacock
the justice of the Bee, which gathereth from all flowers that which ferveth their turn, and
yet destroyeth not the flower; the care of the Nightingale to make her voice pleafant; the
chaffity of a Turtle, the canonical voice and watchfulness of a Cock, and to conclude the
utility of a Sheep? All these and ten thoufand more I could recite, to shew what the
knowledge of the nature of brutifh creatures doth work or teach the minds of men, but I
will conclude this part with the words of S. Jerom against Fovivinian. Ad Herodem di-
ciput proper multum, Ite & dicite volpi bir, Luk. 13, ad Scribas & Pharisaeos gentinum
viperrum, Mat. 23, ad libidinosos equi hinnentes in proximorum feminas, Jer.5, de voluptufo,
Nolite mittere margaritas velis te porcos. De impudicitibus, neque sanitatem date carnibus,
Mat. 7, de infidelibus, Ephefi cum besfias pugnavi in similitudine hominum, And thus far S. Jerom. Whereby we may boldly aver by way of induction, that where-
in the knowledge of God, the knowledge of Man, the precepts of Virtue, the means to
avoid evil are to be learned, that Science is Divine and ought of all men to be inquired
and sought after: and such have I manifested in this History following.

Now again the necessity of this History is to be preferred before the Chronicls and
Records of all ages made by Men, because the events and accidents of the time past, are
peradventure such things as shall never again come in use; but this sheweth that Chron-
icle which was made by God himself, every living Beast being a word, every Kind
being
The second thing in this discourse which I have promised to affirm, is the truth of the History of Creatures, for the mark of a good Writer is to follow truth and not deceivable Fables. And in this kind I have pass'd the straightest passage, because the relation of most things in this Book are taken out of Heathen writers, such as pr·adventure are many times superstitiously credulous, and have added of their own very many rash inventions, without reason, authority, or probability; as if they had been hired to fell such Fables: For, Non bene conditi vendunt perjurias tellae. I would not have the Reader of these Histories to imagine that I have inferred or related all that ever is said of these Beasts, but only so much as is said by many, For in the mouth of two or three witnesses standeth every word: and if at any time I have let down a single Testimony, it was because the matter was clear and needeth not further probation, or else I have laid it upon the Author with special words, not giving the Reader any warrant from me to believe it.

Besides, I have taken regard to imitate the best Writers, which was easy for me to do, because Gesner relateth every man's opinion (like a common place or Dictionary, as he protesteth;) and if at any time he seemed obscure, I turned to the Books which I had at hand to ghislle their meaning, putting in that which he had left out of many good Authors and leaving out many magical devices. Now although I have used no small diligence or care in collecting those things which were most essential to every Beast, most true without exception, and most evident by the Testimony of many good Authors; yet I have delivered in this Treatise many strange and rare things, not as Fictions, but Miracles of nature, for wifemen to behold and observe to their singular comfort, if they love the power, glory, and praise of their maker, not withholding their consent to the things express'd, because they intreat of living things made by God himself. Si ergo quarnus quis fecerit, Deus est; Si per quod, dixit, Fides, & falla fuit: Si quae sit, quia bonus est, Nec enim autor est excellentior Deo, nec ares efficacior Dei verbo, nec causa melior, quam ut bonus crearetur a Deo beno; and this Plato said was the only cause of the worlds creation, ut a Deo bono opera bonifereant.

Now I do in a fort challenge a consent unto the probability of those things to wise and learned men, although no belief. For Fides, is credere invidibilis; but consentum is a clearing or yielding to a relation until the manifestation of another truth; and when any man shall fully reprove any thing I have written for false and erroneous, I will not flink to release the Readers consent, but make satisfied on for ulteration. But for the rude and vulgar fort (who being utterly ignorant of the operation of Learning, do profoundly condemn all strange things which are not engraven in the palms of their own hands, or evident in their own herds and flocks;) I care not, for my ears have heard some of them speak against the History of Sampson, where he tied fire-brands to the tails of Foxes, and many of them against the miracles of Christ. I may remember you (or) of a Country tale of an old Maffe-Priest in the dais of Henry the eight, who reading in English after the translation of the Bible, the miracles of the five Loaves and two Fishes, and when he came to the verse that reckoneth the number of the ghefts or eaters of the banquet, he paused a little, and at last said, they were about five hundred: The Clerk, that was a little wiser, whispered into the Priest's ears that it was five thousand, but the Priest turned back and replied with indignation, Hold your peace sirrah, we shall never make them believe they were five hundred.

Such Priests, such People, such persons I shall draw upon my back, and although I do not challenge a power of not erring, yet because I speak of the power of God, that is unlimited, I will be bold to aver that for truth in the Book of Creatures (although first observed by Heathen men) which is not contrary to the book of Scriptures.

Lastly, that it is the proper office of a Preacher or Divine to set forth these works of God, I think no wifeman will make question, for so did Moses, and David, and Solomon, and
The Epistle Dedicatory.

and Christ, and S. Paul, and S. John, and S. Irene, S. Gregory, S. Basil, S. Austin, S. Jerome, S. Bernard in his expositions of Sermons upon the Canticles, and of latter days Isidorus, The Monks of Messac, Gemnanus, and to conclude, that ornament of our time Jeronimus Zanchius. For how shall we be able to speak the whole Counsel of God unto his people, if we read unto them but one of his books, when he hath another in the world, which we never fludly past the title or outside; although the great God have made them an Epistle Dedicatory to the whole race of Mankind?

This is my deavour and pains in this Book, that I might profit and delight the Reader, whereinto he may look on the Holyest daies, (not omitting prayer and the publick service of God) and passe away the Sabbaths in heavenly meditations upon earthly creatures. I have followed V. Gestaer as near as I could, I do profess him my Author in most of my Stories, yet I have gathered up that which he let fall, and added many Pictures and Stories as may appear by Conference of both together. In the names of the Beasts, and the Phy- sick I have not swarved from him at all. He was a Protestant Physician, (a rare thing to finde any Religion in a Phyfitian) although St. Luke a Physician were a writer of the Gospell. His prais es therefore shall remain, and all living Creatures shall witnesse for him at the last day. This my labor whatsoever it be, I conecrate to the benefit of all our English Nation under your Name and Patronage, a publick Professor, a learned and reverend Divine, a famous Preacher, observed in Court and Countrey; if you will vouchsafe to allow of my Labors, I stand not upon others, and if it have your commendation, it shall incourage me to proceed to the residue, wherein I fear no impediment but ability to carry out the charge, my case so standing that I have not any access of maintenance, but by voluntary benevolence for personal pains, receiving no more but a laborious wages, and but for you, that had also been taken from me: Therefore I conclude with the words of St. Gregory to Leontius, Et nos bona qua de vobis multipliciter pradicanur addiscentes, asidue pro gloria vestra incoluitate omnipotens velamus Dominum deprecari.

Your Chaplain in the Church of

St. Botolph Aldersgate,

Edward Topfel.

THE HISTORY OF
Four-Footed Beasts.

The Antelope.

The Antelope called in Latin Calopus, and of the Grecians Antelope, or Apelos: of this beast there is no mention made among the Ancient Writers, except Suidas, and the Epistle of Alexander to Aristotle, interpreted by Cornelius Neposius. They are bred in India and Syria, near the Country of River Euphrates, and delight much to drink of the cold water thereof: Their breed, body is like the body of a Roe, and they have horns growing forth of the crown of their head, which are very long and sharp; so that Alexander affirmed they pierced through the shields of his Soldiers, and fought with them very irately: at which time his company flew at him as he travelled to India, eight thousand five hundred and fifty; which great slaughter may be the occasion why they are so rare, and seldom seen to this day, because thereby the breeders and means of their continuance (which consisted in their multitude) were weakened and destroyed. Their horns are great, and made like a saw, and they with them can cut asunder the branches of other or small trees, whereby it cometh to pass that many times their necks are taken in the twigs of the falling boughs, whereby the Beast with repining cry, bewrayeth himself to the Hunters, and so is taken. The virtues of this Beast is unknown, and therefore Suidas faith, an Antelope is but good in part.
The History of Four-footed Beasts.

of the APE.

Ape, called in Latin Simia, and sometimes Simidus and Simiolus; of the Greek word Simas (viz.) signifying the flatness of the Nose: for so are an Ape; and called of the Hebrews Kop, and plurally Kopim; as it is by S. Jerome translated, 1 Kings. 10. 22. From whence it may be probably conjectured, came the Latin words Cepi and Cephi, for Apes that have tails. Sometimes they are called of the Hebrews Hoglab, and of the Chaldeans Kofin, the Ithaua Samada Majonio, and Bercnica, and a Munkey Gatto Mammone. The ancient Grecians Filipous and the Later Mimoun, and Ark-bizare, by reason of his imitation. The Moors Bugia, the Spaniards Mass, or Ximia, the French Singi, the Germans Aff, the Flemishe Simme or Schimmegeil, the Illryians Obija, and generally they are held for a lubill, ironical, ridiculous and unprofitable Beast, whose flesh is not good for meat, as a sheep, neither his back for burden, as an Ass; nor yet commodious to keep a house, like a Dog; but of the Grecians termed Gelatopes, made for laughter.

* Athenaeus. * Apeckat of the Philosopher, being at a banquet wherein divers Jesters were brought in to make them merry, yet never laughed, among the rest, but a man of great reputation and learning, answered, that mendo but saith merriments, whereas Apes are naturally made for that purpose; Moreover, Apes are much given to imitation and derision, and they are called Clockets, because of their wicked looks, deceit, impostures and flatteries: wherefore of the Poets it is observed, that there were two brethren most wicked fellows, that were turned into Apes, and from their fear or habitation came the the Phebeesian Islands, which Virgil calleth Inanti: for Ateane was an old Egypthian word for an Ape, and those Islands being the seats of the * Giants (who being by God overthrown for their wickedness) in derision of them, Apes were planted in their rooms. Apes have been taught to leap, sing, drive. Wagons, reigning and whipping the horses very artificially, and are very capable of all humane actions, having an excellent memory either to their love to his friends, or hateful revenge to them that have harmed him, but the saying is good, that the threatening of a flatterer, and the anger of an Ape, are both alike regarded. It delighteth much in the company of Dogs and young Children, yet it will strangle young Children if they be not well looked unto. A certain Ape seeing a Woman washing her Child in a bason of warm water, observed her diligently, and getting into the house when the Nurse was gone, took the Child out of the cradle, and letting water...
water on the fire, when it was hot, stripp'd the Child naked, and washed the Child therewith untill it killed it.

The Countreys where Apes are found, are Lybia and all that desert Woods betwixt Egypt, & Ehbipia and Lybia: and that part of Caucasia which reacheth to the Red Sea. In India they are moit abundant, both red, black, green, duff-colour, and white ones: which they use to bring into Cities (except red ones, who are so venereous that they will ravish their Women) and present to their Kings, which grow to tame, that they go up and down the Streets so boldly and civilly, as if they were Children, frequenting the Market places without any offense: whereof so many fliewed themselves to Alexander, having at first to be an Army of enemies, and commanded to join battle with them, until he was certified by Taxilus a King of that Countrey then in his Camp, they were but Apes.

In Caucasia there are trees of Pepper and Spices whereof Apes are the gatherers, living among those trees: for the inhabitans come, and under the trees make plain a plat of ground, and afterward cast thereupon boughs and branches of Pepper, and other fruits, as it were carelessly; which the Apes secretly oberving, in the night season they gather together in great abundance all the branches loade with Pepper, and lay them on heaps upon that plat of ground, and in the morning come the Ingers and gather the Pepper from those boughs in great measure, reaping no small advantage by the labor of Apes, who gather their fruits for them whiles they sleep: for which cause they love them and defend them from Lions, Dogs, and other wild Beasts. In the region of Bafman, subject to the great Cham of Tartaria, are many and divers forts of Apes, very like mankind, which when the Hunters take, they pull of their hairs all but the beard and the hole behind, and afterward dry them with hot spices, and poudering them, sell them to Merchants, who carry them about the world, persuading simple people that there are men in Islands of no greater stature. To conclude, there are Apes in Inghilistye which are manecked about the neck like Lions, as big as great Bel-weatheres. So are some called Cepot NEG Nugue, Chpuge, Hug Ape, Gers, Glabriuih, Metochiuf, Cynoebas, of a Dog and an Ape, Sarcys, and Spaniges, of which we will speake in order, for they are not all alike, but some resembel men one way, and some another: as for a Cymera, which Albertus maketh an Ape, it is but a higment of the Poets. The fame man maketh Fignereys a kind of Ape, and not men, but Niphus proveth that they are not men, because they have no perfect use of Reason, no mod certainty, nor honesty, nor justice of government, and although they speak, yet is their language imperfect; and above all they cannot be men, because they have no Religion, which (Pleto phaith truly) is proper to every man. Besides, their stature being not past three, four, or five spans long, their life not above eight years, and their imitation of man, do plainly prove them rather to be Apes then Men: and also the flatness of their Noses, their combats with Cranes and Partridges for their egges, and other circumstances I will not stand upon, but follow the description of Apes in general Apes do outwardly resemble men very much, and Vetalum seaweth, that their proportion differeth from men in more things then Salen observed, as in the muscles of the breath, and thato which move the arms, the elbow and the ham, likewise in the inward frame of the hand, in the muscles moving the toes of the feet, and the feet and shoulders, and in the instrument moving in the sole of the foot, also in the fundament and mefentery, the lap of the liver, and the hollow vein holding it up, which men have not; yet in their face, nostrils, ears, eye-lids, breaths, armes, thumbs, fingers and nails, they agree very much. Their hair is very hart and thick, and therefore hairy in the upper part like men, and in the other part like Beasts: they have teeth before and behind like men, having a round face, and eye-lids more above and beneath, which other Quadrupodes have not. Politianus faith, that the face of a Bull or Lion is more comely then the face of an Ape, which is like a man. They have two Dugs, their breaths and armes like men, but rougher, such as they use to bend, as a man doth his foot. So their hands, fingers and nails, are like a mans, but ruder and nimmer; and nature having placed their Dugs in their breath, gave them armes to lift their young ones up to suck them. Their feet are proper, and not like, having the middle one longest, for they are like great hands, and confift of fingers like hands, but they are alike in bignesse, except that which is fett to a man, is greatest to an Ape, whose sole is like the hand but that it is longer, and in the hinder part it is more flethy, somewhat resembeling a heel, but put backward it is like a fitt.

They use their feet both for going and handling; the neather parts of their armes, and their thighs are shorter then the proportion of their elbows and thins: they have no Navel, but there is a hard thing in that place: the upper part of their body is far greater then the neather, like other Quadrupodes, confisting of a proportion between five and three: by reason wereof they grow out of kind, having feet like hands and feet. They live more downward then upward like other four-footed Beasts, and they want Buttocks, (although Albertus faith they have large ones) they have no tail, like two legged creatures, or a very small signe thereof. The gentall or privy place of the female is like a Womans, but the Males is like a Dogs: their nourishment goeth more forward then backward, like the belt Horfes; and the Arabian Seropic, which are higher before then behind; and that Ape whose meat goeth forward by reason of the heat of heart and liver, is most like to a man, in standing upright: their eyes are hollow, and that thing in man is accounted for a signe of a malicious mind, as little eyes are a token of a base and abject spirit. Men that have low and flat Nostrils are Libidinous as Apes that attempt women, and having thick lips, the upper hanging over the neather, they are deemed fools, like the lips of Apes and Apes. Albertus faith, he saw the heart of a Male Ape, having two tops or sharpe ends, which I know not whether to term a wonder or a Monster.
Ape and a Cat have a small back, and so hath a weak hearted man, a broad and long back figuring a valiant and magnanimous mind. The Ape's nails are half round, and when they are in copulation, they bend their Elbowes before them, the finews of their hinder joynets being turned clean about, but with a man, it is clean otherwise. The veins of their armes are no otherwise disiected then a man, having a very small and ridiculous crooked thumb, by reason of the Muscles which come out of the hinder part of the leg, into the middle of the thin, and the fore muscles drawing the leg backward, they cannot exactly stand upright, and therefore they run and stand, like a man that counterfeits a lame manes halting.

As an Historie, a certain Ape after a shipwreck swimming to land, was seen by a Countryman, and thinking him to be a man in the water, gave him his hand to save him, yet in the mean time asked him what Countryman he was, who answered, he was an Athenian: well, said the man, dost thou know Percus? which was a port in Athens) very well said the Ape, and his wife, friends, and children, whereas at the man being moved, did what he could to drown him. They keep for the most part in Caves and hollow places of hills, in rocks and trees, feeding upon Apples and Nuts, but if they find any bitternets in the shell, they cast all away. They eat Lice, and pick them out of heads and garments. They will drink wine till they be drunk, but if they drink it oft, they grow not great, specially they lose their nails, as other Quadrupedes do. They are best contented to sit aloft, although tied with chains. They are taken by laying for them shoos and other things, for which they hunt him well to anoint their eyes with water in their presence, and so departing, leave a pot of lime or hone in stead of the water, which the Ape eating, cometh and anointeth her eyes therewith, and so being not able to see, doth the hunter take her. If they lay shoos, they are leaden ones, too heavy for them to wear, wherein are made such deviles of gins, that when once the Ape hath put them on, they cannot be gotten off without the help of man: So likewise for little bags made like breeches, wherein they are deceived and taken. They bring forth young ones for the most part by twins, whereof they love the one and hate the other; that which they love they bear in their armes, the other hangeth at the dams back, and for the most part the killet that which the love, by pressing it too hard; afterward the feether her whole delight upon the other.

The Egyptians: when they describe a Father leaving his inheritance to his Son that he loveth not, picture an Ape with her young one upon her back. The male and female abide with the young one, and if it want any thing, the male with all, and irreful aspect punisheth the female. When the Moon is in the wane, they are heavy and sorrowful, which in that kind have tails; but they leap and rejoice at the change: as other Beasts, fo do these, fear the defect of the Stars and Planets. They are full of diffimilation, and imitation of man, they readily follow the evil then the good they see. They are very fierce by nature, and yet tamed forget it, but still remain subject to madnefs. They love Conies very tenderly, for in England an old Ape (farre able to go) did defend tame Conies from the Weasel, as Sir Thomas More reported. They fear a shell fish and a Snail very greatly, as appeareth by this Historie.

In Rome, a certain Boy put a Snail in his hat and came to an Ape, who as he was accustomed, leaps upon his shoulder and took off his hat to kill Lice in his head, but eatisfying the Snail, it was a wonder to see with what haufe the Ape leaped from the Boys shoulder, and in trembling manner looked back to see if the Snail followed him. Also when a Snail was tied to the one end of another Ape's chain, so that he could not chufe but continually look upon it, one cannot imagine how the Ape was tormenteth therewith, finding no means to get from it, cast upon whatsoever was in his stomack, and fell into a grievous Fever till it was removed from the Snail, and refreshed with wine and water. Cardenere reported, that it was an ancient custom in former time when a Parricide was executed, he was (after he was whipped with bloody stripes) put into a sack, with a live Serpent, a Dog, an Ape and a Cock: by the Serpent was signified his extreme malice to mankind in killing his Father, by the Ape that in the likenes of man he was a Beast, by the Dog how like a Dog he spared none, no not his own Father, and by a Cock his hateful pride, and then were they all together hurled headlong into the Sea. That he might be deemed unworthy of all the Elements of life, and other blesnings of nature.

A Lion ruleth the Beasts of the Earth, and a Dolphin the Beasts of the Sea; when the Dolphin is in age and sicknes, the recovereth by eating a Sea-ape: and so the Lion by eating an Ape of the earth, and therefore the Egyptians paint a Lion eating an Ape, to signify a sick man curing himself. The heart of an Ape fad and dried, whereof the weight of a great drunk in a draught of stale Hony, fed in water, called Melaveron, strengthens the heart, emboldneth it, and drive away the pulse and puellaminitry thereof: sharpeneth ones understanding, and is sovereign against the falling evil.
The MUNKEY.

The MUNKEY, called in Greek Ceropithecus, and in Latin Ceropithecus, is a tailed Ape; not to distinguish from all other Apes, but from other vulgar and common Apes, for there be Apes with tails besides a Munkey, but not so often seen. It is thought of some that the Hebrew Zim, signifies a Munkey, other Ochim. I. a. 3. Babel shall be destroyed, and the fearful beast Zim shall lie there, and Ochim shall fill their houses. Which Ochim, is interpreted Munkeys, but not generally; wherefore there is an opinion that this kind of Ape is generated of a wild Cat very like an Ape, and an Ape having two black spots on the cheeks, a long tail, and black at the end thereof, it is called the Italians Gatto mainme, of the French Marmot of Marmons, that is, the Ape of a male, for Mona signifies an Ape, of the Germans Merkats, that is the Cat of the Sea, of the Illyrian Morke, and Vock; as for Mammones, it is a beast like

Their urnen.
Muncker.
Others.
Generrons.
Munkeys.
Mammonds.

Inclination of Munkeys.
Secrets of Munkeys nature.
Contention.
The fear of a Munkey.

They are very sportful, and given to imitate the actions of men like Apes, it being a question, whether Dogs, Elephants, or Munkeys, have the most understanding among Brutes, and as was said before, when the Moon waxeth, it is heavy and dull, but in the new Moon joccond and pleasant. Betwixt the Mammones and Apes is continual war, and the Mammones being the weaker, yet the wiser and craftier creature, is much more courageous in fight than an Ape. Thence Munkeys of all things most abhor a Crocodile, for at the sight of the skin afar off, it hath been seen how the creature hath run through fire and water, crying and trembling for the natural dread thereof.

They are bred in the hills of Confrence, in the woods of Bugia and Mauritanias. In Ethiopia, they have black heads, hair like Asses, and voices like to other. In India they report that the Munkeys will climb the most steep and high rocks, and fling stones at them that profecute to take them. When the King of Ioga in India for Religion goeth on Pilgrimage, he carryeth with him very many Munkeys. In like fort, Munkeys are brought from the new found Land, from Caleckut and Prufia; and not far from Adens a City of Arabia, is a most high hill abounding in these beasts, who are a great hinderance to the poor vintagers of the Country of Caleckut, for they will climb into the high Palm trees, and breaking the velliets set to receive the Wine, pour forth that liquor they find in them: they will eat hearbs and grain, and ears of grasse, going together in great flocks, whereof one ever watcheth at the uinabo bounds of their camp, that he may cry out when the husbandman cometh, and then all flying and leaping into the next trees ecape away: the females carry their young ones about with them on their shoulders, and with that burden leap from tree to tree.

There be of this kind of Munkeys two sorts, one greater, the other lesser, as is accounted in England, and Munkeys are in like sort so divided, that there be in all four kinds differing in bigness, whereof the least is little bigger then a Squirrel: and because of their marvellous and divers movings, movings, voices and gestures, the Englishmen call any man using such faculties Actors a Munkey.

The only difference betwixt these and other Apes aforesaid, is their tail; they differ from men in their nerves, in the joints of their loynes, and their processes, and they want the third muscle moving the fingers of their hands. Mammones are leffe then an Ape, brown on the back, and white on the belly, having a long and hairy tail, his neck almost so big as his body, for which cause they are tied by the hips that they flap not collar. They have a round head, a face like a man, but black and bald on the crown, his nose in a reasonable distance from his mouth like a mans, and not continued like an Ape, his stones greenish blew, like a Turkey fone. They are caught after the manner of

B 3

Apes,
Apes, and being tamed and taught, they conceive and work very admirable feats, and their skins pulled off them being dead are dressed for garments. The foolish Arabs dedicated Memnonium cer- to heaven, and small afflictions implored his aid. There is one other kind of Munkeys, whose tail is only hairy at the tip, called Cercolipk.

The C E P H S, or Martine Munkey.

The Martin called Cepus of the Greek word, Kepus, which Aristotle wrote Kebus, and some translate Caesar, some Cepbus or Cephes or more barbarously Cephus, the Latines sometimes Orest, for indeed this kind of Apes in his bent elate is like a garden let with divers flowers, and therefore the beast kind of them is discerned and known by the sweeterst favour, such being always the most ingerious imitators of men. It is very probable that this name Cepus is derived of the Hebrew Keph and Kephin signifying Apes in general, as is before said, but yet this kind is distinguished from other, by Strabo, Elianus and Pliny, although Aristotle doth make no difference betwixt this and another ordinary Munkey.

The games of great Pompy first of all brought these Marines to the sight of the Romans, and afterward Rome saw no more; they are the same which are brought out of Ethiopia and the farthest Arabia; their feet and knees being like a man, and their forefeet like hands, their inward parts like a man, so that some have doubted what kind of creature this should be, which is in part a man, and yet a Four-footed beast: it having a face like a Lion, and some part of the body like a Panther, being as big as a wilde Goat or Roe-buck, or as one of the Dogs of Etruria, and a long tail, the which such of them as have tafted flesh well eat from their own bodies. Concerning their colour, howsoever they are not all alike, for some are black with white spots, having a greater voice than others, some yellow, some Lion-taunt, some golden-yellow, and some cole-black: yet for the most part, the head and back parts to the tail, are of a fiery colour, with some golden hair averted among the residue, a white snow, and certain golden stripes like a collar going about the neck, the inferior parts of the neck down to the breast, and the forefeet are white, their two dugs as big as a mans hand can grip, are of a bluish colour, and their belly white, their hinder legs black, and the shape of their inout like a Cynocophale: which may be the difference betwixt Elianus and Strabo their Cepus, and Arestatos Cebus, for nature many times bringeth forth like beasts which are not of the same kind. In England there was a Martin that had his back and sides of a green colour, having here and there white hair, the belly, chin and beard (which was round) white, the face and thins black, and the nose white, being of the better kind, for in bignefs it exceeded not a Coney. Some of them in Ethiopia have a face like a Satyre, and other members in part resembling a Bear, and in part a Dog, so are the Prasien Apes. This Martin did the Babyloniens, inhabiting near Memph, for the flangenes, the colour, and shape thereof, worship for a God. They are of evil disposition like Apes, and therefore we will spare both their pictures and further description, finding very little of them in Histories worth commemoration.
Of the Calitrzech.

The Ape CALITRICH.

The Calitrzech, so called by reason of his beard, and may be termed in English a bearded Ape, will live no other where than in Ethiopia and India, which are easy to take, but very hard to be carried away alive into these countries. They differ in appearance from all other Apes, having a long beard and a large tail, hairy at the end, being in India all white, which the Indiens hunt with dogs, and being tamed, they are so apt to play, that a man would think they were created for no other purpose, whereupon the Greeks use the proverb, an Ape having a beard, for a ridiculous and foolish jesting man.

Of the Præsan Apes.

Megasthenes (faith Ælianus and Strabo) writeth of Apes in Præsa Region in India, which are no leffe then great Dogs, and five cubits high, having hair like a Man coming forth of their forehead and beard, being altogether white except their tails, which are two cubits and a half long, very like a Lions; and unto a simple man it might seem, that their tufts of hair were artificially trimmed, though it grow naturally. Their beard is much like a Satyres, and although their body be white, yet is their head and tip of their tail yellow, so that the Martines before mentioned, seem to be affianced to these. These Præsan Apes live in Mountains and Woods, and yet are they not wild, but so tame that often times in great multitudes they come down to the Gates and Suburbs of Lonja, where the King commandeth them daily foddren Rice for their food, which they eat, and being filled return again to their home, and such places of harbour in great moderation, doing no harme to any thing.
Peter Martyr telleth this story of one of these, that he being like to a great Monkey, but having a longer tail, by rowling over and over three or four times together taketh such strength, that he leapteth from bough to bough, and tree to tree, as if he flew. An archer of that Sea-voyage hurt one of them with an arrow, the wounded beast pretently leapteth to the ground, and setteth upon the archer, as fiercely as a mad Dog; he drew his sword and struck off one of his arms, and so at last with much ado took the maimed beast, who being brought to the Navy, and accustomed to the society of men, began by little and little to be tame.

While he was in the ship bound with chains, other of the company having been on land to forrage, brought out of the Marshes a Bore, which Bore was shewed to the Munkey; at the first sight either of other set up their bristles, the raging Monkey leapt upon the Bore, and wadeth his tail round about the Bore, and with the one arm which he had left, caught him, and held him so fast by the throat, that he stifled him.

There is another kind of Munkey, for stature, biggesse and shape like a Man, for by his knees, secret parts and face, you would judge him a wilde man, such as inhabit Nomidae and the Lapones. for he is altogether overgrown with hair; no creature, except a man can stand so long as he; he loveth women and children dearly, like other of his own kind, and is so venereous that he will attempt to rape women, whose Image is here described, as it was taken forth of the book of the description of the holy Land.

Of the Cynocephale or Baboun.

Cynocephales are a kind of Ape, whose heads are like Dogs, and their other parts like a mans; wherefore Geza translacteth them Canicpeace, (to wit) dog-heads. In the French, German, and Ilyrian tongues, they are called of some Babbon, and Buboon in Italian, is a small kind of Ape; but Aristotle saith, that a Cynocephale is bigger then an Ape. In English they are called Baboons.

There are many kinds of Baboons, whereas of some are much given to fishing, so that they will tarry, Professor John a whole day in the deep hunting for fish, and at length come forth with a great multitude. Again, ad Rom pont. there are some which abhor fishes, (as Orus saith) which kind the Egyptians Emblematically use to paint.
Of the Baboons.

9

paint, when they will decipher a sacrifice. Some there are which are able to write, and naturally to differ letters; which kind the old Egyptian Priests bring into their Temples, and at their first entrance the Priest brought him a writing Table, a pencil and ink, that by seeing him write, he may make tryall whether he be of the right kind and the beast quickly fweareth his skill; whereof in ancient time, they were dedicated to Mercury, the fained god of learning.

The reason why the Egyptians do nourish them among their hallowed things is, that by them they may know the time of the conjunction between the Sun and Moon; because the nature of this beast is, to have a kind of feeling of that conjunction, for after that these two signs meet, the male Baboon neither will look up nor eat, but cast his eyes to the ground, as it were lamenting the ravishment of the Moon with dishonourable passion. In like manner the female, who moreover, at that time fent forth blood out of her womb of conception: whereupon the Egyptians signifie by a Baboon the Moon, the rising of the Moon, by his standing upright holding his hands up toward heaven, and wearing a crown on his head, because with such gestures doth that Beast congratulate her first appearance.

Another cause why they bring them into their Temples, is, because of the holiness of circumcision, for it is most true (though strange) that they are brought forth circumcised, at the least wise in some appearance, whereunto the Priests give great heed to accomplish and finish the work begun. The Egyptians also paint a Baboon fuitting to signifie the Equinodium, for in every Equinodium they back or bow twelve times in one day, and so many times make water: wherefore the Egyptians also upon their Hydrologies or Conduits did grave a Baboon, out of whole yard or privy part suffed forth water; and they also say that this beast be nourished among their holy things, dyeth not at once other beasts, but every day one part by the space of 72 days (the other parts remaining in perfection of nature) which the Priests take and put in the earth day by day, till all perish and be consumed.

The Wett region of Lybia and Ethiopia have great store of Cynoceplals, Baboons, and Aeopoils, beasts without a head, whole eyes and mouth are in their breasts. In like fort in Arabia, from Dira Southward in a Promontory, there are many Baboons, and in the Continent called Dachinabade Saragoza, and the Eastern Mountains of the Mediterranean region; and those which Apollodorus law between the rivers Ganzer, and Hyphasis, seem to be of this fort, in that he describeth them to be black hair, Dog-faced, and like little men; wherewithall Ethians feemeth to be deceived, in saying, that there are men Cynocephal, Dog-faced, whereas it is the error of vulgar people, to think that Baboons are men, differing only in the face of vantage.

Concerning their members or parts in several, they are black and hairy, rough skinned, red and bright eyes, a long Dogs face, and teeth stronger and longer then Dogs: the face of a Lion muf not be attributed to this beast, nor yet a Satyre, though it be more like. It hath a gum and fearful face, and the female hath naturally her womb cast out of her body, and so the breather it about all her life long: their voice is a shrill whizing, for they cannot speak, and yet they understand the Indian language; under their beard they have a chin growing like a Serpents, and bearding about the lips like a Dragon; their hands are armed with most strong nails, and sharp; they are very swift of foot, and hard to be taken, wherefore they will run to the waters when they are hunted, being not ignorant that among waters they are most hardly taken: they are very fierce and active in leaping, biting deep and eagerly where they lay hold, neither do they ever grow so tame, but that they remain furious. They love and nourish bread and Goats, and drink their milk; they know how to take the kernels out of Almonds, Walnuts and Nuts, as well as men, finding the meat within, though the shell be unprofitable: they will also drink wine and eat flesh, sod, rote, or deliciously dressed, and they will eat Vension, which they by reason of their swiftnes take easily, and having taken it tear in pieces and roll it in the Sun; they can swim safely over any waters, and therefore among the Egyptians they signifie swimming.

They are evil mannered, wherefore also they are pitiuous to signifie wrath, they are so unappeasable. The Latins use them adjectively to signifie any angry, rabbin, roward, or raving man. They will imitate all humane actions, loving wonderfully to wear garments, and of their own accord they clothe themselves in the skins of wide beasts they have killed, they are as lustfull and venereous as Goats, attempting to defile all forts of women, and yet they love little children, and their females will suffer them to suck their breasts if they be held to them, and some fay they will suck womens breasts like little children. There was such a beast brought to the French King, his head being like a Dogs, and his other parts like a man, having legs, hands and garments naked like a man, and a white neck; he did eat fof flesh so mannerly and modestly, taking his meat in his hands, and putting it to his mouth, that any man would think he had understood humane conditions; he feeld upright like a man, and fat down like a man. He discerned men and women asunder, and above all loved the company of women, and young maidens; his genital member was greater then most might match the quantity of his other parts: he being moved to wrath, would rage and let upon men, but being pacified, behaved himself as meekly and gently as a man, and was overcome with fair words: shewing himself well pleased with those that scolded with him. The Nomads people of Ethiopia, and the Nations of Memphis and Tyre live upon the milk of Cynocephals, keeping great herds of them, and killing all the males, except some few preferred for procreation.

The History of Four-footed Beasts.

A TARTARINE.

Thos. Beza.

Here was at Paris another beast called a Tartarine, and in some places a Magot (much like a Baboon, as appearing by his natural circumcision) being as great as a Gray-hound, and walketh for the most part upon two legs, being clothed with a Soldier’s coat, and a sword girded to his side, so that the most part thought him to be some Monster-little-man, for being commanded to his kennel, he would go and tarry there all night, and in the daytime walk abroad to be seen of every man, it was doubtful whether he were of the Monkey kind or the Baboon, his voice was like the squeaking of a Mouse, but his aspect and countenance was fierce, truculent and fearful, as his image is here deciphered.

The SATYRE.

A s the Cynocephal or Baboon Apes have given occasion to some to imagine (though falsely) there were such men, so the Satyres a most rare and seldom seen beast, hath occasioned other to think it was a Devil; and the Poets with their Apes, the Painters, Limners, and Carvers, to encircle that superflition, have therefore described him with horns on his head, and feet like Goats, whereas Satyres have neither of both. And it may be that Devils have at some time appeared to men in this likeness, as they have done in the likeness of the Onsentaurus and wild Ape, and other shapes; it being also probable, that Devils take not any denomination or shape from Satyres, but rather the Apes themselves from Devils whom they resemble, for there are many things common to the Satyre-Apes and Devilish-Satyres, as their humane shape, their abode in solitary places, their rough hair, and lust to women, wherewithal other Apes are naturally infected: but especially Satyres. Wherefore the Ancient Greeks conjecture their name to be derived as it were of Satther, signifying the yard or virile member: and it is certain that the Devils have exercised their prelibious lust, or rather their imagination of lust upon mankind, whereof cometh that distinction of Fauni, that some are Imuli defilers of Women, and some Sweltsis defiled by men. Peradventure the name of Satyre is more fitly derived from the Hebrew Sair, Isa. 34. whereof the plural is Seirim, Isa. 13. which is interpreted monsters of the Desert, or rough hairy Fawns; and when iim is put to the, it signifies Goats.

The Céoldeans for Seirim, render Schaden: that is, evill Devils: and the Arabians, Lystabin: that is, Satanas: the Persians, Devan: the Lyrians, Devadai and Dewas: the Germans, Tuskel: They which passed through the world and exercised daunting and other sports, for Dionysius, were called Satyres, and sometimes Tytii, because of their wanton songs: sometimes Sileni (although the difference is, that the smaller and younger beasts are called Satyri, the elder and greater Sileni:) Allo Bacbe and Nymphs, whereof Bacchus is pictured riding in a Chariot of Vinebranches, Silenus riding beside him on an Ape, and the Bacbe or Satyre shaking together their Italic Javelins and Paulmurers. By reason of their leaping they are called Sciris, and the antick or Satirical dancing Scimmis, and they also sometimes Scimmis: sometimes Aegypane: wherefore Piny reporteth, that among the Western Ethiopians, there are certain little hils of the Satyrique Aegypane, and that in the night time they use great fires, piping and dancing, with a wonderful noise of Timbrels and Cymbals: and so also in Atlas amongst the Moors, whereof there was no footing, remnant, or appearance to be found in the day time.
Of the Satyr, called Galeopithecus.

His figure of the Sogoin, I received of Peter Cordenberg, a very learned Apothecary at Antwerp, who is three times as big as my picture, and John Cay that famous English Doctor had advertised me, that it no way resembleth the Sogoin it self, which is not much greater then a Rat, a little Conny, or a young Hedghog: for he had seen several ones of that bigness, of a grizzled colour, a neat beard, and somewhat ash-coloured, a tail like a Rat, but hairy; the feet of a Squirrel, and the face almost like a Martine, or Satyre, a round ear, but very short and open, the hair black at the root, and white at the end, and in other conditions like a Monkey. They are much set by among women, and by the Bffians where they are bred and called Sogoin, it being very probable that they are conceived by a small Ape and Weasell, for in that Country, by reason of the heat thereof, there are many such unnatural conjunctions. It is a nimble, lively, and quick printed beast, but fearful; it will eat white-bread, Apples, Sweet-grapes, dried in the Sun, Figs or Pears. There was one of them at Antwerp, sold for fifty Crowns. In France they call a Sogoin a little beast not much bigger then a Squirrel, and not able to endure any cold. Some other affirm that a Sogoin is a bearded creature, but without a tail, of an ash-colour, not much bigger then a fift; but of this beast there is not any author writeth more then is already reheard.

Of the Bear-Ape Actopithecus.

Here is in America a very deformed beast which the inhabitants call Haut or Hauti, and the Frenchmen, Cwonn, as big as a great African Monkey. His belly hangeth very low, his head and face like unto a child, as may be seen by this lively picture, and being taken it will figh like a young child. His skin is of an ash-colour, and hairy like a Bear; he hath but three claws on a foot, as long as four fingers, and like the thorns of Privet, whereby he climeth up into the highest trees, and for the most part liveth of the leaves of a certain tree being of an exceeding height, which the Americans call Ambabut, and thereof this beast is called C 2'.
led Hte. Their tail is about three fingers long, having very little hair thereon; it hath been often tried, that though it suffer any famine, it will not eat the flesh of a living man; and one of them was given me by a Frenchman, which I kept alive six and twenty days, and at the last it was killed by Dogs, and in that time when I had set it abroad in the open aire, I observed, that although it often rained, yet was that beast never wet. When it is tame it is very loving to a man, and defirous to climb up to his shoulders, which tho' naked Americans cannot endure, by reaason of the sharpness of his claws.

Of the SIMIVULPA, or Apish-Fox.

The History of Four-footed Beasts.

Those which have travelled the Countrey of Payran, do affirme, that they have been a four-footed beast, called in Latin, Simivulpa, in Greek, Apeopithecus, and in German, Fuchaffe: in the forepart like a Fox, and in the hinder part like an Ape, except that it had man's feet, and ears like a Bat, and underneath the common belly, there was a skin like a bag or fersip, where in the keepe, lodgeth, and carryeth her young ones, until they are able to provide for themselves, without the help of their dam; neither do they come forth of that receptacle, except it be to suck milk, or sport themselves, so that the fame under-belly is her belt remady against the furious Hunters, and other ravening beasts, to preserve her young ones, for the is incredibly swift, running with that carriage as if she had no burthen. It hath a tail like a Monkey: there was one of them with three young Whelpes taken and brought into a flipp, but the Whelpes died quickly: the old one living longer was brought to Small, and afterward to Grandes, where the King of Spain saw it, which soon after by reaason of the change of aire and incertaintie of diet, did also pine away and die. The like thinges doth Cardan report of a beast called Chiara, in Hispania Nova, and Stadimak of a Sarray in America: but I conjecture that the former is this Fox Ape, called in Greek, Apeopithecus, and of the German Fuchaffe, the latter the Female Cyncephal, which carryeth her womb wherein lie her young ones without her belly. There is a filh called Glauclus, whereof the male swalloweith up all the young ones when they are indangered by other, and afterward yeeldeth them forth again safe and sound.

Of the ASSE.

The Ass, is called in Latin, Afinus, in Greek, Onis and Kilbo, because of his labour in bearing burdens, and of some Myganoos, because of his unpleasant voice: Of others Cochonour, or Canthus, from whence cometh Canthus, that is, a Scarbee or Flie, bred of the dung of Asses. The Hebrew call it Chamar, Deur. 5. and the Persians, Care, the latter Hebrews do indifferentely take Cajedor, Tartak, and Carr for an Ass; the Italians, L'asino, the Spaniards, Assa, the French, Unge, the Germans, Ofel, Mul, Malle refel, and the Rhytius, Ofel; the which Beast is intimated
Of the Ass.

Epithets of an Ass.

Howsoever this may be a fabulous commendation of this beast, yet holy Writ teacheth us, that an Ass faw an Angel, and opened his mouth in reproach of his master Balaam; and our most blessed Saviour rode on an Ass to Jerusalem to shew his humility; and Sampson out of the jaw-bone of an Ass, quenched his thirst. *Apollem* in his eleven books of his golden Ass, taketh that beast for an Emblem, to note the manners of mankind; how some by youthful pleasures become beasts, and afterward by timely repentant old-age, are reformed men again: Some are in their lives Wolves, some Foxes, some Swine, some Asses, and so other may be compared to other beasts: and as *Orion* faith, only by pleasure is a man a horse or Mule, when a beastly foul liveth in a humane shape. This world is unto them as an inchoated cup of *Circus*, wherein they drink up a portion of oblivion, error and ignorance; afterwards brutalizing in their whole life, till they taste the Roses of true science and grace enlightning their minds, which is their new recovery of humane wit, life, and understanding.

Asses are bred in Arcadia, wherefore proverbially, the best Asses are signified by the *Arcadian Ass*, and the greatest Asses by the *Arcarican Ass*. In *Timochen* in Persia, are very beautiful Asses, whereof one hath been sold for thirty pounds of silver. Likewise in *Rea*, in Italy, in *Illyria*, *Tirmania*, and *Epirus*, there are Asses but very small ones, although all other Cattel there are very large. In *India* among the *Feliminos*, they are no greater then Rams, and generally all their Cattel are of a very small growth. In *Sicyon*, *Pontius*, *Celts*, and the regions confining them, are no Asses bred, by reason of extremity of cold, for Asses are very impatient of cold. In *Mysea* there are also asses; but their flanks are crooked, and indented as if they were broken; whereupon a proverbial common speech arifeth (one having a broken flanke) for a *Myssian Ass*.

Asses are ingrended both by their own kind, and also by horses, for they chose fellations and put them to their Asses, who have large bodies, well-set legs, strong necks, broad and strong ribs, brawny and high creasts, thighs full of fineews, and of black or flea-bitten colour (for a Mouche-colour is not approved) wherefore he that will have a good flock of Asses, must look that the male and female be found, and of a good age, that they may breed long time, and out of a good Seminary, as of *Arcadia* or *Rea*; for as the best Lampreyes are in *Sicilia*, and the delicate fifth *Helps* in *Rhodes* and not
not elsewhere: so are belt Afges in those forenamed places. When they make choice of a Stallion, they look principally that he have a great head. An Ass is more defirous of copulation then an Horfe, and both male and female do couple at thirty moneths, although it prove not untill three, or three and a halfe Moneths. Men say that Anns the father in law of Ellaw, did firft invent the copulation of Horfes and Afges together; for as a Horfe doth cover the Ass, to an Ass will cover a Mare, and an Ass will sooner fill the huf of a Mare then a Horfe.

Ifa Horse cover a female Ass which hath been entred by a male Ass, he cannot alter the seed of the Ass: but if an Ass cover a Mare which a Horfe hath formerly entred, he will destroy the seed of the Horfe, so that the Mare shall suffer abortment, by reason that the seed genial of an Ass is more frigid then an Horfes. The Mares of kilis cannot at all conceive by Asses copulation, and there is more abortments fallent out by commision of Horfes with Asses, or Asses with Mares, then when every king mingled amongst themselves. It is but a superflition of some, which affime that an Ass cannot conceive for so many years, as the hath eaten grains of Barly corn defiled with womens purgation; but this is certain, that if an Ass conceive not at the first, loosing of her teeth, the remaineth barren. They are not coupled in generation in the Spring Equinoctium, like Mares and other beasts; but in the Summer Sulphur, by reason of their cold natures, that they may bring forth their young ones about the same time, for in the twelth moneth after their copulation, they render their Foles. If the males be kept from labour they are the worfe for generation, wherefore they are not to be suffered idle at that time; but it is not so with the female, she must ret, that the Fole may be the stronger: but prefently after she is covered, she must be coursed and driven to and fro, or else she will caft forth again the received feed.

The time that the goeth with young, is according to the male kind by which she is covered, for fo long as the male lay in the belly of his dam, fo long will the Ass carry her young before deliverance: but in the naturer of body, strength, and beauty, the young onke taketh more after the female then the male. The belte kind of Asses are the Foles of a wild Ass and a tame female Ass. They ufe when an Ass is foaled, to take it from tham, and put it to a Mare, that it may be the greater, which Foles is called Hapaphela, that is, a Horse-fucking; and Mares will not be covered by Asses, except by such a one as was a Horse-fucking. A feene of Asses will engender till the be thirty years old, which is her whole life long, but if she conceive ofte, she will quickly be barren: whereof their keepers must take such care, that they caufe them to be kept from often copulation.

They will not Bole in the fight of man, or in the light, but in darknes; they bring forth but once time, for it hath not been heard of in the life of man, that an Ass hath ever brought forth twins. As soon as they are conceived they have milk in their udders, but some hold not untill the tenth moneth. They love their young ones very tenderly, for they will run through fire to come at them, but if there be any water betwixt them, it coolteth their affections; for of all things they love not to wet their feet. They will drive their young ones from suckling at the fifth moneth, because of the pain in their udders, but their keepers wean them not till a whole year after their foaling. Their milk is so thick that it is used in stead of fodder: a Mares is more thin, and a Camels is thinnest of all. It is mortal to their young ones to taft the dames milk for two days after their foaling, for the food is so fat that it breedeth in their mouths the Colofraction or Reelings.

Touching their several parts, they have teetes on either chape like a Man and a Horfe, an Ass and a Mule have 36 teetes, and joyned neer together: the bloud of Asses and Bulls is the thickest of all other, as the bloud of man is the thinnest: His head is great and his ears long and broad: both male and female lofe their fore-teete in the thirtieth moneth of their age, and the second to the firtt, in the fift moneth; their third and fourth teeth are called Gnomons, that is, Regulars, because by them there is a trued rule to know their age; and those teeth also lofe in the fift moneth. The heart of an Ass is great, as all other fearful beasts have. The belly is uniform as in other beests that have a fold or whole hoof. It wanteth a gall, and hath two udders betwixt the thigges, the forepart of the back neer the shoulder is weakeft, and there appeareth the figure of a Croffe, and the hinder part neer the loins is stronger. The hoofs are whole and not parted: the Stygian water is so cold that nothing can hold it, except the hoofs of an Ass or Mule; although Elianus affirmeth, that it cannot be contained but in the horns of Stybian Asses. Their tails are longer by one joint then a horfes (though not so hairy). They are purged with monethly curious more then every Sheep or Goats, and the urine of the female is more thin then the males. If an Ass was hindered by any diete from making water, certain superflitious perlos for the ease of the bafl, muttered this charm:

    Gallus bibit & non mutit, Myoxus mutit & non bibit: that is,
    The Cock drinketh and maketh no water,
    The Dormouse maketh water and never drinketh.

Their men.

Philemon died with laughing when he saw an ass eat hogs.

Val. Max.
their feet; and that which is more strange, they cannot be brought to go over hollow bridges, through which the water appeareth in the chinks of the planks; and when in travall they are very thinly, they must be unladen and constrained to drink; yea, Herodotus reporteth, that there are certain Aflies among the African shepherds, which never drink. When they sleep they lie at length, and in their sleep conceive many forcible dreams, as appeareth by their often beating back their hinder legs, which if they strike not against the vain air but against some harder subtance, they are for ever utterly lamed.

When the Aflies of Tuscany have eaten Hemlock, or an herb much like unto it, they sleep so long and strangely, that oftentimes the Country men begin to flee them, and on the sudden their skins half take off and the other half on, they awake, braying in such horrible manner, that the poor men are most dreadfully affrighted therewith. Their voice is very rude and fearful, as the Poet saith;

Quiritat verres, tardus rudit, uncat astellas.

And therefore the Greeks to express the same, haved signified many new words, and call it Opeltos, Erafrutenis, as the Latins, Vacuna, that is, to utter forth a voice in a base and rude manner. The Poets feign that at that time when Jupiter came to war with the Gyants, Bacchus and Vulcan, the Artificers and Niens afflietted him and attended him, when the time came that the battell began, the Aflies for their fear brayed most horribly, whereas the Gyants not being acquainted with such strange and unknown voices and cries, took them to their heels and so were overcome.

In the facrice of the Goddesse Vacuna, an Aifie was feated with bread, and crowned with flowers, hung with rich Jewells and Peystreels, because (as they say) when Priapus would have ravished Venus, being asleep, she was suddently awaked by the braying of an Aifie, and so escaped that iniency. And the Lapumcomi in the digrace of Priapus did offer him an Aifie. But this is accounted certain, that among the Scythians by reason of cold, an Aifie is never heard or seen; and therefore when the Scythians set upon the Periuns, their Horsees will not abide the braying of Aflies,wondering both at the strangenes of an Aifie strange, and rudeless of his cry: wherefore there be certain birds, resembling in their chattering the braying of Aflies, and are therefore termed Oncotaur.

When an Aifie dyeth, out of his body are ingended certain Flies, called Scorabees. They are infected with the same diseases that Horsees be, and also cured by the same meanes (except in letting of blood) for by reason their veins be small and their bodies cold, in no case mutt any blood be taken from them.

Aflies are subject to madness when they have tasted to certain herbs growing near Parnass: as are Vegetinis, Bears, Horsees, Leopards and Wolves: they only among all other hairy beasts are not troubled with either tikes or lice, but principally they perish by a swelling about the crown of their paltere, or by a Certaine called Mules, which falling down upon their liver they die, but if it purge out of their nostrils they shall be safe: and Columela writeth, that if sheep be stabled where Mules or Aflies have been houled, they will incur the scab. There is great use made of the skins of Aflies, for the Germanes do make therewith a substance to paint and write upon, which is called Efelhaut. The Arabians have a cloth called Mesha, made of Aflies and Goates hair, whereof the inhabitants of their desert make them tents and sacks. This is reported that Enepheales was called Colunfeanes, because when the Ancientes were troubled with winds by hanging about their City innumerable Aflies skins, he safegarded them from the winds: whereupon some have thought (but falsely) that there was some secret in Aflies skins, against obstinatious Tempeles.

The bones of Aflies have been used for pipes, the Artificers made more reckoning of them then Flings, of the bones of Hattes, and therefore Esop in Phaethon wondereth that so groose and dull a creature, should have such shrill and musical bones; and the Bustriner called the Philosphers Naturaliter, because they played musick upon Aflies bones, for they cannot abide the sound of a trumpet, because it relembeath the voice of an Aifie, who is very hateful to them for Typhon sons.

Mecenates allowed the flesh of young Aflies to be eaten, preferring it before the flesh of wilde Aflies, and this cutlome also prevailed at Athenes, where they did eat the flesh of old Aflies which burneth the stomack, having in it no good juice or sweetness, and is very hard to be digested. In like sort about the coasts of Alexandria, men use to eat the flesh of Aflies, which beingget in their body much melanchoke and added humeur, causet them to fall into the Euphania or spotted leprofe.

Aflies are named three years old, and taught for those businesse which they must be applied unto; some for the mill, some for husbandry and the plough, some for burthens and carriage, some for the wars, and some for draught. Merchants use Aflies to carry their wine, oil, corn, and other things to the sea-side, wherefore the Country man maketh principal account of this beast for his carriage to and fro, being fit to carry both on his neck and on his back: with then they go to market with their wares, and upon them being home their household necessaries.
They grind in their mills and fetch home their corn, they plough their land, as in *Compania, Lybia*, and *Butia*, where the ground is soft, and in *Byzantium* that fruitful Country, which repayeth the husbandsman labor with increase of an hundred and fifty times more then the feed, and where in dry weather their ground is not arable with the whole strength of Bulls, yet after a little rain, one *Afs* in one end of a yok, and an old woman at the other end, do easily draw the plough, and open the earth to tow their feed: wherefore *Cato* said mildly, that Mules, Horses and *Afs*, keep no holy-days, except they be such *Afs* as keep within doors. In like sort they draw from place to place the carts of Bakers, or Carts laden with any other carriage, if it be not over great.

The people *Carman* (by reason they want Horses) use *Afses* in their wars, do also do the *Scymnarii*, who never use them in mils or any such base works, but upon them undertake all their martial perils.

There was a cullome amongst the *Scymnarii*, that when a Woman was taken in Adultery, she was led to the Market, and there set upon a bare *Afs*, afterwards she was set upon a bare *Afs* back, and so carried throughout the City, then brought back again to the former *Afs* for a publick spectacle to all the City, whereby she remained infamous all her life after, and was called *Onmatia*, that is, one that had ridden an *Afs*; and the *Afs* whereupon the flood, was accounted an unlucky, and an odious place for all posterity. In like sort among the *Parthians*, it was held a disgraceful thing to ride or be carried upon a bare *Afs* back. The dung of *Afses* is precious for a garden, especially for Cathages; and if an Apple tree be dying, it may be recovered by wafting in *Afs* dung by the space of six days; and some have used to put into Gardens the skull of a Mare or the *Afs* that hath been covered in copulation, with periwasion that the Gardens will be the more fruitful.

*Afse*s are of very foolish conditions and slender capacity, but yet very tame, not refusing any manner of burthen although it break his back: being loaded, it will not out of the way for any man or beast, and it only underlatheth the voice of that man, with whom it is laboured, knowing allo the way whereunto it is accustomed. *Ammoniatus* was in such love with an *Afs*, and holding him of so great a capacity, that he had one continually to hear his Lectures of Philosophie. *Galate* affirmeth, that an *Afs* underlatheth genus, species & individualum, because if you shew him a Camell that never saw one before, he is terrified and cannot endure his fight: but if he have been accustomed to such a fight, if you shew him never so many, he is not moved at them. In like sort, he knoweth men in general, being not afraid of them, but if he see or hear his keeper, he knoweth him for his keeper or master.

There was a cunning player in *Africs*, in a City called *Alcatur*, who taught an *Afs* divers strange tricks or feats; for in a publick spectacle, turning to his *Afs* (being on a scaffold to shew sport) said, *The great Sultan* purpofeth to build him an house, and shall need all the *Afses* of *Alcatur* to fetch and carry wood, stones, lime, and other necessaries for that buifinesse; presently the *Afs* fellath down turneth up his heels into the air, groaneth, and thutteth his eyes falt, as if he had been dead: while he lay thus, the Player desired the beholders to confider his efcape, for his *Afs* was dead; he was a poor man, and therefore moved them to give him money to buy another *Afs*. In the mean time having gotten as much money as he could, he told the people he was not dead, but knowing his matters poverty, counterfeiteth in that manner, whereby he might get money to buy him provender, and therefore he turned again to his *Afs* and bid him arife, but he flirred not at all. Then did he strike and beat him fow (as it seemed) to make him arife, but in all vain, the *Afs* lay fow.

Then said the player again, our *Sultan* hath commanded that to morrow there be a great triumph without the City, and that all the noble womens shall ride eithera upon the fairest *Afses*, and this night they must be fed with Oates, and have the beft water of *Niles* to drink. At the hearing whereof, up started the *Afs*, frothing and leaping for joy: then faid the Player, the Governor of this Town hath defired me to lend him this my *Afs* for his old deformed wife to ride upon; at which words the *Afs* hangeth down his ears, and underlathing like a reasonable creature, began to halt as if his leg had been out of joint; why, but faid the Player, had thou lifer carry a fair young Woman? The *Afs* wagged his head in token of content to that bargain, go then (faid the player) and among all thefe fair Women, chufe one that thou mayst carry; then the *Afs* looketh round about the Assembly, and at last went to a fober woman and touched her with his nose, whereat the residue wondered and laughed, fluttering up the sport, with crying out: An *Afs* Woman, An *Afs* Woman, and fo the Player went unto another Town.

Such things do ferve to teach us that *Afses* are not altogether indolent, besides in their own nature they know how to refrench themselves in their wearines, by wallowing on the ground, and being overcome with melancholy humor, they naturally look for the hearty *Caterach* or *Finger-feaste* to cure them. When the *Afses* of *Mauritania* are bound to a journey, they fet forward fo fast, that a man would think they rather flew then ran; but being overwearyed they are fo abated, that they fend forth tears, and then are they drawn at Horses tails to their journeys end.

The *Afs* is never at peace with the Crow, because it longeth for the *Afses* eyes, likewise the bird *Salem*, for when the *Afs* comes to the thornies, to rub himself where the faid bird buildeth her nest,
of the asse.

neit, the Ase spoileth it, wherefore the faind bird maketh continual asfalt upon him. In like fort the Caloct or Strelle, for it feepeth in the mangers, and creepeth up into the Afses nose to hinder him from eating.

The Wolfe is also an enemy to the Afe, for he lovethe his flefh, and with small forceth doth compeffe the deftruction of an Afe, for the blockisf Afe when he feeth a Wolfe, layeth his head on his fide, that he might not fee, thinking that because he feeth not the Wolfe, the Wolfe cannot fee him; but the Wolfe upon this advantage feteth upon the beaft on the blind fide, and eafily deftroyth the couragelfs Afe. Another argument of an Afe's stupiditie, is that he careth not for his own life, but will with quietnes fave, if meat be not laid before him. Wherefore it is apparent that when a dull Scholar not apt to learn, is bid to fell an Afe to fignifie his blockifhnes, is no vain fenfence; therefore they which refembe Afses in their head, round forehad, or great face, are faind to be blockifh; in their fleffifh face,feirtifh; in broad or great eyes, fimple; and like to be mad in thick lips, and the upper hanging over the neather, Foolifh; and in their voice, contumelious and difdainfull.

To conclude, the ancients have made many fignifications of Afses and their fhaipes, making a man with an Afe head to fignifie; Firft, one ignorant of manners, histories, and Countries. Secondly, immoderate riot of unborn perions in Scripture is deciphered in an Afe. Thirdly, impudence and flamelefnes, because an Afe will not for any fhaipes forfake his own wayes. Fourthly, the feift people, who like Afses could not understand the evident truth of Christ in the plain text of Scripture, wherefore our Saviour secretly upbraided their dullnes, when he rode upon an Afe. Fifthy, the Egyptifh by an Afe, noted a man without all divine knowledge; wherefore they tield to take an Afe and follow him with all defpit, beating him from place to place till he brake his own neck; for they believed that an Afe was poffefled of a Devil. Sixtly, Indocility, by an Afe bridled. Seventhly, the fnares of flatterers; for their Priets fet an Afe between flowers and ropes, neither of both partaining to an Afe's skill; teaching thereby how mighty men fall by treachrsh of flatterers. Eightly, a Woman difembling her Pregnancy. Ninthly, by a man weaving a cord, and an Afe behind him biting it afunder; they fignifie, a painful husband and a prodigal wife. Tenthly, a good Vufe-dreffler, for when an Afe did bite of the branch of a vine, it was obferved that the next year the Vine was more fruitful. Finally, hafe fervility, trilfing flaughterfnes, good fortune, Tyrants, and fools, are Hieroglyphically comprised under the difcourfe of Afses.

Touching fuch medicinal vertues as have been tried and found to be in the several parts of Afses, by learned and approved writers, now in the conclusion of this History they shall be briefly remembred, and fo this Narration be finifhed.

A draught or two of the fame water whereof an Afe or an Oxe hath drunk, will eafe the head- ache, the forehead of an Afe tied to the neck of one that hath the falling evil, cureth him; and the brain of an Afe steeped in sweet water and infuamed in leaves, whereof taken for certain days, half an ounce, eafeth the falling evil: the number of which days cannot be lefs then thirty, but this is very ridiculous, that if a man hurt by a Scorpion, dowhisper his bare in the ear of an Afe, prefently the hurt ceaeth. When one is vexed with a Quotidian Fever, with three drops of blood out of the vein of an Afe ear, put into eighteen ounces of water and drunk by the patient, eafe that pain.

The liver of an Afe burnt, driveth away venomed things, and the fame dried and beat to powder, helpeth the Cough and shortnes of breath, and roiled to be eaten, ifr be eaten falling it is againft the falling evil. Other fay, ifr be mixed with Opponox, and inflinced into the mouth forty days together, defendeth infants from the aforefaid ficknes. Also the heart of a male black Afe, eaten with bread at the evening, in the first or second day of the Moon, is good againft the falling evil. The liver dried with Parifely, and three Walnuts clenfed from the pil and put into hony, is marvellous good for one that is liver fick; the ashes of it mixt with oil, taketh away Wers; and the ashes of the liver and the flefh is good againft the chapping, cleits, or flifers in the body, which come by cold: but Dofowd, whom I rather follow, attributeth both these vertues to the ashes of the hoof. He that is fick of the mil, be holpet with the old mil of an Afe, If he eat thereof every day dryed and calling, he shall find eafe by it within three days. The fame firft dryed and then steeped in water, maketh the dogs full of milk, fo also doth the Spleen, and the Spleen with fewet of a Bear, and oil made as thick as hony, by anointing the eye-lids therewith, refethore the hairs which are wanting. The reins exenterated brooffed and put into new pure wine, do help the bladder, and fay the incontinency of the Urine. The fame dried, burned, and beaten into very small powder, whereof a nut shell full put into two cups of pure wine and drunk off, careth the Strangeury.

It is thought, t'while with the powder of the Afe genital, the hair may be made grow thicker: and the fame beaten with lead and oil, and anointing the head where gray hairs are shaven off, keept from more gray hairs. The bones of an Afe kept in falt and sprinkled in a portion of Afe's milk or Water, helpeth the falling evil. The Gall of an Afe or a Bull, either of them, feverally broke into Water, taketh away the spots in the face, if after the patients skin be pilled, he muft keep himfelf from fun and wind.

The blood of an Afe flayeth the flux of blood coming from the skin or films of the brain; and two or three drops of the fame drank with wine, careth the Quotidian Fever: the felf fame thing is reported of the blood let out of the vein in the ear. The blood of the Fole of an Afe with wine, careth

Eusebius.
cureth the Kings evil. The froth or scum of Vide with the fat of an Affe or the fat of a Sow, cureth the wincings of Dogs: and if there be any freas in the body, the fat maketh them of the fame colour with the refulde of the body. And if one vexed with the Falling evil, be announced with the feet or fat of an Affe, it will ease them very much; likewise the marrow of Affes helpeth the Scabs from a man, and with the feet the places infected with Caraths, Leprofies, or Scars, receive their former colour; and the skin laid upon young Infants, maketh them without fear. And if the bill of a Hen wrapped in an Affes skin, be bound to ones forehead, it provoketh feep.

A Pallie man will fall down if he taste of the perfume made of the hairs of an Affe or Mule.

The Affes of the hares of Affes, fayweth bleeding; and the fame hath the more force if they be of a male, and be mixed with Vinegar and laid in wooll to the blude bleeding. The bones of an Affe broken and rod, are very foveryal against the venom of Sea-hair-fish. The powder of an Affes hoof drunk a moneth together, two spoonfuls at a time, helpeth the Falling evil very greatly; and the fame mixed with oil, helpeith the Kings evil; and being put upon Kibeor Chil-blaines, cureth them. The hoofs of Affes burned and beaten to powder, given to them that have the Falling evil in drink, helpeth them speedily: also a burned hoof is mingled with many medicines, to cure the swelling of the Navel in children; and the hoofs perfumed procure speedy deliverance in travel of young, that the dead thing may come forth, otherwise it is not used, for it will kill the living young ones.

The durt thereof with the milk of an Affe, by annointing cureth the Scars and Webs of the eyes, and as Marcellus faith, only the parings of an Affes hoof scraped and mingled with a womans milk; and they say, that if an Epilipick, in a ring made of Affes hoof wherein is no blacknes, it will preserve him from falling. The powder of an Affes hoof burned and beaten, laid in Vinegar and made in little bals, and one of them put into the mouth and there held, helpeith the loofenes and pain in the teeth. There is a collection of certain hard matter about an Affes legs, called Lichen, which if it be burned and beaten, and put into old oil, will caufe hairs to grow out of baldnes, and it is of such force, that if it be applied to a womans cheek, it will produce the fame effect, and mingled with Vinegar it raiseth up the Leibangke man.

And if a man take the Ring-wormes growing naturally on Affes legs, and shreadeth them into powder put them in Vinegar, it stayeth all pain in the head, which maketh one feepy. The ffeeth of Affes fodd in poottage helpeith them, that have the Pothisi or disease of the Lungs, and there are some which prescribe the taking of Affes ffeeth, or the blood of Affes mingled with Vinegar, to be taken forty days together against the falling evil. The milk of an Affe mingled with hony and drunk, looethereth the belly, and therefore Hippocrates gave it for a gentle purgation, being moother then any other kind of milk, and fitter to take down the belly. It will also ease the tooth-sach, if the teeth be washed in it, and faften them that are looether, being very good to waft the teeth withal. Galen gave Affes milk mixt with hony, to one in a Confrontation when he came newly from a bath, and therefore it is given in Fevers Heelick, and all confuming diseases, because the sublime of it is fitter for deteration then nutriments; when the beafts are in pain, by drinking Affes milk they be holp; and the fame mingled with hony, caufeth Womens purgation; by drinking Affes milk, an exulerate Homest is relieved; likewise all other pains in the homest, where a come of fnares or low- row, fivering, and defeption; and Horeludes gave Affes milk with Annised to one that had his lights hopped, and it is likewise recommanded against the Cough, extenuation, fittung of blood, Dropifie, and hardnes of the Spleen, but it is not good for a weak head troubled with giddines or noife, yet will it loofen the hardnes of the belly in a Fever.

It is also freely used against eating of Morture, White-leade, Sulphur, and Quickfliver; and when a mans meat doth not either nourifh nor digeft, let him drink Affes milk safely: and it is also good to gargarize in fore chaps or throates. Likewise in a Fever when there is no head-ache. The ancient in old time gave Affes milk to children before meat, and for want thereof Goats milk; for fore mouths it must be gargarized. It is very profitable against the Colick and Blondy-flux, if hony be put thereto; loosefnes or defire of ftool is taken away by drinking Affes milk: the whay or milk of an Affe did Hippocrates prescribe against the Confunption of the reins or back; and the fame with the root of a pomgranate against the loosefnes and other diseases of the belly to be drunk.

Alfo there are examples where the whay of Affes milk have helped the Gout, both in hand and foot; sweet water with Affes milk is wholesome againft poison of Hen-bane, and other poisons, but it must be use new, or else soon after warmed: This milk will make womens skins whiter, wherefore P. pap., the wife of Demitrus Nero carrie about with her in her progres fifty milch Affes, wherewith she did use to bath her self.

The Urine with the own dung, he leth bright flooing, feabs in a man, and the roughnes of the mils. It taketh away the feurfe of Oxen. It is given in drink, to cure them that have ache in their reins, and with Pyr or wort it is profitable against Suppurations and Apolloem in the flesh. If any be hurt by the Stirs, waft them in Affes flate, mingled with Sphina: the fame force hath it againft cornes and all hardnes or thicknes of skin. The dunge of Affes new with oil of Rofes, dilufed warme into the ears, helpeith deafnes; and putthes or fuddain boils of the head, are cured with the Juice of Affes dunge, and of Sea-onionts beat to powder, and the fat of beef, layed to the boils like a plaifer: both the dung of Affes and Horses either raw or burnt mingled with Vinegar, reftaineth bleeding both in Fluxes and Wounds, used like a plaifer, being new and mingled with Vinegar; and for
Of the Hinnus, Innus, &c.

for the bleeding at the nofe, snuffe in the athes of Aflès dung burnt to powder. The dung of Aflès cureth the Piles, and the fame dried and moistened in wine being drunk of Cartel which are flung with Scorpions, cureth them if it be at graffe; and it is found true by long experience, that the dung of an Aflè rubbed, in quantity two spoonfuls, and taken every day, delivereth one from the falling evil.

mitis prodeft ex ubere fuccus aﬄè,  
Sit tepido wine infundus ac meli piferque.

This is good againft the gall and running over thereof, if it be mingled with warm water, pepper, and hone. The Syrians call the dung of a young Fole which it first callifed up after the foling, Polcau; and give it againft the ficknefs of the milk.

In fopâ dreciHum folo magnupere prodeft.

The fame is good againft the Colick and the Bloody-flux. The juice of Aflès dung, Aflès milk, and sweet wine, anointed on the fick member, cureth the Gowe: and the fame layeth the fowreffe of women with child; the juice hereof cureth the closing up of the eyes in the right. The skin wherein the young Fole lyeth in the dams belly being fmelel not unto him that hath the Falling evil, it ealeth him. Anaiauli hath reported, that if the excrements of a Mares copulation be burned, there will appear monstrous figures of Horfes heads. If a Horfe have a web in his eye, mingle together the milk of an Aflè, the blood of a Dove, and the dew of Cabages, and anoint him therewith: and there be some which take of the dirt where an Aflè hath made water in the way, and therewith anoint the Scabs of Sheep for their recovery: but when one is fieckened with a Scorpion, the Aflès dung must be prefently applied, or else it profiteth nothing in that malady.

Of the Hinnus, Innus, and Ginnus, Mannus, mammulus, Beft & Burdeus, &c.

There is no word in the Greek that have any words to express thefe Beasts, and the Latins have derived thefe terms from them. Thofe are Beasts of a fmall fize, as dwarfs among men, and therefore feldom feen in these parts of the world. They which are called Hinnus, are conceived of a Horfe, and a Aflè, whofe bles that they take their denomination from the male, yet do they more reffemble the female. In ancient time, the males which were conceived of a Horfe and a Aflè, were called Hinnus, and likewise of an Aflè and a Mule; fo are the young ones of little Goats, Deer, Hares, and other like: although fome take Innus for the young Harts, and the Hinnus Hinnus for the breed of a Horfe, and an Aflè; fo that there appeareth two kinds, and both of them tranplanted out of other.

The Hinnus is leffe then the Muie, but more ruddy, having ears like a Horfe, and a mane and tail like an Aflè, lying in the womb before the fologing twelve moneths like a Horfe, and are brought up like little Horfes, whose age is difcerned by their teeth, and they are fometimes procreated of a Horfe and a Mule, and because of their aptnefs to bear, they are called Burdeus, or else of Burdeus by reafon of their folly and lownefs.

Mannus and mammulus are very little low horfes, being very gentle and easy to be handled, being called alfo among the Civilians, Beft. There is in France, not far from Grattenon, a kind of Mules which in the Country I speech are called Innus, being bred of an Aflè and a Bull, and in the Helvetian Alps beyond Cunna, about the Town Speluga, I have been fincerely informed, that there was a Horfe conceived of a Bull and a Mare, and therefore Seeliger faith, that fuch a fole is called Hinnus, whereof he reported he had feen many; and he himfelf had two of them, and at that inftant had only one female, becaufe whole ears there were two hone buncbes about the bignefs of half a Walnut, giving evident teftimony by the forehead, that her father or Syre was a Bull: and fome fay that this kind want their upper teeth: and their underchop doth in a deformed manner forth from it felf beyond the upper, as it is in many fishe, being called of the Catell and Avernus, Beft: And at this day there is in the Court of France a certain beaft which in the former part is like an Aflè, and in the hinder a Sheep. In Ferraria among other extraordinary beafts, they nourifh dwarff Aflès, of whom Maffini made a Difcription to this effect, that they are not fo high as a man, when he fitteth on the ground.

His tibi de mulit non est metuenda ruina:  
Altius in terris fene fecere folet.

For the Innus, and Ginnus, or Hinnus, they are conceived by a Male and a Mure, which are very small by reafon of some difeafe the dam that beareth them hath in her belly: the word Innis signifying a young or new born Nephew, and is attributed to this kind of beafts, because they never exceed the quantity of a young foie. Both the Male and the Burde remain barren and never conceive, theire neigh like a Horfe, and that brayeth like an Aflè. A Muffimon is a short Horfe, Aflè, or Mule.
The History of Four-footed Beasts.

Of the Wild Ass.

A Wild Ass, called of the Latin, Onager; of the Hebrews, Arad and Arda, and as Sebastian Munster affirmeth, Meodos and Arda; in the German tongue it may be termed Ein Waldesfell, and the young ones called Lalisouns.

These wild Asses are not Elkz, as some have reported of Elkz, nor that Oryx which the ancient writers do constantly affirm to live in a continual thirst, as for the most part wild Asses do. Of these Asses are great store in Persia, Lycaonia, and Africa, and it is said, that the Saracen King of Tama in Africa, sent unto Ferdinand King of Naples, a goodly great wild Ass, such an one as hath not been seen in this part of the world.

Apollonius affirmeth, that he saw wild Asses in great plenty beyond Cappadocia in Egypt; so there many in Cauca, an Island near Crete: as Persia, in Asia, in Madaura, and Abosia, Arabia desert, Mauritania, and Armenia. Cellini reporteth that there are such wild Asses in that region under the Equinoctial towards the East and South, of wonderful nature; their skins (beside the usual manner) being of divers colours, intermixed variably with white and black, and the Zones and Strakes descending from the top of the back unto the fides, and there divided by their winding and turning, make the foles appear of admirable variety.

These Asses love the higheft Mountains and rocks, as holy Scripture teacheth, Jer. 14. The Ass in the high place and drew in the wind like Dragons: which words gave occasion to some to imagine, that wild Asses would quench their thirst with the wind without water; whereas it is the manner of all wild beasts, in extremity of thirst, to gape wide and greedily draw in the cold refreshing air, and they will not drink but of pure fountain water. They live in flocks and great companies together, but in defolate places: the males going before the females, and commonly one male will lead and rule the whole flock of females, being exceeding swift, and fleetful, and therefore do they often change their places of abode; and yet it is observed, that the wild Asses of Asia never go over the mountain that divideth them from Cappadocia.

They engender among themselves, their females being much more lustful then the males, and therefore do the males observe and watch them with a jealous eye towards their own foles, especially after they have conceived; and the female as warily avoideth the fight of the male, especially at the time of her foling; for if the bring forth a female, the male receiveth it with all love, joy, and welcome: but if a male, then doth he with angry and envious countenance look upon it, taking it heavily that another male is bred, which in time may in the fathers place possesse his dam; wherefore in a raging madness he falleth upon the foles, seeking by all his power to bite off his bones; the poor female although weakened with poore delivery, yet helpeth her young one against the fathers rage, and like a Mother who seeing her Son slain in war, embraceth his bleeding corps, and cryeth out with doleful voice, tearing her cheeks and bleeding betwixt her breasts: so would you think this fife female Ass, to mourn for her foles, now ready to die by the Sires cruelty laying, O my husband why is thy ass so insolent? Why are thy eyes now become so bloody, which even now were as white as light? Doth thou look upon the face of that monster Medusa? which turneth men into foles? or doft thou look upon some new hatch'd horrible Dragon, or the wheet of some Lion lately littered? Why wilt thou gild this your young one which nature bath given unto us both by preception? O wretched foles that I am, which have conceived an unclean fole by the fathers wickedness! O my poor and unhappy! which for a jealous fear art deprived of thy natural parts, not by the claws of Lions (that I would endure) but by the unnatural and more then basilethy of thy own father.

These wild Asses have good and strong hooves, their swiftnes is compared to the wind, and in the time that they are hunted, they can call backward with their heels Bones with such violence; as they pierce the breyes of them that prosecute them if they be not very wary. They are of a large, broad, tall and beautiful body; long ears, and a silver colour, (that is as I heffe) a bright cloud-colour, for it is but vain to imagine, that an Ass can be all white, for then were all the ancients deceived, which with one voice affirm, that he hath a black lift on the back, at either side whereof are two white lines.

Their food is only grasse and herbs of the earth, whereby they grow very fat, their heart being the fittest part of their body, and they will not abide any flesh-eating beast, especially the Lion whom he feareth very much, for all these strong beasts devour and eat them. These Asses are very fit for civil uses, as for plowing and fowing, for being tamed they never grow wild again, as other beasts will, and they easily grow tame. It is observed, that the same being tamed, is most tame which before time was most wild. They love figs and meat above all things, wherefore the Armenians use to take a certain black fift bred in their waters which is poison, and covering it with the meat the wild Asses come and lick thereof, and so are destroyed. The bell of them are generated of a Mare and a wild Ass tamed, for they are the twintfil of intense, by hardhkeit hoof, a lean body, but of a generous and untiresable stomac. The Indian wild Asses have one horn in their forehead, and their
their body all white, but their head is red: So is there another beast in India very like a wild Ass, which the Inhabitants eat (as we have read) about the Strait of Maelstrom: When these Asses are hunted with Dogs, they cast forth their fire or dung, with the favour whereof the Dogs are stayed while it is hot; and by that means the beast escapeth danger: but the Asses of Monstrianus are very short wined, and subject to weariness and champing, for which cause they are more easily taken, and the bell of all are not so swift as a Barbary horse; besides their nature is, when they see a man to stand stone still, crying, braying, and kicking, till you come at them, and when one is ready to take them, they take their heels and run away. The Inhabitants of Arabia Deserta, by many guns and other deceptive devices take them, and on horseback follow them till they tire, or can strike them with their darts. Their fleth being hot, doth stink and taste like an other Asses, but boiled and kept two days hath a pleasant taste; yet doth it not breed good blood, because it is viscus and hard to be concocted, although there be many which eat that, as also the flesh of Panthers and other such beasts.

Pliny teacheth that there is more virtue in the wild Asses milk and bones against venom and poison, than in the tame. Likewise, in the heel of an Ass, a principal remedy against Apoplexy, and buncbes, and scabes in the heth, if it be applied to the inner part of the thigh. The gall draweth out botes, and must be anointed upon impollutable scars. It is used also in Empiheurs against Saint Anthony fire, the leprous, and dwelling in the legs and guts. The fat with oil of haery Mary by anointing the reins of the back, helpheth and eateh that pain which was engendred by wind. The spleen dryed to powder and drunk in wine or drink, is good against the thicknes of the spleen. The fleth is good against the pain in the ridge and hip-bones: and Genan affirmeth, that the urine breaketh and disolves the stone in the bladder. The ass's of the hoof helpheth the falling evil, and mingled with oil, cureth the kings evil, and the looseness of the hair. The marrow eateh the Gout, and the dung mixed with the yolk of an egge and applied to the forehead, liethy bleeding: also the fame cureth the hair if it be mingled with an Oxes gall and dryed: put into wine and drunk, cures the stings of a Scorpion: and Zor an Hebrew affirmeth very constantly, that if a man look into an Asses eye, it preferveth the sight, and hindereth the water that defcendent into the eye.

Of the Scythian Asses.

The Asses of Scythia have horns wherein it is reported that the Stygian water of Arcadia may Helianus be contained, although it will eat through all other vessells be they never so hard. Sosthen brought of them to Alexander the great, who admiring the rareness, would not put them to any private use, but sent them to Delphi, to be offered to Pythias; but that these can be properly called Asses, no man can defend, although Herodotus alfo affirmeth, that among the Africans called Aetas, there be Asses with horns.

Of the Indian Asses.

It is questionble whether the Monoceros, commonly called a Unicorn, the Rhinoceros, the Oryx, and the Indian Ass be all one beast or divers: for the Unicorn and Rhinoceros have the same things attributed to them in stories, and differ in very few reports: but for the Asses of India, both Aetianus, Pliny and Helianus, joyntly agree, that they differ from all other whole-footed beasts, because they have one horn in the forehead, and so alfo have the Rhinoceros, Monoceros, and Oryx, but the Indians call a Unicorn, Carthusian; and the horn so highly prized at this day, is thought to be of the Rhinoceros: but Helianus and Pliny acknowledge no other Valerius then the Indian Ass, who in bignesse equalleth a Horse among the Indian, being all white on the body, but purple headed or red (as some say) black eyes, but Valerianus faith bl ew, having one horn in the forehead a cubit and a half long, whose upper part is red or bay, the middle black, and the neather part white, wherein the Kings and mighty men of India use to drink, adorning it for that purpose with fundry bracelets, precious flones, and works of gold, for holding for truth that all those which drink in those horns, shall be freed from annoyance of inuerable diseases, as Convulsions, the Falling evill, and deadly poysons.

These wild Asses exceed all other, both in stature of body, and also swiftnes of foot, for at the firll, they set forth very gently, and afterward sped their journey with better pace, so that it is very hard for any to follow them, but impossible to overgo them. The males take great pains in keeping their young ones, whom they continually watch and hide in the most remote and desert places they can finde. When they are hunted, they keep their weak young ones behind them, and fight for them very furiously, neither fear they to encounter horfemen. They are so strong, that no beast may stand before them, for they will receive the charge of Horfes with such violence, that in their encounter they bite out their fides and tear their guts out of their belly: for which cause they are dreadful to Horfes, who are most unwilling to joyn with them, for they never meet but they both perish. They fight with their heels, but their teeth are most dangerous, for what they apprehend in D them
them; they bring it clean away: and because of this rage, those which are of any years, can never be tamed. The great King of India doth once every year appoint all manner of fights both men and beasts, wherein are wilde Bulls, tame Rams, these wild Asses with one horn, Hyænas and Elephants. To conclude, it is but a fable of Volaterranus, that faith, these Asses want a gall, for they have the bladder of the gall, a portion whereof drunk, cureth the falling evil.

Of the **Alborach** and **Axis**.

There are two other beasts to be added to the end of this rank, namely the Alborach among the Turks, being a fair white beast like an Affe, whereupon the Turkish Priests blaspheous idolaters, persuade the silly Pilgrims of Mecha, that Mahomet was carried up to heaven. The Axis, of which Plato speakseth, is a wilde beast, having a skin like the Hinnulus aforesaid, but spred over with whiter spots, which is bred in India. **Bellanus** affirmeth, that they saw two of them in the Castle of Cairo, a male and a female, and either sex wanted horns, having long tails down to their mid-legs like Deer, and differ very little from Deer, faving in their large white spots and yellow colour, yealding a much more clear and founding voice than a Deer, and the female thereof is smaller than the male. This beast is by idolatrous people, dedicated to their drunken god Bacchus.

Of the **Badger**, otherwise called a Brocke, a Gray, or a Bausen.

The Badger could never find a Greek name, although some through ignorance have foiled it into a Greek Dictionary Melo, whereas in truth that is his Latin word Meles or Meles, and so called, because above all other things, he loveth hony, and some later writers call him Texo, Tass, Taxo, and Albertus Magnus, Duxus. But whereas in the Scripture some translate Tejus, Tejas, or Tachseh, and plurally Tebafem, Badgers, yet is not the matter so clear, for there is no such beauty in a Badgers skin, as to cover the Arke, or to make Princes choose thereof: therefore some Hebrews say, that it signifies an Oxe of an exceeding hard skin. Onaheus translateth it Salgus, that is, a beast skin of divers colours; Symmachus and Aquila a jacinet colour, which cannot be; but the Arabians, Darasch, and the Persians, Albasch; yet it may be rather said, that those skins spoken of Exod. 25. Numb. 4. Ezek. 26. be of the Lynx, or some such other beast: for Tachseh cometh near to that, signifying a kind of Wolf not hurtful to men, being rough and hairy in Winter, but smooth in Summer.

The Italians call a Badger Tasso, the Rhetians, Tosh: the French, Tasse, Tasson, Taixin, Taffon, Tass, and sometime Grasfart, for her colour: sometime Blasen, and at Paris, Bedese. The Spaniards, Taffo, Texon; the Germans, Tach, or Dux; the Illyrians, Graswex.

Badgers are plentiful in Naples, Sicily, Lucane, and in the Alpine and Helvetican coasts; so are they also in England. In Lucane there is a certain wilde beast, resembling both a Bear and a Hog, not in quantity, but in form and proportion of body; therefore this may fitly be called in Greek, Superitor, for a Grey, in short legs, ears and feet, is like a Bear, but in fatness like a Swine. Therefore it is observed, that there be two kinds of this beast, one resembling a Dog in his feet, which is called Cume; the other a Hog in his cloven hoof, and is called Swinefis: also these differ in the fashion of their shoue, one resembling the shoue of a Dog, the other of a Swine: and in their meat,
Of the Badger.

meat; the one eating flesh and carrion like a Dog, the other roots and fruits like a Hog, as both kinds have been found in Germany and other parts of France and Sicily. This beast diggeth him a den or cave in the earth, and there livest; never coming forth but for meat and cæson, which it maketh out of his den: when they dig their den, after they have entred a good depth for avoiding the earth out, one of them sitteth on the bank, and the other layseth all the earth on his belly, and so taking his hinder feet in his mouth, draweth the belly-laden Badger out of the cave, which disburtheth her cariage, and goeth in for more till all be finished and emptied. The wily Fox never matcheth a Den for himself, but finding a Badgers cave, in her absence, layseth his excrements at the hole of the Den, the which when the Gray returneth, if the smell (as the tavour is strong,) the forebeareth to enter as noforme, and to leaveth her elaborate house to the Fox. These Badgers are very sleppy, especially in the day time, and flir not abroad but in the night, for which cause they are called Lucifers; that is, Fiends of the light. They eat bony, and wormes, and horns, and flesh like things, because they are not very swift of foot to take other creatures. They love Orchards, Vines, and places of frutes also, and in the autumn they grow therewith very fat.

They are in quantity as big as a Fox, but of a shorter and thicker body; their skin is hard, but rough and rugged, their hair harsh and stubborn, of an intermingled grizzled colour, sometime white, sometime black; his back covered with black, and his belly with white, his head from the top thereof to the ridge of his shoulder, is adorned with theakes of white and black, being black in the middle, and white at each side. He hath very sharp teeth, and is therefore accounted a deep-biting beast. His back is broad, his legs (as some say) longer on the right side then on the left, and therefore he runneth best when he geteth to the side of a hill, or a cart-road-way. His tail is short but hairy, and of divers colours, having a long face or snowlike, as the Zibetibus; his forelegs being a full span long, and the hinder legs shorter, short ears and little eyes, a great bladder of gall, a body very fat between the skin and the flesh, and about the heart; and it is held that this fat increaseth with the Moon, and decreaseth with the fame, being none at all at the change: his forelegs have very sharp nales, bare and apt to dig withall, being five both before and behind, but the hinder very short ones and covered with hair. His favour is strong, and is much troubled with lice about his secrets; the length of his body from the nose which hangeth out like a Hogs nose, to the tail or rump, is some thirty inches and a little more, the hair of his back three fingers long; his neck is short and like a Dogs; both male and female have under their hole another outwardly, but not inwardly in the male. If the be hunted out of her Den with Hounds, the bithem they gravely if they lay hold on them, wherefore they avoid her carefully, and the Hunters put great broad collars made of a Grays skin about their Dogs neck, to keep them the safer from the Badgers teeth: her manner is to fight on her back, using thereby both her teeth and her nales, and by blowing up her skin above measure after an unknown manner, she defendeth her self against the keys of men, and the teeth of Dogs: wherefore she is hardly taken, but by devils and gins for that purpose inventd; with their skins they make quivers for arrows, and some the heard in Italy use thereof to make facks, wherein they wrap themselves from the injury of rain.

In Italy and Germany they eat Grays flesh, and boil with it pears, which maketh the flesh tast like the flesh of a Porcupine. The flesh is best in September if it be fat, and of the two kinds, the Swinsh Badger is better flesh then the other. There are sundry vertues confected out of this beast: for one is affirmed, that if the fat of a Badger mingled with crude bony, and anointed upon a bare place of a horse, where the former hairs are pulled out, it will make new white hairs grow in that place: and it is certain (although the Grecians make no reckoning of Badgers grace, yet,) it is a very forerain thing to soften, and therefore Serenus prescribeth it to anoint them that have Feyes or Inflamations of the body.

Nec sernendas adeps dederit, quem belsia melis.

And not to be despifed for other cures: as for example, the eashing of the pain of the reins if it be given in a glyfter, and likewise the fat of a Dog and a Badger mingled together, do loosen contracted fines.

The ashes of a Badger is found to help the bleeding of the stomack and the fame sod and drunk, preventeth danger by the biting of a mad Dog: and Brunfelsius affirmeth, that if the blood of a Badger be intillled into the horns of Cattel with fat, it keepeth them from the murrain, and the fame dryed and beat to powder doth wonderfully help the Leprosie. The brain sod with oil eatch all aches; the liver taken out of water, helpeth swellings in the mouth; and some affirm, that if one were soles made of Badgers skins in their sooes, it giveth great eafe unto the Gowt. The biting of this beast is venemous, because it feedeth upon all venemous meats which creep upon the earth, although Arnoldus be of a contrary judgement: and of this beall I can report no other thing, worth the noting, save that the Noble family of the Taxons in Ferraria, took their name from this creature.
A Bear is called in the Hebrew, Dub; and plural Dubim; of the Arabians, Dukle; of the Chaldeans, Dubah, Aleb and Debah; of the Greeks, Arutos; of some Delphus, because of the roughness of his hair; of other Beeros, and Monius, signifying a solitary Bear. The Latins call him Ursus, which some conjecture to be tanguam orus, signifying that it is but begun to be framed in the dams bellye, and perfected after the littering thereof. The Italians call it Ursus; fo also the Spaniards; the French, Ours; the Germans, Bears; and Bears; the Boemians, Nedsved; the Polishers, Vultures; and the attributes of this beast are many among Authors, both Greek and Latin; as Lemnian Bears, armed, filthy, deformed, cruel, dreadful, fierce, greedy, Calydonian, Erymanthian, bloody, heavy, night ranging, Lybic, menacing, Numidian, Ursus; head-long, ravening, rigid and terrible Bear; all which serve to set forth the nature hereof, as shall be afterward in particular disoured.
Of the Bear.

First, therefore concerning several kinds of Bears, it is observed, that there is in general two; a greater, and a less; and these leffer are more apt to clime trees then the other, neither do they ever grow to so great a stature as the other. Besides there are Bears which are called Amphiibus, because they live both on the Land and in the Sea, hunting and catching fish like an Otter or Beaver, and these are white coloured. In the Ocean Islands towards the North, there are Bears of a great stature, fierce and cruel, who with their fore-feet do break up the thickest congealed Ice on the Sea, or other great Waters, and draw out of those holes great abundance of fishes: and so in other frozen Seas are many such like, having black claws, living for the most part upon the Seas, except tempestuous weather drive them to the Land.

In the Eastern parts of Indis, there is a Bear in proportion of body very like a Bear, yet induced with no other quality of that kind, (being neither so wild, nor ravenous, so strong) and it is called Fo-tmicarian Bear; for that it is pretended, whereas that Courtesey is abundantly annoyed with the Emeriche Ants, that bear doth so prey and feed upon them, that by the strength and vertuous humor of his tongue, the filly poor Inhabitants are exceedingly relieved from their grievous and dangerous numbers.

Bears are bred in many Countreys, as in the Helvetian Alpine region, where they are so strong and full of courage, that they can tear in pieces both Oxen and Horses, for which cause the Inhabitants study by all means to take them away. Likewise there are Bears in Persia, which do raven beyond all measure, and all others; so also the Bears of Numidia, which are of a more elegant form and composition than these reducet; and whereas Pliny affirmeth, that there are no Bears in Africa, he mistook that Countrey for Crete, and so fay many, that in that island be no Wolves, Vipers, or other such venemous creatures; whereas the Poets give a vain reason, because Jupiter was born there: but we know alfo, that there be no Bears in England.

In the Countrey of Arabia, from the Promontory Diræ to the South, are Bears which live upon eating of flesh, being of a yellowish colour, which do far excel all other Bears, both in activity or swiftefe, and in quantity of body. Among the Koscelani and Littinians, are Bears, which being tamed are presents for Princes. A fi[6]lo in his wonders reporteth, that there are white Bears in Miyra, which being esierly hunted, do send forth such a breath, that putrifeth immediately the flesh of the Dogs, and whatsoever other beast cometh within the favour thereof, it maketh the flesh of them not fit to be eaten: but if either men or dogs approach or come nigh them, they vomit forth such abundance of phlegm, that either the hunters are thereby choked or blinded.

The rays also breed white Bears, and the King of Ethipia, in his Hebrew Epistle which he wrote to the Bishop of Rome, affirmeth, that there are Bears in his Countrey: In Buufonia are Bears, both of a Snow white, yellow, and dusky colour, and it hath been seen that the Noble women Charities drawn by six Horses, have been covered with the skins of white Bears; from the pattern to the head, and as all other creatures do bring forth some white, and some black, so also do Bears, who in general do breed and bring forth their young in all cold Countreys, some of a dusky and some of a brown black colour.

A Bear is of a moft venenous and luflful disposition, for night and day the females with most ardent inflamed defires, do provoke the males to copulation: and for this cause at that time they are most fierce and angry.

Philippus Celsus, Confinste, did moft confidently tell me, that in the Mountains of Savoy, a Bear carried a young maid into his den by violence, where in venenous manner he had the carnal life of her body, and he kept her in his den, he daily went forth and brought her home the bell Apples and other fruits he could get, presenting them unto her for her meat in very amorous sort; but always when he went to forrage, he rouled a huge great stone upon the mouth of his den, that the Virgin should not escape away: at length her parents with long search, found their little Daughter in the Bear's den, who delivered her from that Savage and beaftful captivity.

The time of their copulation is in the beginning of Winter, although some time in Summer, (but such young ones seldom live) yet most commonly in February or January. The manner of their copulation is like to a man, the male moving himself upon the belly of the female, which lyeth on the earth flat upon the back, and either embrace each other with their fore-feet: they remain very long time in that act, insomuch as if they were very fat at their first entrance, they disjoin not themselves again till they be made lean.

Immediately after they have conceived, they betake themselves to their dens, where they (without meat) grow very fat (especially the males) only by sucking their fore-feet. When they enter into their den, they convey themselves in backwards, so that they may put out their foot-steps from the sight of the hunters. The males give great honor to the females great with young, during the time of their fereifie, so that, although they lie together in one cave, yet do they part it by a division or small ditch in the midst, neither of them touching the other. The nature of all of them is, to avoid cold, and therefore in the Winter time do they hide themselves, chufing rather to suffer famine then cold; lying for the most part three or four months together and never see the light, whereby...
The History of Four-footed Beasts.

When they first enter into their den, they betake themselves to quiet and rest, sleeping without any awaking, for the first fourteen days, so that it is thought an easie stroke cannot awake them. But how long the females go with you’re is not certain, some affirm three months, others but thirty days, which is more probable, for wild beasts do not couple themselves being with young (except a Hare and a Lins) and the Bears being (as is already said) very lufiful, to the intent that they may no longer want the company of their males, do violently call their Whelps, and so presentiy after delivery, do after the manner of Conies betake themselves to their luft, and nourishing their young ones both together: and this is certain, that they never come out of their caves, till their young ones be thirty days old at the least; and Flin precisely affirmeth, that they litter the thirty day after their conception; and for this cause, a Bear bringeth forth the least whelp of all other great beasts, for their whelps at their first littering are no bigger then rats, nor longer then one finger. And whereas it hath been believed and receivd, that the whelps of Bears at their first littering are without all form and fashion, and nothing but a little congealed blood like a lump of flesh, which afterwards the old one frameth with her tongue to her own likenes, as Flin,

A superflitious life of Bears lived or fat.

Some affirm, that Bears do wax or grow as long as they live, that there have been seen some of them five cubits long; yea I my self saw a Bears skin of that length, and broader then an Oxes skin.

The head of a Bear is his weakest part (as the hand of a Lyon is the strongest) for by a small blow on his head he hath often been stricken dead, the bones of the head being very thin and tender: yea more tender then the beak of a Parrot. The mouth of a Bear is like a Hogs mouth, but longer; being armed with teeth on both sides, like a fow, and flanding deep in his mouth, they have very thick lips, for which cause, he cannot easily or halfly with his teeth break aunder the hunters nets, except with his fore-feet.

His neck is short, like a Tygers and a Lyons, apt to bend downwards to his meat; his belly is very large, being uniform, and next to it the intrals as in a Wolf: it hath also four spears to her Paps. The genital of a Bear after his death waxeth as hard as horn, his knees and elbows are like to an Apes, for which cause they are not swift or nimble: his feet are like hands, and in them and his lions is his greatest strength, by reason whereof, he sometimes feteth himself upright upon his hinder legs: the pattern of his leg being fleshy like a Cammels, which maketh them unfit for travel: they have sharp claws, but a very small tail as all other long haired creatures have.

They are exceeding full of fat or lard-grease, which some use superflitiously beaten with Oyl, wherewith they anoynt their Grasp-fickles when they go to vintage, persuading themselves that if no body know thereof, their tender Vine-branches shall never be confumed by Caterpillars.
Of the Bear.

Other attribute this to the virtue of Bears blood, and Tiphresius affirmeth, that it Bears greale be kept, at such time as the Bears he secret, it will either fill it up, or cause it to run over. The fleth of Bears is unfit for meat, yet some use to eat it, after it hath been twice sod; other eat it baked in paffies; but the truth is, it is better for medicine then for food. Tiphresius likewise affirmeth, that at the time when Bears he secret, their dead fleth encreaseth which is kept in houfes, but Bears fore-feet are held for a very delicate and well falted food, full of sweetnefs; and much used by the German Princes.

The skins of the Bears are used in the far Northern regions for garments in the Winter time, which they make so artificially, covering themselves with them from the crown of the head to the feet, that (as Monier affirmeth) some men deceived with that appearance, deeme the people of Lapponia to be hairy all over. The fouldiers of the Moos wear garments made of Lyons, Pardals, and Bears skins, and fleep upon them; and it is reported of Herodatus Megarensis the Mufitian, who in the day time wore a Lyons skin, and in the night lay in a Bears skin.

The constitution of the body of a Bear is beyond measure phlegmaticke, because he falleth in the Winter time fo long without meat: His voyce is fierce and fearful in his rage, but in the night time mounrful, being given much to ravening. If a Bear do eat of Mandragoras, he presently dyeth, except he meet with Emmets, by licking of whom he recovereth: fo likewise if he be sick of a Swирует.

A Bear is much subject to blindness of the eyes, and for that caufe they desire the Hives of Bees, not only for the Hony, but by the stinging of the Bees, their eyes are cured. It hath not been seen that a female Bear was taken great with young, which cometh to pafs, by reafon that they go to their Den so soon as they are conceived, and come not out thence till they have littered: And because of the fierceenes of this beast, they are seldom taken alive, except they be very young: fo that some are killed in the Mountains by poifon, the Country being too steep and rocky that Hunters cannot follow them; some taken in ditches of the Earth, and other gins. Oppianus relateth, that near Tigrius and Armenius, the Inhabitants ufe this stratagem to take Bears. The people go often to the Woods to find the Den of the Bear, following a Leam-hound, whose nature is fo soon as he windeth the Bear, to bark, whereby his leader discovereth the prey, and do draweth off the Hound with the Leam; then come the people in great multitude, and compassing him about with long nets, placing certain men men at each end: then they a long rope to one fide of the net as high from the ground as the small of a mans belly: whereunto are fatted divers plumes and feathers of Vultures, Swans, and other repleident coloured birds, which with the wind make a noise or hisling, turning over and gliding; on the other fide of the net they build four little bowsls, wherein they lay four men covered all over with green leaves, then all being prepared, they found their Trumpets, and wind their Horns; at the noise whereof of the Bear ariseth, and in his fearful rage runneth to and fro as if he faw fire: the young men armed make unto him, the Bear looking round about, taketh the plainest way toward the rope hung full of feathers, which being firred, and hated by them that hold it, maketh the Bear much afraid with the rating and hisling thereof, and so flying from that fide half mad, runneth into the nets, where the Keepers entrap him so cunningly, that he feldom elcape.

When a Bear is set upon by an armed man, he standeth upright and taketh the man betwixt his fore-feet; but he being covered all over with iron plates can receive no harm, and then may easily with a sharp knife or dagger pierce through the heart of the beast.

If a the Bear having young ones be hunted, the drove ther her whelps before her until they be weared, and then if he be not prevented, the clumbeth upon a tree, carrying one of her young in her mouth, and the other behind. A Bear will not willingly fight with a man, but being hurt by a man, he gnatheth his teeth, and licketh his fore-feet: and it is reported by an Ambaffador of Poland, that when the Sarmatians find a Bear, they inclose the whole Wood by a multitude of people, standing not above a cubit one from another, then cut they down the outmost trees, so that they raise a wall of wood to hem in the Bears; this being effecteth, they raffe the Bear, having certain forks in their hands made for that purpofe, and when the Bear approacheth, they (with thole forks) fall upon him, one keeping his head, another one leg, another his body, and fo with force muzzle him and tie his legs, leading him away. The Rhettians ufe this policy to take Wolves and Bears: they raffe up great poifes, and crofe them with a long beam laded with heavy weights, unto the which beam they fasten a cord with meat therein, whereunto the beast coming, and biting at the meat, pulleth down the beam upon her own pate.

The Inhabitants of Helvetia hunt them with maftiff Dogs, because they should not kill their Carrell at large in the field in the day time; They likewise shoot them with guns, giving a good fum of money to them that can bring them a flain Bear. The Sarmatians ufe to take Bears by this flegft; under thofe trees wherein Bees breed, they plant a great many of sharp pointed flakes, putting one hard into the hole wherein the Bees go in and out, whereunto the Bear climbing, and coming to pull it forth, to the end that he may come to the Hony, and being angry that the flake licketh fo fuit in the hole, with violence plucketh it forth with both her fore-feet, whereby the loofeth her hold and fallceth down upon the picked flakes, whereuon the dieth, if they that watch for her come not to take her off. There was reported by Demetrius Ambassador at Rome, from the King of Melos, that a neighbour of his going to fpeak Hony, fell into a hollow tree up to the brelf in Hony, where he lay two days, being not heard by any man to complain; at length came
The History of Four-footed Beasts.

came a great Bear to this Hony; and putting his head into the tree, the poor man took hold thereof, whereas the Bear suddenly affrighted, drew the man out of that deadly danger, and ran away for fear of a worse creature.

But if there be no tree wherein Bees do breed near to the place where the Bear abideth, then they use to annoy some hollow place of a tree with Hony, whereunto Bees will enter and make Hony-combes, and when the Bear findeth them the he is killed as aforesaid. In Norway they use to saw the tree almost alder, so that when the beast climbeth it, the falletth down upon piked flakes laid underneath to kill her: And some make a hollow place in a tree, wherein they put a great pot of water, having anointed it with Hony, at the bottom whereof are fastened certain hooks bending downward, leaving an easie passage for the Bear to thrust in her head to get the Hony, but impossible to pull it forth again alone; because the hooks take hold on her skin: this pot they bind fast to a tree, whereby the Bear is taken alive, and blindfolded, and though her strength break the cord or chain wherewith the pot is fastened, yet can the not escape or hurt any body in the taking, by reason her head is fastened in the pot.

To conclude, other make ditches or pits under Apple-trees, laying upon their mouth rotten ficks, which they cover over with earth, and throw upon it herbs, and when the Bear cometh to the Apple-tree, the falletth into the pit and is taken.

The herb Wolf-chen or Libardine is poison to Foxes, Wolves, Dogs, and Bears, and to all beasts that are littered blinde, as the Alpine Bihetians affirm. There is one kind of this called Cyclamem, which the Valdenfians call _Twa_, and with the yucey thereof they poiyon their darts, whereof I have credibly received this story: That a certain Valdenfian, having a wild Bear, having a dart poyoned herewith, did cast it at the Bear being far from him, and lightly wounded her, it being no sooner done, but the Bear ran to and fro in a wonderful perplexity through the woods, unto a very sharp chife of a rock, where the man saw her draw her last breath, as soon as the poiyon had entered to her heart, as he afterward found by opening of her body. The like is reported of Henbane, another herb: But there is a certain black fift in Armenia, full of poiyon, with the powder whereof they poiyon Figs, and cast them in those places where wilde beasts are most plentiful, which they eat, and so are killed.

Concerning the indufly or natural disposition of a Bear, it is certain that they are very hardly tamed, and not to be trusted though they seem never fo tame; for which cause there is a story of _Diana in Lysias_, that there was a certain Bear made fo tame, that it went up and down among men and would feed with them, taking meat at their hands, giving no occasion to fear or mistrust her cruelty: on a day, a young maid playing with the Bear lafbrivously did so provoke it, that he tore her in pieces; the Virgins brethren seeing the murder, with their darts flew the Bear, whereupon followed a great perpetuall wrath upon all that region: and when they consulted with the Oracle, the paynim God gave anfwer, that the plague could not ceafe, until they dedicated some Virgins unto _Diana_, or the Bears fake that was illain; which some interpreting that they should sacrifice them: _Embarus_ upon condition the Priesthood might remain in his family, flw his only daughter to end the pellife, and for this cause the Virgins were after dedicated to _Diana_ before their marriage, when they were betwixt ten and fifteen year old, which was performed in the month of _January_, otherwise they could not be married: Yet Bears are tamed for labours, and especially for sports among the _Rexolani_ and _Lybian_, being taught to draw water with wheels out of the deepest wells; likewise stones upon felds to the building of walls.

A Prince of _Lippania_ nourished a Bear very tenderly, feeding her from his table with his own hand, for he had used her to be familiar in his Court, and to come into his own chamber when he listed, so that she would go abroad into the fields and woods, returning home again of her own accord, and would with her hand or foot rub the Kings chamber door to have it opened, when she was hungry; it being locked: it happened that certain young Noble-men confpired the death of this Prince, and came to his chamber door, rubbing it after the custom of the Bear, the King not doubting any evil, and supposing it had been his Bear, opened the door, and they presently flew him.

There is a fable of a certain wilde Bear, of huge stature, which terrif'd all them that looked up on her, the which _Pythagoras_ sent for, and kept to himself, very similarly using to stroke and milk her at the length when he was weary of her, he whistled in her ear, and bound her with an oath, that being departed the Bear never more harm any living thing, which faith the fable, she obferved to her dying day. These Bears care not for any thing that is dead, and therefore if a man can hold his breath; as if he were dead, they will not harm him; which gave occasion to _Eopis_, to fable of two companions and fworne friends, who travelling together met with a Bear, whereas they being amaz'd, one of them ran away and got up into a tree; the other fell down and counterfeited himself dead, unto whom the Bear came and fmelt at his nostrils and ears for breath, but perceiving none, departed without hurting him: soon after the other friend came down from the tree, and merrily asked his companion what the Bear said in his ear, Marry (quoth he) the war'd me that I should never tru't such a fugitive friend as thou art, which didd forfake me in my greatest necelcity: thus far _Eopis_.

They will bury one another being dead, as _Teucer_ affirmeth, and it is received in many Nations, that children have been nurfed by Bears: _Paris_ throwed out of the City, was nourished by a Bear. There is in _France_ a Noble house of the _Orfani_, whose first founder is reported to have been certain years
Of the Bear.

They will not willingly fight with a man, although men may do it without hurt, for if they annoy or sprinkle the mouths of Lyons or Bears with Vitriol or Copperas, it will fo bind their claws together, that they shall not be able to bite, which caufed Martiull to write thus:

Alexander had a certain Indian Dog, given unto him, to whom was put a Bore and a Bear to fight withall, but he did them not, but when a Lyon came, he rose up and fought with him. Bears, they will fight with Buls, Dogs, and Horfes: when they fight with Buls, they take them by their horns, and to with the weight of their body, they weary and prefs the beast, until they may easily flay him: and this fight is for the most part on his back. A Ki\-ne\-cros let on by a Bear in a publick spectacle at Rome, did easily call him off from the hold he bad on his horn. She doth not adventure on a wide Bore, except the Bore be asleep, or not seeing her. There is also a mortal hatred between a Horfe and a Bear, for they know one another at the first sight: and prepare to combat, which they rather act by policy then by strength: The Bear falling flat on his back,

33
back the Hore leaping on the Bear, which pulleth at his guts with her fore-feet-nails, and is by the heels of the Hore unkinded to death, if he strike the Bear upon his head. Also Bears bear a Sea-calf, and will not fight with them if they can be avoided, for they know they shall be overcomen.

Great is the fiercenes of a Bear, as appeareth by holy Scripture, Hose. 13. I will meet them as a Bear raked of her whelps (saith the Lord) and will tear in pieces their inward heart: And Chief telleth Al-La-

Jenes, Silvatis HS. Of The What of Beaf, Fiber notation (j-etk heels back like powder, pounded them) they vered! Of the of Beaf, Bears, Wolves, Lyons, and Leopards, muzled and disarmed, so that when they did awake, they shoulde finde such chamber-fellows, as they could not behold (if darknes did not blind them) without singular terror; whereby many of them fell into swounds, ficknes, exaffte and madnes.

Vitellus King of Lituanian, kept certain Bears of purpole, to whom he cast all persons which spoke against his tyranny, putting them firl of all into Bears skins; whose crueltie was so great, that if he had commanded any of them to hang themselves, they would rather obey him then endure the terror of his indignation: In like fort did Alexander Therman deal with his subjects, as is reported by Tector, Valentiannus the Emperor nourished two Bears devourers of men, one of them called golden Bice, the other Inonezencia; which he lodged near his own Chamber: at length after many Laughters of men, he let Inonezencia go loose in the Woods for her good defects, in bringing so many people to their funerals.

There are many natural operations in Bears. Pity reporteth, that if a woman be in fore travaile of child-birth, let a fcone or arrow which hath killed a Man, a Bear or a Boar, be thrown over the house wherein the woman is, and the shall be eased of her pain. There is a small worm called Vol-

rex, which eateth the Vine-branches when they are young, but if the Vine-ficcles be anointed with Bears blood, that worm will never hurt them. If the blood or grease of a Bear be let under a bed, it will draw unto it all the fleas, and fo kill them by cleaving thereunto. But the virtues medicain are very many: and the firl of all, the blood cureth all manner of Bunche and Apotomuses in the fteeth, and bringeth hair upon the eye-lids if the bare place be anointed therewith.

The fat of a Lyon is most hot and dry, and next to a Lyon, a Leopard; next to a Leopard, a Bears; and next to a Bears, a Bul. The latter Physitians use to cure cupulved and disfrahed parts, spots, and tumors in the body. It also helpeth the pain in the loines, if the fick part be anointed therewith, and all Ulcers in the legs or thins, when a Plaifer is made thereof with Bole-armorick. Also the Ulcers of the feet mingled with Allom. It is sovereign against the falling of the hair, compounded with wilde rofes. The Spaniards burn the brain of Bears when they die in any publique sports, holding them venemous, because being drunk, they drive a man to be mad as a Bear; and the like is reported of the heart of a Lyon, and the brain of a Cat. The right eye of a Bear dryed to powder, and hung about childrens necks in a little bag, drive away the terror of dreams, and both the eyes whole, bound to a mans left arm, eafeth a quartain Ague.

The Liver of a Sow, a Lamb, and a Bear put together, and trod to powder under one shooes eafe-

eth and defendeth Cripples from inflammation: the gall being preffed and warmed in water, deliveth the body from cold, when all other medicine faileth. Some give it mixt with water, to them that are bitten with a mad Dog, holding it for a singular remedy, if the party can fast three days before. It is also given against the Paffie, the Kings Evill, the Falling-ficknes, an old Cough, the Inflammation of the Eyes, the running of the Ears, the difficulty of Urine, and delivery in Childe-birth, the Hemorrhois, the weaknes of the Back. The ftones in a Perfume are good against the Falling evil, and the Paffie; and that women may go their full time, they make Amulets of Bears nails, and caufe them to wear them all the time they are with childe.

Of the BEAVER Male and Female.

A Beaver is called in Grecian, Caffar; in Latin, Fiber; in Italian, Biarre, or Bivero, and Icafloros; in Spanien, Caffar; in French, Bierre, and sometime Caffar; in Illyrian, Bobr; in German, Biber: all which words at the first sight seem to be derived from the Latin: There is no certain word for it in Hebrew; in Arabia it is called Almodinofher; it is also called in Latin, Canis Fonicus, but Ca-

nis Fluvialis, is another Beaf, as we shall manifest in the fucceeding discourse of an Otter: and the reason why in Latin it is called Eberis, because (as Varro faith) it covereth the fides, banks, or extremities of the river, as the extremities or laps of the ear and liver are called Fibres, and the skirts of garments Pimborie: but the reason why the Gracians call it Caffar, is not as the Latins have supposed, because it bitheth off his owne ftones, quasi capudo foemum, as shall be manifest here after, but of Caffaros, because the ftones thereof it is hunted and killed, or rather of Caffar, signifying a bel-

ly for that the body is long and almost all belly; or rather because of the colour & ill favour thereof.

This Beaver is no other then that which Aritfotle calleth Latinas, and it differeth from an Otter only in
Of the Beaver.

They are most plentiful in Pontus, for which cause it is called Canis Ponticus; they are also bred in the Rivers of Spain, and in the River Marne in France; Padus, in Italy; Saône, in the Rivers Isara and Rhône, and in the Island called Camargo, and in Helvetia, near Arada, Orlé and Limoges: Likewise throughout all Germany, Poland, Scaronia, Russia and Prussia: and there are Beavers in the woods of Mocho and Lithuania, of excellent perfection and stature above others, having longer white hairs which glitter above other. These beasts live both in the water and on the land, for in the day time they keep the water, and in the night they keep the land, and yet without water they cannot live, for they do participate much of the nature of fishes, as may be well considered by their hinder legs and tail.

Their quantity is not much bigger than a Country Dog, their head short, their ears very small and round, their teeth very long, the under teeth standing out beyond their lips three fingers breadth, and the upper about half a finger, being very broad, crooked, strong and sharp, standing, or growing double very deep in their mouth, bending compass like the edge of an Axe, and their

colour yellowish red, wherewith they defend themselves against beasts, take fishes as it were upon hooks, and will gnaw in funder trees as big as a man's thigh: they have also grinding teeth very sharp, wherein are certain wrinkles or folds, so that they seem to be made for grinding some hard substance, for with them they eat the rindes or bark of trees; wherefore the biting of this beast is very deep, being able to crush render the hardest bones, and commonly he never lothes his hold, until he feeleth his teeth gnash one against another. Pliny and Silvius affirm, that the person so bitten cannot be cured, except he hear the crashing of the teeth, which I take to be an opinion without truth.
The History of Four-footed Beasts.

They have certain hairs about their mouth, which seem in their quantity or bigness to be rather hard they are so hard, but their bones are most hard of all and without marrow: Their forefeet are like a Dogs, and their hinder like a Gooses, made as it were of purpose to go on the land, and swim in the water, but the tail of this beast is most strange of all, in that it cometh nearest to the nature of fishes, being without hair, and covered over with a skin like the scales of fish, it being like a foal, and for the most part fix fingers broad and half a foot long, which some have affirmed the beast never pulleth out of the water; whereas it is manifest, that when it is very cold, or the water frozen he pulleth it up to his body, although Agricola affirm, that his hinder legs and tail, freeze with the water; and no leffe untrue is the assertion, that they compel the Otter in time of cold and frost, to wait upon their tail, and to trouble the water so that it may not freeze round about them; but yet the Beaver holdeth the Otter in subjection, and either overcometh it in fight, or killeth it with his teeth.

This tail he useth for a stern when he swimmeth after fish to catch them. There hath been taken of them whose tails have weighed four pound weight, and they are accounted a very delicate dish, for being drest they eat like Barbles: they are used by the Letter ringers and Savages for most allowed to be eaten on fish-dayes, although the body that beareth them be feath and unclean for food. The manner of their dressing is, first roasting, and afterward steething in an open pot, that so the evil vapor may go away, and some in pottage made with Saffron; other with Ginger, and many with Brine; it is certain that the tail and forefeet taft very sweet, from whence came the Proverbe, That sweet is that fis, which is not fis at all.

These beasts use to build them Caves or Dens near the Waters, so as the Water may come into them, or else they may quickly leap into the water, and their wit or natural invention in building of their Caves is most wonderful: for you must understand in the night time they go to land, and there with their teeth gnaw down boughes and trees which they likewise bite very short fitting their purpoze, and so being busied about this work, they will often look up to the tree when they perceive it almost aunder, thereby to discern when it is ready to fall, left it might light upon their own pates: the tree being down and prepared, they take one of the oldest of their company, whose teeth could not be used for the cutting, (or as others say, they constrain some strange Beaver whom they meet withal) to fall flat on his back (as before you have heard the Badgers do) and upon his belly place all their timber, which they so ingeniously work and fasten into the compasse of his legs that it may not fall, and so the residue by the tail, draw him to the water side, where these buildings are to be framed: and this the rather seemeth to be true, because there have been some such taken, that had no hair on their backs, but were pulled; which being espied by the hunters, in pity of their slaverie or bondage, they have let them go away free.

These beasts are so constant in their purpoze, that they will never change the tree that they have once chosen to build withall, how long time so ever they spend in biting down the same: it is likewise to be observed, that they never go to the same, during the time of their labour, but in one and the same path, and so in the same return to the water again. When they have thus brought their wood together, then dig they a hole or ditch in the bank side, where they underfet the earth to bear it up from falling, with the aforesaid timber; and so they proceed, making two or three rooms like several chambers, one above another, to the intent that if the water rise they may go further, and if it fall they may defend unto it. As the husbandmen of Egypt do observe the building of the Crocodile, so do the inhabitants of the Countrey where they breed, observe the Beavers, that when they build high, they may expect an inundation, and flow on the Mountains; and when they build low, they look for a calm or drought, and plow the valles. There is nothing so worthy in this beast as his stones, for they are much sought after and desired by all Merchants, so that they will give for them any great price.

There is both in male and female, certain bunches under their belly as great as a Gooses, egg, which some have unskilfully taken for their cods, & between these is the secret or privie part of both sexes; which tumours or bunches are nothing else, but a little fisthe bag within a little thin skin, in the middle whereof is a hole or passage, out of the which the beast sucketh a certain liquor, and afterward
ward therewith anointeth every part of her body that the can reach with her tongue. Now it is very plain that the be bunches are not their cods, for these reasons; because that there is no passage either of the feed from them, or from them into the yard; besides, their bones are found within their body; neither ought this to seem strange, seeing that Hares have the like bunches, and also the Malebus or Mask-cat: the female hath but one passage for all her excrements, and to conceive or bring forth young ones.

It hath been an opinion of some, that when a Beaver is hunted and is in danger to be taken, the bitch of her own bones, knowing that for them only her life is sought, which caueth Alcimus to make this Emblem,

Et pedibus segnitus, tumida & pendensibus albus,
Hac tamen infidias effulgat arte fiber :
Mordicus ipse fluidecia virilis uellit ;
Atque objecta se se manus ab ilia peti.
Et ut in exemplo dicist non parcat e rebus,
Et vitam ut rectam hosibus ara dare.

Teaching by the example of a Beaver, to give our purse to the thieves, rather then our lives, and by our wealth to redeem our danger, for by this means the Beaver often escape. There have been many of them found that wanted bones, which gave some strength to this error, but this was exploded in ancient time for a fable; and in this and all other honest discourses of any part of Philo- sophy, the only mark whereat every good student and profesfor ought to aim, must be verity and not tales; wherein many of the ancient have greatly offended (as is manifefted by Morcellus Virgil- ius) especially Plato: and this poyson hath also crept into and corrupted the whole body of Religion. The Erytian in the opinion of the aforefaid Censure, when they will signific a man that hurteth himself, they picture a Beaver biting off his own bones. But this is most safe, as by Scribon, Plu- nius, Donecius, and Albertus, is manifefted. First, because their bones are very small, and so placed in their body as are a Boars, and therefore impossible for them to touch or come by them. Secondly, they cleave to fall unto their back, that they cannot be taken away but the beast must of necessity lose his life: and therefore ridiculous is their relation, who likewise affirm, that when it is hunted (having formerly bitten off his bones) that he standeth upright and sheweth the hunters that he hath none for them, and therefore his death cannot profit them, by means whereof they are averted and seek for another.

These Beavers eat fish, fruits, and the bitter rindes of trees, which are unto them most delicate. Their food; especially Aldern, Poplar, and Willow; whereupon it is proverbially said, of one that serveth another for gain: Sic me fas quotidian ut fist falicem, you love me as the Beaver doth the Willow, which eateth the back and deltroeth the tree.

They are taken for their skins, tails, and cods, and that many ways; and first of all when their Calves are found, there is made a great hole or breach therein, whereinto is put a little Dog, which the beast espying, flyeth to the end of her den, and there defendeth her self by her teeth, till all her structure or building be rafed, and the laid open to her enemies, who with such instruments as they have pretent, beat her to death: some affirm that the rouzeth up her body, and by the strong favour of her bones the driveth away the Dogs, which may be probable, if the bones could be seen. These Dogs are the same which hunt wild fowl and Otters.

It is reported that in Prussia they take them in bow-nets, baited with the rinde of trees, whereinto they enter for the food, but being entrapped cannot go forward again. They cannot dive long time under water but must put up their heads for breath, which being eliped by them that befet them, they kill them with gun-shot, or pierce them with Otters spear, so that one would think seeing such a one in the water, that it was some hairy kind of fish; and his nature is, if he hear any noise to put his head above water, whereby he is discovered and loseth his life. His skin is precious in Polonia, either for garment, or for Goves, but not so precious as an Otters, yet it is used for the edging of all fur garments, making the belt thw and enduring longest; they are belt that are blackest, and of the bellies which are like felt wool, they make caps and stockings against rain and foul weather.

The medicinal vertues of this beast are in the skin, the urine, the gall and the cods: and first, a garment made of the skins, is good for a Paralytik person; and the skins burned with dry Onions and liquid pitch, layeth the bleeding of the nose, and being put into the soles of shoes easeth the Gout. The urine preferred in the bladder, is an antidote against poiyon: and the gall is profita- ble for many things, but especially being turned into a glye it helpeth the falling evil. The gener- nals of a Beaver are called by the Pliny Cafferum, and therefore we will in this discourse use that word for expressing the nature, qualities, remedies, and miraculous operation thereof, where-fore they must be very wary and skillfully taken forth, for there is in a little skin compassing them about a certain sweet humor (called Humor Molletus) and with that they must be cut out, the utter skin being cut aunder to make the more easie entrance, and the Apothecaries use to take all the fat about them, which they put into the oil of the Cafferum, and fell it unto fisher-men to make bait for fifties. The females have fones or Caf- foreum, as well as the males; but very small ones. Now you must take great heed to the choise of your Beaver, and then to the bones which

The cods or stones of the beath,

Kamoselum

The Beaver doth not bite off her own bones.

Herbis. An emblem,
mult grow from one root conjoined, otherwise they are not precious, and the beast must neither be a young one nor one very old, but in the mean betwixt both, being in vigor and perfection of strength.

The Beavers of Spain yeeld not such virtuous Cafforeum as they of Ponsius, and therefore if it be possible, take a Pantique Beaver, next one of Gallatius, and laitly of Africk. Some do corrupt them putting into their skin Gum and Ammoniac with blood, other take the reins of the beast, and so make the Cafforeum very big, which in it self is but small. This beast hath two bladders, which I remember not are in any other living creature, and you must beware that none of these be joyned to the Cafforeum. You may know if it be mingled with Ammoniac by the tale, for although the colour be like, yet is the favour different. Platearius sweeth, that some adulterate Cassaforem, by taking off his skin, or some cod newly taken forth of another beast, filling it with blood, fines and the powder of Cafforeum, that, fo it may not want his strong smell or favour: other fill it with earth and blood: other with blood, roten, gum, fines and pepper, to make it raft sharp: but this is a falsification discoverable, and of this sort is the Cassaforeum which is sold in Venetie, as Brafasola affirmeth: and the most of them sold at this day are bigger then the true Cassaforem, for the full weight of the right flones is not above twelve ounces and a half, one of them being bigger then the other, being fix fingers breadth long, and four in breadth. Now the sub stance contained in the bag is yellowish, solid like wax, and sticking like gleet, not sharp and cracking betwixt the teeth (as the counterfeit is). These flones are of a strong and finking favour, such as is not in any other, but rotten and sharp, as Grammatius affirmeth; yet I have smelled it in its dried, which was not unpleasant, and things once seasoned with the favour thereof, will ever taft of it, although they have not touched it, but lie covered with it in the same box or pot: and therefore the Cassaforem of Persia is counterfeit, which hath no such smell, for if a man smell to the right Cassaforem, it will draw blood out of his nose.

After it is taken forth from the beast, it must be hung up in some place to be dried in the shadow, and when it is dry, it is soft and white: it will continue it strength fix years, and some say feven: the Persians affirm, that their Cassaforem will hold its virtue ten years, which is as faft as the matter they speak of is counterfeit. Archigenes wrote a whole booke of the virtue of this Cassaforem, whereunto they may resort, that require an exact and full declaration of all his medicinal operations: it shall only be our purpose, to touch some general heads, and not to enter into a particular discovery thereof.

Being so dried as is declared, it must be warily ufed, for it fafteth out herein as in other medicinal subiects, that ignorance turneth a curing herb or sub stance, into a venemous and destructive quality; therefore we will lift of all fer down the dangers to be avoided, and afterward some particular cares that come by the right ufe of it. Therefore it must be understood that there is poftoy in it, not naturally, but by accident: as may be in any other good and wholesome matter: and that especially in the smell or favour thereof: whereunto if a woman with child do smell, it will kill the childe unborn and cause abortion: for a womans womb is like a creature, nourished with good favours, and destroyed with evil: therefore burning of feathers, shoo-soles, woolen clothes, pitch, Gulanum, gum, onions, and garlick is noftom to them. It may be corrupted not only as is before declared; but alfo, if it be shut up close without vent into pure aire, when it is hanged up to be dried, or if the bag be kept moist, so that it cannot dry; and it is true (as Avien faith) that if it be ufed being fo corrupted, it killeth within a dayes space, driving one into madness, making the sick perfon continually to hold forth his tongue, and infecting him with a Fever by inflaming the body,loosing thecontinuity of the parts, through sharp vapors arising from the stomac: and for a proof that it will inflame, if you take a little of it mingled with oil, and rub upon any part of the body, or upon your nail, you shall feel it.

But there is also a remedy for it being corrupted; namely, Affes milk mingled with some sharp syrop of Citron, or if need require, drink a dram of Phlius Antidote at the moft, or take buter and sweet water, which will cause vomit, and vomit therewith fo long, as you feel the favour of the flower, and afterward take syrop of Limmons or Citrons: and some affirm upon experience, that two penny weight of Curador-feed, scorched in the fire, is a presernt remedy for this evil. And it is most strange, that seeing it is in greatest strength, when the favour is hottest, which is very displeasing to a mars nature in outward appearance, yet doth it never harm a man taken inwardly, (being pure and rightly compounded) if the perfon be without a Fever, for in that case only it doth hurt inwardly, otherwise apply it to a moist body lacking refrigeration, or to a cold body wanting evaporation, or to a cold and moist body, you shall perceive an evident commodity thereby, if there be no Fever: and yet it hath profirld many where the Fever hath not been over hot, as in Extaties and Lethargies, miniftred with white Pepper, and Melicrate, and with Rofe cakes laid to the neck or head. The fame virtues it hath being outwardly applied and mingled with oil, if the bodies be in any heat, and purely without oil, if the body be cold, for in heating it holdeth the third degree, and in drying the second. The manner how it is to be administered is in drink, for the moist part, the sweet liquor being taken from it, and the little skins appearing therein cleaned away, and so it hath among many other these operations following. Drunk with Vinegar, it is good against all venom of Serpents, and against the Chameleon, but with this difference, against the Scorpion with wine, against Spiders with sweet water, against the Lizards with Myrrh, against Dipius and Cerastes, with Opium, or wine made of Rews, and against other Serpents with wine tumply.

The dangers in the use of Cassaforem, Serpens.
Of the Bison.

Take of every one two drams, for a cold take it a scruple and a half in four cups of wine, used with Ladanum, it cureth the Euphilaes and Ulcers, provoking freezing by smellng to it; procureth sleep, they being anointed with it; Maiden-weed and Conferve of Rofes, and being drunk in water, helpe of Phrenife, and with the Rofes and Maiden-weed asfoafed, eafeth head-ach; being laid to the head like a plaifter, it cureth all cold and windy affections therein; or if one draw in the imoak of it perfumed, though the pain be from the mothers womb, and given in three cups of sweet Vinegar falling, it helpe the Falling sicknefs, but if the perfon have often ills, the fame given in a Glyfier, giveth great eafe: Then muft the quantity be two drams of Cafiorum, one fextary of honey and oil, and the like quantity of water, but in the fit it helpe with Vinegar by smellung to it. It helpe the Palfic, taken in Rew or wine, fold in Rew, fo alfo all heart trembling, ach in the stomack, and quaking of the fitews. It being infused into them that lie in Lethargies with Vinegar and Conferve of Rofes doth prefently awake them, for it strengthnethe the brain, and moveth Iternation. It helpe obfition coming by reafon of ficknefs, the party being firft purged with Pfera Ruff, Cafiorum, with oil bound to the hinder part of the head, and afterward a dram drunk with Mincrate, alfo taken with oil, cureth al Convulsion proceeding of cold humors, if the Convul-

A secret; 

A miraculous

Monifter.

Of the name.

Bifon called of some Latins, though corruptly, Urifum, and Vifum: of the Greces, Bifon: of the Lithuanians, Suber; of the Polonians, Zubr, from whence some Latins derived Zubr, for a Bifon. Of the Germans, Vizent, and Vifent, and Wifent: a beaft very strange as may appeare by his figure prefixed, which by many Authors is taken for 

A

two parts, as is Scythia, Moscovia, Hercynia, Thracia, and Prufia. But those tall wide Oxen which are fai to be in Lapponia, and the Dukedom of Angeromania, are more truly fai to be Urif, as in their ftory thall be afterward declared. Their name is taken from Thracia, which was
was once called Bifhonis, and the people thereof Bifhons, from Bifho the Son of Cicero and Tereiffa-
re; and thereof came Bifhoni Gruza, cranes of Thracia, and Bifhoni Laci, for the lake or sea of
Dices, near Adina, where never living thing, or other of lefle weight was call in but it prefently
funk and was drowned.

This Bifon is called Taurus Pecianum, the Pecian Bull, whereof I finde two kinds, one of greater and
another of lefle fize, called the Scotian, or Caldonian Bifon, whereof you allhall fee the picture and qua-
litics at the foot of this History.

The greater is as big as any Bull or Ox, being maned about the neck and back like a Lion, and
hath hair hanging down under his chin or neather lip like a large beard: and a rising or little ridge
down along his face, beginning at the height of his head, and continuing to his nofe very hairy;
his horns great and very fharp, yet turning up towards his back, and at the points hooked like the
wilde Goats of the Alpes, but much greater: they are black of colour, and with them through the
admirable strength of his neck can he taffe into the air, a horse and horfeman both together. They
are as big as the Dextars which are the greatest Stallions of Italy. Their face looketh downward,
and they have a strange strength in their tongue, for by licking they grate like a file in any indifferent
hard fubstance, but especially they can therewith draw unto them any man or beaff of inferior con-
dition, whom by licking they wound to death.

Their hair is red, yellow, or black, their eyes very great and terrible; they smell like a Mofheu or
Musk-cat, and their mane reacheth over their shoulders, making it irrele when he brayeth; their
face or forehead very broad, especially betwixt their horns, for Sigismund King of Polonia, having
kild one of them in hunting, ftood betwixt his horns, with two other men not much leffer in quan-
ty than himfelf, who was a goodly well proportioned and perfonal Prince.

There are two bunches on his back, the former near his shoulders, which is the higher, and the
other near the rump, which is somewhat lower. I have feen the horns of a Goldsmith to tip with filver and gilt, that it might be fit to drink in: it did bend like the talon of an Eagle or Gryphion, or fome ravenous bird. The flefth in Summer time is molt
fat, but it raffeeth so much of wide Garlick, or Ramfens, that it is not pelfant to eat, being full of
small veins and ftrings, and is accounted a noble and strong kind of flefth: the bloud is the molt
pureth in the world, excelling in colour any purple, and yet for all that it is fo hot, that being let
forth when the Beaff dyeth, within two hours fpace it putrefeft, and the flefth it felf in the coldest
Winter will not keep fweet many hours, by reafon of the immoderate heat thereof, if the
Hunter do not after the fall of the beaff, separate from it the inrafts: and which is molt strange of
all, being pierced alive with any hunting spear, dart, or sword, the weapon by the heat of the body
is made fo weak and folute, that it cometh forth as flexible as lead: and to conclude, it is a molt
noble and fierce spirited beaff, never afraid, or yeielding till breath failed, neither can he be taken
with any nets or gins, till they be thoroughly wearyed: wherefore they which hunt him, muft
be
be very strong, nimble and skilful men, or else that sport will be their own undoing and overthrow.

Therefore when they go to hunt this Bison, they choose a place replenished with large trees, neither so great that they cannot easily wind about them, nor so little that they shall not be able to cover their bodies from the horn or tongue of the beast: behind which the hunters place themselves out of sight: and then the Dogs rouse up the beast, driving him to that place where the hunters stand; whom the beast first espieseth, to him he maketh force, who must warily keep the tree for his shield, and with his spear wound him where he can, who will not fall without many mortal strokes, but wax more and more eager, not only with horn but with tongue, for if he can but apprehend any part of the hunters garment with his tongue, he loveth no hold but draweth him unto him, and with his horn and feet killeth him: but if the fight be long, and so the hunter wearied and out of breath, then doth he call a red cap unto the beast, who maketh at it with head and feet, never leaving till it be all in pieces; and if another come to help him as hunters must, if they will return alive, then shall he easily draw the beast to combat, and forake the first man, if he cry Lu-lu-lu.

فزاناس theweth how these Bisons are taken alive, in this sort. The hunters (faith he) chuse ouf some steep and slippery down hill, whereupon they lay skins of beasts newly taken off, and if they want flesh, then anoint them old skins with oil, and to leave them spread upon those steeping or bending passages: then raise they the beasts, and with Dogs and other means on horfeback drive them along to the paces where they laid their hides, and as soon as they come upon the skins they flip and fall down, rolling headlong till they come into the valleys, from whence they contrain them back again some other way, three or four times a day, making them fall down the hills as aforesaid, and so wearying them with continual hunting, and fasting. At the last they come unto them, when they are no more able to rise for faintness, and give them Fine-apples taken out of the shels, (for with that meat are they delighted) and so while they eagerly feed and lie weary on the ground, they intoil them in bands and manacles, and lead them away alive. The medicines coming from this beast may be conjectured to be more forcible, than of common and ordinary Oxen, but because they were not known to the Greeks and Arabsians, and we finde nothing recorded thereof; we will conclude the story of this great Bison, with good opinion of the virtues, though we are not able to learn or discover them to others.

Of the white SCOTIAN BISON.

In the Woods of Scotland, called Gallander or Caldar, and in ancient time Calydonia, which reacheth from Mineth and Brunel, unto Atholus and Loghaboria, there are bred white Oxen, maned about the neck like a Lyon, but in other parts like ordinary and common Oxen. This wood was once full of them, but now they are all flain, except in that part which is called Cummirland. This beast is so hateful
The nature of the beast, that it will not feed of that grasse or those herbs, whereof he favour-eth a man hath touched, no not for many days together; and if by art or policy they happen to be taken alive, they will die with very fullen grief. If they meet a man, presently they make force at him, fearing neither Dogs, Spears, nor other weapons. Their flesh is very pleasant, though full of finesse, and very acceptable to the greatest Nobles, for which cause they are grown to a small number; their qualities being like to the former beast, excepting their colour and beard, I will term them a white Calydonian, or Scolian BISON.

BONASUS, the figure of the Head and Horns.

Of the name. This beast is called in Greek Μονόπες, and in Latin Monopius, or Monops, and once in Aristotle, Balisthus, the Bohemians, Loll, now the Germans & English call the long hair about the neck of any beast, a Mane or Mane, from whence cometh this word Monopius, which signifies a maned Ox. This Bison is the greatest beast, Bull or Ox, though it be shorter in length, yet are the sides larger and broader then all other. Pausanias. They are bred in Pannonia in the mountain Mepus, not in Lydia and Phrygia, as Salinus and Alberti have delivered; being deceived, because the Pannonians were joined with the Medians which they derive from Medes a people of Asia, whereas the Pannonians and Medes in Pliny (as is observed by Hermolus in his Caesitations of Pliny) are a people of Thracia in Europe; so called of Feron the Son of Endymion and brother of Epeus, who was seated near the river Axius in Macedonia: for it was agreed
Of the Bosusus.

Of the two brethren striving for the kingdom, that which was overrun by the other should yield the kingdom inquietnes to his brother.

The head of this beast is like the head of an Ox or Bull; his horns bending round to the sides of the cheek, by reason whereof he hath no defence by them, neither can a man be hurt that is cast upon them. His neck is very thick with a large mane, from his eyes down to his shoulders in length like an Horse; but the hair thereof is much longer, and lyeth more smoothly, the uppermost hairs being hairier, and the undermost softer like wool. Their colour betwixt red and ash colour, but black and yellow appearreth not in them. They have no upper teeth, in this point resembling an Ox and other horned beasts; their horns being in compacts about nine inches and somewhat more, are very smooth and black like varnish. Their voice is like the voice of an Ox, their legs all hairy, and their feet cloven, their tail too short for the other members of the body like a Bugies, their back stretched out at length, as long as a feat for seven men; their flesh is very sweet, for which cause he is much sought for in hunting; he will with his feet dig up the ground like an Ox or Bull in this rage; when he is once struck, he flyeth away, fighting with his heels backward; and whereas nature hath denied him the benefit of horns, which other beasts have, so that he is only adorned and not armed by those weapons, like a Souldier that cannot draw forth his Sword; the hath given him the secret operation of his dung, which in his chafe he causeth forth of his body to plentifully upon the Dogs or other that pursueth him, by the space of four paces backward, that he flyeth their course, and the heat of his dung is so admirable, that it scorches or burneth the hair or skin of any beasts or men that hunt him: neither hath this time such vertuous operation at any other time, but only when the beast is being, being hunted and pursuéd for life, at other times it lying quiet, there is no such virtue therein: neither ought this to seem incredible, seeing many other beasts in their chase, have the like or at the least do then eject their excrements more plentifully and noisomly then at other times: as the Cattell-stiff, for when in chafe the intrails are heated, and the passag somewhat restrained, so that the holding in of breath breedeth more wind in the guts, it may very naturally chance, the excrement being with the inclosed wind and heat sent forth by violent eruption, that it may fie far backward, and also burn as aforesaid. These beasts Calve in the Mountains, and before that time cometh the chufeth a place, which the walleth in with the abundance of her own dung, so high as it may cover her young one, wherefore is there no beast that is naturally so full of excrement as a Bosusus. Their ears are very broad as the Poet faith, Patule commia sub cornubis aureis, broad ears, under crooked winding blunt horns; the skin is so large, that it hath covered a good part of a house, the inward colour whereof is like the earth whereon the beast did use to feed. That excellent Physitian of England, John Cai, did send me the head of this beast, with this description, in an Epistle, laying.

I send unto thee the head of a great wilde beast, the bare mouth and the bones supporters of the horns being very weighty, and therefore bearing up some like heavy burden, the horns are recurved and bending backward, so that they do not spire directly downward but rather forward, though in a crooked manner, which because it could not appear forward, as they do when the beast is alive, therefore they are described turning on the one side: the space betwixt the horns or breadth of the forehead, is three Roman palms and a half; the length of the horns, three palms one finger and a half; and their compacts where they are joyned to the head, is one foot one palm and a half. In the Castle of Warwick where are preserved the Armor and Spear of one Earl Guy of Warwick a most valiant strong man, I have seen the head of a beef not unlike to this, faying that if the horns whereon the horns grow should be joyned together, then would the horns be longer, and of another crooked fashion. And in the same place there is also the backbone of the same beast, the compasse thereof is at the least three Roman feet two palms and a half, whereunto I may also add that shoulder-blade which hangeth on the North gate of the City of Coventry, being in the lowest part three foot broad and two fingers, and four foot long and two palms: and the compasse of the arm hole wherein the shoulder is joyned, is three foot and one palm, and the whole compasse of them both in breadth and length, is eleven foot one palm and a half.

In the Chappel of the said great Guy, distant from Warwick about one thousand paces (or a mile) there hangeth a rib of this beast (as I suppose) the compasse whereof in the smallest place is three palms, and in length it is fourteen feet; a half; the rib is dry and rotted in the superficies thereof. The vulgar people affirm, that it is the peice of a Bear, which was slain by Earl Guy; other say, by tradition of their elders, that it is a piece of a wilde Cow remaining near Coventry, and did much harm to many people; which latter opinion I embrace, taking it for a Bosusus, who in most things is like a Cow, and therefore some affirm it is an Indian Cow (but ignorantly) because any thing that is not common is usually attributed to some strange Country breed (with an addition to that it mort of all remembeth.) Thus for D. Cay.

Whereunto I assent, holding his conjectures to be very probable, until by the diligent industry of some other, or my own eye-light we may deliver to the world some more assured and perfect knowledge in these kinde of beasts. Exhorting in the mean season all learned men, to discover more exactly their present or future knowledge herein, to the high benefit of all them that are diligent students in this part of Gods creation.
The History of Four-footed Beasts.

Of the **BUFFE**.

A **BUFFE** is called in Greek, *Tarandos*; and in Latin, *Tarandus*; which some have corrupted barbary, tearing in *Parandros* and *Pyraus*; and I conjecture that it is the same beast, which the Polonians call *Tur* or *Tuaro*; howsoever other confound this *Tarandus* with another beast, called *Rangifer*; and some with a kind of *Ursus*, which have many properties in common with a Buffe, yet my reason, why the Polonian *Tur* can be no other then a Buffe, is, because the head and mouth differeth from those beasts; and also because this is taken in *Sarmatia*, where the common people call it *Daran*, or *Daraus*; although the later Writers call it *Daran* and *Daraus*, and translate it a *Boynus*, which can by no means agree with this beast; and the name of *Daran* is easily derived from *Tarandus*, or *Tarandes*.

Also that the Polonian *Tur* should not be a Buffe, all that can be objected, is, that the horns there-of are cragged or branched, which thing *Pliny* attributeth to a Buffe: whereunto I answer, that the Ancients did confound a Buffe with an Elk, and a *Rangifer*; for in the description of an Elk they vary, divers times mistaking one for another, by reason that they wrote altogether by report, none of them being seen in their Countries, and therefore may easily be deceived in a Buffe, as well as in an Elk. The chief Authors of this opinion have been Sir *Thomas Eliot*, and *Georgius Agricola*, with whom I will not contend, nor with any other man that can give better reason: for *Pliny* maketh a Buffe to be a beast proportioned between an Hara and an Oxe, of which sort is not a *Rangifer*, as shall be manifest; and if it be, yet can it never appear that a *Rangifer* doth change colour like a Buffe, as also we will make more evident: So then distinguishing a Buffe from a *Rangifer*, and presuming that the Polonian *Tuaro*, or *Tur*, is a Buffe; we will proceed to his description.

The head of this beast is like the head of a Hara, and his horns branched or cragged; his body for the most part like a wild Oxes, his hair deep and harsh like a Bears, his hide is so hard and thick, that of it the *Sepihus* make breast-plates, which no dart can pierce through. His colour, for the most part, like an Asses, but when he is hunted or feared, he changeth his hew into whatsoever thing he feeth; as among trees he is like them; among green boughs he seemeth green; among rocks of stone, he it transmuted into their colour also; as it is generally by most Writers affirmed: as *Pliny* and *Sibburn* among the Ancient; *Stephanus* and *Eusebius* among the later Writers.

This indeed is the thing that seemeth most incredible, but there are two reasons which draw me to subcribe hereunto: first, because we see that the face of men and beasts through fear, joy, anger, and other passions, do quickly change; from ruddy to white, from black to pale, and from pale to ruddy again. Now as this beast hath the head of a Hara, so also hath it the fear of a Hara, but in a higher degree; and therefore by secret operation it may easily alter the colour of their hair, as a pallion in a reasonable man, may alter the colour of his face.

The same things are reported by *Pliny* of a beast in India called *Lycaon*, as shall be afterward declared; and besides these two, there is no other among creatures covered with hair, that changeth colour.
Of the Bugil.

A Bugil is called in Latin, Lebaulae, and Buffer in French, Buffete; in Spanish, Buga; in German, Buffen; and in the Lybian tongue, Bulafr. The Hebrews have no proper word for it, but comprehended it under 74, which signifieth any kind of wide Oxen; nor can either can it be expressed by Merub, which signifieth fatted Oxen; or Bekarmi, which signifieth Oxen properly; or Zachmor, which the Persians call Zatoozi, or Buzoozi, and is usually translated a Wilde-Off. For which beast the Hebrews have many names; neither have the Grecians any proper word for a vulgar Bugil, for Buffer and Buffer, are amongst them taken for a kind of Rock buck. So that this Buga was first of all some modern or barbarous term in Africa, taken up by the Italians, and attributed to this beast, and many other for whom they knew no proper names. For in the time of Pliny, they used to call strange beasts like Oxen or Bulls, Uris; as now a days (led with the same error, or rather ignorance) they call such, Buffete, or Buffete. The true etymology of the vulgar Bugil, was sent unto me by Carusius Silvadus, a famous Physitian in Northerm, and it is pictured by a tame and familiar Bugil, such as liveth among men for labour, as it seemeth to me. For there is difference amongst these beasts, (as Aristote hath affirmed) both in colour, mouth, horn, and strength.

This vulgar Bugil, is of a kind of wide Oxen, greater and taller then the ordinary Oxen, their body being thicker and stronger, and their limbs better compact together; their skin very hard, their other parts very lean, their hair short, small, and black, but little or none at all upon the tail, which is also short and small. The head hangeth downward to the earth, and is but little, being compared with the residue of his body; and his aspect or face bereiketh a tameable and simple disposition. His fore-head is broad and curved with hair, his horns more flat then round, very long, bending together at the top, as a Goats do backward; insomuch as in Crete, they make bows of them; and they are not for defence of the beast, but for distinction of kind and ornament. His neck is thick and long, and his rump or nether part of his back is lower then the residue, depending to the tail. His legs are very strong, broad and strong, but thinner, then the quantity of his body would seem to permit. They are very fierce being tamed, but that is corrected by putting an Iron ring through his Nother, whereunto is also put a cord, by which he is led and ruled, as a Horse by a bridle (for which cause in Germany they call a simple man over-rulled by the advice of another to his own hurt, a Bugle, led with a ring in his nose.)

His feet are cloven, and with the formost he will dig the earth, and with the hindmost fight like a Horse, forgetting on his blos with great force, and redoublling them again if his object resisteth him. His vowe like the voice of an Ox; when he is chafed he runneth forth right, folden winding or turning, and when he is angered, he runneth into the water, wherein he covereth himself all over, except his mouth, to cool the heat of his blood; for this beast can neither endure outward cold nor inward heat; for which cause, they breed not but in hot Countries, and being at liberty are seldom from the waters. They are very tame, so that children may ride on their backs; but on a 

dan they will run into the waters, and so many times indanger the childrens lives.

Bellerophon. The name of their horses.

Erasnum. The nature of their breeding places.

Their love to their young ones is very great; they always give milk from their copulation to their Calving; neither will they suffer a Calf of another kind (whom they discern by their smell) to suck their milk, but beat it away if it be put unto them: wherefore their keepers do in such cases, anoint the Calf with Bugils excrement, and then the will admit her suckling.

They are very strong, and will draw more at once than two Horses; wherefore they are famed for service, and will draw Wagons and Plows, and carry burdens also, but they are not very fit for Carriages: yet when they do draw, they carry also great burdens or loads, tye'd to their backs with ropes and wantslytes. At the first setting forward they bend their legs very much, but afterward they go upright, and being over-laden they will fall to the earth, from which they cannot be raised by any stripes until their load or carriage be leftened. There is no great account made of their hides, although they be very thick: Selinus reporteth, that the old Brites made Boats of Ofer ears, covering them round with Bugils skins, and sayled in them: and the Inhabitants of the Kingdom of Cartagin, made them bucklers and shields of Bugils skins, which they use in Wars; the flesh is not good for meat, which caused Beptis Fiera to make this Poem:

Bubalus bino abeat, nova intert prandia nostra:  
Non edat hunc quiquam: sub Juga semper eat.

For they ingender melancholy, and have no good taste, being raw they are not unpleasant to be hold, but lod or rolled they thaw into a deformed substance. The milk of this beast maketh very hard Cheefe, which tasteth like earth.

The medicines made of this beast are not many: with the horns or hoofs they make rings to wear against the Cramp, and it hath been believed (but without reason) that if a man or woman wear rings made of the horns or hoofs of a Bugil in the time of carnal copulation, that they will naturally fly off from their fingers; whereas this secret was wont to be attributed to rings of Chrystydes or Smedeirde bones. To conclude, some teach husbandmen to burn the horns or dung of their Bugils on the windy side of their corn and plants, to keep them from Cankers and blainting: and thus much of the vulgar Bugil, called Bubalus Recensentorum: whose beginning in this part of the world is unknown, although in Italy, and other parts of Europe they are now bred and festered.

Of the African Bugil.

Bullionis reporteth, that he saw in Car a small beast, which was in all things like a little Ox, of a beautiful body, full of flesh, well and neatly limned, which he could take for no other then the African Ox, or Bugil of the old Gracians, which was brought out of the Kingdom of Aamia unto the City Carth; it was old, and not so big as a Hart, but greater then a Ram; he never in all his life took more pleasure to behold a beast, then in the viewing the excellent beauty of every part of this creature. His hair was yellow with, glittering as if had been combed and trimmed by the art of a Barber, under his belly it was somewhat more red and tawny then upon his back. His feet in all things like a vulgar Bugil, his legs short and strong, the neck short and thick, whereon the two dew-laps of his crest did scarce appear. His head like an Oxes, and his horns growing out of the crown of his head, black, long, and bending like an half Moon: wherof he hath no use to defend himself, or any another, by reason their points turn inward. His ears like a Cows, and shoulder blades standing up a little above the ridge very strongly. His tail to the knees like a Carnivorae, from whence hangeth some few black hairs, twice so great as the hairs in a Horses tail. His voice was like an Oxes, but not so strong and loud: to conclude therefore, for his description; if a man conceive in his mind a little yellow near Ox, with smooth hair, strong members, and high horns above his head, like a half Moon; his mind cannot erre from the
true and perfect shape of this beast. There was such a one to be seen of late at *fower,* under the name of an *Indian Oxe,* saving his head was greater and longer, his horns not high nor bending together, but standing up right, and a little wrettling into fpires above their root; and the hinder part of the back much lower then the shoulders, but it may be the obferver of this beast failed and took not the true defcription of it.

This creature of *African Bugil,* must be underftood to be a wilde beast, and not of a tame kind, although *bellonius* exprifeth not fo much. *Leo* in his defcription of *Aftrick,* relateth a difcourfe of a certain beast called *Laus,* or *Daus,* who is left then an Oxe, but of more elegant feature in his legs, white horns, and black nails, which is to fift, that no beast can out-run it, except a *Barbary Horse:* it is taken most eafily in the Summer time; with the skin whereof they make targets and shields, which cannot be pierced by any weapon, except Gunfhot; for which caufe they fell them very dear; which is conjectured to be the *Bugil* that *bellonius* defcribeth, although it be not juft of the fame colour, which may vary in this beast as well as in any other, and I have a certain *manuscript* without the Authors name, that affirmineth there be *Bugils in Lybia,* in likenefs reftembling a Hart and an Oxe, but much leffer, and that thefe beafts are never taken alfeep, which caufe them an opinion that they never feep; and that there is another *Bugil* beyond the *Alpes,* near the River *Rhone,* which is very ftrong and of a white colour.

There is a horn in the Town-house of *Argentum* four *Roman cubits* long, which is conjectured to be the horn of some *Urs:* (or rather as I think of some *Bugil*) it hath hung there at the leaft two or three generations, and by fraping it I found it to be a horn, although I forgot to measure the compass thereof, yet because antiquity thought it worthy to be reffered in fo honourable a place for a monument of fome strange beast, I have alfo thought good to mention it in this difcourfe: as when *Philip King of Macedon,* did with a dart kill a wilde Bull at the foot of the Mountain *Orebius,* and confecrated the horns thereof in the Temple of *Hercules,* which were fifteen yards or paces long, for poffeignty to behold.

**Of the Bull.**

A Bull is the husband of a Cow, and ring-leader of the herd, (for which caufe *Hornt* compar-
The History of Four-footed Beasts.

The Hebrews call him Tor, or Taur; which the Chaldees call Abirs, for a strong Ox; so the Arabians, Taur: the Greeks, Taurus; the Latins, Taurus; the Italians, Tauri; the French, Taureau; the Germans, ein Stier; ein Vucherstier, ein Vucher, ein Mammelfier, ein Hagen, and ein Bollen; the Egyptians, Vul, and Juncce: by all which several appellations, it is evident, that the name Taurus in Latine is not derived from Taurus, the stretching out the tayl; nor from Gaurus, signifying proud; but from the Hebrew, Tor, which signifies great: upon which occasion, the Grecians called all large, great, and violent things, by the name of Taurus, and that word Taurus among the Latines, hath given denomination to Men, Stars, Mountains, Rivers, Trees, Ships, and many other things, which called Iacobus Camerarius to make thereof this eminatly riddle.

Maecius cramregia: sed ligna mumba sequendar.
Et Cicicon men jam: sed mans jam nomine sola.
Et in arteo: sed in ipsis ambito terris.

That is in divers fenes, Taurus was a Kings Tandar, the root of a tree, a Mountain in Gigia, a Bull, a Mountain in name, a Star or sign in heaven, and a River upon the earth: so also we read of Statallus Taurus, and Pamponius Vitalus, two Romans. It was the custom in those days, to give the names of beasts to children, especially among the Troglydites, and that Adulator which ravished Europa, was Taurus the King of Crete; or as some say, a King that came in a Ship, whose Ensign and name was the Bull; and other affirm, that it was Lupus in the likenes of a Bull, because he had so defloured Ceres when he begat Proserpina, and afterward defloured Proserpina his daughter, in the likenes of a Dragon. It is reported that when Achelous did fight with Hercules for Deianira the Daughter of Oeneus King of Calydon, finding himself as to be too weak to match Hercules, turned himself suddenly into a Serpent, and afterward into a Bull; Hercules seeing him in that proportion, speedily pulled from him one of his horns, and gave it to Cepis the companion of Fortune, whereof cometh that phrase of, Cronisops. Afterward, Achelous gave unto Hercules one of the Horns of Amalthea, and so received his own again, and being overcome by Hercules, hid himself in the River of I leus, which after his own name bending forth into one horn or crook, was called Achelous. By these things the Poets had singular intentions to decipher matters of great moment under hidden and dark Narrations.

But there are four reasons given, why Rivers are called Taurorani: that is, Bul-heads. First, because they empty themselves into the Sea, they roar or bellow like Bulls, with the noise of their falling water. Secondly, because they burrow the earth like a draught of Oxen with a plow, and much deeper. Thirdly, because the sweetest and deepest places unto which these cattle refer, are near the rivers. Fourthly, because by their crooking and winding, they imitate the fashion of a horn, and also are impetuous, violent, and unrefrangible.

The strength of the head and neck of a Bull is very great, and his fore-head feemeth to be made for fight: having horns short, but strong and piked, upon which he can tos into the air very great and weigthy beasts, which he receiveth again as they fall down, doubling their elevation with renewed strength and rage, until they be batter by confounded. Their strength in all the parts of their body is great, and they use to strike backward with their heads; yet is reported by Callimachus that Acestis, a Bear, that being in the field among the cattle, took one of the most fierce and strongest Bulls in the herd by the hinder-leg, and there in defpite of the Bull striving to the contrary, held him with one hand, until another Bull came by him, whom he likewise took in his other hand, and so perforce held them both: which thing being seen by Milo Cretanistes, he lifted up his hands to heaven, crying out by way of Interrogation to Jupiter, and saying: O Jupiter, haft thou sent another Hercules among us? Whereupon came the common proverb of a strong armed man: This is another Hercules. The like story is reported by Suidas of Paldamus, who first of all flew a Lyon, and after held a Bull by the leg so fast, that the beast striving to get out of his hands, left the hoof of his foot behind him.

The Epithets of this beast are many among Writers, as when they call them Brazen-footed, wide, cheerful, sharp, plower, warrier, horn-bearer, blockish, great, glittering, fierce, valiant, and louring, which feemeth to be natural to this beast; infomuch as the Grammarians derive Taurus, grimmels or lowring, from Taurus, a Bull, whose aspect carrieth wrath and hatred in it: wherefore it is Proverbially laid in Wisphalia, of a lowing and louring conSetence, Eir jet als ein der dem fliebuchwer Entferfleitt: That is, he looketh like a Bull escaped from one stroke of the Butcher. Their horns are leffer but stronger then Oxen or Kie, for all beasts that are not gelded, have smaller horns and thicker skules then other, but the Bulls of Syphianas is said elsewhere, have no horns. Their heart is full of nerves or sinews, their blood is full of small veins, for which caufe he ingendereth with most speed, and it hardneth quickly. In the gall of a Bull there is a stone called Clers, and in some places the gall is called Mammas. They are plentiful in most Countries, as is said in the discourse of Oxen, but the belt fort are in Epirus, next in Tracia, and then in Italy, Syria, England, Maccotie, Phrygia, and Belgia: for the Bulls of Gallia are impaire by labour, and the Bulls of Ebiue are the Robinetics, as the Bulls of the woods are Elephants.

They defire the Cow at eight months old, but they are not able to fill her till they be two years old, and they may remain tolerable for breeders until they be 12. and not paft. Every Bull is sufficient for ten Kie, and the Bulls must not feed with the Kie, for two months before their leaping time.
time, and then let them come together without restraint, and give them Paele, or Barley, if their pasture be not good. The beast time to suffer them with their females, is the midst of the Spring, and if the Bull be heavy, take the tayl of an Hart and burn it to powder, then moisten it in Wine, and rub therewith the genitals of a Bull, and he will rise above measure into lust: whereof, if it be more then tolerable, it must be allayed with Oyl. The violence of a Bull in the act of copulation is so great, that if he miss the females genital entrance, he woundeth or much harmeth her in any other place; sending forth his feed without any motion except touching, and a Cow being filled by him, he will never after leap her, during the time she is with Calf: wherefore the Egyptians decipere by a Bull in health, without the itch of lust, a temperate continent man, and Epictetus saying of Sudden and Allike; that is Bear and Forbear, was emblematized described by a Bull, having his knee bound and tryed to a Cow in the hand of the Neat-herd, with this subperation. Hard fortune is to be endured with patience, and happiness is oftentimes to be feared; for Epictetus said, Bear and forbear: we must suffer many things, and wide-build our fingers from forbidden fruits for is the Bull which forsweth rule among leaved, being bound in his right knee, at least from his female great with young.

When they burn in lust, their wrath is most outrageous against their companions in the same pature, with whom they agreed in former times, and then the conquerer coupleth with the Cow: but when he is weakened with generation, the beast that was overcome, setteeth upon him affreth, and oftentimes overcometh: which kinde of love-fight is elegantly describ'd by Oppianus, as followeth.

One that is the chiefest raleth over all the other herd, who tremble at the fight and presence of this their eagar King, and especially the Kye, knowing the infulting jealousie of that raging husband. When the herds of other places meet together, beholding one another with disdainful countenances, and with their loughing terrible voices, provoke each other, puffing out their flaming pride of defiance, and dimming the glittering light with their often dull-beating-feet into the air, who pretently take up the challenge, and separate themselves from the company, joyning together at the sound of their own trumps-roughing voice, in fearful and sharp conflicts, not sparing, not yeelding, not retiring till one or both of them fall wounded to the earth: sometimes turning round, sometimes holding heads together, as if they were Coach-fellows: and as two mighty thips well manned, with sufficient armes and strength, by force of winds and floods violently rushing one against another, do break and split asunder, with the horrible cry of the Souldiers, and rattling of the armour: so do these Bulls, with voice, legs, horns, and strength, like cunning and valiant Martialists, make the sounds of their blows to ring betwixt heaven and earth, untill one of them be vanquished and overthrown.

The poor over-comed Beast, with shame retireth from the herd, and will no more appear, untill he be enabled to make his party good against his triumphant adversary: then he feedeth solitarie in the Woods and Mountains, for it is proverbially said, to signify a single and unmarried life, abit Turus in silvam: that is, the Bull is gone to the Wood to live solitarie without his female, often exercing himself like a furious Champion against the day of a new combate, and when he findeth his strength increas'd, and his courage armed for the day of battel, then roareth he in the Woods and Mountains, to provoke his adversary to anuer: and perceiving his own voice to be more fierce and violent then his enemies, forth he proceedeth like some refreshed Giant, confident in his strength, defending the lits of a second combate, where he easly overcometh the Victor, weakened with copulation, and not exercied or fitted to such a triall through fulnes and venery: so the first that was vanquished becometh Conqueror.

The very same is in other words describ'd by Virgil: Bulls are enemies to all beasts that live upon prey, as Bears, Lyons, and Wolves: when they fight with Wolves, they winde their tails togeth'r, and do drive them away with their horns; when the Bear fighteth with an Oxe, the falleth on her back, watching opportunity to take his horns with her fore-foot; if she catch, with the catch of her body the weareth the beast, who is so earneft in combate with these beasts, that they will fight their tongues hanging out of their mouths. The Crow is enemy to Bulls and Alles, for in her flight she will strike at their eyes; and it is easier for the Bull to be revenged of a Lyon, then on such a bird: Red colour fireth up a Bull to fight, neither can the Neat-herds govern them with such facility as they do the females, for when they wander and go a-fay, nothing can recall them but the voice of their females for copulation, which they understand and hear, being a mile or two distant.

The voice of a Bull is sharper and thriller then is the lowing of a Cow; they are most corrosive that have short and thick necks, and in their greatest wilderness, if their right knee can be bound, they will not fir; or if they be tyed to a wide fig-tree, which is so fearfull to the nature of an Oxe or Bull, that it hath been feen, how a very few ficks of that wood have fed a great quantity of Bulls flesh in shorter time, than a far greater number of other wood for on fire could perform: which caused the Egyptians in ancient time, to picture a Bull tyed to a wide fig-tree, to signify a man that changed his manners through calamity.

Out of the hides of Bulls, especially their ears, necks, and genitalis, is most excellent gleye confecuted, but for the most part it is corrupted, by seething with it old lether of chooes or boots: but that of Rhodés is without all fraud, fit for Physitians and Painters, and evermore the whiter the better, for that which is black is good for nothing; wherefore that which is made out of Bulls hides, is so white, that it fendeeth forth a brightes,whole veruous conjuncion in conjugulation is so powerful, that it is easier to break a whole piece of wood then any part so gleewed together therewith: and for this invention, we are (faith Plijyt) indebted to Dédalos the first author thereof. They used it in instruments of musicke, and such other tender and precious actions.
Chapter 50

The History of Four-footed Beasts.

Of the Bull.

The bull or an Ox put upon Copper or Braiis, maketh it glister like Gold; for which cause it is used by Priests, to colour their counterfeit Crowns. The fleith of a Bull is good for meat, but yet not so good as an Ox or Cow; yet did the Egyptians abtian from eating Cows flesh, and not from the flesh of Bulls.

These beasts are used in some places to plow, in some to fight; and it is reported by Athanas, that Methisses King of Phœbus, before his guard of men, had also a guard of a Bull, a Horie, and a Hure, which he tamed with his own hands; so that when his followers were alseep, if any stranger came near, they failed not to awake him, by one of their several vocies. It is reported also, that if the nostrils of a Bull be anointed with Oyl of Roses, he will presently lose his eye-fight; and that in the Lake Aphiinæus there no living creature abide, and yet many Bulls and Camels sweem therein safely. It is but fabulous that there were Bulls in Celesib, which did breath out fire, except by that fiction the Poets understood the beaftly rage of the rich inhabitants. Touching the sacrificing of Bulls; it was also the custom of the old Egyptians to sacrifice a Bull unto Egyptus; and their manner was, first of all to try him whether it were fit for sacrifice, by laying meal before them, whereof if they refused to take, they were adjudged not apt for the Temple.

The Druides call a general sacrifice Vifien, whereby they afford all grievances may be cured. First they prepared a banquet with sacrifice under some tree, then brought they two white Bulls fattened together by the horns, and then they gave a drink to any barren creature, woman, or brute beast, holding religiously, that by that drink they should be made fruitful, and free from all poyson: Unto to great a height did the folly of blinde people arise, to put religion in every unreasonable invention, under pretence of any good intention devised by idolatrous Priests. As often as they flew and offered a Bull, and poured Frankincence and Wine upon the hoatt, they said: The Bull is increated with Frankincence and Wine: but the Ionians did bel comfort themselves in their sacrifices, where the Bull before his death did lough at the Altar: and the Meffiania did bands his Bull which was to be sacrificd to the ghost of Arinomene, unto certain Pillars in his Sepulchre: if therefore the Bull did shake the pillar while he leaped to and fro to get liberty, they took it for a good sign or Omen, but if it flood immovable, they held it a mourant and lamentable thing.

It is likewise reported by Varinus, that when Agamemnon ignorantly killed one of the Harts of Diana in Aulis, she was so wroth, that she flew the winds from blowing upon his Navy, so as they could not stir out of harbour: hereupon they went to the Oracle, where answer was given, that the goddess was to be pacified with some one of Agamemnon blood, therefore Xiphes was sent away to fetch Iphigenia, the daughter of Agamemnon from her mother Clitemenstra, under pretence to be married to Actites: but when he was ready to be sacrificd, the goddess took pity on her, and accepted a Bull in her stead, which ought not to be thought incredible, seeing that in holy Scripture a Ram was substituted in the place of a Boar.

They were wont also to sacrifice a Bull to Neptune, and to all the Rivers, because of that affinity which they held a Bull hath with all waters: and to Apollo, according to this Virgilian verse, Tuturn Neptunus, Taurum tribu pulcher Apollo. But unto Jupiter it was unaccustomed to be offered, perhaps because he had often thwed himself in that likenes, to ravish and defour women. There be certain Proverbs of a Bull, which are not altogether impertinent in this place. First, it is commonly said, that he may bear a Bull that hath borne a Calf; whereby is meant, that he may be more subject to fithnesses in age, which is so yout. Quastella was a woman of most wise reputation for uscleannes, because the faid, that when the was little, the lay with little ones like her self, and when the grew bigger, she applied her self to the pleasure of elder men, growing in fithinesse as the she increated in years. Likewise they were wont to say of an abfur or impossible thing; that if a Bull could reach his head over Tagus, he might drink of the river Erups, and the beginning of this proverb, was taka of an Apologie of Cerudos, when his Hoatt upon a time did ask him what punishment the Lacedemonians had appointed for adulterers, he anwered: there was no adulterers in Lacedemon, and therefore the punishment and quellen were frivolous. His Hoatt replied: But if there should be an adulterer there, what punishment would they appoint for him? Marty (said Cerudos) he should pay for such a Bull as would reach over Tagus to drink of the water Erups: whereof the hoatt laughed, demanding where such a Bull could be found? then said Cerudos, and where can you finde an adulterer in Lacedemon? so putting of one abfurdisy with another. And thus much of the natures and properties of a Bull in general. In the next place before this beast be turned into the Woods, we will describe his medicinal vertues, and so let him loose.

The powder of a Bulls horn drunk in water layeth a flux of blood, and the looñnes of the belly. Scintus and Eufcopus say, that if a Bulls horn be burned in a place where Serpents abide, it driveth away the male. The blood of Bulls mingled with Barley flower, driveth away hardnes in the fleith, and being dried cureth Apothemes in every part of the body. It taketh away spotes in the face, and killeth Serpents: It is commended warm against the Gout, especially in Horces. It is not good for drink, because it is easily congealed, except the little veins be taken out. It is accounted among the chiefest poupons, and therefore it is thought by Plutarch, that Hannibal poisoned himself by drinking Bulls blood, being thereunto persuaded by his servant: for so dyed Themistocles, and Pharnacesus king of Egypt, taken by Carisbius, was restrained to drink the blood of a Bull; whereupon immediately he gave up the ghost. For remedy hereof, it is good to beware of vomitting, because the blood congealed in the Romach into lumpes, stoppeth the throat; wherefore all those things which dissolve milk in the Romach, are also medicinal against the blood of Bulls. In these cases let the
party be first of all purged by Gl, tler or otherwise, and then anoint the stomack and belly with Early meal and sweet Water, laying it unto them like a plaster; likewise Lupines, Oxymel, and Nitre, are sovereign in this, as all Physitians know. The dry leaves of Neppe and Calamach is profitable against this Malady; so also are afftes made of the lees of Wine burned.

The fat of a Bull is profitable to many things. First therefore, it must be plucked out warm from the reins of a Bull and washed in a River or Brook of running Water, pulling out the skins and tum- cles, then melt it in a new earthen pot, having call among it a little salt, then let it in fair cold Water, and when it beginneth to congeal, rub it up and down in the hands, wringing out the water, and letting it foak in again, until it appear well washe: then boyli it in a pot with a little sweet Wine, and being sodden, let it stand all night: it in the morning it favour strong, then pour in more Wine, feethe it again, until that favour cease, and so all the poyson be removed: and beware of Salt in it, especially if it be to be used in diances, whereunto Salt is an enemy, but being thus used, it looketh very white: after the same manner may be used the fat of Lions, Leopards, Panthers, Camels, Boars, and Horses.

The fat call about the guts melted in a frying pan, and anointed upon the genitals and breast, helpeth the Defenterie. The marrow of a Bull beaten and drunk, cureth the pain in the small of the belly: and Kafi, that if it be melted at a fire, and mingled with one fourth part of Myrthe and Oyl of Bays, and the hands and feet be therewith antonied and rubbed, morning and evening; it helpeth the contractions of the Nerves and Sinews.

The fat of a Dormoufe, of a Hen, and the marrow of a Bull, melted together, and poured warm in to the ears, eafeeth their pain very much: and if the liver of a Bull be broyleed on a hot fire, and put into one mouth that hath the Tooth-ach, the pain will go away so soon as ever the teeth touch it. The gall of a Bull is sharper than an Oxes, and it is mingled with Hony for a Wound-plater, and in all outward remedies against poyson. It hath also a quality to gnaw the deadness or corruption out of Wounds, and with the joyce of Leeks and the Milk of women, it is applied against the Swine-poxt, and Filitas; but the gall alone rubbed upon the biting of an Ap, cureth that Malady. Likewise the Ulcers in the head, both of men, women, and children. And if the wool of an Hare be burned to ashes, and mingled with oyl of Myrtes, Bulls gall, and beaten Alone, and so warmed and anoynted upon the head, it layeth the falling away of the hair of head.

With the gall of a Bull, and the white of an Egge, they make an Eye-salve, and so anoynt therewith dissoled in water four days together: but it is thought to be better with Hony and Balsam: and infilled with sweet new Wine into the Ears, it helpeth away the pains of them especially running-mattery Ears, with Womans or Goats milk. It being taken with Hony into the mouth, helpeth the chists and feares therein: and taken with the Water of new Calonintida, and given to a woman in travel, cautheth an eafe childe-birth. Gallen was wont to give of a Bulls gall the quantitie of an Almond, with two spoonefulls of Wine, called (Vium Lymbatium) to a woman that hath her childe dead within her body, which would presently caufeth the dead Embryon to come forth. The genital of a red Bull, dried to powder, and drunk of a woman, to the quantity of a golden Noble, it maketh her to loath all manner of copulation: but in men (as the latter Physitians affirm) it cautheth that defire of lust to increase. The dung of a Bull laid to warm, helpeth all hardnes, and burnt to powder, helpeth the member that is burnt. The urine of male of Bulls with a little Nitre taketh away Scabs and Leprrose.

Of another Beast called BUSELAPHUS.

Here was (faith D. Cey) a cloven-footed beast brought out of the Deferts of Mauritania into England, of the bignes of a Hinde, in form and countenance betwixt a Hinde and a Cow, and therefore for the reSEMBlance it beareth of both, I will call it Buselapbus, or Bossicmenus, or Myxelaba, phus, or a Cow-Hart: having a long and thin head and ear, a lean and slender leg and thin, fo that it may seem to be made for chase and celerity. His tail not much longer then a foot, but the form thereof very of a Cows, and the length like a Harts: as if nature seemed to doubt whether it shoulde encloue to a Cow or a Hart: his upper parts were yellowish and smooth, his neither parts black and rough; the hair of his body betwixt yellow and red, falling close to the skin, but in his foore-head sounding up like a Star; and forso about the horns which were black, and at the top smooth, but downward rough with wrinkles meeting on the contrary part, and on the nearer side spreading from one another, twice or thrice their quantity. These horns are in length one foot and a hand-breath, but three hands-breath thick at the root, and their distance at the root was not above one fingers breadth, fo ariseth to their middle, and a little beyond where they differ or grow asunder three hands-breath and a half; then yeeld they together again a little, and so with another crook depart asunder the second time, yet fo, as the tops of the horns do not stand asunder above two hands-breath, three fingers and a half. From the crown of the head to the noitris, there goeth a black strake which is one foot, two palms and one finger long, in breadth above the eyes where it is broadelet, it is seven fingers, in thickness one foot and three palms, it hath eight teeth, and wanteth the uppermoft like a Cow, and yet cheweth the Cud, it hath two udders under the belly like a Heifer that never had a Calf, it is a gentle and pleasant beast, apt to play and sport, being not only swift to run, but light and active to leap: It will eat any thing, either bread, broth, salted or powdered beef, grapes or herbs, and the ufe hereof being alive is for hunting, and being dead the flesh is sweet and pleasant for meet.
We are now to describe those beasts which are less foreign and strange, and more commonly known to all Nations, than any other four-footed beast: for howsoever Beagis, Buffs, Lyons, Bears, Tigers, Beavers, Porcupines and such others, are not always found in every Nation, yet for the most
Of the Oxe.

most part are Oxen, Kine, Bulls and Horfes, by the Providence of Almighty God, diftributed in all the habitable places of the world: and to feak the truth, Oxen and Horfes were the first riches, and fuch things wherein our Elders got the firft property, long before houses and lands: with them they rewarded men of highest deferit, as Melampus, who opened an Oracle to REDE that fought out the loft Oxen of IBIUS. And Eris King of Sicily, fo much loved Oxen, that Her Ces iuered from Gryphon, that when he was to contend with Hercules about thefe, he rather yeelded to de- part from his Kingdom then from his Cattel: and LOHIUS PALLUX affirmeth, that there was an ancient coin of mony, which was ftamped with the figure of an Oxe, and therefore the Cryer in every publick speeche made proclamation, that he which deferved well, fhould be rewarded with an Oxe, (meaning a piece of mony having that imprefion upon it:) which was a piece of Gold compared in value to an English Rofe-noble: and in my opinion the firft name of mony among the Latins is derided from Cattel, for I cannot invent any more probable etymologie of PETUNIA, then from PETUS, signifying all manner of Cattel: howeyer it is related by fome Writers, that on the one fide of their coin was the Kings face, and on the other an Oxe picture; and that SEUTUS was the firft that everfigured money with Sheep or Oxen. Mirus the great painter of ELEUTHERUS, and difciple of AGETUS, made an Heifer or Cow of Bras, which all Poets of GREECE have celebrated in fundry Epigrams, because a Calf came unto it to fuck it, being deceived with the proportion, and APUSUS als added this following unto the faid Cattel and Cow, saying:

Vtra quaer pulstas fragipia matris oberta,
O vita f qua pro pote patet.

Whereunto the brazen Cow is caufed to make this anfwere following:

Volla. O bue namis
Bon. Abeerum

Why whereby he defired their vain labours, which endeavoure to fatisfie themselves upon mons devifes, which are cold and comfortlesfs without the bliffing of Almighty God. To begin therefore with these beafts, it muft be firft of all remembred, that the name BOS, or an Oxen as we fay in English, is the moft vuglar and ordinary name for Bugils, Bulls, Cows, Buffes, and all great cloven-footed houfe beafts: although in proper speech, it signifies a heaft gelded or libbed of his bones: and BOS signi fiehts a hug great Serpent whereof there were one found in IADU, that had falwallowed a childe without breaking one of his bones, of which being olso in Oxen the deftruction of years or age; which giveth them feveral names, for in their young age they are called Calves, in their second age Steeres, in their third Oxen, and the Latines add the fourth, which they call VITUS, old Oxen. There are alfo distingufhed in sex, the Male Calis is VITUS, the Female VITULUS; likewife ICWENUS, a Steer, and IWENUS, an Heifer, BOS, or an Ox, and VACCA, a Cow; Taurus, a Bull; Jura, a barren Cow; and HYND, a bearing and fruitful Cow: of whom the Romans obferved certain feftival days called HERODETUS, wherein they sacrificed thofe Cattel. The Latines have alfo VACCA and BUCULA for a little Cow:

Vaccam non nunguam secreta cubilis suspitit, Virg.
And again,

Ant Bucula Calum.

And BUCULA or BULVULVUL for a little Oxen. SABOR in the Hebrew signifies a Bull or Oxen, BAKR, Herds, or a Cow. TUR in the Chaldees hath the fame signification with SEBI, and among the later Writers you may finde TARA a male-fwine, and TORATA a feminine, for a Bull and a Cow, accustomed to be handled for labour. The Greekes call them BOS, or Bous, the Archibounds, BAKR: and it is to be noted, that the holy Scriptures diftingufh between TEOM, signifying flocks of Sheep and Goats, and BAKR or Herds of Cattel and Neat: and MERA is taken for Bugils, or the beft Oxen, or rather for fatt Oxen, for the verb MAR is signifieth to feed fat. EGELA is interpreted Jer. 46. for a Young Cow; and the PARIS, GELALUT: It is very probable that the Latine VACCA, is derived from the Hebrew, BAKR, as the Saracen word, BOSQAR: in Hebrew, PARA is a Cow, and PAR, a Steer, and BEN BAKR, the lion of an Ox, or Cali: and whereas the Hebrews take PARIM, for Oxen in general, the Chaldens translacte it TUR; the Arabes, BAKRA; the Persians, NADAG, or MIHAGUCHA; the Italines, call it BOS; the French, BUEF; the Spaniards, BUEZ; the Germans, OIER, and KINZE; the Illyrians, WUL: The Italianes call a Cow VACA at this day; the Greckes, BUBALUS, and DAMAUL, or DAMALUT; (for a Cow which never was of a Cow, covered with a Bull, or tamed with a yoke) and ADELADA. The French, VACA, the Spaniards, VACA; the Germans, KU or RUBE; and the Citizenes of ALEPH, NEM, from which the English word Cow feemeth to be derived: the Latine word is, a young Heifer, which hath caed to be a Cali.

There are Oxen in moft part of the world, which differ in quantity, nature, and manner, one from another, and therefore do require a feveral Treacite. And firft, their Oxen of Italy are most famous, for as much as fome learned men have affirneth, that the name ALTUS was firft of all derived of the Greek word INALTUS, signifying Oxen; because of the abundance bred and nourifhede in thofe parts, and the great account the ancient Romans made hereof, appeareth by notable example of punishment, who banifled a certain Country man for killing an Ox in his rage, and denying, that he eat thereof, as if he had killed a man: likewife in ITALY their Oxen are not all
The History of Four-footed Beasts.

The Cyprians, which dwell about Rhusi, have Oxen as white as snow, and of exceeding high and great stature, (greater then the Oxen of Grecia) yet so meek and gentle, that they are easily ruled and governed by men. The Armenian Oxen are of divers colours, intermingled one within another, having a whole round hoof like a horse, but one horn growing out of the middle of their forehead.

The domestic or tame Oxen of Asia are so small, that one would take them for Calves of two years old; the Armenians (last Stabs) which dwell between Gruza and our Coast or Country, have Oxen and Horses which have longer lips and hoofs than other, and by the Grecians are termed Microcleticians.

The Armenian Oxen have two horns, but winding and crooking to and fro like Ivice which cleaveth to Oiks, which are of such exceeding hardness that they will blunt any sword that is stroke upon them, without receiving any impression or cut thereby. Some are of opinion, that the only excellent breed of Cattel is in Bactia, near the city Tanagra (called once Pamendes) by reason of their famous Cattel, the which Oxen are called Coprophago, by reason that they will eat the dung of man; so also do the Oxen of Cypria, to eafe the pains of their small guts. The Carianians in a part of Asia are not pleasant to behold, having thaggie hairs, and bunches on either shoulders, reaching or dwelling to their necks; but those which are either white, or black, are refused for labour.

Epirus. Epirus yeeldeth also very great and large Oxen, which the inhabitants call Pircis, because that their first Rock or Seminary were kept by King Pyrrhus: howsoever other way, that they have their name of their fiery flaming colour: they are also called Larani of a Village Larim, or of Larim, a chief Next-herd: of whom Abhenus maketh mention, who received this great breed of Cattel of Hercules when he returned from the slaughter of Grecus: who reigned about Amphareis and Ampholochi, where through the fame's of the earth and goodness of the Fatture they grow to so great a stature. Other call them Cepriani, I know not for what cause, yet it may be probable that they are called Larani, by reason of their broad Nothris, for Rines in Greek signifieth Nothris: but the true cause of their great bone and stature is, because that neither sex were suffered to couple one with another, until they were four years old at the least, and therefore they were called Ate or Setus, and were the proper goods of the King; neither could they live in any other place but in Epirus, by reason that the whole Countrey is full of sweet and deep pastures.

All the Oxen in Fulgar are white at the time of their Calving, and for this cause the Poets call that Countrey Argozoon. If that Oxen or Swine be transported or brought into Haiipanda, they grow to great, that the Oxen have been taken for Elephants, and their Swine for Mules, but I take this relation to be hyperbolical.

There are Oxen in India which will eat flesh like Wolves, and have but one horn, and whole hoofs; some also have three horns; there be other as high as Camels, and their horns four foot broad. There was a horn brought out of India into Poem the second, which received three Angiobrae of water, amounting the leath to thirty English gallons of wine measure; whereby it may be conjectured of how great quantity is the beaft thatbare it. The Indiuns both Kings and people, make no small reckoning of these beafts, (I mean their vulgar Oxen) for they are most swift in course, and will run a race as fast as any horse. So that in their course you cannot know an Ox from a Horfe, waging both gold and silver upon their heads; and the Kings themselves are so much delighted with this pastime, that they follow in their Wagons, and will with their own mouths and hands provoke the beasts to run more speedily; and herein the Ox exceedeth a Horfe, because he will not accomplish his race with sufficient celerity, except his rider draw blood from his fides with the spur, but the Oxes rider need not to lay any hands or pricks at all upon him, his only ambitious nature of overcoming (carrying him more swiftly then all the rods or spurs of the world could prevail on him). And of this game, the lowell of the people also are very greedy, laying many wagers, making many matches, and adventuring much time and price to see their event.

Among the Indians there are also other Oxen which are not much greater then great Goats, who likewise in their yoaks are accustomed to run many races, which they perform with as great speed as a Grecian Horfe; and all these Oxen must be understood to be wild Oxen.

There be Oxen in Ludria (which are Artbule affirmed) that have their ears and horns growing both together forth of one fleem. The Oxen of the Garamantes, and all other Neat among them, feed with their necks doubled backward, for by reason of their long and hanging horns, they cannot eat their meat, holding their heads direectly straight. The self same is reported of the beafts of Triagodisse: in other things they differ not from other Oxen, save only in the hardness of their skin, and theye Oxen are called Opifhianus.

In the Province of Bangala, are Oxen (saith Paulus Venetus) which equal the Elephant in height. The Oxen in Myjsia have no horns, which othre affirm also of the Scythians, whereasof they aflign this reason,
reason, because the universal bone of the skull hath no Commiſsuro joint opened, and cannot receive any humour flowing unto it, by reason of the hardneſs reſtilling, and the veins belonging to this bone are weaker and thinner then in other ; for which alſo they are more unfit to convey nourishment to the place: and to the neck of these beaſts muſt needs be more dry and leſſe ſtrong, because the veſsels are very little. The Oxen have bunces growing on their baſcets like Cats, and upon them do they bear their burdens, being taught by the diſcipline of men, to bend on their knee to receive their load.

Among the Nomades (which winter their Catteł about the Marſhes of Mod⃞) there are alſo certain Cattel without hoſns; whereof ſome are so naturally, the other have their hoſns faſhed off, as soon as they grow forth, because of all the parts of their body, they only can endure no cold.

There be Oxen in Phrygia and Etrurſea which are of a flaming red colour, of a very high and winding neck, their hoſns are not like any other in the world, for they are moved with their ears turning in aſſeſsiable manner fomeſtimes one way and fomeſtimes another.

The Syran Oxen caſled Perib are of great ſtrength, having a broad forehead. ſtrong hoſns, and fearful or courageſſe agrit, being neither too ſmall nor too ſeant of their bodies; and they are uſed both for war and alſo for running.

The Oxen of the Belſian Provinces, expecially Frieſeland and Holland, are alſo of very great force: for it had been found by good experience, that one of them hath weighed ſixteen hundred pounds Troy weight: and when the Earl of Hotchſlate was at Mecklen in Frieſeland, there was preſented unto him a great Ox, which being killed, weighed above two ſeventh thousand and twenty eight pound. The which thing being fo ſtrange as the like had not been befores time obſerved; to the intent that ſucceeding ages might not miſtrace ſuch a memorable report, the ſaid Earl cauſed the full picture of the ſaid Ox, to be set up in his Palate, with an incription of the day and year when this Ox was delivered and killed.

Of COWES.

HAVING thus noted briefly the Countries wherein Oxen are bred and nourished, with their ſeveral forms: it muſt be alfo obſerved, that Kiene or Cowes which are the female of this kind, are likeſwife found in all the places before tied with ſeſpondent and ſeemable quanſties, qualities, members, parts, and other accidents to such creatures appertaining; excepſed alwaies thoſe things which belong to their sex, which principally concern their milk. And firſt of all the Kiene of moft plentiful Milk in all Italy, are about Altina a City of the Venetians, near Aquileia, which Kiene are of the ſmalleſt body, and yet the greaſteſt labourers, who are not yoaked or coupled together by their necks as in other Countries, but only by their Ŝeads.

The Cowes of Arabia have the moſt beautiful hoſns, by reaſon of aboundance of ſmear, which flow to them, feeding them continually with ſuch generous liquor as naturally doth encreafe them.

The Phrycean Kienes are not admitted to the Bull till they be four year old at the leaſt, which thing cauſed them to grow to a very high and ſaſtle gture: whereof there were ever four hundred kept for the Kings ſtore.

These Kiene do grow at one time ſeven or eight gallons of Milk, of Wine measure, and they are fo tall, that the person which milketh them muſt ſtan upright, or else ſtoe very little: neith'er ought this ſeen incredible, for it is evident that the Cowes of the Phoenicians were fo ſta‐ble, that a very ſmall man could not milk them except he ſtoe upon a ſhootfoot.

The manner is in Germany and Heſtia, that about April there take Kiene to hire, which have none of their own, and other Kiene to ſtare them out to other; and the common price of a Cow for six moneths is payed in Butter, and is rated at seventy five pounds, twelve ounces to the pound: which payment is due to the owner, or money to that value. Other again, buy Kiene and let them forth to ſtare, referring the Calf to ſeſeſeves; and if by the negligence of the Cow herd or ſtareſ of them, the Cow call the Calf, then is the hire bound to anwer the value, but if it miscarry without his negligence (as oftentimes they may) then is the loſfe equall to the Loca‐tor or Farmer. Yet it is noted, that the Kienes of greaſteſt bodies, are not alwaies both or moſt plentiful in Milk; for the Cowes or Caw of Altina in Italy, are of little bodies, but yet very full of Milk.

The principal beneſt of Cowes Milk is for making of Butter, for the Milk it self, the Cheese and Whay, are not fo fit for nourishment of man, as are thoſe of Sheep; and the reaſon is, because the Milk of Kienes is faſteſt of all other, and therefore the name of Butter, which is in Greek, Buſtrimos and Bouyron, and Buynum in Latin, is derived properly from this kind of Cattel. The Cow herdes do alſo for their profit, obferve the paffure and food, which doth alſo above other multiphe Milk; and therefore they give their Kienes Trifſite, or Three-leaved grass: and Medoc, (which is a kind of Clover graffe) Verches, Pule, and Beans, for Beans have a great beneſt to multiply Milk: likewise I have been bundles of Hemlock, or an herb much like unto it, (which we call Hartſtongue) given to milch Kienes.

There
There is an herb much like Crow-foot, called of the German, Butterblumen, and in English, Butter-flower, which is used to colour Butter, for thereby is the whiteness thereof taken away: they will not eat Walwort or night-shade (commonly called Deaths herb) but if they eat herbs whereupon falleth an Honey-dew, then will their Milk be wonderful sweet and plentiful: there is no food so good for Cows, as that which is green, if the Countrey will afford it; especially if they love the wet and watery places, although the Butter coming from the milk of such beasts, is not so wholesome as that which is made of such as are feed in dryer Pastures. The like care is had of their drink, for although they love the coldest and clearest waters, yet about their time of Calving it is much for better them to have warmer waters, and therefore the Lakes which are heated and made to come by the rain, are most wholesome to them, and do greatly help to ease their burden and pains in that business.
Of the Cow.

Paulus reports a wonder in nature, of the Rivers Miltius and Charadus, running through the City Patra, that all the Kie which drink of them in the Spring time, do for the most part bring forth males, wherefore their herdmen avoid those places at that time. Kie for the most part before their Calving, are dry and without milk (especially about Torana). They are also purged of their menses in greater measure, then either Goats or Sheep, which especially come from them a little before or after they have been with the Bull ; howsoever Artifical faith, that they come from them a little after they have been five moneths with Calf, and are discerned by their urine ; for the urine of a Cow is the thinnest of all other.

These beasts are very lustful, and do most eagerly desire the company of their male, which if they have not within the space of three hours after they mourne for it, their lust isswageth till another time. In a Village of Egypt called Sychias (under the government of the Hemophilus) they worship Venus under the title Thentis in the shape of a Cow, perswading themselves that there is great affinity between the Goddess and this beast ; for by her mournful voice she giveth notice of her love, who receiveth the token many times a mile or two off, and so presently runneth to accomplish the lust of nature : and for this cause do the Egyptians picture Jf with a Cows horns, and likewise a Bull to signific hearing. The signes of their Bulling (as it is termed) are their cries, and disorderly forwaking their fellows, and resifting the government of their keeper. Likewise, their secret generation forth more then at other times, and they will leap upon their fellows as if they were males : besides after the manner of Mares, they oftener make water then at other times.

The most cunning herdmen have means to provoke them to desire the Bull, if they be flack, Secrets to proc- or if all they withdraw from them some part of their meat (if they be fat) for that will make them saper to conceive ; then take they the genitals or stones of a Bull, and hold it to their nose, by smelling whereof are provoked to desire copulation ; and if that prevail not, then take they the tender part of Shrimps, which is their fish, and beat them in water till they be an ointment, and therewith anoint the breasts of the Cow, after they have been well washed, untill it work upon her. And some affirm, that the tail of an Eel put into her bath the fame virtue ; other attribute much force to the wise liquor, to procure lust and conception.

They are a great while in copulation, and some have gesshed by certain signes at the time of copu- lation, whether the Calf prove male or female; for say they, if the Bull leap down on the right side of the Cow, it will be a male, if on the left, it will be a female : which conjecture is no longer true, when then the Cow admitteth but one Bull, and conceiveth at the first conjunction, for which cause the Egyptians deepeth a woman bringing forth a maiden child, by a Bull, looking to the left hand, and likewise beholding a man child, by a Bull, looking to the right hand.

They are not to be admitted to copulation before they be two year old at the leaft, or if it may be four ; yet it hath been seen, that a Heifer of one year had conceived, and that another of four moneths old hath likewise defined the Bull ; but this was taken for a moniler, and the other never thrilled.

One Bull is sufficient for fifteen Kie, although Varro faith, that he had but two Bulls for threecore and ten Kie, and one of them was two year old, the other one. The best time for their copulation is about the time of the Dauphins appearance, and so continueth for two or three and forty daies, which is about June and July, for those which conceive at that time, will bring forth their young ones in a moist temperate time of the year : and it hath been observed, that an Ox immediately after his gelding, before he had forgotten his former fire and inclination, his seed not dried up, hath filled a Cow, and the proved with Calf.

They go with Calf ten moneths, except eighteen or twenty daies ; but those which are Calved before that time, cannot live ; and a Cow may bear every year (if the Country wherein she liveth is full of grasse, and the Calf taken away from her at fifteen days old). And if a man desire that the Calf should be a male, then let him tie the right side of the Calf at the time of copulation ; and for a female bind the left. Others work this by natural observati- on, for when they would have a male, they let their Cattel couple when the North wind blow- eth ; and when a female, they put them together when the air is Southerly. They live not above fifteen years, and thereof ten times they may inender. The best time to Calve in, is April, because then the Spring bringeth on grass, both for themselves, and to increaie milk for the young ones.

They bear not but in their right side, although they have twins in their belly, which happeneth very seldom, and the beast immediately after her delivery, must be nourished with some good meat, for except she be well fed, she will for sake her young to provide for her self : therefore it is requisite to give her Vetches, Millet-feed, and milk mingled with water, and scorched Corne, and unto the Calves themselves, dried Millet in milk, in the manner of a maff : and the Kie muft also be kept up in stables, so as they may not touch their meat at the going forth, for they are quickly brought to forfake and loath that which is continually before them : and it is observed that when Kie in the Summer time do in greater number above cultum go to the Bull then at other times, it boeroken- eth and foreweeneth a wet and rainy winter, for it cannot be (faith Albertus) that a beast so dry as is a Cow, can be increaseth in moisture, which thirreth up the defire of procreation, except there be a mutation in the air unto abundance of moisture. And to conclude this discourse of a Cow, in ancient time they were wont to call light women Heifers, Harlots, and Kine, by reston of
The History of Four-footed Beasts.

of two famous harlots of Athens, Chena and Salmonchba, and from this came the fiction of Io, whose fable is at large protracted by Ovid, how the being the daughter of Idaus, was in a darknese brought upon her by Jupiter, by him ravished, which mist being espied by Juno. the defendd to the earth, and Jupiter fearing his wives jealousy turned the said Io into a Heifer, from which shape she was afterwards delivered and married to Osiris the King of Egypt, and after her death was worshippd by the Egyptians for a god, and called Set, unto whom they hierurised Geese which were called Sacra Lince.

In the choice of Kie, you must observe this direction, you must buy them in the month of March, let them be young, not past their first or second calf, their colour black or red, seldom brown or white, bright coloured, specially red, brown legs, blakith horns smooth and beautiful, high foreheads, great eyes and black, hairy and grisly ears, flat Nostrils like an Ape, but open and wide, their back bones bending somewhat forward, black lips, long and thick necks, most broad fair creets, descending from the neck, well ribbed, a great belly, the back and shoulders very broad, the buttocks broad, with a long tail hanging down to their heels, and their neuter part in many places creped and curled, well let and compacted legs rough and short, straight knees, and their bunches hanging over; their small feet, not broad but round, standing in good distance one from another, not growing crooked or play-footed, and their hoofs smooth and like one another every way. Finally, it were a profitable thing to prosecute natures perfection in every one of their several parts, but I spare to speak any more of the Females, and returning again to the story of Oxen from which we have digressed, leaving the readers who desire to hear more of this discourse of Kie to other Authors, who purposely describe every part more particularly.

To begin therefore with their description, because among-folded beasts they are of most dignity and worth, especially in Italy, where the bounds of their best priviledged and flourishing Cities, were first of all declared and laid out, by the lowering together of an Ox and a Cow in one yoke. Magn Carthaginensis teacheath, that the time to provide or buy oxen, is best in the time of March, because then in their lean bodies, which they fell them cannot cover their faults so well, as if they were fatter, and also if they should be unruly and stubborn, they may be the more easily tame, before their flesh increase their strength.

Their notes or marks must be thefe, let them be young, having square and great limbs, a found body, thick and short, having his muscles flanding up red and round, and all his body smooth, his horns black, strong and large, without crooking or windng, after the fashioned of a half moon, great and rough ears, their eyes and lips black, broad Nostrils and flat upward, a long thick and fof, neck, his creft descending down to the knee, a great breast, large shoulders, big belly, long, light, ftraight sides, broad loins, a ftraight back defending a little, and a round pair of buttocks, ftraight, round and fine, short legs, good knees, great hoofs, and long tails rough and grisly. And it is to be noted, that the Oxen of a mans own Country breed, are better and to be preferred before strangers, becaufe he is already naturally fitted to the air, food, water, and temper of the soil: for it is not good to bring them from the Mountains to the Valleys, becaufe then they will grow laifie and fat, and fo into diætes: neither from the Valleys to the Mountains, becaufe they will quickly grow out of heart through want of their first deep and fat palurie; and above all, have regard to match them equally in yoke, as fo one may not overbear the other. Oxen loose their teeth at two or three year old, but not all as a Horfe doth, their nerves are harder, but not so hard as a Buls; their fih is dry and melancholick, their horns are greater and larger then are a Buls, for the fame reason that Eunuchs and gelded perffons can never be bald; for copulation weakeneth the brain, only a Bull hath a stronger forehead then an Ox, becaufe the humour that should grow forth into horns, is hardned under the bone: and the horns of Kie which are also bigger then a Buls; may through heat be made flexible with wax or water; and bend every way: and if when they are thus made soft, you may divide them into four, that is, every horn in two, they will so grow afterward, as if every heaft had four horns, and sometime through the thickness of their fcul, closing up the part where the horn should grow, and the smallnes of their veins in that place to feed the horns, there come no horns at all, but remain polled; And it is reported that they have a little fone in their head, which in the fear of death they breath out. Their teeth do all touch one another, and are changed twice, they chew the cud like fheep, wanting a row of their upper teeth, that is four of them, their eyes are black and broad, and their heart full of fines, yet without any bony lubftance, although Pliny affirmeth that sometimes in the hearts of Oxen and Horfes are found bones.

Their creft called Palm cometh of Pius their hair, and it is nothing else but long strakes in their hair, whereby the generofity and thomach of the beast is apparent. A Cow hath two udders under her loins, with four spears, like a Goat and a Sheep, because the concoction and juice of their meat may better descend to the lower parts then to the upper; their navell is filled with many veins, their hair fhort and soft, their tail long, with harder hair then in the other parts of the body; their milk is long and not round, their reins are like the reins of a Sea-calf, and by reason of their dry bodies they grow very fat, and this fat will not easily be difolved, but their manner of feeding mainainteth their strength, for they which eat much are flow in the chewing, and speedy in the concoction, for they do better preserve their fat which eat flowly, then those that eat hastily and with more greedines.

Or the choice of Kie.

The description of Oxen in common.

Time best to provide Oxen.

Outward marks of good Oxen.

Their several parts.

The reasons why some Oxen are polled, Athenians.

Arifotle.

Pliny.

The parts of a Cow different from Oxen.

Galen.
Of the Ox.

It hath been already shewed, that some Oxen will eat flet, and tear wilde beastes in pieces, the people of Persia give to their yoked or working Oxen fish, and also in the Province of Adam, and where their Horfes, Sheep, and Oxen, eat dryed fish, by reason that the abundance of heat doth dry up their palture: neither is anything so plentiful among them as fish: the like is reported of the people Hottentot, and Ceylons, and of Maymun a City of Arabia, and in Frisland: in the Province of Norway, there is an herb growing in waters, which is so much desired of their Cattel, that they will thrust their heads into the water above their ears, to bite that to the roots: and the Oxen of the Northern ocean illands of Germany do grow so fast, that they are indangered to die thereby.

The most common food for Oxen, is the same that is already specified in the former discourse of Kie; namely, Three-leaved grasse, Clover grasse, all green herbs, Hay, Beans, Vetches, Chaife, and in some places Barley and Straw. There is also a monethly diet or food given to Oxen, for in January and February, they give them Vetches, and Lupines, bruised in water among Cafffe or Peafe, so bruised and mingled, and where is want of such pulse, they may give them preflings of Grapes dryed and cleansef, which is not turned into wine, and mingle them with chaife for the Cattel to eat, but the Grapes themselves are much better before the prefling, with their small twigs or leaves, because they are both meat and drink, and will fat an Ox very speedly.

The like may be added of boughs, of Laurel, Elmpe, and other leaves, and also Nuts and Acornes, but if they be not wearey and fed with Acornes till they loath them, they will fall into febs. In March and April, give them Hay, and from April unto June give them Graffe, and fuch green meat as may be found abroad; Afterward all the Summer and Autumn, they may be satisfied with the leaves of Elmpe, Bay, Holm, and especially that kind of Oak which is without prickles, and therefore they cannot abide Juniper. In November and December, while the feed time lafteth, they must have as much given them as they can derive, either of the forenamed food, or else of some better if need require; for it must be principally regarded, that the Cattel fall not into leannes in the Winter time, for leannes is the mother of many ficknefles in Cattel, and their utter overthrow. and therefore the benefits by their full feeding are many, as may appear by that common proverbs., Bas ad autumnam, that is, an Ox to a whole heap, to signify such men as live in all plenty and abundance.

The like care must be had of their drink, for the Neat-herd must diligently look unto their drink, that it may be alway clear, and it is reported of the rivers Cruibus and Sbabri, that the Cattel which drink of their water do turn white, whatsoever colour they had in former times.

They will live in strength and perfection twelve years, and their whole life is for the most part but twenty, Kie live not fo long; the means to know their age is by their teeth and their horn, for it is observed that their teeth grow black in their age, and their horns wax more circled as they grow in years, although I dare not affirm that every circle betokens a years growth, (as some have written) yet I am assured the smooth horn sheweth a young beast. Moreover, although Kie will endure much cold and heat both in Winter and Summer, yet must you have more regard to your Oxen, and therefore it is required that they in the Winter cold weather be kept dry and houfed in halls, which must be of convenient quantity, In every Ox may be lodged upon straw, the floor made higher under their forefeet then their hinder, so as their trine may peaceably and not stand to hurt their hooves: and there be also allowed for the standing and lodging of every Ox eight foot in breadth, and a length answereable. The like regard must be had to their manger and rack, whereof the flaves must not fland above one foot, or rather lefte from one another, so they may not draw out their meat and lappen it underfoot.

But all the diet and food that the wit of man can ordain, will do them no manner of good if regard be not had to their bodily health, and preversation of strength, for which cause they must receive an ordinarie medicine every quarter of the year; that is, in the end of the Spring, Summer, Autumn, and Winter; which in some places is thus made and given in potion, they take of Cypress, and Lupine leaves an equal quantity, beat them small, then set them in water in the open air a day and a night, and afterward give unto every one for three daies together warmed as much as a wine pinte.

In other places they give them to prevent sicknefs, a raw Egge, a handful of salt in a pint of wine: and other put into the meat of Oxen, the form of new oil mingled with water, if it a little at once until they be accustomed unto it, and afterward more, and this they do every fourth or fifth day. Cato receiteth a certain vow or prayer, which the old Idolatrous Romans were wont to make for the health of their Cattel, to Silvanws Mars, which was on this manner. First, they take three pound of green wheat, and of Lard four pounds, and four pound and a half of flathie fisnews, and three pints and a half of wine, then put them into earthen pots with hone, and put in the wine by it self, and this they did yearly, but no woman might know how it is made, or be present at the time of the preparation, and it being made must be presently consumed by fire. Unto this ridiculous and superstitious idle invention, serving more to express the folly of man, then to benefit either man or beast, I may add that kind of sacrifice made for beasts, which Pliny calleth Dops, that was made in the Spring time when the Pear-tree did bloomm, the manner whereof was thus, They did offer to Jupiter Dapalí a bowl of wine, on the same day the herd-men and herds make their sacrifice, saying in this manner, O Jupiter Dapala, I offer unto thee this cup of wine, in the behalf of my self, family and
and Cattel, if thou wilt perform that unto them which belongeth to thee, be good to this wine beneath, be good to this my sacrifice: Afterward the party washed his hands, and then drank the wine saying, O Jupiter Dolius, be good to this my sacrifice, be good to this inferior wine, and if thou wilt give part thereof to Venus: the sacrifice being ended he took Millet-feed, Lentils, Osipnun, and Garlic: Tun in Cats; wherewith if any Reader be offended, let him remember to pay such poor remedies, and commend his Cattel to the true God, that fave them and beaft. The Drudk of the Gauls called a certain herb growing in moyst places Samum; which being gathered by the left hand of them that were falling, they gave it for an Antidote to Oxen and Swine. And Cato telleth of another superfluous cure for Oxen, when a man took the horn of a Hart, and laid it upon the Chapell of Pan, and set upon it a burning Candle, which must not be forgotten, but alway thought upon in the day time, calling upon holy Demusariis, which foolish people have thought as it were a witchcraft, to cure the evils of their Cattel.

But to let passe these and such like trifles, let us follow a more perfect description and rule to cure all manner of diseases in this Cattel, whose safeguard and health next to a man, is to be preferred above all others: and first of all the means whereby their sickness is discovered may be considered as all Latitudine or wearisomeness through overmuch labour, which appeareth by forbearing their meat, or eating after another fashion then they are wont, or by their often lying down, or else by holding out their tongue, all which and many more signs of their diseases, are manifest to them that have observed them in the time of their health: and on the other side it is manifest, that the health of an Ox may be known by his agility, life and firing, when they are lightly touched or pricked, starting, and holding their ears upright, fulnes of their belly, and many other ways.

There be also herbs which inrease in Cattel divers diseases, as herbs bedewed with Hond brungeth the Murrain, the joyce of black Chamerion killeth young Kie like the Chine, black Hellebore, Aegnam, or Wolf-bane, which is that graffe in Cilicia, which inflameth Oxen, herb Henry, and others. It is also reported by Aphaeste, that in a piece of Thracia, not far from that City which is called the City of Mediae, there is a place almost thirty furlongs in length, where naturally groweth a kind of barley, which is good for men, but pernicious for beafts. The like may be said of Aegolabros, Orbanache and Asylus, but I will halfe to the particular description of their diseases.

In the first place is the Malis or Graunders already spoken of in the story of the Aife, which may be known by these signs, the oxes haire will be rough and hard, his eyes and neck hang down, matter running out of the nose, his pace heavy, chiving his cud out, his backbone sharp, and his meat loathsome unto him; for remedy hereof take Sea-onions or Garlic, Lupines or Cipres, or else the foam of oil. And if a beaft eat Hogs dung, they presently fall sick of the Pities, which infecteth the herbs and graffe they breathe on, the waters whereof they drink, and the flats and lodgings wherein they lie. The humors whith annoy the body of Oxen are many, the first is a moist one called Malis, influing at the nofe, the second a dry one when nothing appeareth outwardly, onely the beaft foraketh his meat, the third an articular, when the fore or hinder legs of the beaft halt, and yet the hoofs appear found, the fourth is Furcimius, wherein the whole body breaketh forth into matter buncches and biles, and appear healed till they break forth in other places, the fifth Subtercenten, when under the skin there runneth a humour that breaketh forth in many places of the body; the sixth a Subrenal, when the hinder legs halt by reason of some pain in the loins, the seventh a Maunge or Leprose, and lastly a madnes or Phrensie, all which are contagious, and if once they enter into a herd, they will infect every beaft if they be not separted from the sick, and speedy remedy obtained.

The remedies against the last-foven are thus described by Columella. First take Oxipanun and scabroser roots mingled with Fennel-feed and meaat of beaten wheat rath-ripe; put them in spring water warmed with Hond nine spoufons at a time, and with that medicine anoint the beaft of the beaft, then take the bloud of a Sea-faife, and for want thereof a common Snail, and put it into wine, and give the beaft in his nofe, and it hath been approved to work effectually. It is not good at any time to furp Oxen to running, for chastening either move them to loosening of the belly, or drive them into a Feaver: now the signs of a Feaver are these, an immoderate heat over the whole body, especially about the mouth, tongue and ears, tears falling out of the eyes, hollownes of their eyes, a heavy and hooping drowzie head, matter running out of his nofe, a hot and difficult breath, and sometime fighting and violent beating of his veins and loathing of meat: for remedy whereof, let the beaft fail one whole day, then let him be let blood under the tail failing, and afterward make him a drink of bole-worfe flakles sod with oil and liquor of fish fauce, and let him drink it for five daies together before he eat meat; afterward let him eat the tops of Lentils, and young snall Vine branches, then keep his nofe and mouth clean with a fponge, and give him cold water to drink three times a day, for the beit means of recovery are cold meats and drinks, neither must the beaft be turned out of doors, till he be recovered: When an Ox is fick of a cold, give him black wine, and it will prefently help him.

If an Ox in his meate taif of Hens dung, his belly will prefently be torment and, and swell unto death if remedy be not given; for this malady, take three ounces of parsley feed, a pinte and a half of Cammion, two pounds of honey, beat thefe together and put it down his throat warme, then drive the beaft up and down, as long as he can stand, then let as many as can stand about him rub
rub his belly, until the medicine work to purgation: and \textit{Verginia} adddeeth, that the ashes of Elime wood well red in oil, and put down the beasts throat, cureth the inflammation of hen-dung. If at any time it happen, that an Ox get into his mouth and throat a horse-leech, which at the first will take fast hold, and tuck the place the holds (be it mouth or throat) til the have kild the beast; if you cannot take hold on her with the hand, then put into the Oxes throat a Carse, or little hollow pipe, even to the place where the Leech sucketh, and into that pipe put warm oil, which as soon as the Leech feelith, the presently leaveeth hold.

It fortunate sometimes that an Ox is rung or beaten with a Serpent, Adder, Viper, or other such venemous beati; for that wound take sharp Trifoly, which growth in rockie places, strain out the juice and beat it with salt, then fearthe the wound with that ointment, till it be wrought in. If a field-mouse bite an Ox, so as the dint of her teeth appear, then take a little Cumin or soft Pitch, and with that make a plaster for the wound; or if you can get another field-mouse, put her into oil, and there let it remain till the members of it be almoxt rotten, then bruise it and lay it to the fore, and the same body shall cure, whose in nature gave the wound. Oxen are also much troubled with a disease called the Hide-bonde; for remedy wereof, when the beast is taken from his work, and panteth, then let him be sprinkled over with wine, and put pieces of fat into his mouth: if then you perceive no amendmet, then seethe some Laurel, and therewith heat his back, and afterward with ill and wine fearthe him all over, plucking his skin up from the ribs, and this must be done in the sunshine, or else in a very warm-place.

For the febs, take the juice of Garlic, and rub the beast all over; and with this medicine may the biting of a Wolf or a mad Dog be cured: although other affirm, that the hoof of any beast with Brimfione, Oil, Water and Vinegar, is a more present remedy; but there is no better thing than Butter and Thale Urine: When they are vexed with worms, pour cold water upon them, afterward anoint them with the juice of onions mingled with Salt.

If an Ox be wrinched and strained in his fine ws, in travel or labour, by crumbling on any root or hard sharp thing, then let the contrary foot or leg be let blood, if the finews swell: If his neck swell, let him blood, or if his neck be winding or weak (as if it were broken) then let him blood in that ear to which the head bendeth. When their necks be bald, grinde two tile together, a new one and an old, and when the yoak is taken off, cast the powder upon their necks, and afterward oil, and so with little reit the hair will come again.

When an Ox hangeth down his ears and eateth not his meat, he is troubled with a Cephalalgie; that is, a pain in his head: for which seethe Thyme in Wine, with Salt and Garlic, and therewith rub his tongue a good space; also raw Barly steeped in Wine, helpeth this disease. Sometime an Ox is troubled with madness, for which men burn them benwixt the horns in the forehead till they bleed: sometime there is a Fie which biteth them continually, driveth them into madness; for which they are wont to call Brimfione and bay sprigs sod in water in the Pattures where they feed, but I know not what good can come thereby. When Oxen are troubled with leam, put a sprig of black Hellosor through their ears, wherein let it remain till the next day at the same hour. All the evils the eyes are for are the molt part cured by intusion of Hony, and some mingle therewith Ammoniak, Salt and Bat-tieck. When the palat or roof of their mouth is so swelling that the beast forkeeth meat, and bendeth on the one side, let his mouth be pared with a tharpe instriment, or else burned or abasted some other way, giving them green and soot meat till the tender fore be cured: but when the cows swell, for remedy wheerof they fell them away to the Butcher for slaughter: it filleth out very often that there grow certain bunches on their tongues, which make them forake their meat, and for this thing they cut the tongue, and afterward rub the wound with Garlic and Salt, till all the feamy matter issue forth.

When their veins in their cheeks and chaps swell out into ulcers, they soothen and wath them with Vinegar and Lees, till they be cured. When they are liver-sick, they give them Rubache, Multram, and Gentian, mingled together. For the Cough and short breath, they give them twigs of Vines or Juniper mingled with Salt; and some use Betony.

There is a certain herb called Apleon or Citterneb, which consumeth the milts of Oxen, found by this occasion: in Cete there is a River called Proterus, running betwixt the two Cities Gnosof and Gottina, on both sides thereof there were herts of Cattel, but those which fed neer to Gottina had no Spleen, and the other which fed neer to Gnosof were full of Spleen: when the Physitians endeavored to find out the true caufe hereof, they found an herb growing on the coast of Gottina, which diminished their Spleen, and for that caufe called it Apleon. But now to come to the diseases of their beast and stomack, and first of all to begin with the Cough, which if it be new, may be cured by a pinte of Barley meal with a raw Egg, and half a pinte of sod wine: and if the Cough be old, take two pounds of beaten Hyop sod in three pints of water, beaten Lentils, or the roots of Onions washed and baked with Wheat meal given fasting, do drive away the olded Cough. For thornets of breath, their Neck-herds hang about their neck Deaths-herb and Harts-wort: but if their Livers or Lungs be corrupted, (which appeareth by a long Cough and leaness) take the root of Hafell, and put it through the Oxes eat; then take like or equal quantity of the juice of Onions, and oil mingled, and put into a pinte of Wine, let it be given to the beast many days together. If the Ox be troubled with crudity, or a raw evil stomach, you shall know by these figues; he will often belch, his belly will rumble, he will forbear his meat, hanging down his eyes.
and neither chew the cud or lick himself with his tongue: for remedy whereof, take two quarts of warm water, thirty flakes of Balsam’s, seethe them together till they be soft, and then give them to the beast with Vinegar.

But if the cruelty cause his belly to stand out and swell, then pull his tail downward with all the force that you can, and bind thereunto Mother-wort, mingled with salt, or else give them a Glyster, or anoint a Woman’s hand with oil, and let her draw out the dung from the fundament; and afterward cut a vein in his tail with a sharp knife. When they be distermed with choler, burn their legs to the hoofs with a hot Iron, and afterward let them rest upon clean and soft straw; when their guts or intras are pains’d, they are eased with the fight of a Duck or a Drake.

But when the small guts are infected, take fifteen Cypress Apples, and so many Gauls, mingle and beat them with their weight of old Cheele in four pints of the sharpest wine you can get, and so divide it into four parts, giving to the beast every day one quantity. The excrements of the belly do deprive the body of all strength and power to labour; wherefore when they are troublesome with it, they must ret, and drink nothing for three daies together, and the first day let them forbear meat, the second day give them the tos of Wilde Olives, or beside thereof Canes or Reeds; the walks of Lantake and Myrtillus; and a third day a little water, and unto this some add dryed Grapes in six pints of sharpe wine, given every day in like quantity. When their hinder parts are lame through congealed bloud in them, whereas there is no outward appearance, take a bunch of Nettles with their roots and put it into their mouths, by rubbing whereof the condenfate bloud will remove away.

When Oxen come first of all after Winter to graffe, they fall graffe-fick, and piffe bloud; for which they seethe together in water Barly, Bread, and Lard, and so give them all together in a drink to the beast: some prauie the kernels of Walnuts put into Egggeiefis for this cure; and other take the bloody water it fell, and blow it into the beasifs Noftirs; and herd-men by experience have found that there is no better thing then Herb-Robert, to make the pilling of bloud; they must also be kept in a flall within doors, and be fed with drye graffe and the belt hay. If their horns be anointed with wax, oil, and pitch, they feel no pain in their hoofs, except in cafes where any beast treadeth and presseth another hoof; in which cafe take oil and fow wine, and then use them in a hot Barly plaifeir or pouffe laid to the wounded place: but if the plough-share hurt the Oxes foot, then lay thereunto Stone-pitch, Greafe and Brimstone, having first of all feared the wound with a hot Iron bound about with thorn wool.

Now to return to the taming and instruction of Oxen. It is said that Bussirs King of Egypt was the first that ever tamed or yoaked Oxen, having his name given him for that purpose. Oxen are by nature meek, gentle, flow, and not fubborne, because being depriv’d of his genitals he is more tractable, and for this caufe it is requisite that they be always used to hand, and to be familiar with man, that he may take bread at his hand, and be tied up to the rack, for by gentlenefs they are belt tamed, being thereby more willing and strong for labour, then if they were roughly yoaked or suffer’d to run wilde without the sociery and fight of men. Varro faith, that it is belt to tame them betwixt five and three year old, for before three it is too foon, because they are too tender; and after five it is too late, by reason they are too unweldy and fubborne.

But if any be taken more wilde and unruly, take this direction for their taming: Firft, if you have any old tamed Oxen, joynce them together, (a wilde and a tame) and if you pleasure, you may make a yoak to hold the necks of three Oxen; so that if the beast would rage and be dis disobedient, then will the old one both by example and strength draw him on, keeping him from flitting aside, and falling down. They must also be accustom’d to draw an empty Cart, Wain, or flid through some Town or Village, where there is some concourse of people, or a plow in falledow ground or fand, so as the beast may not be discourag’d by the weight and strength of the burden; their keeper must often with his own hand give them meat into their mouth, and stroke their Noses, that so they may be acquainted with the smell of a man; and likewise put his hands to their fides, and stroke them under their belly, whereby the beast may feel no displeasure by being touched. In some Countries, they wash them all over with wine for two or three daies together, and afterward in a horn give them wine to drink, which doth wonderfully tame them, although they have never been so wilid.

Other put their necks into engins, and tame them by subftracting their meat. Other affirm, that if a wilde Ox be tyed with a halter made of wooll, he will presently wax tame: but to this I leave every man to his particular inclination for this busines; only let them change their Oxens fides, and let them sometime on the right side and sometime on the left side, and beware that he avoid the Oxes heel, for if once he get the habitt of kicking, he will very hardly be refrained from it again. He hath a good memory, and will not forget the man that pricked him, whereas he will not flir at another, being like a man in fetters, who dissembleth vengeance until he be releas’d, and then payeth the perfon that hath grieved him. Wherefore it is not good to use a young Oxe to a goad; but rather to awaken his dulnefs with a whip.

These beasts do understand their own names, and dillinguish betwixt the voice of their keepers and strangers. They are also faid to remember and understand numbers, for the King of Persia had certain Oxen, which every day drew water to Suffi to water his Gardens, their number was an hundred Vefsells, which through cultom they grew to obverse, and therefore not one of them would
would halt or loiter in that business, till the whole was accomplished: but after the number fulfilled, there was no good, whip, or other means, could once make them stir, to fetch another draught or burthen. They are said to love their fellows with whom they draw in yoke most tenderly, whom they seek out with mourning if he be wanting. It is likewise observed in the licking of themselves against the hair, (but as Cicero faid) if he bend to the right side and lick that, it proceeds a storm; but if he bend to the left side, he foretelleth a calm day fair: In like manner, when he lougheth and fleemeth to the earth, or when he feedeth fuller then ordinary, it betokeneth change of weather: but in the Autumn, if Sheep or Oxen dig the earth with their feet, or lie down head to head, it is held for an affured token of a tempest.

They feed by companies and flocks, and their nature is to follow any one which strayeth away; for if the Neat-herd be not present to restrain them, they will all follow to their own danger. Being angered and provoked they will fight with strangers very irefully, with unappeasable contentions; for it was seen in Bceitas, between Curia and Veluvius, that when the herds of two Villages met in a certain plain together, they fought so long, that of three score, four and twenty were slain, and all of them wounded, eight excepted, which the inhabitants took for an ill preface or mischief of some ensuing calamity, and therefore they would not suffer their bodies to be covered with earth: to avoid this contention, skilful Neat-herds gave their Cattel some strong herbs, as garlick and such like, that the favour may avert that strife. They which come about Oxen, Bulls, and Bugeis, must not wear any red garments, because their nature riseth and is provoked to rage, if they see such a colour.

There is great enmity between Oxen and Wolves, for the Wolf (being a flesh-eating creature) lyeth in wait to destroy them; and it is said, that there is so great a natural fear in them, that if a Wolves tail be hanged in the rack or manger where an Ox feedeth, he will abstain from eating. This beast is but simple, though his aspect seem to be very grave; and thereof came the proverb of the Oxen to the yoak, which was called Ceroma; wherewithal Wrestlers and Prize-players were anointed, but when a foolish and heavy man was anointed they said ironically But of ceroma.

Again the folly of this beast appeareth by another Greek proverb, which faith, that An Ox raiseth dust which blindness his own eye; to figurate, that foolish and indifferet men flir up the occasion of their own harmes. The manifold epithets given this beast in Greek and Latin by sundry authors, do demonstratively shew the manifold conditions of this beast; as that it is called a Fower, Wilde, an earth-tiller, brazen-footed, by reason of his hard hoofs, Cerebratus, more brain then wit; horned, fibburned, horn-biting, hard, rough, untamed, devourer of graffe, yoak-bearer, fearful, overtaimed, drygdes, wry-faced, flow, and ill favoured, with many other such notes of their nature, ordination, and condition.

There remain yet of this discourse of Oxen, two other necessary Trajesis; the one natural, and the other moral. That which is natural, contains the several uses of their particular parts, and first for their flesh, which is held singular for nourishment, for which cause, after their labour which bringeth leannes, they use to put them by for fantast, or (as it is said) in English for feeding, which in all countries hath a several manner or custom. Saturn affirmeth, that if you give your Cattle when they come fresh from their pishure, Cabbage leaves beaten small with some sharp Vines and pourred among them, and afterward chaffe winowered in a fiee, and mingled with Branc for five daies together, it will much fatten and creaseth their flesh, and the sixth day ground Barly, encreasing the quantity by little and little for fix daies together.

Now the beft time to feed them in the Winter is about the Cock crowing, and afterward in the morning twilight, and soon after that let them drink: in the Summer let them have their first meat in the morning, and their second service at noon, and then drink after that second meat or eating, and their third meat before evening again, and so let them drink the second time; it is also to be observed, that their water in Winter time be warm, and in the Summer time colder. And while they feed, you must often wash the roof and fides of her mouth, for therein will grow certain Wormes which will annoy the beast, and hinder his eating, and after the washing, rub his tongue with salt. If therefore they be carefully regarded they will grow very fat, especially if they be not over aged or very young at the time of their feeding; for by reason of age their teeth grow loose and fall out, and in youth they cannot exceed in fatnes, because of their growth: above all Heifers and barren Kie will exceed in fatnes, for Varro affirmeth, that he saw a field Moufe bring forth young ones in the fat of a Cow having eaten into her boody the being alive: the selfsame thing is reported of a Sow in Arcadia: Kie will also grow fat when they are with Calf, especially in the middell of that time. The Turk use their greatest fealls and Mariages, to roast or leethe an Ox whole, putting in the Oxes belly a whole Sow, and in the Sowes belly a Goofe, and in the Gooses belly an Ege, to note forth their plenty in great and small things: but the bell flesh is of a young Ox, and the worst of an old one, for it betgetteth an ill yjuce or concoction, especially if they which eat it be troubled with a Cough or rheumy feam, or if the party be in a Consumpition, or for a woman that hath ulcers in her belly, the tongue of an Ox or Cow salted and flie afunder, is accounted a very delicate dish, which the Priets of Mercury said did belong to them, because they were the fervants of Iephach, and howsoever in all sacrifices the beasts tongue was refused as a profane member, yet these Priets made choife thereof, under colour of sacrifice to feed their dainty flamachs.

G 2 The
The horns of Oxen by art of man are made very flexible and slanting, whereof are made Combes, hafts for knives, and the ancients have used them for cups to drink in, and for this caue was Bacchus painted with horns, and **Crueler** was taken for a cup, which is derived of **Kera** a horn. In like manner the first Trumpets were made of horns, as Virgil alluded unto this sentence, *Ranse siferpentem cornua cana*, and now adays it is become familiar for the carriage of Gunpowder in war. It is reported by some husbandmen, that if seed be cast into the earth out of an Oxes horn (called in old time **Cresbocha**) by reason of a certain coldness, it will never spring up well out of the earth, at the least not so well as when it is sowed with the hand of man. Their skin is used for chores, Garments, and Gum, because of a spongy matter therein contained, alfo to make Gunpowder, and it is used in navigation when a shot hath pierced the sides of the ship, prefently they clap a raw Ox hide to the mouth of the breach, which instantly keepeth the Water from entering in; likewife they were wont to make bucklers or shields or hides of Oxen and Bugis, and the seven-folded or doubled shield of **Afas**, was nothing else but a shield made of an Ox hide, fo many years, and in a piece upon one another, which caueth Homer to call it *Saca scep$ebh$ear*.

Of the teeth of Oxen I know no other use but scraping and making paper smooth with them; their gall being sprinkled among feed which is to bowen maketh it come up quickly, and killet field-mice that eat of it, and it is the bane or poison of those creatures, so that they will not come near to it, nor not in bread if they discern it; and birds if they eat corn touched with an Oxes gall put into hot water first of all, and the lees of wine, they wax thereby afomnshed: likewife Emmets will not come upon those places where, there remaineth any favour of this gall; and for this caue they anoint herewith the roots of trees. The dung of Oxen is beneficial to Bees if the hive be anointed therewith, for it killeth Spiders, Gnats, and drone-bees; and if good heed be not taken, it will work the like effect upon the Bees themselves: for this caufe they use to smoother or burn this kind of dung under the mouths of the Hives in the spring time, which so displays and disperseth all the little enemy-bees in Bee-hives that they never breed again. There is a proverb of the table of **Auga**, which **Auga** was so rich in Cattel, atal he defined the Countrie with their dung, whereupon that proverb grew: when Hercules came unto him he promised him a part of his Countrie to purge that table, which was not cleaned by the yearly labour of 3000 Oxen, but Hercules undertaking the labour turned a River upon it, and so cleansed all. When **Auga** law that his table was purged by art, and not by labour, he denied the reward; and because Phyleus his eldest Son reproved him for not regarding a man so well deserving, he called him out of his family for ever.

The manifold use of the members of Oxen and Kie in medicine, now remaineth to be briefly touched. The horn beaten into powder, cureth the Cough, especially the tips or point of the horn, which is also received against the Pitlick, or short breath made into pills with Honey. The powder of a Cowes horn mixed with Vinegar, helpeth the morphew, being washed or anointed therewith. The same infud into the Nofftrils, slayeth the bleeding: likewife anointed with warm water and Vinegar, given to a **Splentick** man for three daies together, it wonderfully worketh upon that passion: powder of the hoof of an Ox with water put upon the Kings evil helpeth it, and with Water and Honey it helpeth the apotomes and swelling of the body: and the same burned and put into drink, and given to a Woman that lacketh Milk, it encreaseth milk and strengtheneth her very much. Other take the tongue of a Cow, which they dry fo long till it may be beaten into powder, and fo give it to a woman in white wine or broath. The duff of the heel of an Ox or ancle bone, taken in wine and put to the gums or teeth doth faften them, and remove the ach away: The ribs of Oxen beaten to powder do flay the flux of blood, and restrain the abundance of monthly comres in women. The ancle of a white Calf laid forty daies and nights into wine, and rubbed on the face with white Liner, taketh spots and maketh the skin look very clear.

Where a man biteth any other living creature, seethe the fleth of an Ox or a Calf, and after five daies lay it to the fore, and it shall work the ease thereof. The fleth being warm laid to the swellings of the body, easeth them: fo also do the warm blood and gall of the same beast.

The broth of beef healeth the loofness of the belly, coming by reason of choler; and the broth of Cowes fleth, or the marrow of a Cow, healeth the ulcers and chinks of the mouth. The skin of a Ox (especially the leather thereof) warm in a shooe, burned and applied to pimples in the body or face, cureth them. The skin of the feet and nose of an Ox or Sheep, fold over a soft and gentle fire, untill there arise a certain sCRM like to glew from it, and afterward dried in the cold, windie air, and drunk helpeth (or at leaft) easeth burtines very much.

The marrow of an Ox, or the fewet, helpeth the strains of lines when they be anointed therewith. If one make a small candle of Paper and Cowes marrow, lettting the same on fire, under his browes or eye-lids which are bald without hair, and often anointing the place, he shall have very decent and comely hair grow thereupon. Likewife the fewet of Oxen helpeth against all outward poisons: so in all Leprofies, Botches, and Scurvines of the skin, the same mingled with Goose greese, and poured into the ears, helpeth the deafnes of them. It is also good against the inflammation of the ears, the fluidity and dulness of the teeth, the running of the eyes, the ulcers and rines of the mouth, and itchines of the neck. If ones blood be liquid and apt to run forth of the body,
Concerning their Milk, volumes may be written of the several and manifold virtues thereof, for the 
Philadelphia refuted all medicine, only in the Spring time when their beafts did eat graffe, they

drink Cowes milk, being perfuaded, that the virtue and vigour of all good herbs and fruits were 

received and digested into that liquor; for they gave it medicinally to them, which were fick of

the Plague, of Consumption, of an old Cough, of the Consumption of the reins, of the hardnefs of

the belly, and of all manner of poiffons which burn inwardly; which is also the opinion of all the 

Greek Physicians: and the shell of a Walnut fod in Cow-milk and laid to the place where a Serpent hath 

bitten it, itcheth it, and itayeth the poiffon.

The fame being new and warm Gargarized into the throat, helpeft the foreneffes of the kernels, 

and all pain in the Arteries, and swelling in the throat and flameth: and if any man be in danger of

a short breath, let him take daily soft pitches with the heart Mammies, and Harts fuet clarified in a

Cup of new Milk, and ithath been proved very profitable.

Where the pains of the flameth come by falfehefs, Melancoly, or defperation, drink Cow-milk,

Womans milk, or Alles milk, wherein a flint fome hath been fodder. When one is troubled with a

defire of going often to the floo, and can eafe nothing, let him drink Cow-milk and Alles-milk

fold together: the fame also heaved with gads of Iron or fleet, and mingled with one fourth part of

water, helpeft the Bloody flux; mingled with a little Hony and a Buls gall, with Common and

gourds, leaved to the Navel: and foam afterfe, that Cow-milk doth helpe conception if a woman be

confumed with the whiteflow, fo that her womb be indangerd, let her drink a purgation for her

upper parts, and afterward Alles milk, fait of all let her drink Cow-milk and new wine. (for forty

days together if need be) fo mingled that the wine appear not in the milk, and it hall fill the flux. 

But in the use of milk, the rule of Hippocrates must be continually observed, that it be not used with

any sharp or tart liquor: for then it curdeth in the flameth, and turneth into corruption. The whay of

Cow-milk mingled with Hony and Salt, as much as the taff will permitant and drunk, loofetheth the

hardness of the belly.

The marrow of a Cow mingled with a little meat, and with new cheefe, wonderfully flatteth the

Blody flux. It is affirmed, that there is in the head of an Ox, a certain little bone, which only in

the fear of death he caufeth out at his mouth, if this bone be taken from them suddenly by cutting

the head, it doth make children to breed teeth eatily, being tooon tyed about them. If a man

or woman, drink of the fame water, whereof an Ox drank a little before, it will eafe the headach:

and in the second venter of a Cow there is a round black Stone found, being of no weight, which is

accounted very profible to Women in hard travails of child-birth. The Liver of an Ox or Cow

dried, and drunk in powder curdeth the flux of blood. The gall of a Cow is more forcible in operation

then all other befts gals whatsoever. The gall of an Ox mixed with Hony draweth out any thorn

or point of a needle or other Iron thing out of the feth where it sticketh. Likewise it being mingled

with Alone and Myrthre as thick as hony, it cureth those evils which creep and annoy the privy

parts; laying it upon afterward Beets foid in wine.

It will not fuffer the Kings evil to grow or spread it self if it be laid upon it at the beginning.

The hands washed in an Oxet gall and water, are made white how black foret they were before

time; and if purblind eyes be anointed with the gall of a black Cow, one may read any

writing the more plainly: there is in the gall of an Ox a certain little bone, like a ring, which

the Philofofers call Aether and some Grael and Nestam, which being beaten and held to ones

Nole, it cleareth the eyes, and maketh that humour do dilate to annoy their: and if one take

thereof the quantity of a Lintel feed, with the juice of Beets, it is profitable against the Pal-

ling evil. It one be deaf or thick of hearing, take the gall of an Ox and the urine of a Goat;

or the gall of Goole: likewise, it caufeth the headach in an Ague, and applyed to the temples

provoketh feep, and if the breasts of a woman be anointed therewith it keeps her milk from

curdling.

The milk of an Ox is eaten in hony for eafeing the pains of the milk in a man, and with the skin that

a Calf caufeth out of his dams belly, the ulcers in the face are taken away: and if twenty heads of Gar-

lick be beaten in a Oxes bladder, with a pinte of Vinegar, and laid to the back, it will cure the milk.

It is likewise given against the Spleen, and the Colick made like a plaifer, and layed to the Navel

till one sweat.

The urine of an Ox caufeth a cold flamath to recover, and I have been that the urine of a Cow

taken in Gargarizing, did cure intolerable ulcers in the mouth. When the Bee hath tafled of the

flower of the Corn-tree, the presently dyeth by loofenes of the belly, except the taff the urine of a

Man or an Ox.

There are likewise many ues of the dung of Oxen made in Physick, whereof Authors are full,

but especially against the Goose, plaiftering the fick member therewith hot and newly made: and

against the Dropifie, making a plaifer thereof with Barley meal and a little Brimstone alperled, to

cover the belly of a man. And thus much for the natural properties of this kind, now we will

briefly proceed to the moral.

The moral ues of this beall, both in labour and other things, do declare the dignity and high

account our forefathers made hereof, both in Vintage, Harvett, Plowing, Carnaghe, Drawing,

Sacrificing,

G 3
Sacrificing, and making Leagues of truce and peace; in so much as that if this failed, all tillage and vintage mukt in many places of the world be utterly put down; and in truth, neither the fowls of the air, nor the Horse for the battle, nor the Swine and Dogs could have no sufficiency but by the labor of Oxen: for although in some places they have Mules, or Camels, or Elephants, which help them in this labor, yet can there not be in any Nation a neglect of Oxen; and their reverence was so great, that in ancient time when an offender was to be fined in his Cattel (as all amerciements were in those days the Judge might not name an Ox, until he had first named a Sheep; and they fined a final offence to two Sheep and not under, and the greatest offence criminal, at thirty Oxen and not above, which were redeemed, by giving for every Ox an hundred Asses, and ten for every Sheep.

It is some question among the ancients, who did first joyn Oxen together for plowing; some affirming that Aristem first learned it of the Nymphs, in the Island Ge; and Didimus affirm, that Dionysius Son of Jupiter and Ceres or Pioferpine, did first of all invent the plow. Some attribute it to Briger the Athenian; other to Triptolemus, Ofiris, Habider a King of Spain; and Virgil affirmeth most confidently, that it was Ceres, as appeareth by this verse:

Prima Ceres fitro mortalibus vetera terram
Infinita, &c.

Whereunto agreeeth Servius: but I rather incline to Josephus, LaCroamius and Ensebius, who affirm, that long before Ceres was born, or Offin, or Hercules, or any of the residu, there was a practicre of plowing, both among the Hebrews and Egyptians; and therefore as the God of plowing called by the Romans Jguginus (because of yoaking Oxen) was a fond abration from the truth, so are the residu of their inventions about the first man that tilled with Oxen: seeing it is laid of Cain and Noah, that they were husbandmen and tilled the earth. The Athenians had three several plow-feals which they observed yearly, one in Seizmas, the other in Kerkr, and the third under Pelusius: and they call their managi-sealls, plow-sealons, because then they endeavored by the seed of man to multiply the world, in procreation of children, as they did by the plow to encrease food in the earth.

The Grecians had a kind of writing called Baustraphelon, which began, turned, and ended as the Oxen do in plowing a furrow, continuing from the left hand to the right, and from the right hand to the left again, which no man could read, but he that turned the Paper or Table at every lines end. It is also certain, that in ancient time, the leagues of truce and peace were written in an Oxes hide, as appeareth by that peace which was made by Tarquininus, betwixt the Romans and the Gabii, in which was raised up in the Temple of Jupiter, as Dionysius and Pompeius Secutus affirm (in the likenes of a buckler or shield: ) and the chief heads of that peace remained legible in that hide until their time, and therefore the ancients called the Oxes hide a shield, in regard that by that conclusion of peace, they were defended from the wars of the Gabii.

And there were certain people called Homolotti by Herodotus, who were wont to strike up their leagues of peace after war and contention, by cutting an Ox into small pieces, which were divided among the people that were to be united, in token of an inseparable union. There be that affirm, that a Team or ox of Oxen, taking six or eight to the Team, will plow every year, or rather every season a hyde of ground; that is, from account 20 Manfas or in English and German account 30 Acres; which hath gotten the name Jugaera from this occasion, as Eustabius and Farinus report. When Sicyon the husband of Dido, who was daughter of Ageron and Biter to Pygmaion, wandered to and fro in the world with great fole of treasure, he was slain by Pygmaion secretly, in hope to get his wealth: After which time, it is said, that he appeared to his wife Dido, bidding her to save her life from her cruel brother; who more elateed money then nature, she fled into Lybia, taking with her some Tyrians among whom she had dwelled, and a competent sum of money; who being come thither, creaved of Ithas King of Namadus, to give her but so much land as the could compaith in with an Oxes hide, which with much ado she obtained, and then did cut an Oxes skin into small and narrow thongs or ties, wherewith she compassed in so much as builded the large City of Carthage, and first of all was called the New City, and the Callie thereof Byfia, which signifieth a Hide.

Eustabius also reporteth another story to the building of this City, namely that it was called Carthage of one of the daughters of Hercules, and that when Elisa and the other companions of Dido came thither for the foundation of the City, they found an Oxes head, whereupon they were disencouraged to build there any more, supposing that Omen betokened evil unto them, and a perpetual slavery in labour and misery, such as Oxen live in, but afterward they tried in another corner of that ground, wherein they found a Horfes head, which they accepted as a good signification of riches, honour, magnanimity, and pleasure, because Horses have all food and maintenance provided for them. Among the Egyptians they paint a Lion for strength, an Ox for labor, and a Horse for magnanimity and courage, and the Image of Meda which among the Pharaohs signifieth the Sun, is pictured in the face of a Lyon holding the horns of a striving Ox in both hands, whereby they signifie that the Moon doth receive light from the Sun, when she beginneth to be separated from her beams.

There is in the Coasts of Babylon a Gem or precious stone like the heart of an Ox, and there is another called Sarvites, which representeth the flessh of an Ox. The ancients had like-
wife, for great regard of this beast, that they would neither sacrifice nor eat of a labouring Ox; wherefore Pytheus was condemned when he had desired meat of Teoconemus in Ulysses, for his hungry companion the Son of Hyle, because by violence he took from him one of his Oxen and slew him. A crowned Ox was also among the Romans a sign of peace; for the Souldiers which kept the Castle of Anubus near the river Euphrates against the Turms and his Army, when they yielded themselves to mercy, they descended from the Castle, driving before them a crowned Ox; for this manifold necessity and dignity of this beast came the Idolatrous cultum of the Heathens, and especially the Egyptians, for they worshipp'd him instead of God calling him Apis and Epaphus whole choyse was on this fort. He had on his right side an exceeding splendid want of feet, and his horns crooking together like the new Moon, having a great bunch of their tongue; they, called Cantharum; neither do they suffer him to exceed a certain number of years, or very big, for these caues they give him not of the water of Nile to drink, but of another consecrated well, which hindereth his growth: and also when he is come to his full age, they kill him, by drowning him in another consecrated well of the Priests: which being done, they seek with mourning another (having shuved their heads) to substitute in his place; wherein they are never very long but they finde one, and then in a holy Ship, for that purpose, they transport and convey him to Memphis. And the Egyptians did account him a blessed and happy man, out of whose fold the Priest had taken that Ox-God. He hath two Temples erected for him, which they call his Chambers, where he giveth forth his Augurins, answering none but children and youths playing before his Temples: and refusing aged persons, especially women; and if any not sacred, happen to enter into one of these Temples, he dyeth for it, and if into the other, he fore-sleweth some monstros cruel event, as they fondly imagine.

The manner of his answer is privately to them that give him meat, taking it at their hands; and they observe with great religion, that when Germanicus the Emperor came to ask counsel of him, he turned from him and would not take meat at his hand; for presently he was ill. Once in a year they shew him a Cow, with such marks as he hath, and alway they put him to death upon the same day of the week that he was found; and in Nilus near Memphis, there was a place called Philae, where were preferred a Golden and a Silver dish, which upon the birth or Calving days of Apis, they threw down into the river, and those days were happy; wherein they affirm that no man was hurt by Crocodiles. The Egyptians do also consecrate an Ox to the Moon, and a Cow to Urania. It is reported that Myrmicus King of Egypt, fell in love with his own Daughter: and by violence did ravish her; the not able to endure the conscience of such a fact, hanged her self: whereupon the King her impure father, did bury her in a wooden Oxen, and so placed her in a secret place or chamber, to whom daily they offer many odours; but the mother of the maiden did cut off the hands of those Virgins or Women that attended her Daughter, and would not refuse her how to vile a contempt. There were also many other pictures of Oxen, as in Carystus and Eretria; and most famous was that of Perillus, which he made and presented to Phalaris the Tyrant of Agrigent, shewing him; that if he would torment a man, he should put him into that Oxet over a fire, and his voice of crying should be like the loughing of a Heifer; which thing being heard of, the Tyrant to shew his detestation of more strange invented torment then he had formerly used, he called Perillus, that prefentated unto him, to be put into it alive, and so setting it over a fire, made experiment of the work upon the workman, who bellowed like a Cow, and was so tormented to death that it damnable and dangerous invention; which caused Ovid to write thus:

Et Phalaris taurum violentum membra Perilli
Tornavit: infelix imbuit author opus.

When an Ox or Cow in ancient time did dye of themselves, (Viz.) if it were an Ox, they buried him under the walls of some City, leaving his horn flinking visibly out of the earth, to signifie the place of his burial, for when his flesh was consumed, they took it up again, and buried the bones in the Temples of Venus in every City; but the body of a dead Cow they cast into some great River near adjoining. The Poets have signified a certain Monfer called Minotauros, having in part the form of a man, and in part the form of a Bull; and they say, that Pasitaeus the Daughter of the Sun and wife of Minos, King of Crete, fell in love with a Bull, and by the help of Dedalus, she was included in a wooden Heifer, covered with a Cows hides, and so had copulation with the Bull, and so came that monfer Minotauros included in a labyrinth; and contrived the Athenians, who had slain his son Androgus, to rend every year seven young men, and seven maides to be given to that Monfers to feed upon, for he would eat mans flesh. At last Theseus son of Aegeus King of Athens, came into that labyrinth, and slew that Minotaurus, and by the help of Ariadne escap'd out of the labyrinth. Other relate the story in this manner; that when the Cretensians would have expelled Mi nos from his Kingdom; he vowed that whatsoever likenes first appeared out of the Sea for sign of victory unto him, he would sacrifice it to the Gods, if he did enjoy his Regiment: and thereupon a goodly Bull came unto him out of the Sea, wherewithall he was delighted: But after he had recovered his Kingdom in quiet, he kept that Bull in his own hands, and sacrific'd another; and that by this Bull was the Minotaurus begotten on his wife Pasitaeus. But the truth is; that when Minos was in danger to lose his Kingdom; one Taurus, a valiant Prince and Captain, came with a Navy.
of good fouldiers, and established him in quiet. Afterward falling in love with Penelope King Minos's wife, he lay with her in the house of Dedalus: which Dedalus wrought with the Queen to give him his pleasure, and that the Minotaur was a Monster in Crete, that had the face of an Ox, and the other members like a man, such an one was seen in Arisbotes time. Although other take it for a fiction: because the Romans had it pictured in their Ensigns of war, until Caius Marius altered it to an Eagle, which remaineth to this day. Alietus yeddeth this reason, why the Romans gave such an armes, to signify that hecereiae becometh a Captain, and that proud and crafty counsels do hurt the authors of them.

**Limine quad cecro obscura e caliginos monstrum**

Cenfus brevis Dedalus in lateribus:

Depithum Romanum phalanx in prete fuit,

Semistisque vivae signa superba bone:

Noua multitudo debet eundem secreta latere

Consilia, auctor cognita testina nivea.

It is reported also, that when Cadmus went from Delphi to Phocis, an Ox did direct him in the way, and was his guide: which Ox he was brought out of the herbs of Pelion, having in both his sides a white spot: it must needs be underlood of the Moon, for Cadmus flying by night; having the Moon to shine upon him (which is Hieroglyphically deciphered by the Ox,) gave him light and direction to another City. It were endless to prosecute the several speeches, proverbs, allusions, emblems, plays, prizes, and hieroglyphicks made upon Oxen: whereby, men and women, Cities, Regions, and People have taken denomination from Oxen; but also some of the scar in the firmament: therefore I will not proceed to those devices, but only touch the sacrifices made with Oxen, and so conclude this story.

It cannot be denied, that the prime institution of sacrifices, was from, by, and for the Ordinance of God, to teach the world to worship him in blood for sin: which could not be expiated but by the blood of the only immaculate Son and Lamb of God; and therefore I will but remember how corruption polluted that Ordinance, which was purely without idle Ceremonies intituted by the everlasting God; and yet was by man's invention made wretched, horrible and damnable, through abuse of the fact, that other wife by divine constitution (as appears in holy Scripture) was heavenly, honourable and blest.

To begin therefore with the original of that Heathenish and Paganish sacrifice, in stead of God, the only true and divine Efficiency, to whom all sacrifice and divine worship was due, and whose creatures, both Men, Oxen, and all other living and visible things are; they offered unto all the hosts of Heaven, the Sun, and Stars, the Heathen Gods, Jupiter, Mars, Minerva, Pantheus, and others: and if the Sacrifice were costly and sumptuous, it was called Heorombe. Now before their Sacrifice they made Prayers, burned Incense for odours, presented Praenms (as they were termed) certain preparations and cakes made of Barley and Salt, (called Ulobetes.) After which, the Priest turned him sometimes to the right hand, and sometimes to the left, and then began to take the griffe hars growing on the Oxes fore-head betwixt his horns, making a taste of them, and calling them in the fire to begin the Sacrifice. Then did he give into the hands of the people standing by, little pots of Wine likewise, to taste for Sacrifice, and then he which killed the beast drew his knife, or axe, or cleaver, from the head to the tail of the beast. Now in every Sacrifice they had burning torches, which were lawful for none to carry but for men, and not women; then the Priest commanded to kill the Sacrifice, which sometime they did by knocking him on the head, if the beast were to be sacrificed to Hell, and those that were therein; for they sacrificed a barren Cow, or a black Sheep to those ghosts. But if the Sacrifice were for Heaven, and to the powers thereof, they lifted up his head and cut his throat: then put they under him their Sphagian vessels to receive his blood, and when the beast was fall down, they flayed off his skin.

Then did the Priest or Flamen divide the entrails, that so he might make his augurium (the bowels being proved at the Altar.) Having looked into the bowels, they took out of every gut, member and part, a first fruit, moulten them together in the meal of green wheat-corn, then was it given to the Priest, who put thereunto frankincense, herbage, and fire, and so burned them all together, which was called a perfect Host. But if they sacrificed to the gods of the Sea, then did they first of all wave the bowels of the beast in the Sea-floods before it was burned. The best Sacrifices were fatted and white Oxen or Kine, such as had never been under yoke: for the beast used to labour was accounted unclean: they never offered in Sacrifice one under thirty days old, nor over five years by the Laws of the Priests. When the Spartans overcame their enemies by stratagem, they sacrificed to Manna one, but when by open force, they sacrificed a Cock; for they esteemed more of an unbloody then a bloody victory. When a man sacrificed a Cow to Minerva, he was bound to sacrifice a Sheep and an Ox to Pandrosus.

When the Lorenzani in a publick Spectacle would make a Sacrifice, they wanted an Ox: for which cause they gathered together so many sticks of small wood, as made the Image of an Ox artificially conjointed together, and so setting it on fire burned it for an offering: whereupon a Lorenzani Ox, was an Ironical Proverb, for a Sacrifice of no weight or merit. It is also reported, that an Heifer being brought to the Altar of Minerva to be sacrificed, did there Calve; wherefore the
Of the Calf.

A Calf, is a young or late enaged Bull or Cow, which is called in Hebrew, Egel, or Par: and sometimes ben-bafer, the son of an Oxe. Yet Rabbi Solomon, and Abraham Ema, expound Egel, for a Calf of one year old. The Saracen of that word call a Calf Hesel. The Graecians, Melchos; whence of is derived Mojclesis: but at this day they call him Muskaris, or Melchior. The Italians, Vitello, the French, Veu; the Spaniards, Terena de Veneritudo, signifying tenderness; and sometimes Biceps, and Vicero: the Germans, Vn Kalb; the Flemings, Kalf; and the Latines, Vitulus, of the old word Vitel, signifying to be wanton, for Calves are exceedingly given to sport and wantonnese, or as other suppose from the Greek word Iatrus, came Vitulus: and therefore the Latines do not alway take Vitulus for a young or new foaled beast, but sometime for a Cow, as Virgil Elog.

And this word (like the Greek, Melchos) signifies male and female: whether by divers Authors both the Graec and Latines, are added divers Epithets by way of explication, both of the condition, inclination, and use of this young beast; calling it Wilde, ripe for the temples, unarm'd, weak, sucklings, tender, wandring, unhorn'd, and such like. And because the Poets assign that was turn'd ed into a Cow, and that the violet herbe was asphill'd by Jupiter for her meat; they derive Viole, a Vi- olet, from Vitula a Calf, by a kinde of Graecian imitation.

It is also certain that the honor of this young beast have given demination to some men, as Pom- ponia Vitulii, and Vitulii Niger Tarantrans, and Vitellius was derived from this Item or them, al- though he were an Emperour. The like may be said of Melchors in Greek, signifying a Calf; for there was one Mofchet a Sophaht that drank nothing but water, and there was another Mofbus, a Grammarian of Socratus, whom Athenaeus doth record, was a familiar of Aristobulus, and also of another, a Poet of the Buccliers; and this ferveth to fhow us, that the love our Ancelors bare unto Calf- tel, appeared in taking upon them their names, and were not ashamed in those elder times, where- in wisdom and invention was most pregeable, to glory in their herds from which they receiv'd main- tenance. But to the purpoze, that which is said of the severall parts of an Oxe and a Cow, belongeth also to a Calf; for their Anatomy differeth not, because they are conceived and generated by them, and in them: and also their birth, and other fuch things concerning that, must be inquired in the discourse of a Cow.

It is reported by an obscure Author, that if the hoof of a Calf be not abollved or finisht in the Dams belly before the time of Calving, it will dye. And also it must be obser'd, that the same diseases which do infect and harm an Oxe, do alfo befall Calves, to their extreme perill: but they are to be cure'd by the same fore-named remedies. And above the residue, these young beasts are troubled with worms, which are ingendered by crudity, but their cure is to keep them fasting till they have well digerst their meat, and then take two pipes half sod, and half raw, beaten together, and let the juice thereof be poured down his throat; otherwise take dry figs and fritches beaten together with Santonic, called Lavender-cotten; and so put it down the calves throat as aforesaid, or else the fat of a Calf and Marrube with the juyc of Leeks, will certainly kill these Evils. It is the manner to regard what Calves you will keep, and what you will make of and kill either for sacriice, as in an ancient time, or private use, and to mark and name those that are to be reserved for breed and labour, according to these verses:

Poet parum curat, vitulus traducitur omnium,
Et quos aut pecoris malum submittere habende.
Contraque notas & nomina gentis invensus,
Antr aris ferreare factis, aut seindere terram,
Et campum horre arbitale frallis inventure glebis.

And all these things are to be performed immediately after their weaning: and then in the next place you must regard to geld the males, which is to be performed in June, or as Mogus faith, in May, or at the farthest let them not be above a year old; for else they will grow very deformed and small: but if you let them after two years old, they will prove stubborn and intractable; wherefore it is better to geld them while they be young ones, which is to be performed not with any

To choose Calves for future.
any knife or iron instrument, because it will draw much blood, and endanger the beast through pain, but rather with a cloven reed or stick, pressing it together by little and little: but if it happen that one of a year or two years old be to be libbed, then you must use a sharp knife, after you have pressed the stones into the cuds, and cut them out at one stroke, and for flanching of the blood, let the cod, and the ends of the veins be feared with an hot iron, and so the wound is cured as soon as it is made.

And now the time for the effecting hereof, is best in the wane of the Moon, either in the Spring or Autumn; but it is good to leave as many of the veins and nerves of the virile member untouched and whole as may be, that so he may not lose any condition of a male, except the power of generation. And if the wound be overmuch given to bleed, lay upon it ashes with the ipume of fuller, which is apt to itch blood in all green wounds; and that day let him not drink, and eat but a very little meat: for three days after give him green tops or grafts, soft and easy to chew, and at the third days end, anoint the wound with liquid pitch, ashes, and a little Oyl, which will soon cure the scar and keep the flies from flunging or harming it. If at any time a Cow call her Calf, you may put unto her another Calf, that hath not suck enough from his own Dam; and they use in some Countries to give their Calves Wheat-bran, and Barley-meal, and tender meat; especially regarding that they drink morning and evening. Let them not lie together in the night with their Dam, but alinder, until their fucking time, and then immediately separate them again, unless the Cow be well fed when the Calf sucketh; her ordinary food will yield no great tribute of Milk; and for this cause you must begin to give the Calf green meat betimes. Afterward being weakened, you may suffer those young ones to feed with their Dams in the Autumn, which were calved in the Spring. Then in the next place, you must regard the timing of the beast, being ready for labour, which is expressed in the former treatise of an Oxe.

The Ancients called Victoria by the name of the Goddess Vitula, because they sacrificed unto her Calves, which was termed a Vitalic: and this was usual for victory and plenty, as is to be seen at large in Grelows, Macrobius, Xenius, Ovid, and Vngil: but the Heathens had this knowledge, that their Gods would not accept at their hands a one Calf for a Sacrifice, although it were brought to the Altar; and if the tail of the Calf did not touch the joynts of his hinder legs, they did not receive him for Sacrifice. And it is said of Euminius Paulus, when he was to go against the Macedonians, he sacrificed to the Moon in her declaration eleven Calves. It is very strange, that a Calf being ready to be sacrificed at the Temple of Jerusalem, brought forth a Lamb, which was one fore-coming sign of Jerusalem destruction. But Aristoteles declareth, that in his time, there was a Calf that had the head of a child, and in Lusisia a Town of Helibia, was there a Calf which in his hinder parts was a Hart.

When Charles the fifth, went with his Army into Africk, and arrived at Larbera, a Noble City of Sardinia, there happened an exceeding great wonder; for an Oxe brought forth a Calf with two heads; and the woman that did owpe the Oxe, presented the Calf to the Emperor; and since that time I have seen the picture of a more strange beast calved at Bonne, in the Bifhoppriek of Colon, which had two heads; one of them in the side not bigger then a Hares head, and two bodies joyned together; whereof the hinder parts were smooth and bald, but the tail black and hairy; it had also feuen feet; whereof one had three hoofs: this Monster lived a little while, and was brought forth in Anno 1552: the 16. day of May, to the wonder and admiration of all them, who either knew the truth, or had seen the picture.

Butchers are wont to buy Calves for to kill, and sell their flesh; for in all creatures, the flesh of the young ones are much better then the elder, because they are moist and soft, and therefore will digest and containe more easily: and for this cause Kids, Lambs and Calves, are not out of deaon in any time of the year; and are good from fifteen days to two months old, being ornaments to the Tables of great Noble men, which caused Virgilius to make this Distichon:

Afflusse habeas vitulum tua prandia in ufas,
Cui medica & sapida juncta repare caro est.

And principally the Germans use the chawthen, the head, and the feet, for the beginning of their meals; and the other part either roasted, or baked, and sometime sod in broath, and then buttered, spiced and fauced, and eaten with Onions.

The Medicines arising from this beast, are the same that come from his Sires before spoken of, and especially the flesh of a Calf doth keep the flesh of a new wound, (if it be applied thereunto) from swelling, and being sodden, it is precious against the bitings of a mans teeth: and when a mad Dog hath bitten a man or a beast, they use to pare the wound to the quick; and having sodden Veal mingled with the fetw and heel, they lay some to the wound, and make the patient drink of the broth: and the same broth is sovereign against all the bitings of Serpents. The horns of a Calf sod soft, are good against all intoxicate poysen, and especially Hemlock. The powder of a Calves thigh drunk in Womans Milk, cureth all filthy running Ulcers; and out of the brains of a Calf they make an Ointment, to looopen the hardnes of the belly. The marrow softneth all the joynts, driveth away the bunches arisinf in the body; having an operation to faoten, fill, dry and heat. Take Oyl, Wax, Rulf, and the marrow of a Calf, against all bunches in the face: and Calves marrow with an equal quantity of Whay, Oyl, Rose-cake and an Egg, do soften the hardnes of the
the cheeks and eye-lids, being laid to for a plaiter, and the same mixed with Cummin, and infused into the ears, helsthe pains of them: and also eafeth the Ulcers in the mouth.

The marrow with the lewet composeth together, cureth all Ulcers and corruptions in the Secrets of Men and Women. The Fat pounded with Salt, cureth the Louzy evil, and likewife the ulcerous fores in the head. The same mixed with the fat of a Goofe, and the juice of Bafli or wilde Cum- man, and infused into the ears, helpeth deafnefs and pains thereof. The fat taken out of the thighb of a Calf, and fod in three porringers of water, and uppeth up, is good for them that have the Flux: and the dung of a Calf fried in a pan, laid to the Buttoks and Secrets, doth wonderfully cure the Bloody flux: also laid to the reins, provoketh Urine; and sod with Rue, cureth all the inflammati ons in the feat of a man or woman. The Sewet of a Calf with Nitre, alfiawgeth the dwelling of the gods, being applied to them like a plaifter: and the Sewet alone, doth cure the peeling of the Nails. The Liver with Sage leaves cut together, and preffed to a liquor, being drunk, eafeth the pain in the small of the Belly. The gall mingled with powder of a Harts-horn, and the Seed of Marjoram, cureth Leprofies and Scurs; and the gall alone anointed upon the head, driveth away mits. The milk of a Calf is good for the milk of a man, and for Ulcers in the mouth; and glew made of his bones, as thick as Hony, and anointed upon the leprous place, cureth the fame, if it be fuffered to dry thereupon.

With the dung of Calves they perfume the places which are hurt with Scorpions; and the afses of this dung with Vinegar, layeth bleeding: Marcellus magnifieth it above measure, for the cure of the Gout, to take the fime of a Calf which never eat gras, mixed with lees of Vinegar; and also for the deafnes of the ears, (when there is pain withall) take the Urine of a Bull, Goat, or Calf, and one third part of Vinegar well sod together, with the herb Fulonna, then put it into a fagon with a small mouth, and let the neck of the Patient be perfumed therewith.

Of the supppofed Bafli CACUS.

There be some of the late Writers, which take the Cacus spoken of by Virgil in his eight Book of Æneids, to be a wilde beast, which Virgil defcribeth in these words:

His spes unius, uacuo non amota recettu:
Sambominitis Carci: foeces quam dira tegebat,
Sulis inacongrum radit: femperque rocent,
Caepe tegebat humus: fortis et unce aequitibus
Ora virum triqui pendebat palida tuba;
Hie monstro Vulconius erat pater: ille atra
Ore vomintis magna fe mole ferbat.
Nec quantum exsulmir carto tuendo:
Fulonna femper itaque estinatis faucibus ignes.

That is, Cacus was half a beast and half a man, who had a cave in the earth against the Sun, his Den replenished with the heads of men, and he himself breathing out fire, so that the earth was warmed with the slaughter of men flain by him, whose slaughter he fattened upon his own doores, being supposeth to be the fion of Fulcon. And there be some that affirm this Cacus, to have wafted and depopulated all Italy; and at length when Hercules had flain Geryon, as he came out of Spain through Italy with the Oxen which he had taken from Geryon, Cacus drew divers of them into his cave by their tails: but when Hercules misfled daily fome of Cattell, and knew not which way they frayed,at laft he came to the den of Cacus: and seeing all the steps fland forward, by reason the cattell were drawn in backward, he departed; and going away, he heard the loughing of the Oxen for their fellows, whereby he discovered the fraud of Cacus: whereupon he presently ran and took his club, the Monfer being within his cave, closed up the mouth thereof with a wonderful great stone, and fo hid himfelf for fear: but Hercules went to the top of the Mountain, and there digging down the fame, until he opened the cave, then leaped in suddenly and flew the Monfer, and recovered his Oxen.

But the truth is, this forged Cacus was a wicked servant of Eoander, which used great robbe ry in the Mountains, and by reafon of his evil life was called Cacus; for Cacus in Greek signifieth evil. He was faiid to breath forth fire, because he burned up their corn growing in the fields, and at laft was betrayed of his own Sifter; for which caufe he was defied, and the Vir gins of Jfuba made Sacrifice to her: and therefore it fhall be idle to profecute this fable any farther (as Albertus Magnus doth) it being like the fable of Æidea, which the Poets fign was a Bird of the earth, and being invincible burned up all Phogyila, and at laft was flain by Minerus.
The History of Four-footed Beasts.

Of the Camel.

Although there be divers sorts of Camels, according to their several Countries; yet is the name not much varied, but taken in the general sense of the denomination of every particular. The Hebrews call it Camel; the Chaldeans, Camel; and the Arabians. French, Camello; the Arabic, Camel Alongeb: Algazar. The Persians, Salbut; the Saracens, Smyhur: the Turks call a company of Camels traveling together, Caravanis. The Italians and Spaniards call a Camel, Camella; the French, Chameau; the Germans, Kamelheit; all derived of the Latin, Camelus; and the Greek, Camelos. The Hibernians, call it Velebid: and the reason of the name Camellus, in Greek, is, because his burden or load is laid upon him kneeling or lying, derived (as it may seem) from Campellus merus, the bending of his knees, and flownees of pace: wherefore a man of a flow pace, was among the Egyptians deciphered by a Camel. For that cause, there is Town in Syria called Ganganela; that is, the house of a Camel, erected by Punicus, the Son of Hyphasis, allowing a certain provision of food therein for wretched and tyred Camels. The Epithets given to this beaft are not many among Authors, for he is tarmed by them rough, deformed, and thrilling; as Inventional.

Dormus paterent immania membrum Camelis.

Silvaticus.

Aristotle, Pliny.

The food of Camels.

There are of them divers kinds, according to the Countries wherein they breed: as in India, in Arabia; and in Bactria: All those which are in India, are said by Diodorus to be bred in the Mountains of the Bactrians, and have two bunches on their back, and one other on their breast, whereupon they lean; they have sometimes a Bore for their Sire, which feedeth with the flock of the Camels; for as Mules and Horses will couple together in copulation, so also will Bores and Camels: and that a Camel is so indangered sometimes, the roughness of his hair like a Bore or Swans, and the strength of his body, are sufficient evidences; and these are worthy called Bactrians, because they were first of all conceived among them, having two bunches on their backs, whereas the Arabian hath but one. The colour of this Camel is for the most part brown, or pale; yet there are herds of white ones in India.

Pseudont Labi brought two strange things into Egypt, a black Camel; and a man which was the one half white, and the other half black in equal proportion; the which caused the Egyptians to wonder and marvel at the shape and proportion of the Camel, and so laugh at the man: whereupon it grew to a Proverb, a Camel among the Egyptians, for a matter fearful at the first, and ridiculous at the last.

The head and neck of this beaft is different in proportion from all others; yet the Ethiopian have a beaft called Nabim, which in his neck remembeth a Horse, and in his head a Camel. They have not teeth on both sides, although they want horns, (I mean both the Arabian and Bactrian Camel:) whereof Aristotle diputeth the reason, in the third Book of the parts of creatures, and fourteenth chapter. Their necks are long and nimble, whereby the whole body is much relieved; and in their neck toward the other part of the throat, there is a place called Anbar, wherein a Camel doth by spear or sword, most easily receive his mortal or deadly wound.

His belly is variable, now great, now small like an Oxes; his gall is not distinguisht within him like other beafts, but only carried in great veins, and therefore some have thought he had none, and assigned that as a cause of his long life. Between his thighs he hath two udders, which have four sphears depending from them like a Cow. His genital parts are confected, and standeth upon a finew, inomuch as thereof may a string be made, for the bending of the strongest bow. The tail is like the tail of an Ass, hanging down to their knees, they have knees in every leg, having in their former leg three bones, and in the hinder four. They have an ancle like an Oxes, and very small buttocks, for the proportion of their great body: their foot is cloven, but so, that in the under part it hath but two fisures or clefts, opening the breadth of a finger, and in the upper part four fisures or clefts, opening a little, and having a little thing growing in them, likeas is in the foot of a Goose: The foot it self is flihy like a Bear, and therefore they are flihy with leather when they travail, lest the hanging of their feet caufe them to tire. Aristotles affirmeth, that he had seen Camels with whole feet, like a Horses, but their feet (although flihy) are fo tyed together with little lungs that they never wear; and their manner of going or pace is like a Lyons, going walking as the left foot never out-goeth the right, whereas all other beafts change the setting forward of their feet, and lean upon their left feet while they remove their right; but these after step after step, so as the left foot behide, followeth the right before, and the hinder foot followeth the left before. Thofe Camels which are conceived by Bores are the strongest, and fall not fo quickly into the myre as other, although his load be twice fo heavy.

Camels love grafs (called Sekennath) and especally Barley, which they eat up wonderful greedily until all be in their stomoch, and then will they chew thereupon all the night long: so that the greatnes of their belly to lodge their meat in before concoction is better then the benefit.
benefit of their upper teeth, because he can ruminate and chew it so often as he please. There is a certain herb, which hath a seed like a myrtle seed, that is poison to worms, and this seed is food for Camel's wherever they grow. It is therefore called Camel-thorn, and Afterpur in the Arab. tongue. When the Province of Aden, both Sheep, Oxen, Horses, and Camels, eat a kind of fish, and their beax being dry and flate, then new and fresh, by reason the immoderate heat in that region burns up all pateure and frutes: neither is there any beast which is so easily fed as a Camel. They will not drink of clear or clean water, but of muddy and limy, and therefore they ramp in it with their feet. They will endure thirst for three or four days together; but when they come to drink, they suck it in huge measure, recompensing their former thirst, and providing against which is to come. Of all kinds of Bedouins are least troubled with thirst.

They are, by one side to another, otherwise than any other beasts do: this beast is very hot by nature, and therefore wanton and full of sport and wrath; braying most fearfully when they are angered. They engender like Elephants and Tygers; that is, the female lying or sitting on the ground, which the male imbraceth like other males, and continue in copulation a whole day together. When they are to engender, they go unto the secretest places they can finde; herein excelling in modesty the ancients Maslages, who were not ashamed to lie with their wives in the open field, and publick view of one another, where as brute beasts by instinct of nature, make the procreation of their kind to be a most secret shameful honest action.

At the time therefore of their lust, they are most unruly and fierce, yielding to none, not to their own keepers: the best time of their copulation is in September, in Arabis, they begin to ingender in the third year of their age; and so within ten or eleven moneths after she is delivered of young, being never above one at a time, for twain come not in her great belly; so the goeth a year before the conceive again, although her young be separated or weaned, before which time they do not commonly. Unto their former modesty for their copulation, we may add another divine instinct and most true observation about the same, for the male will never cover his mother, or his sister; whereof it is sincerely reported, that when a certain Camel-keeper (defirous to try this secret) having the male, sent a female to a camel, which he also kept, he so covered the female-mother-Camel in all parts of her body, except her secrets, that nothing could be seen of her, and so brought her faithful son to cover her; which according to his present rage he performed. As soon as he had done it, his manner and owner pulled away the mask, or disguifie from the dam, in the presence of the son; whereby he instantly perceived his keepers fraud, in making him unnaturally to have copulation with his own mother. In revenge whereof he ran upon him, and taking him in his mouth, lift him up into the air, presently letting him fall with noise and cry underneath his murdering and man-quelling feet; where, with unappallable wrath and blood-dripping livor, he pressed and trode to pieces the incest marriage-causer, twixt him and his dearest mother; and yet not herewith satisfied, like some reasonable creature, depriv'd of heavenly grace, and carried with deadly revenge against such uncleanesses, being persuaded that the guilt of such an offence could never receive sufficient expiation by the death of the first defiler, except the beguiled party suffered also some smart of penalty; adjudging himself guilt, and no longer worthy to live by nature's benefit, which had so violated the womb that first conceived him, and therefore running to and from as it were a Hang-man for himself, at last found a steepy rock, from whence he leaped down to end his life; and although he could not prevent his offence, yet he thought it best to cleanse away his mothers adulterie with the sacrifice of that blood which was first conceived in that wombe which he had defiled.

These Camels are kept in herds, and are as swift as Horses, according to the measure of their strength, not only because of their nimblenes, but also because their frides and reach doth gather in more ground: for which cause they are used by the Indians for race, when they go to fetch the gold which is said to be kept by the Formice Lyons, which are not much bigger then Foxes: yet many times do these Lyons overtake the Camels in course, and tear the riders in pieces. They have been also used for battel or war (by the Arabians in the Persia war;) but their fear is so great of an Horse, that (as Xenophon faith in the institution of Cyrus) when the Armies came to joyst, neither the Camel would approach to the Horse, or the Horse to the Camel; whereupon it is accounted a base and unprofitable thing for a man to nourish Camels for fight; yet the Persians for the fight of Cyrus in Lydia, ever nourished Camels and Horses together, to take away their fear one from another. Therefore they are used for carriage, which they will perform with great facility, being taught by their keepers to kneel and lye down to take up their burthens, which by reason of their height a man cannot lay on them; always provided, that he will never go beyond his ordinary lodging and bating place, or endure more then his usual burthen; and it hath been seen that one of these Idarian Camels, hath carried above ten Minars of corn, and above that a bed with five men therein. They will travel in a day above forty ordinary miles; for as Pliny faith, that there was from Tiona to Gaza, sixty and two lodging places for Camels, which was in length one thousand five hundred thirty and seven miles.

They are also used for the plow in Numidia, and for this cause are yoked sometimes with Horses, but Hecalegalius, like as the Tartarians, yoked them together not only for private spectacles and plays; but also for drawing of Wagons and Chariots. When they desire to have them free and strong for any labour in the field, or war, they use to geld both the male and the female, the manner
Of the Camel.

whereof is in this fort. The male by taking away his liones, and the female by fearing her privy parts within the bum and lips thereof with a hot iron, which being so taken away, they can never more join in coition; and these are more patient in labour and thrift, and likewise better endure the extremity of fond in those parts, having this skill, that if the mili of rain or fond, do never so much obscure the way from the rider, yet doth the remember the fame without all fagering.

The urine of this beaft is excellent for the use of Fullers; of the hair called Biber, or Camels Wool, is cloth made for Apparel, (called Cemelote, or Camels hair,) and the hair of the German Camels is so soft, that it may be therein compared with the softest Milejion Wool, whereof their Princes and Priests make their garments; and it is very probable, that the garments of Saint John Baptist was of this kinde. In the City of Calacis, (under the great Cam) and in the province of Brgaria, is cloth made of the hair of Camels, and white wool (called Zambilotto) shewing most gloriously; but the beft of this kinde are in the land of Gog and Magog.

It is forbidden in holy Scripture to eat a Camel, for although it chew the cud, yet is not the hoof altogether cloven; and besides, the flesh thereof is hard of digestion, and the juycy thereof very nourishing, heating the body above measure; yet many times have men of bafe condition and mindes eaten thereof, as in Arabia, and in the Kingdom of Penzen; and Athenes affirmeth, that the King of Persia was wont to have a whole Camel rodded for his own table at his royal feastings; and Heliogabalus likewise caufed to be prepared for himself the heels of Camels, and the spurs of Cocks and Hens, pulled of alive, and whole Offtriches and Camels; saying, (though faffly) that God comanded the Jewes to eat them. Camels milk is wholeome for meat, because it is thinnet of all other, and because thereof it breedeth fewer obstructions; and is good for softning of the belly. For the natural disposition of this beaft: it is partly already related, whereby the singular use thereof may be collected: yet there are certain proverbs and stories thereof farther expressinge their qualities.

It is difdainfull, and a discontented creature: whereupon it is laigned of the Poets, that they befooth Jupiter to give them Horns, with which Petition he was so offended, that he took from them their ears, and therefore in that, those are reproved, which are to farre in love with other things they want, that they desire to lofe the things they have. Likewise the wantonnes thereof appereath by the proverbs of a dancing Camel, when one taketh upon him more then his skill will serve to discharge: yet hath not this beaft beene free from ignorance; for when the Emperor Jupiter had found the Treaty of Artaces the Armenians, he caufed him to ride through the Citie upon a Camel, to be shamed for his offence, although in former times it was a kinde of triumph and honor to be carried upon a Camel, led through a City.

In the lake of Aflatites, wherein all things sink that come in it, many Camels and Bulls swim through without danger. The Arabians sacrifice a Camel to the unknown God, because Camels go into foreign Countries, and likewise sacrifice their Virgins before they are married, because of the chaitlity of this beaft, and the Sagaretes with great observance, keep the combat of Camels, in the honour of Minerva.

These Beasfts are hated of Horfes and Lyons, for when Xerxes travelled over the river Gobocrt, through Pontia and Cretfonia; in the night time the Lyons defended into the camp, and touched no creaturestherein, except the Camels, whom they destroyed for the most part.

A Camel will live in the foil wherein he is bred, fifty or an hundred years; and if he be translated into any other Nation, he falleth into madness or fcas, or the gow, and then they live not above thirty years. There is a kinde of graffe that groweth by the high ways in the Country of Babylon, that killett Camels when they taste thereof.

There are also medicinal properties in Camels, for by reaſon he is of a hot and dry temperament: if a man infected with poyfon, be put into the warm belly of a Camel newly slain, it lootheneth the power of the poyfon, and giveth strength to the natural parts of the body. The fat taken out of the bunch and perfumed, cureth the Hemmorhoides; and the blood of a Camel fried, is precious against the bloody flux, or any other loofenes of the belly; the brain dried and drunk with Vinegar, helpeith the Falling-evil; the gall drunk with Hony, helpeith the Quinzy: and if it be laid to the eye-brows and forehead, fod in three cups of the best Hony, it cureth the dimnes of the eyes, and avoideith the flect that groweth in them: and if the hairs of a Camels tail be wound together like a string, and ryed to the left arm, (Pliny affirmeth) they will deliver one from a quartan Ague.

The milk of Camels newly delivered of young, helpeith obstructions, and all shortenes of breath; and is also good against the Dropifie and hardness of the milk. Alfo when one hath drunk poyfon, this is a good Antidote, and amendeth the temper of the body. The fime of Camels dried to duff with Oyl, will cripe and curl the hair, and stay bleeding at the nofe; and the same hot, is good against the Gout.

The urine is most profitable for running fores, there have been which have preferred it five years together; and ufed against hardness of the belly; washing also therewith fore heads: and it helpeith one to the fene of smellings, if it be held to the nofe: likewise against the Dropifie, the Spleen, and the Ring-worm.
A Camel is called the Greecians, Dromos, by reason of the swiftness of his race; and also an Arabian Camel, which hath all things common with the former Babitan Camel, except, first, in the shape, for the hath but one bunch on the back, and many Nations, as the Italians, French, Germans, and Spaniards, use the word Dromedary, only without addition; the Greecians never name it without the addition of a Camel. Therefore this is a kind of Camel of lefs stature, but much swifter; for which cause it is derived from running. It cheweth the cud like a Sheep, and the other Camel: the French King had sent him from the great Turk two of these, white coloured; and I my self have seen one of them, being fifteen cubits high, wanting some nine inches, and about six cubits in length, having the upper lip cloven in the middle like a Hare, and two broad nails in his feet, which in the upper part appeared cloven, but underneath they were whole and fitting without division, and round in proportion like a pewter dish: It hath also a hard bunch on its back, whereon it leaned, sitting down and rising; and also upon either knee one: these are said to live fifty years; but the Babitans an hundred: they were used for drawing of Chariots, and great prefents for Princes; and when they go to war, every one carryeth two Archers, which fit upon him, back to back, shooting forth their darts, one against the front of the enemy, and the other against the protectors and followers.

They are able to go an hundred miles in a day, bearing a burden of fifteen hundred weight; yet sometimes two thousand, bending upon his knee to take up his load and rider, which received; he riseth up again with great patience, being obedient and ruleable; yet kicking when he is angry, which is very seldom: and therefore Terence did significantly describe a good servant by the name of Dromos, derived from Dromos, a runner: And for the conclusion of the History of these two sorts of Camels, I will here add the relation and memorable observations of Johannes Leo Afer, in his ninth Book of the description of Africk, in his own words following.

"A Camel is a gentle and pleasant tame beast, whereof there are plenty in Africa, especially in the Deserts of Lybia, Numidia, and Barbary: by which African affine their own wealth; for when they contend who is the richest Prince or Noble-man among them, they say he was worth, or hath so many thousand Camels, and not so many thousand Crowns. And he that hath Camels, liveth among them like a Gentleman; because he can at his pleasure travel into the Deserts, and fetch Merchandise from far, which the greatest Prince or Noble-man cannot without them, by reason of the drought of those places. And of these kinds of creatures, there are to be seen in all parts of the world, both in Asia, Africk, and Europe; for the Tartarians, Cossians, Dalmatians, and Turkomans use them in Asia; and the Turkish Princes convey all their carriages upon them in Europe: Likewise do all the Arabians in Africa. But it must be observed, that the African Camels are much more worth than the Asian, for they can endure travel for forty and fifty days together, with very little or no meat, except sometimes in the evening, when they are unloaded, they go to the hedges, thorns, and other green places, and there eat any small thing they meet withal, as leaves and such like, wherewith they remain satisfied, whereas the Asian can perform no such journey, except they be kept far and well fed: and it hath been proved by good experience, that one of the Africans hath travelled fifty days without meat, first wearing away the fat in their bunchy back, then about their skin and breast, and lastly, about their ribs, never giving over till it was not able to bear one hundred weight.

But the Africans must always carry provender to sustain their beasts, never travelling but they have one Camel laden with meat, for the other laden with carriage, and so induce a double charge: and when the Africans go to any Marts or Fairs being to return empty and unloaded, they take no thought for their Camels food. Of these Camels there be three kinds, one of them called Egenian, (being broad and tall) and therefore apt to bear packs and burthens, but not before they be four year old, and after their ordinary load is one thousand weight of Italian meafure, being taught by the jerking of a small rod, on the breast or knees, to lie down for their burthens, and afterward to rise up again. And the Africans do use to geld their Camels, referring but one male for the covering of ten females.

Another kind of their Camels they call Becbebas, such as have two bunches, one for burthen, and the other for a man to ride upon: and the third sort are called Ragunabils, which are of lower stature and leaner bodies than the residue, unfit for burden and therefore are used for the faddle, by all the Noblemen of Numidia, Arabia, and Lybia: being able to run an hundred miles a day, and performing long journeys with little or no provender: for the King of Tombatu being to send to Dara, or Selimieha, (which is distant from his Court nine hundred miles) his messenger performeth it upon one of these Ragunabils, within the space of eight days.

In the beginning of the Spring they are most frolick and unruly, because then they incline to generation: at which time, they rage and fall upon many that come unto them, and especially those from whom they have received blows, remembering at that time, and requiring their former injuries, upon such as wronged them, whom if they can take in their mouth, they lift them up into
The History of Four-footed Beasts.

They can easily endure thirst, five, nine, or fifteen days in necessity; neither will their keeper give them drink at three days thirst, for fear to harm them. As these Camels are pleasant and profitable, so also they seem to participate with the nature of man: for they being wearied, no spur or stroke can make them hasten to their journey end; therefore in Ethiopia and Barbary, they sing certain songs behind the Beast, which to revive their decayed spirits, that they set forward so fast, forgetting their tyred limbs, to their journeys end, that their keepers can hardly follow.

I have also seen in Acair, a Camel, that could dance at the sound of a Timbrel, being thereunto taught when he was young by this means; first, he was brought into a room like a stable, the pavement whereof was made hot by a fire underneath it, and without doors flood a Musician playing on his Timbrel; the Camel, not for love of the music, but for the heat under his feet, lifted up first one foot, and then another, as they do which dance, and so the heat increasing, he likewise did lift up faster, whereunto he was accustomed for the space of ten months; at every time one hour and a half, during which time the Timbrel still sounded; so that at last, use framed Nature to such a strain, that hearing a Timbrel, he instantly remembered the fire that was wont to punish his feet, and so prentently would leap to and fro like a dancer in publick spectacle, to the admiration of all beholders.

Of the two sorts of Camelopardals.

Of the name. This Beast is called in Hebrew, Zamar; Deut. 14. which the Arabians translate Saraphab; and sometime Gryphus, Gryaffe, and Zarafa; the Chaldeans, Doba, and Ana; the Persians, Seraphab; and the Septuagint Grecians, Camelopardis, which word is also retained by the Latins, whereunto Albertus
Of the Allocamelus.

Albertus addeth Orasius, and Orasius. The Ethiopians call it Nkin, from whence cometh Anabula, and Pausanias translateth it an Indian Sheep, so indeed Anabula may be Englished a Wilde Sheep.

There were ten of these seen at Rome, in the days of Gordianus the Emperor, and before that time, Cesar being Dictator, and such an one was sent by the Sultan of Babylon to the Emperor Frederick, so that it is without question that there is such a beast, which is engendred of a Camel and a female Libard, or Panther, as Horace faith;

Diversum confusum genus Panthera Camelto.

But the same which the Latins call Panthera the Gracians call Pardalis. The head thereof is like to a Camel, the neck to a Horse, the body to a Harts; and his cloven hoof is the same with a Camel: the colour of this Beast is for the most part red and white, mixed together, therefore very beauti-

full to behold, by reason of the variable and interchangeable skin, being full of spots: but yet they are not alway of one colour. He hath two little horns growing on his head of the colour of iron, his eyes rowing and frowning, his mouth but small like a Harts, his tongue is near three foot long, and with that he will so speedily gather in his meat, that the eyes of a man will fail to behold his haft, and his neck diversely coloured, is fifteen foot long, which he holdeth up higher then a Camel, and far above the proportion of his other parts. His forefeet are much longer then his hinder and therefore his back declineth towards his buttocks, which are very like an Affe. The pace of this beast differeth from all other in the world, for he doth not move his right and left foot one after another, but both together, and so likewise the other, whereby his whole body is removed at every flep or train.

These beasts are plentiful in Ethiopia, India, and the Georgian region, which was once called Media. Likewise in the Province of Aesia in India, it is called Surnaja, and in Aesia, Surnoppa, and the latter picture before fet down, was truly taken by Melchior Lavige at Constantinople, in the year of salvation 1559. by the light of one of thefe, lent to the great Turke for a present: which picture and description, was afterward lent into Germany, and was imprinted at Norimberge. It is a solitary beast, and keepeth altogether in woods, if it be not taken when it is young: they are very tractable and eafe to be handled, so that a child may lead them with a small line or cord about their head, and when any come to see them, they willingly and of their own accord turn themselves round as it were of purpose to shew their soft hairs, and beautiful colour, being as it were proud to ravish the eyes of the beholders.

The skin is of great price and estimation among Merchants and Princes, and it is said that under neath his belly, the coloured spors are wrought in fashion of a fifters net, and the whole body so admirably intercoloured with variety, that it is in vain for the wit or art of man, once to go about to endeavour the emulous imitation thereof. The tail of the beast is like the tail of an Affe, and I cannot judge that it is either swift for pace or strong for labour, and therefore well tearmed a wilde Sheep, because the fleth hereof is good for meat, and was allowed to the Jews by God himself for a clean beast.

neath is fayed that under

neath his belly, the coloured spors are wrought in fashion of a fifters net, and the whole body so admirably intercoloured with variety, that it is in vain for the wit or art of man, once to go about to endeavour the emulous imitation thereof. The tail of the beast is like the tail of an Affe, and I cannot judge that it is either swift for pace or strong for labour, and therefore well tearmed a wilde Sheep, because the fleth hereof is good for meat, and was allowed to the Jews by God himself for a clean beast.
Sceinor affirmeth, that in the land of the Giants, there is a beast which hath the head, neck, and ears of a Mule, but the body of a Camel; wherefore it is probable, that it is conceived by a Camel and a Mule: the picture whereof is before set down, as it was taken from the fight of the beast, and imprinted with a description at Middelborough in the year 1558. which was never before seen in Germany, nor yet spoken of by Finny.

They saith that it was an Indian Sheep, out of the region of Petra, and so was brought to Antwerp, six thousand miles distant from that nation. It was about two yards high, and five foot in length, the neck was as white as any Swan: the colour of his other parts was yellowish, and his feet like an Ostrige-Camels: and although it were a male, yet it did render his urine backward: it was afterward given to the Emperor by Thessalia Ius, a Citizen of the neather Celen. It was a most gentle and meek beast like the Camelopard, not past four year old: wherefore I thought good to express it in this place, because of the fimilitude it hath with the manners of the former beast, although it want horns and differ in some other members.

Of another Beast called CAMPE.

Iderus Siculus maketh relation, that when Diumius with his Army travelled through the desert and dry places, annoyed with divers wilde beastes, he came to Zambira a City of Libya, where he flew a beast bred in those parts called Campe, which had before that time destroyed many men, which action did persuade him among the inhabitants a never dying fame, and that therefore there might remain a continual remembrance to all posterity of that fact, he raised up there a monument of the plain beast to stand for evermore.

Of the CAT.

A Cat is a familiar and well known beast, called of the Hebrews, Catul, and Schenar, and Schenard; of the Grecians, Athetos, and Kater, and Kats; of the Saracen, Kats; the Italians, Gatta; and Gato; the Spaniards, Gata, and Gatos; the French, Chat; the Germans, Katze; the Thyrans, Kueks, and Furoz, (which is nigh for a Cat by Albertus Magnus) and I conjecture, to be either the Persian or the Arabic word. The Latin call it Felis, and sometimes Marilgear, and Muske, because it catcheth Mice, but most commonly Gatos, which is derived of Catus, signifying wary. Owed faith, that when the Giants warred with the Gods, the Gods put upon them the shapes of Beasts, and the fitter of Apollo lay for a spy in the likenes of a Cat, for a Cat is a watchful and wary beast seldom overtaken, and most attendent to her sport and prey: according to that observation of Mutilan:

Non sumps er marialis, ille invadere perniam,
Nimius, hic rimos acuot observat acuas.

For and for this cause did the Egyptians place them for hallowed beastes, and kept them in their Temples, although they allused the use of their skins for the cover of Shields, which was but an unreasonable theft, for the footmen of a Cats skin is not fit to defend or bear a blow: It is known also, that it was capital among them, to kill an Ibis, an Afpe, a Crocodile, a Dog, or a Cat; in so much as, that in the days of King Ptolemy, when a peace was lately made betwixt the Romans and the Egyptians; and the Roman Ambassadors remaining still in Egypt, it was ordained that a Roman unawarely killed a Cat, which being by the multitude of the Egyptians eluded, they presently fell upon the Ambassadors houses, to rafe down the same, except the offender might be delivered unto them to suffer death: so that neither the honour of the Roman name, nor the necessities of peace, could have restrained them from that fury, had not the King himself and his greatest Lords come in person, not so much to deliver the Roman Cat-murderer, as to safeguard him from the peoples violence. And not only the Egyptians were fools in this kind, but the Arabians also, who worshipped a Cat for a God; and when the Cat dyed, they mourned as much for her, as for the father of the family, shaving the hair from their eye-lids, and carrying the beast to the Temple, where the Priests salted it and gave it a holy funeral in Babuscum, (which was a burying place for Cats near the Altar) wherein may appear to all men, in what miserable blindness the wittie men of the world, (forsoaking, or deprived of the true knowledge of God) are more then captivated, so that their wretched estate cannot better be expressed then by the words of St. Paul, Whan they thought to be wise, they became fools.

Once Cats were all wild, but afterward they retired to houfes, wherefore there are plenty of them in all Countries: Matrual in an Epigram, celebrated a Pannonian Cat with this difficion;

I annamnus molicis nungam dedit Umbria Cattis,
Mavitul haec domina mittere denuo pudens.

The
The Spanish black Cats are of most price among the Germans, because they are nimble, and have the softest hair fit for garment.

A Cat is in all parts like a Lion, except in her sharp ears, wherefore the Poets feign, that when Venus had turned a Cat into a beautiful woman, (calling her Aetius) who forgetting her good turn, contended with the Goddeffe for beauty; in indignation whereof, she returned her to her first nature, only making her outward shape to resemble a Lion; which is not altogether, but may admonish the wifelt, that fair and foun, men and beafts, hold nothing by their owne worth and benefite, but by the virtue of their Creator: Wherefore if at any time they rife againft their maker, let them think to lofe their honour and dignity in their belte parts, and to return to basenes and inglorious contempt; out of which they were first taken, and howsoever their outward shape and condition please them, yet at the belte are but beasts that perish, for the Lions suffer hunger.

Cats are of divers colours, but for the most part grifled, like to congealed ice, which cometh from the condition of her next: her head is like unto the head of a Lion, except in her sharp ears: her fifths is soft and smooth: her eyes glitter above measure, especially when a man cometh to see them on the fuddain, and, in the night they can hardly be endured, for their flaming aspect. Wherefore Democritus describing the Persian Smeragde faith that it is not transparent, but filleth the eye with pleafant brightnes, such as is in the eyes of Panthers and Cats, for they call forth beams in the shadow and darknes, but in fumme, they have no fuch clearnes, and thereof Alexander Aphrodis given this reason, both for the fight of Cats and Bats, that they have by nature a molt sharp spirt of feeling.

Albertus comparath their eye-light to Carbuncles in dark places, because in the night they can see perfectly to kill Rats and Mice: the root of the herb Valerian (commonly called Pho) is very like to the eye of a Cat, and whereassoever it groweth, if Cats come thereunto, they infantly dig it up, for the love thereof; as I my self have seen in mine own Garden, and not once only, but often, even then when as I had caused it to be hedged or compass'd round about with thornes, for it smelleth marvellous like to a Cat.

The Egyptians have observed in the eyes of a Cat, the increase of the Moon-light, for with the Moon they skin more fully at the full, and more dimly in the change and wane, and the male Cat doth also vary his eyes with the Sun; for when the Sun arifeth, the apple of his eye is long: toward noon it is round, and at the evening it cannot be feen at all, but the whole eye sheweth alike.

The tongue of a Cat is very attractive and forcible like a file, attenuating by licking the flesh of a man, for which caufe, when he is come near to the bloud, fo that her owne fpittle be mingled therewith, she falleth mad. Her teeth are like a faw, and if the long hairs growing about her mouth (which some call Grammi) be cut away, the loileth her courage. Her nails sheathed like the
the nails of a Lion, striking with her forefeet, both Dogs and other things, as a man doth with his hand.

This beast is wonderful nimble, setting upon her prey like a Lion, by leaping, and therefore the hunteh both Rats, all kind of Mice, and Birds, eating not only them, but also fish, wherewith all she be well pleased. Having taken a Moufe, the first playeth with it, and then devoureth it, but her watchful eye is most strange, to see with what pace and soft steps, the taketh birds and fies; and her nature is to hide her own dung or excrement, for she knoweth that the favour and preference thereof, will drive away her sport, the little Moufe being able by that foil, to smell the preface of her mortal foe.

To keep Cats from hunting of Hens, they use to tie a little wide Rew under their wings, and so likewise from Dove-coates, if they set it in the windows, they dare not approach unto it for some secret in nature. Some have said that Cats will fight with Serpents, and Toads, and kill them, and perceiving that she is hurt by them; the prefently drinketh water and is cured: but I cannot confent unto this opinion; it being true of the Weasell shall be afterward declared.  

Potizium, 
fheweth by experience that Cats and Serpents love one another, for there was (faith he) in a certain Monaftery, a Cat nourifhed of the Mons, and suddenly the molt parts of the Mons which used to play with the Cat fell fick: whereof the Phyfiffians could no caufe, but some fecret poifon, and all of them were affured that they never caufed any: at the lat a poor labouring man came unto them, affuring that he saw the Abbey-cat playing with a Serpent, which the Phyfiffians underhanding, prefently confented that the Serpent had emptied some of her poifon upon the Cat, which brought the fame to the Mons, and they by fworlding and handling the Cat, were infected therewith; and whereas there remained one difficulty, namely, how it came to paffe, the Cat her felf was not poisoned thereby, it was resolved, that for as much as the Serpents poifon came from him but in play and sport, and not in malice and wrath, that therefore the venom thereof being loft in play, neither harmed the Cat at all, nor much endangered the Mons; and the very like is obferved of Mice that will play with Serpents.

Cats will also hunt Apes, and follow them to the woods, for in Egypt certain Cats set upon an Ape, who prefently took him himself to his heels, and climbed into a tree, after whom the Cats followed with the fame celerity & agility: (for they can falfen their claws to the barke and run up very fpeedily,) the Ape fceeing himfelf overmatched with number of his advancers, leaped from branch to branch, and at lat took hold of the top of a bough, whereupon he did hang fo ingeniously, that the Cats durft not approach unto him for fear of falling, and fo departed.

The nature of this beaffis, being the place of her breeding, neither will the farry in any ftrange place, although carried far, being never willing to forfake the house, for the love of any man, and molt contrary to the nature of a Dog, who will traveile abroad with his matter; and although their matters forfake their houses, yet will not these beaffs bear them company, and being carried forth in clofe baskets or facks, they will yet return again or lofe themselves. A Cat is much delighted to play with her image in a glaffe, and if at any time the behold it in water, prefently the leapeth down into the water which naturally the doth abhor, but if the be not quickly pulled forth and dryed the dyeth thereof, because the is impatient of all wet. Thofe which will keep their Cats within doors, and from hunting birds abroad, must cut off their ears, for they cannot endure to have drops of rain difhild into them, and therefore keep themselves in harbour. Nothing is more contrary to the nature of a Cat, then is wet and water, and for this caufe came the proverb that they love not to wet their feet. It is a neat and cleanly creature, oftentimes licking her own body to keep it neat and fair, having naturally a flexible back for this purpofe, and washing her face with her forefeet: but fome obferve, that if the put her feet beyond the crown of her head, that it is a prefage of rain, and if the back of a Cat be thin the beaff is of no courage or valour. They love fire and warm places, whereby it often falleth out that they often burn their Coats. They defire to lie foft, and in the time of their luft (commonly called cat-wralling) they are wide and fierce, especially the males, who at that time (except they be gelded) will not keep the house: at which time they have a peculiar direful voice. The manner of their copulation is this, the female lyeth down, and the fenfibly inflates, and their females are above meafeure defirous of procreation, for which caufe they provoke the male, and if he yeeld not to their luft, they beat and claw him, but it is only for love of young, and not for luft: the male is moft libidinous, and therefore feeing the female will never more engender with him during the time her young ones fuck, he killeth and eateth them if he meet with them, (to provoke the female to copulation with him again, for when she is deprived of her young, the seeketh out the male of her own accord,) for which the female moft warily keepeth them from his fight. During the time of copulation, the female continually cryeth, whereof the Writers give a double caufe; one, because he is pinched with the talons or claws of the male in the time of his luftful rage; and the other, because his seed is fo fiery hot, that it almost burneth the females place of conception. When they have lithered, or as we commonly say kitted, they rage against Dogs, and will suffer none to come near their young ones. The beft to keep are such as are littered in March; they go with young fifty days, and the females live not above five or seven years, the males live longer, especially if they be geld or lubb'd; the reafon of their short life is their ravelling of meat which corrupteth within them.

They
Of the Cat.

They cannot abide the favour of ointments, but fall mad thereby; they are sometimes infected with the falling exu-11, but are cured with Geleum. It is needless to spend any tune about their loving nature to man, how she flattered by rubbing, her skin against ones Lees, how she the whirihed with her voice, having as many turns as turns, for the hath one voice to beg and to complain, another to tell her delight and pleasure, another among her own kind by flattering, by billing, by spitting, as much as some have thought that they have a peculiar intelligible language among themselves. Therefore how the beggih, playeth, lepeth, looketh, catcheth, tofeth with her foot, rich up to flings held over her head, sometimes creeping, sometimes lying on the face, playing with one foot, sometime on the belly, sniffing now with mouth, and anon with foot, apprehending greedily anything, save the hand of a man, with diuers such critical actions, it is needless to stand upon, so much as Catius was wont to say, that being free from his Studies and more urgent with affairs, he was not ashamed to play and sport himself with his Cat, and by vertue thereof he well be called an idle man pastime. As this beast hath been familiarly nourished of many, so have they payed dear for these love, being required with the loffe of their health, and sometime of their life for their friendship: and worthily, because they which love any beast in a high measure, have so much the less charity unto man.

Therefore it must be considered what harms and perils come unto men by this beast. It is most certain, that the breath and favour of Cats consume the radical humour and deltoiy the lungs, and therefore they which keepe their Cats with them in their beds have the air corrupted, and fall into severall Hecticks and Consumptions. There was a certain company of Munks much given to nourish and play with Cats, whereby they were so infected, that within a short space none of them were able either to say, read, pray, or sing, in all the Monastery; and therefore also they are dangerous in the time of Pestilence, for they are not only apt to bring home venemous infection, but to poison a man with very looking upon him; wherefore there is in some men a natural dislike and abhorring of Cats, their natures being so composed, that not only when they see them, but being near them and unfeen, and hid of purpose, they fall into passion, frettings, sweating, pulling off their hats, and trembling fearfully, as I have known many in Germany; the reason whereof, because the contamination which threatens their bodies which is peculiar to every man, worketh by the presence and offence of these creatures: and therefore they have cried out to take away the Cats.

The like may be said of the feath of Cats, which can seldom be free from poison, by reason of their daily food, eating Rats and Mice, Wrens and other birds which feed on poison, and above all the brain of a Cat is most venemous, for it being above measure dry, floppeth the animal spirits, that they cannot passe into the ventricle, by reason whereof memory faileth, and the infected person falleth into a Phrenzie. The cure whereof may be this, take of the water of sweet Marjoram with Terra femina the weight of a great mingled together, and drink it twice in a moneth, putting good store of spices into all your meat to recreate the spirits withall, let him drink pure Wine, wherein put the seed of Diosmou. But a Cat doth as much harm with her venemous teeth, therefore to cure her biting, they prescribe a good diet, sometime taking Hony, Turpentine, and Oil of Rifes met together and laid to the wound with Century: sometime they waft the wound with the urine of a man, and lay to it the brains of some other beast and pure Wine mingled both together.

The hair also of a Cat being eaten unawares, floppeth the Artery and causeth Suffixation: and I have heard that when a child hath gotten the hair of a Cat into his mouth, it hath so cloven and stuck to the place that it could not be gotten off again, and hath in that place bred either the wens or the Kunki evil. To conclude this point, it appeareth that this is a dangerous beast, and that therefore as for nececity we are constrained to nourish them for the suppreffing of small vermine: so with a wary and discreet eye we must avoid their harms, making more account of their life then of their perrons.

In Spain and Gallia Narbon, they eat Cats, but first of all take away their head and tail, and hang the prepared flesh a night or two in the open cold air, to exhale the favour and poison of it, finding the flesh thereof to be almost as sweet as a Cony. It must needs be an unclean and impure beast that liveth orly upon vermin and by ravening, for it is commonly said of a man when he needeth, that he hath eaten with Cats: likewise the familiars of Witches do most ordinarily appear in the shape of Cats, which is an argument that this beast is dangerous to soul and body. It is laid that if bread be made wherein the dung of Cats is mixed, it will drive away Rats and Mice. But we conclude the story of this beast with the medicinal observations, and tarry no longer in the breath of such a creature compounded of good and evil. It is reported that the flesh of Cats failed and sweetened hath power in it to draw wens from the body, and being warmed to cure the Hemorrhoids and pains in the reins and back, according to the Verse of Euseb.

Et lumbis lumbis praefat adeus opem.

Ayllius prescribeth a fat Cat fod for the Gout, first taking the fat, and anointing therewith the fiek part, and then wetting Wool or Tow in the same, and binding it to the offended place.

For the pain and blindnes in the eye, by reason of any skins, webs, or nails, this is an approved medicine: Take the head of a black Cat, which hath not a spot of another colour in it, and
The History of Four-footed Beasts.

and burn it to powder in an earthen pot leaded or glazed within, then take this powder and through a quill blow it thrice a day into thy eye, and if in the night time any heat do thereby annoy thee, take two leaves of an Oke, wet in cold water and bind them to the eye, and so shall all pain flee away, and blindness depart although it hath oppressed thee a whole year: and this medicine is approved by many Physicians both elder and later.

The liver of a Cat dried and beat to powder is good against the stone: the dung of a female Cat with the claw of an Oul hanged about the neck of a man that hath had seven fits of a Quartain Ague, cureth the same: a nesting powder made of the gall of a black Cat; and the weight of a great three of taken and mingled with four crowns weight of Zambach, helpeth the convulsion and wryneck of the mouth: and if the gall of a Cat with the black dung of the same Cat, be burned in perfume under a woman travelling with a dead child, it will cause it presently to come forth: and Pliny faith that if a pin, or thorn, or fish bone, stick in one mouth, let him rub the outside against it with a little Cats dung, and it will easily come forth. Given to a woman suffering the flux, with a little Rozen and Oul of Roses, it stayeth the humour; and for a Web in the eye of an horse, evening and morningblow in the powder of Cats dung, and it shall be cured.

Of the Wilde CAT.

A Li Cats at the beginning were wide, and therefore some do interpret Im, Is. 34. for wide Cats: and the Germans call it Bonenweiter, that is, a tree-rider, because the huntest Birds and fowles from tree to tree. The Spaniards callet h it Gato-montes, and in some places of France it is called Chatcarrat. There are great store of them in Helvetia, especially in the Woods, and sometime near the waters, also being in colour like tame Cats but blacker, such as in England is called a Poolcat. I saw one of them, which was taken in September, and observed, that it was in length from the forehead to the top of the tail, four full spans, and a black line or strake all along the back, and likewise some black upon the legs; buttwixt the breast and the neck there was a large white spot, and the colour of her other parts was dusky, red, and yellow, especially about the buttocks, the heels of her feet were black, her tail longer then an ordinary house Cats, having two or three black circles about it, but toward the top all black.

They abound in Scandinavia, where the Linxes devour them; otherwife they are hunted with Dogs, or shot with Guns, and many times the Countrey men seeing one in a tree, doth compass it about with multitude, and when the leapeth down kill her with their Cubs, according to the verse of Nervians:

--- Felemque minacem
Arboris in truncus, longis perfigere tis.

In the province of Malabar, thefe Cats live upon trees, because they are not swift to run, but leap with such agility, that some have thought they did flie: and verily they do flie, for they have a certain skin, which when they lie in quiet, cleaveth or shrinkeith up to their bellies, but being fir’d, the same spreadeth from their forefeet to their hinder, like the wing of a Bat; by vertue whereof they flay up themselves in the air, pasling from tree to tree like a fowl; as also doth the Poniique Moule, as shall be declared afterward.

The skins of Wilde Cats are used for garments, for there is no skin warmer, as by experience appearseth in Scythia and Moscovia, where their women are clothed with the fur of Cats, but especially for buskins and sleeves with their hair turned inward, not only against cold but for medicine, against contracted sinews, or the Gowt. The fat of this beast is refered by some for heating, softening, and displaing tumours in the flesh: and whatsoever Kafis or any other faid of the houfe Cat before in the medicinal parts, that also appertaineth to this, except as in all other, fo it falleth forth herein, that the virtues of the wilde kind is more effectual then the tame.

There are some among the Elavians and Germans, which eat the flesh hereof, accounting it delicate, having firft cut of the head and tail; they cannot abide the fume of Rews, or of bitter Almonds; there is nothing memorable in the nature of this beast that I can learn, except that which is related by Aetius, that when men are bitten by Crocodils, this beast by a natural instinct hating a Crocodil, will come about the wounded perfon, otherwife fearing the presence of man.

We may hereunto add the beast which is bred in America, called Heyratt, spoken of by Thevetius: which name signifieth a beast of Hoany, and the reason is, because it defireth Hoany above meate, for it will climb the trees, and coming to the caves of Bees, it will with much dexterity take out the Hoany with their nails, that it neither hurteth the Bees, or receiveth harm by them. It is about the bignefs of a Cat, and of a Chefeft-natur colour.
Here is among the Suybians and Sarmatians a four-footed wild beast called Colur, and some Salac; the name, in Latin; of the Polomants, Subae, of the Moscovite, Sorga; of the Tartarians, Artem, and Snak; of the Turks, Acmes; being in quantity and stature between a Ram and a Hart, and duskie white coloured, but the young ones yellow: of a strong swiftness and celerity in course. Her manner is to drink by the boles in her nostrils, whereby the veineth up abundance of Water, and carryeth it in her head, so that she will live in dry pastures remote from all moisture a great season, quenching her thirst by that Calmer in her head.

They are most plentiful to be found in Tartaria, in Pomer, where are so many plains, that a man can see nothing but heaven and earth; Likewise they are found in Moscova, in Podicia, and about the River Nepr, and Burythems: they can never be taken but by wearisomeness: wherefore if men follow them with Pipes and Tumbrils, playing upon them, they so weary themselves with leaping and running to and fro, being compassed in by multitudes of men, that they fall down for weakness, and so are taken. They live in fleeks together, sometimes five hundred; and after Febr in the Spring, two hundred in a troop: having a Snout like a Hogs, they endure much hunger, but no cold.

In March they dig up with their Horses a certein root, whereof they eat, and presently their lust for generation encreaseth unto rage; so much that for satisfying thereof they continue in that act both male and female, until they lose all strength of body, lying half dead on the earth by the space of 24 hours, not being able to go or stand during which time they are often taken alive, but when they come again to themselves, they rather die then endure to be tamed.

The flesh of them is very sweet and wholesome, they conceive and bring forth for the most part twins, or two at a time; their greatest enemy is a Wolf (for in the Winter and snow they hunt and kill them.) Their horn are about four palms in length, growing upright or bending very little and very sharp, whereby they can pierce the belly of a Horse, or other beast that standeth over them; at the root they are about six inches compassed, and so growing leffe and leffe to the top, one of them weigheth about nine ounces; the blade toward the point is transparent, being held against the light or sun, because it is white and thin, but the otherpart is duskie and thicker, and therefore it is not penetrable by the eye of man. There are about 14 circles like rings compassing about the horn, one above another, but the uppermost is not perfect. This horn is of great price, being a present for any Noble man, for in Turkey they are sold for six Cossian thillings; yet I know no other use of them, but either to make hafts for knives, or else horns for Spectacles.

This beast liveth altogether in the plains except in snow, and then he runneth into the Woods; where he may be taken more easily, and killed with the stoke of a Staffe. When the Tartarians know in what plains they lie, their King cometh and with a multitude of men compasseth them and wearyeth them by muckin as aforesaid. All this was related to me by one that had killed of them above two hundred with his own hand (faith that right honorable and most learned Gentleman Johannes Bonaventura, Baron of Balziar a Palamian.)
The History of Four-footed Beasts.

Of the cont.

Among the divers kinds of Hares, Conies have the third rank, being therefore called in Latin, Lepusculi, (as it were little Hares) and some time Levertide, as it were a Leveret or young Hare, as well as Cuniculus: whereof the reason is, that it maketh holes in the earth, for Cuniculus was a Latin word for a hole or cave in the earth, before it was taken for a Cony: Scaphian in the singular, and Sechbanim, in the plural, Levit. 14. and Psa. 104. is taken in Hebrew for a Cony or Conies, and not for a Hedge-hog, as the Septuagint translate, or for a Porcupine, although they live also in Caves and secret places of the earth; and therefore Choerogallem, or Choerogallem, or Choerogallem, cannot signify a Cony: as the Septuagint translate Scaphan, but a Hedge-hog, as the word derived from the face of a Hog doth most evidently declare, which can by no means agree with a Cony. In the 14. of Deut. the word Scaphan is joyned with a Hare, because it is a beaif neer of kind unto it, for it is evident, that both of them chew the cud, howsoever a Cony hath not a simple cloven foot into two parts. A Cony also is called Aadoo, because of the roughnefs of his feet; The Cœule calleth it Tcaph; the Arabians, Vebar; the Persians, Bezanarab; and the Arabians, following some times the Greeks, call it Altrach, that is, Hares. The Greeks call it vulgarly Skele and Daifop, Cœnichus, Scemex, and Lapis, Georycho a Hare digging, living in the earth. The Italians call it Conigli the French, Conin; the Spaniards, Conio; the Germans, Kinnigle, or Kœne; and sometime Kœnein; the Itarians, Kralik or Krilik.

There are few Countries wherein Conies do not breed, but the most plenty of all is in England, they are also in an Island where are but few men near unto Denmark, or as it is now called Furtoli in Italy. Likewise in all Spain, especially in those parts near unto Lombardy, whereupon Appius in Varro did write to one of his acquaintance which had tarried long in Spain, that he thought he was there following or hunting of Conies, because as their multitude is great, so it would ask long time to take them. Among the Balceans are also great store of Conies, and once they so abounded there, that the people were constrained to entreat at the hands of Augustus, a military company of Romans to destroy them; and when Camillus was besieging the City Vetii in Italy, he learned of the Conies, which had undermined a whole City in Spain, likewise to take and overthrow that City by their example of undermining, whereupon Martial said:

Monspiravit tacitus hollibus ille vis

Vegetius saith, that the proverb Cuniculus agere took his beginning, when one by secret underminings, and not by open violence overthreweth a Town or Nation. There are also, faith Albertus,
Of the Cony.

*Albimus,* great store of wilde Conies in *Bohemia,* so like a Hare as one beast may be like another, fave only they seem stronger, and are shorter and leffer, which thing cau'd *Baptista Eura* to write thus:

*Crediteram leporem, sic forma simillima fallit,*

_Amto superflavit, dense vel aure pares._

Pet. Marlyse likewise affirme in his *Ocean Decades,* that in *Curiana* a region of the new found world, are Conies for colour, quantity, and hair like a Hares, which the inhabitants call *Vitis,* and there are two little Ilands called *Cunicularias,* which feem to be denominated of Conies, standing between *Corfica* and *Sardinia.* For their feveral parts, they are moft like unto a Hare, except in their head and tail which is shorter, and their colour which is alway brighter, and leeffe brown and fandy: or else sometimes Conies are white, black, grifelfl, tauny, bleftvwh, yellow spotted, ath-coloured, and fuch like. And *Abfurdifalit,* that in fome places, they are alfo green, and their skins are of great ufe through the world, especially in all the North and Eft for garments, facings, and linings. The gray and yellowvwh are the work, but the white and black are more precious, especially of the *Engli{h}l* if the black be afperfed with fome white or filver hairs: and in their ufe the Bucks are moft durable, yet heavier and hardier. The belly is moft loft, gentle, and eafe, and therefore more fcty, although of leffe continuum. Their feth is very white and fweet, especially of the young ones, being about fourteen or twenty dayes old, and fome have devifed a cruel delicate meat, which is to cut the young ones out of the dams belly, and to defte and eat them, but I truft there is no man among Christians fo inhumanely gluttonous, as once to defce or approve the sweetnefs of fo foul a dish: but the tame ones are not fo good, for in *Span* they will not eat of a tame Cony, because every creature doth partake in that wherein he liveth, and therefore tame Conies which are kept in a clofe and uffeft air, by reafon of their own excrements, cannot taft so well, or be fo wholefome as thofe which run wilde in the mountains and fields, free from all infection of evil air.

They love above all places the rocks, and make Dens in the earth, and whereas it is faid, *Phl. 104.* that the ftony rocks are for the Cony, it is not to be underftood as if the feet of the Cony could pierce into the rock, as into the earth, and that the diggett her hole therein as in loofer ground; but that finding among the rocks holes already framed to her hand, or elfe fome light earth mingleth therewith, the more willingly entrench thereinto, as being more free from rain and floods then in lower and loftier ground; for this caufe they love alfo the hills and lower grounds and woods where are no rocks, as in *England* which is not a rocky Country, but wherefoever he is forced to live, there the diggett her holes, wherein for the day time she abideth; but morning and evening commeth out from thence and fitteth at the mouth thereof.

In their copulation they engender like Elephants, Tygres, and Linxes, that is, the male leapeth on the back of the female, their privie parts being fo framed to meet one another behind, becaufe the females do render their urine backward: their secrets and the feed of the male are very fmal. They begin to breed in fome Countries, being but fix moneths old, but in *England* at a year old, and fo continue bearing by moneth at the leffe feven times in one yeare: if they fettle in *March* or *April,* then in the Winter they do not engender at all; and therefore the Authors fay of thefe and Hares, that they abound in procreation, by reafon whereof, a little foare will serve to encrease a great bowth. Their young being littered are blind and fee not till they be nine dayes old, and their dam hath no fucht for them, till the hath been fix or seven hours with the male, at the leffe feven hours with the female, thefle fuffet them greatly defirous to go to the Buck, and if the be not permitted prefently, the is fo far displeafed that the fhe will not be fo inclined again for 14 days after.

I have been alfo credibly informed by one that kept tame Conies, that he had *Doe* which littered three at a time, and within fourteen daies after, they littered four more. Their ordinary number in one litter is five, and fometimes nine, but never above: and I have feen that when a Doe hath had nine in her belly, two or three of them have perifhed and been opprefled in the womb by fuffocation. The males will kill the young ones, if they come at them like as the Bore cats, and therefore the female doth alfo avoid it carefully, covering the neft or litter with gravell or earth, that fo they may not be defcovered: there are alfo fome of their females very unnatural, not cauring for their young ones, but fuffet them to perifh, both becaufe they never provide a warm litter or neft for them, as alfo becaufe they forfake them being littered, or elfe devour them. For the remedy of this evil, he that loveth to keep them for his profit, mult take them before they be delivered, and pull off the hair or fleth underneath their belly, and fo put it upon their neft, that when the young one cometh forth, it may not perifh for cold, and fo the dam will be taught by experience of pain to do the like felf: *Thus far Thomas Gypfin an English Psysician.* For Conies you may give them Vine-leaves, Fruits, Herbs, Graffe, Bran, Oatmeal, Mallows, the parings of their meat Apples; likewife Cabbages, Apples themelves, and Letteuce; and I myfelf gave to a Conye blew Wolfe-bane, which the did prefently eat without hurt, but Gallinglye and blind Nettle they will not eat. In the Winter they will eat Hay, Oats and Chaffe, being given to them thrice a day: when they eat Greenes they mult not drink at all, for if they do, it is hazard but they will incur the Dropifie: and at other times they mult for the fame caufe drink but little, and that little must be alway freth. It is alfo dangerous to handle their young ones, in the abifence of the dam,
The History of Four-footed Beasts.

Albertus.
The medicines in a Cony.

for her jealoufie will eaisily perceive it, which caufeth her so to disdain them, that either the biteth, forfaketh, or killeth them. Foxes will of their own accord hunt both Hares and Conies, to kill and eat them.

Touching their medicinall properties, it is to be observed that the brain of Conies hath been eaten for a good Antidote againit poison: fo alfo the Hart which is hard to digeited, hath the fame operation that is in treacle. There is alfo an approved medicine for the Squinacy or Quinfie: take a live Cony, and burn her in an earthen pot to powder, then take a spoonful of that powder in a draught of wine, and drink the molt part thereof, and rub your throat with the refidue, and it shall cure with fped and ease, as M arcelius faith. The fat is good againit the stopping of the bladder and difficulaty or urine being anointed at a fire upon the hairy place of the secrecs, as Alex. Benedictus affirms. Other things I omit concerning this beaf, because as it is vulgar, the benefits thereof are commonly known.

Of the Indian little P I G - C O N T.

I Received the picture of this beaf from a certain Noble-man my loving friend in Paisi, whose parts it is not needfull to decrire, feeing the image it self is perfpicuous and eafe to be obserued. The quantity of this beaf doth not exceed the quantity of a vulgar Cony, but rather the body is shorter, yet fuller, as alfo I obserued by thofe two, which that noble and learned Phyfician Job. M unzing erus fent me. It hath two little low ears, round and almoft pil'd without hair, having alfo short legs, five claws upon one foot behind, and fix before; teeth like a mouse, but no tail, and the colour va- riable. I have feen of them all white, and all yellow, and alfo different from both thofe: their voice is much like the voice of a Pig, and they eat all kinds of Herbs, Fruits, Oats, and Bread; and fome give them water to drink, but I have nouriffed fome divers moneths together, and never given them any water, but yet I gave them moift food, as Herbs, Apples, Rapes, and fuch like, or else they would incur the Dropifie.

Their flefh is sweet for meat, of a yellowifh colour, like the Larde of Swine, and therefore not fo white as is our vulgar Cony: they do not dig like other Conies, and for the farther description of their nature, I will express it in the words of M unzing erus aforefaid, for thus he writeth.

"One of the males is sufficient in procreation for seven or nine of the females, and by that means "they are made more fruitful, but if you put them one male to one female, then will the venerous "falacity of the male procure abortion. It is affirmed that they go threefcore daies with young "before they litter, and I saw of late one of them bear eight at one time in her womb, but "three of them were lifted. They bring forth in the winter, and their whelpes are not blinde as "are the Conies. They are no way fo harmful as other are, either to bite or dig, but more tractable "in hand, howbeit untamable. If two males be put to one female, they fight fiercely, but they will not "hurt
Of the Buck and Doe.

"hurt the Rabbits. As the male is most libidinous, so doth he follow the female with a little murring noise, bewraying his appetite for generation, without wrath, and these are also called "Spanish Cones, by Peter Martyr, whose nature except in their abundant superfoetation cometh nearer to Hogs then Cones.

Of the Fallow Deer, commonly called a BUCK and a DOE.

There are some beasts (saith Pllmy) which nature hath framed, to have horns grow out of their head like fingers out of the hand, and for that cause they are called Platicyrtos: such is this vulgar Fallow Deer, being therefore called Cervus Palmatus, that is a palmed Hart, by reason of the similarity the horn hath with the hand and fingers. The Germans call this beast Dam, and Damlin, and Damhitz. The Italians Dais and Dasis; the French, Dain, and Daim. The Spaniards, Garn, and Gaza. Certain, the Cretans vulgarly at this day Agrimi, and Platigus; and Ariophite, Pros; the Latins, Damna, and Damulis, because, de mano, that is, it quickly flyeth from the hand of man having no other defence but her heels; and the female scepta, and the Polonians, Lani. It is a common beast in most Countries, being as corpulent as a Hart, but in quantity resembleth more a Roe, except in colour.

The males have horns which they lose yearly, but the females none at all: their colour divers, but most commonly branded, or fannie on the back, like the furrow of a new plowed field, having a black colour and o-strake down all along the back: a tail almost as long as a Calves, their bellies and sides spotted with white, which spots they lose in their old age, and the females do especially vary in colour, being
The History of Four-footed Beasts.

What Hippelaphus is.

Aristotle.

A bearet in the blood.

By being sometimes all white, and therefore like unto Goats, except in their hair which is shorter. The horns of this beast are carried about every where where to be seen, and therefore this is also likely to be the same beast which Aristotle calleth Hippelaphus as some would have it; yet I rather think that Hippelaphus was like to that rare seen horse which Francis the first of that name King of France, had presented unto him for a gift; which was engendred of a Horse and a Hart, and therefore can have no other name then Hippelaphus, signifying a Horse-hart.

In the bloud of theke kind of Deer are not thininges or Fibres, wherefore it doth not congeal as other doth, and this is assign'd to be one cause of their fearfull nature; they are also said to have no gall: in their horns they differ not much from a Harts (except in quantity) and for their other parts they much resemble a Roe-buck: their flesh is good for nourishment, but their bloud doth increase above measure melancholy, which caused Hiera to write thus of it, after his discours of the Roe.

Damula aduia magis si matris ab ubere rapa est, Huic prior in nostro forte erit orbis locum; For the preparation or dressing of a Buck, we shall lay more when we come to the description of a Hart. Albertus translacteth the word Alzagel a Fallow Deer, and fayeth that the fleth thereof is very hurtful, being cold and dry, and bringeth the Hemorrhoids if it be not so fedonned with Pepper, Cinnamon, Mustard seed, and Hony, or else Garlick, which caused Juvenal to cry out upon the excess of rich men for their fealls and delicate fare, being compared with the Ancients which lived upon fruits, in these words following, as they are left in his eleventh Satyre.

Olum ex quavis arbore mons fiebat, At nunc divitiis canandi nulla coluphis: Nil homines, nil dama supit, putare iustitir Unguentum atque rore, Of the medicines.

Of the second kind of Deer the ROE-BUCK.

There is so great difference among writers about the name of this beast, that it is a difficult and hard matter to set down certainly, in the prime and original tongues, the true and perfect denomination thereof, yet I will endeavour to go as near the mark as can be, by laying together all the probabilities that I find in other, or observe by my self. To begin then with the Hebrew as the fountain of all the refidue, they call it Zeb:i, and the feminine hereof Zebah, and therefore in Deut. 14. it is permitted to the Jewes to eat; and the plural of the Maleculine is Zebaim, and of the feminine Zebaubh. The Chaldean translation calleth it Thabia, which in the Acts of the Apostles cap. 9. is called Tabitha, and is interpreted Dorcas, a Roe: and sure it is probable that the Hebrews do call a Roe, because of the outward beauty thereof, being full of spots upon a ground or skin of another colour, shewing with great delight pleasant to the beholder, which caused Martial to write this Diliehion;

Delicium parvo donatis dorcad a natu, Jactatis soleb bance mittere turbus vofigs. The representation both of male & female.

The Persians call this beast Abu. The Arabians, Thabius, which cometh neer to the Chalde word; the Germans Reeb or Reh, and the male Reh-becke, and the female Reh-gist; the Hyrians, Senna or Sana; the French, Chevoux, and Chevroujauge. The Spaniards, Zoito, or Cabrenzello-manso; the Italians, Caprio, and Capiro for the male, and Capriola, and Capriola for the female.

The Greeks, Dorcas, as the Septuagint do every where translate, which Strabo termeth corruptly, Zorcos, alias Doros, Nexus, Nebras, and vulgarly as at this day Zarkosi; and Doralis, Doradonis, for a little Roe. The Latins do also use the word Dorcas in common with the Greeks, and besides Capreus and Capreulus for a little Goat, for I do not think that any learned man can find any difference betwixt
Of the Roe-Buck.

These beasts are most plentiful in Africa, beyond the Sea of Carthage; but they are of another kind, where Aristotle denied to be in Africa: there are also in Egypt, and in Germany, and in the Helvetian Alps. Likewise in Catacapa beyond Nileus, in Arabia, in Spain, and in Lybia: and it is to be observed, that the Lybian Roes do never go over the Syrian Mountains. *Hellenus* doth deliver these things of the Lybian Roes, which for the colour and parts of their body may seem to belong to all. They (faith he) are of admirable velocity or swiftness; but yet inferior to the Lybian Harces, their belly is parted with black stripes and drops, and the other parts of their body are of a red yellowish colour, they have long feet, but longer ears, their eyes black, and their horns are an ornament to their heads.

Their swiftness doth not only appear upon the earth, but also upon the waters; for with their feet they cut the waters when they swim as with Oares; and therefore they love the lakes and strong streams, breaking the floods to come by fresh pasturage, as Sweet-rushes and Bul-rushes. Their horns grow only upon the males, and are set with fix or seven branches, but the females have none, and therefore also they differ in horn from the Fallow-deer: so as they cannot be called Platyceles, for their horns are not pointed like a hand, and although they be branchy, yet are they shorter; they differ not much from the common Deer, but in their horn: and whereas the horns of other beasts are hollow toward the root, whereunto entereth a certain bony substance; the horns of these (as also of the vulgar Buck and the Elks) are solid, without any such emptiness: only they are full of pores. It hath also been believed, that a Roe doth not change her horns, because they are never found; whereas in truth, they fall off yearly as doth a Hart, but they hide them, to the intent they should not be found.

It hath likewise been thought, a Roe was called in Greek, Dorcus; because of the quickness of her sight; and that she can see as perfectly in the night as in the day; and not only for her self, but the learned Physicists have observed a certain vicious humor about her bowels, which being taken forth, and anointed upon a mans eyes, which are dark, heavy, and near blinde, it hath the same effect to quicken his eye-sight. It is also said of them, that they never wink, no not when they sleep; *Pliny*.

The reason of the Latin name.
The History of Four-footed Beasts.

Cardium. fly, for which confess, their blood is prescrib'd for them that are purblind. The tail of this beast is shorter and leffer then is the fallow-Deers, infomuch as it is doubtful whether it be a tail or not.

The place of their abode, They keep for the most part in the Mountains among the rocks, being very swift, and when they are pursued by Dogs, (Martial faith) they hang upon the rocks by their horns to deceive the Dogs, after a manner strange to fall and kill themselves, and yet have no harm, whether the Dogs dare not approach, as appeareth in this Epigram:

Pendentem summa capream de rupe videbis,
Cejaram ferres, decipit illa Canes:

Yet this doth better agree with the wilde Goat then with the Roe, as shall be manifested in due time. 

Their concord with other beasts, Alcanum faith, that the Cynocephali, men with Dogs faces, live upon the flesh of Roes and Bugles, in the Wilderness of Egypt: and also it is usual to conclude them in Parks; for they will agree very naturally with Hares and Swine: wherefore in the Lordship which Varro bought of Pilil, it was seen how at the sound of a Trumpet, both Roes and Boars, would come to their usual places for meat: and although they be naturally very wilde, yet will they quickly grow tame and familiar to the hand of man; for Blanquus did nourish many at Rome. Being wilde, they are hunted with Dogs, shot with Guns, taken in nets; but this falleth out seldom, because they live most among the woods. They are most easily taken in the Woods. When they are chafed, they defire to run against the wind, because the coldness of the air refresheth them in their course; and therefore they which hunt them place their Dogs with the winde; for sometimes against the hunters minde, do what they can to the contrary, she taketh her course that way: but Harts when they hear the barkings of Dogs, run with the wind, that the favour of their feet may pass away with them. They are often taken by the counterfeitfeating of their voyce, which the hunter doth by taking a leaf and hipping upon it.

They are very good meat (as Bibliothetae affirmeth) and that the Indians dress at their feates whole Lynes and Roes for their gheats to eat, and the Sophists in their Banquet, which is described by Athenæus, had Roes therein: and therefore Florus affirmeth it before the fallow-Deer, alladging the agreement that is betwixt it and the body of man, being dresse daccording to Art.

Simon Sethi.
Aestuella.

Hic optarit feret nobis feminae calce
Uda levis, multicae mosisque coquenda foci.

And therefore also affirmeth, that it excelleth all wilde beasts whatsoever, being not only fit for nourishment, but for the sick; as for them that have the Colic, or the Falling Evil, or the Tympany: and therefore they be bleft at a year old, or under. Likewise their broth with Pepper, Lovage, seed of Rue, Parley, Honey, Mulford, and Oyl; and for sauce to the meat, they take Pepper, Rue, Honey melted, and an Onyon: sometime also they see the hanches or hips, and make Patties of the fides and ribs. It is a beaft full of fear, and therefore the flesh thereof although it be very dry, yet will it engender some melancholy; of the fear Martial faith thus:

Tam differt aquila columba non est,
Ac dorso rigido fugit leo.

As the Dove from the Eagle, and the Roe from the Lyon, which afterward grew into a Proverb. It hath also some Epithets among Authors, which do confirm their disposition full of fear: as flying, weak, wanton, and such like; yet will they fight one with another so fiercely, that sometime they kill each other.

They fear also the Woolls, whereof came the proverbe, that first of all the Roes will be joyned to the Woolls, to express an incredible fear. They have also been used for Sacrifice to Diana, for the Sabritae women in Patras, did lay upon her great Altar whole Harts, Roes, Roes, and other beasts alive: and the Capita did eat the males; but religiously worshipp'd the females, not daring to eat them, because they believed that Isis loved them dearly.

Of these beasts the Island Caepress beyond Surrentum in Campania, where Tiberius had a famous Caite, and was ennobled by his presence; but since the decay thereof, it is now celebrated for the multitude of quails that are found therein.

The remedies or medicines coming from this beast are these: first, the flesh of them eaten, is good against all pains in the small guts, for it dryeth and layeth the belly. Flamy affirmeth, that the teeth of a Dragon tyed to the finews of a Hart in a Roe skin, and wore about one's neck, maketh a man to be gracious to his Superiors, and them to be favourable and pitiful to him in all his supplications; and if the white flesh in the breast of the Hanta, & seven hairs thereof with the genital of a Hart, be tyed in a piece of Roe skin, and hanged about a Woman's neck, it maketh that her womb shall suffer no aborrtions; but these things are trivial, and not to be believed but at pleasure. I know that the tail of a Dragon tyed to the Nerves of a Hart in a Roe skin, the fuet of a Roe with Goose-grease, the marrow of a Hart, and an Onyon, with Rozen, and running Lime, do wonderfully help the falling Evil. (If it be made into a plaster.)

Sextus faith, that if one give the brain of a Roe drawn or pressed through a ring to an Infant, it will
Of the Deer-Goat.

will preserve him for ever from the Falling sickness and apparitions. The liver of a Roe fed in salt water, and the eyes of a purblind man held over the same or reek thereof, are cured of their blindnes: and some fetch it in a little cup, and anoint the eyes with the scum or froth coming from it. The same liver being burned to powder, and the dust cast on a man bleeding, stayeth the flux or flux. The gall of this beast mixed with Wine, and the Meal of Lupines the weight of a groat, and Honey, take away the spots of the face: and the same gall mixed with water, helpeth a Sun-burned face, and freckles: The same with Hony Attick, taketh away the dimnes from the eyes, and with the juice of a gourd anointed upon the eye-brows, causeth that where the hair hath been pulled off, that it never shall grow again: and this gall is alway the better for the age thereof, and as Hippocrates did prescribe, it must be kept in a silver pipe or box.

For the tingling of the ears, take with this gall the Oyl of Roses, with the juice of an Onion beaten together, and unstilled warm into the ears for a present remedy: so also, with the Oyl of Roses only, it helpeth the pain in the teeth, and with the Hony Attick, all swellings or pains in the jaws or chaps, putting thereto Myrrhe, Saffron, and Pepper. The same gall with a little Hogs-bread, and the powder of burnt Allum with Anise-seed, made into a Suppository, procureth loosening, if the party have not the Hemerhoids.

Also the gall taken with Hony, and the juice of Eglantine, cureth the exulceration of the virile member by anointing it. The Spleen being drunk, helpeth windiness, and the milt is commended against the Colick and biting of Serpents.

Against the jaundice they take the dung of a Roe dried and sifted, and drink it in Wine; the same also to drunk cureth the Ague: and because the Roe-buck doth wonderfully love his female, there be some that affirm, that if a woman eat the bladder of a Roe, it will likewise make her husband to love her exceedingly.

Of the first kind of Trachelaphus which may be called a Deer-Goat.
Here is another kind of like a Deer (although conceived of a Buck-Goat and a female Hart) that I cannot but express the figure and brief narration thereof (as is in the foregoing page.) It is like a Deer (except the beard and bristles growing about the shoulders) and Pliny affirmeth, that they are found about the river Phasis, in Arabia and Arachote, which is a City of India so called of Arabia, a river issuing from Canopus which the Greeks call Tragelaphus, and the Germans, Ein Brandbirze; and some think this beast to be mentioned by the name of Age, in Deut. 14. This doublet is the same beast which Aristotle calleth Hippelaphus, because he attributed the self same things to it that Pliny assigneth to this, both for the beard, the bristles, and deep hair about the shoulders, which hangeth down like the mane of a Horse.

The similitude both in proportion and quantity holdeth with a Hart in the feet which are cloven, and that the female thereof doth want horns. The horns of the male are like the horns of a Roe. Therefore howsoever some have imagined that there is no such beast to be found in the world, they are rather to be pitied then confuted, for it is not to be doubted, that neither the Ancients, nor other, ever have seen all the divers and marvellous shapes of Beasts, which are to be found in many remote and far distant places of the world, especially in Arabia and India, where are many Deferts; and therefore the reason why they affirm this, is, because they never saw any such, and so it is to be understood: for the rare pictures of these beasts called in ancient time Canabra, whereupon children were carried in Pageants and fhews, gave them occasion to think, that these were but mens devises, and that God never ordained such creatures. Georgius Fabritius which sent me this picture, both among other things write unto me very probably, that this kinde is only distinguished from other in form, name, and strength, and not in kinde: and this being more strange and left known among men, was called by the Greeks, Tragelaphus; being greater then the vulgar Deer, deeper haired, and blacker in colour, and this (faith he) is taken in the Ridings or Forrests of Mifena, bordering upon Ebomina, and the common sort of hunters hold opinion, that by reason it loveth to lie where Coals are made, and in their dust, feeding upon such grass as grows as and in those places, therefore the Germans call it Brandbirze, and so the Foxes which resemble them in colour, are called Brandysobze.

It is for certain that these are greater and stronger then Harts, their upper part of the back being black, and the noather near the belly not white (as in a Hart) but rather blackish; but about his genitals very black. I have seen the horns to have seven spires or branches, growing out of one of them, being palmed at the top. These are like to those which are called Achaines in Greek, by reason of their pain and sorrow: and Kummerer in German, because they live in continual sorrow for their young ones, while they are not able to run out of their dens, belike fearing by some influence of nature, left their tender and weak age, should betray them to the Hunters, before they be able to run away.

The Figure of another TRAGELAPHUS, or DEER-GOAT, exprest by BELLONIUS.

The description of the several parts.

Here is another Tragelaphus (faith he) whereof I finde no name among the French: it wanteth beard, and the hair thereof resembleth an Iber-Goat, (whose description followeth afterward among Goats:) the horns hereof are like a Goats, but more crooked and bending, compassing behind, as a Rams do, which he never lofeth. His face, nose, and ears, are like a Sheeps, the skin of his eads being very thick and hanging down. His legs are white like a Sheeps; his tail white; his hairs are so long about his neck and flomach, that you would think it werebearded. His hair on the shoulders and breast black, and it hath two great spots on its flankes on either side: the nostrils are
are black, the beak or face white; so also is the belly beneath, but the description hereof seemeth rather to agree with a Nygarg, or Mufson, of which I shall speak afterward.

I do rather approve the relation of another of this kind, which was sent unto me by that most learned English Physician: Mr. Cog, which as he writeth unto me, was brought in the year 1561: out of the Country of Mauritania, which was cloven-footed, and liveth for the most part in the Mountain parts of that Country, being given to a fancy between a fallow-Deer and a Hart, the body more like a Hart, and the side branded and hanging down: a shorter and thick neck, the colour in the Winter black and red, set one with another; the beard like a Goat, but more divided and turned backward; his hair very long, even to his knees, a mane full of bristles, stretched out in length through his whole neck, but especially about the top of his shoulder-blades, where it standeth like bunchedes, being in colour darker then in other parts of the body; and the hinder legs are covered with longer and harder hairs down to the pattern. (as I think) for no other cause but to defend them from harm in his leaping: and the hoof of this beast was more strange (for being, as was said before) the outward hoof in his fore-legs is longer and greater then the inward, and contrary in the hinder: and the inward clove thereof is longer and greater, and the outward smaller and shorter; so as on either side you would think one of them was the hoof of a Goat, and the other of a Hart, both of them hollow and without sockets; whereof I can give no other reason, then the pleasure of nature, which hath so provided, that whereas this beall liveth among the rocks, and sharp places of the Mountains, his foot-steps are by his hollow hooeums more firm and stable, because by that means, the itones and sharp-pointed rocks entree into them to stay them up from hiding: but it is more strange in the females hoofs, for they have upon the top and upper face of them three or four pleasent impressions, (as it were of carved or embroidered flowers, if a man mark them earily) which I think are given unto them only for ornament and delight.

Either iex looee every year their hoofs; and Harts do their horns, that nature may shew their resemblance in their feet to a Hart, as he doth in their head to a Goat. His ear is short like a Goats, but his eye, genitale, itones, and tail, like a Hart, though somewhat shorter. The horns like a Rams, crooked and distingued in the middle, by a black line all their length, which is two Romae feet and one finger, and in compass at the root, one foot, one palm and a half, standing one from another, where they differ most not above one foot, three palms, one finger and a half. The rugged circles going about them, toward the top are bunche, and toward the bottom or root they are low, with beaten notches or impressions.

They are not at the top ditant one point from another, above one foot and a palm. The length of their face, from the crown to the tip of their nose, one foot and three fingers: the breadth in the hee-head, where it is broadest, two palms and one finger.

The height of this beast not above three foot and a half, except where his mane standeth, and the whole length hereof from the crown of the head to the tail is four feet and a half and two fingers.

It hath only teeth beneath on the neither chap, and those in number not above six, neither did I observe any defect in them. It cheweth the cud like other cloven-footed beaull. The nostrils are black from whom the upper lip is divided by a long perpendicular line. It is a gentle, pleasant & wanton beast; in the disposition rather resembling a Goat then a Hart, desiring the steepell and flipperey fields whereon it leapeth, and from whence (it is reported) that it doth call down it felt head long upon the horns naturally, that by them it may the violence of his fall or leap, and then flyeth his body upon the fore-knees.

It will run a pace, but it is most excellent in leaping, for by leaping it ascended the most highest Mountains and Rocks. The females are greater: then the males, but not in horn or hair, it cical Grai, Oats, Chesfi, Hay, and Bread, they bring forth twins every time: and this we call in England a Barbary Deer. Thus fur Doctor Cog.

Of the HART and HINDE.

The male of this beall is called in Hebrew, Aid, Deur. 14. and the Arabians do also retain that word in their translations; the Persians call him Gueunen; the Septuagint, Elphos; the Greeks in this day Lapite Pediakte; and Saint Jerom for the Latines, Cerusus; the Chaldees, Attu; the Italians, Cerue; the Spaniards, Cerro; the French, Cerf; the Germans, Hiriz, or Hirs, and Hebrews; the Flemings, Hert; the Polishians, Golien; the Ilyrians, Jelii, elfi. The female or Hind Likewise term'd in Hebrew, Asit; and sometime Ali, and Aitike; the Latines and Italian, Cerus; the Spaniards, Cerue; the Germans, Hinde, and Hind, and the Germans more specially, Hin, and Webrecht; the French, Biche; and the Palomans, Lamiti. The young Fawns or Calfs of this beall they call in Latines, Formali; the Greeks, Nerebas; the Hebrews, Ofare; the German, Hindecal.

Also it is not to be forgotten, that they have divers other names, to dillinguish their years and Countries, as for example: when they begin to have horns, which appear in the second year of their age like boddins without branches, which are in the Lattin called Subale, they are also called Subulons; for the similitude they have with Boddins, and the Germans call such an one Spitzbusch, which in English is called a Spitter, and the Icbains, Carbii; but the French have no proper name for this beall that I can learn, until he be a three yearling, and then they call him (in Gallo) which in Latines are called Subalons, and Farcari.
And indeed I was once of this opinion, that these Subulones were only two-yearing Harts, until I consulted with a very true of Segufium, who did assure me from the mouths of men trained up in hunting wilde Beasts from their youth; that there are a kinde of Subulones, which they call also Brocards, with straight and unforked horns except one branch, in the Mountain of Jura near the lake Lemans, and that these also do live among other Harts; for there was seen near a Monastery, called the Roman Monastery, by certain Hunters, in the year 1553, a vulgar Hart with branched horns, and his female; and likewise with a Subulan, or Brocard, which when in pursuit he was constrained to leap from rock to rock, to get to the water, he brake his leg and so was taken. These Brocards are as great in quantity as other vulgar Harts, but their bodies are leaner, and they swifter in course. They have but one branch growing out of the flem of their horn, which is not bigger than a man's finger; and for this cause in the rutting time, when they join with their females, they easily overcome the vulgar Hart, with his branched and forked horns. The Hunters call this Brocard the shield-bearer to the refidue; for by him they are delivered being hunted; for whereas it is the nature of the vulgar Hart, to get into ditches, and hide himself in hollow places when he heareth the Hounds, this Beast never coveteth any secret place to cover himself, but runneth still in the sight of Dogs, who leave the other that hide themselves, because they keep this on foot; and so when the Hunters are paffed by the lurking Harts, they return back again, being safe both from Nets and Dogs, while the poor Brocard is chased unto death. These being old, are also known by their teeth and horns, for they never change them; but it is questionable, whether they have any Hindes or females, although my Author informeth me, that he hearth there be also Hindes with horns like these, being not above one finger long; which if it be true, it is not improbable that these are the females of that kinde: whereunto I yield more easily, because the vulgar Hindes will not admit copulation with the Brocard, except they be constrained, and as it were ravished against their will, from whence it cometh that they are so rare and seldom bred: their flesh is much sweeter than the vulgar Harts.

I have therefore here expressed the figure of the head of this Beast with his horns, which is also called Anonyma, or a Burgundian Brocard, whose horns are at the longest about eighteen inches long, and at the shortest about nine inches, whereof that part which cleaveth to the head is bunchy and indented; the longest as they grow in length,
Of the Hart and Hinde.

length, do more and more stand out one from another, turning up at the top like a bow, but the letter do not stand out so far, and bend very little at the point; and whereas in the vulgar Harts the root of the horn is in a round circle, as it were fastened upon the skull of the Beast, in this the bony roots lie within the skins much deeper, as may be easily differed by comparing both together.

The reason why I call this Burgundian Hart, or Subluna Anamanta, is, because it not only wanteth the manifold branches of vulgar Harts, but that also which is called Amynta.

There are also another sort of Harts called Abchahni, bred in Crete near Achaea, whereas in all other parts of Crete there are no Harts, whereof it is affirmed by Gaza, that there was one of them which had a bough of green Ivie growing in his horns, it was conjectured that when it was young, some spring of that Ivie was taken in a flutter of the horn, which by reason of some nourishment it found in the horn natural to that tree, being like a rocky sublunation, it grew to more perfection. These are also called Synbones, although that term be also given unto vulgar Harts, to signify their full age; yet some are of opinion, that this Abchahni Hart was but an invention or pigment made in bread; for there was in ancient time a kind of loaf called Abchahni in the likenes of a Hart.

The picture of another face and horns.

I received also of that learned man John Guy, another head out of England, which he complecteth to be the head of the palmed Buck, as it was called by Julius Capitellus, which I do not take to differ from the fallow-Deer: and yet because this semeth to be of the most excellent kind, I have thought good to express it in this place, being far different from all other horns of this kind of Beasts, and more beautiful.

Harts are bred in most Countries, but the Ancients do celebrate and prefer those of Britain before other, where they are of divers colours both white and black, as Paulus affirmeth. In Oder, a region of Asia, toward the Northern Ocean, they ride upon Harts; likewise there are Harts in Sibylis and the people call Medes, which are subject to the Kings of Tartaria, make their Harts so tame, that they also ride upon them; there are none in Greece, except in the region of the Cydenites. There are also in the Woods of Helvetia, but not so many as in time past, because Democrates do not nourish game and pleasures like unto Monarchies, and therefore they are daily killed by the vulgar sort, there being no law against it.

The Harts of Illyricum, and about Arquitana, have one of their ears slit or cut afunder by nature in their dam's belly; and therefore they never go over the Mountains into other regions: (as indeed it is the property of all Harts to love their native foils above all other places.) There is a City called Dora, in Africa, near the banks of Euphrates, where are many flocks of Harts, of whom many times some are slain with Harts, and others as they swim away to their accustomed solitudes are oppressed in the water by the weight of Oares, and so taken. They are for the most part land-coloured, and intermingled with some white spots, especially the Hinde and their Calvts, and sometimes milk-white, which happeneth unto them by some defect in their nourishment before they be calved; and for natural imbecility: so have I seen white Bears, Hares, Quails, Partridges, and Swallows.

When Apollanius and his Colleagues travelled by Parara, a City of India, they suddenly heard a noise like the sound of a pipe, and while they looked about to see what it signified, they perceived that it was the pipe of a Keeper or Forrester, which governed a whole flock of white Harts: such an one was the Hart of Servotius that noble Captain, whereby he led his Army, as they were perplexed by it, who affirmed that it was a Spanish Prophet or Wizard given to him by a certain Luipanis, whom he took in an Island of Portugal, saying moreover, that he was inspired by Diana, and that the had authority from her that Goddes to admonish him, and make the hearts of his Soldiers, cleave fast unto him; and therefore if at any time he miscarried in his proceedings, he could easily pacifie them from mutinies, in saying that his Hart set him upon that enterprize, to putting off the fault cunningly from himself to the beast for fear of detection, wherefore also these were tied in the Braucan of Graccia, and their feth being foster, is peculiarly termed by the French, Patijon; These do excell all other in the Beauty of horns, which are very high, yet grow they not to their bones or skalps, but to their skin, branching forth into many speers, being

Of the region breeding Harts.

Of the region breeding Harts.

Of their horns, and the beauty of them.
solid throughout, and as hard as stones, and fall off once every year, but if they remain abroad in the air, where some wind and rain fall upon them, so as now they are wet, and anon dry again, they grow as light as any vanishing or hollow substance, as I have proved by experience, finding some which have been lost by them in the Woods: wherefore I gather that they are of an earthly matter, concrete and hardened with a strong heat made like unto bones. It must be understood that the males only are horned, and yet have they small benefit by them, because (as I find) they grow but within their skin, and these also they lose every year in the Spring time. At one year old they have nothing but small bunches, as it were fragmentations of their horns to one growing on their head; at two years old they appear more perfectly, but straight and simple; at three years they grow forked into two spears, at four into three, and so increase every year in their branches till they be fix, and above that time you cannot certainly discern their age by their head, for their horns or spears grow not more in number, although their years make them greater in quantity; yet the old Harts do want these two branches, which the Gracians call Angymetari, and the Latins, Adimincula; because they first come forth; and I have heard there were Harts horns in an Apothecaries shop of Antwerp, which had every one fifteen branches upon one item, which if it be true, it goeth beyond all experience. Every year in the month of April, they lose their horns, and so having lost them, they hide themselves in the day time, inhabiting the shadowy places, to avoid the annoyance of flies, and feed only during that time in the night. Their new horns come forth like bunches at the first, and afterward by the increase of the Sun's heat, they grow more hard, covered with a rough skin, which the Hunters for honours fake call a Velvet head, and as that skin dryeth, they daily try the strength of their new head upon trees, which not only scrapeth off the roughness, but by the pain they feel in rubbing them, they are taught how long to forbear the company of their fellows; for at last, when in their chafing or fretting of their new horn against the tree, they can no more feel any smart or grief in them, they take it for high time to fortake their solitary dwellings, and return again to their former condition, like one that is supplied with new arms, after the loosing of his old. The tender and new horns the Germans call Marchi, and Kolben: these being taken from the Beatt, are accounted among great Noble men a delicate dish of meat. Cyprius saith to have a Hart with four horns, which was called Nicerous, and by him dedicated to Apollo, which I do therefore remember in this place, because it is seldom seen, that an Hart can bear naturally above two horns. Authors do generally affirm, that when a Hart hath lost his horns, he hideth them in some secret places, because he understandeth some secret vertues are contained in them, which mankind seeketh for, and therefore he either envyeth the good of another, or fearing lest they bewray him hereafter to Hunters, taketh the best care and providence his defcription can afford, that they never come to the handling of men. When the people asked Apollo, what they should do with Protes their Tyrant, the Oracle answered, that he should go to that place where Harts cast their horns: whereby it was gathered, that he should be flain and buried in the earth, and this caused the Proverb, Ubis est abjicitur cornu, to signify a desperate busines: yet could it not be agreed, whether the Hart make more account of his right horn or his left, and therefore Arifiole affirmeth, that the left horn is never found; and Pliny, that the right horn is never found.

This difference may be reconciled with ease, for right and left are so earneum for three causes, or three manner of ways. First, properly in all creatures, according to the beginning of motion. Secondly, for similitude or likenesses, as the right and left side of Images, statues, &c. Thirdly, improperly when the right side of one thing standeth against the left side of another, being opposite, as when two men stand face to face, and by this reason may the left horn of Arifiole, and the right horn of Pliny signify all one thing: but we know that the horns of Harts are found yearly both in Fields and Woods.

The wilde Harts of Sarmacia neere Turkie, have the greatest horns of all other, for it hath been proved, that one pair of them have weighed forty pounds Troy weight and above: and there they lose their horns in March, neither do they fall off together, but first one, and then the other, and after the first falling, it is manifest, that a certain worm getteth on them, and maketh upon them many circles and little furrows, whereby the root or baits is weakened, the horn groweth very white in that place, and yet not without some appearance of blood remaining, which cleaveth to it, from the first falling off: for, when the head of this Beatt is disarmed, there issueth blood from the skull, and in appearance the naked place is like a wound, and yet it is wonderful to mark, that within those three days the same is heald and filled with the blood which congealeth in that place first to a finew, and afterward to a hard bone, so as in August at the farthest, the horns are perfect; and therefore the Egyptians to describe a long-lived man, picture a Hart losing his horns every year, and now coming in their place. If any man be defirous to know the reasons, why only Beats of this kind lose their horns in this manner; I will not spare my pains to set down the beef, which Authors have rendered for this wonder of nature.

First, because of the matter whereof they confist, for it is dry and earthy like the substan ce of green leaves, which fall off yearly, wanting gleweing or holding moisture to continue them; and for this cause the horn of a Hart cannot be bent. Secondly, from the place they grow upon, for they are not rooted upon the skull, but only within the skin. Thirdly, from their efficient caufe, for they are hardened both with the heat of Summer and cold of Winter, by means whereof the pores to receive their nourishment liquor, are utterly shut up and stopped, so as of necessity their native heat dyeth, which
Which falleth not out in other Beasts, whose horns are for the most part hollow, and fitted for longer continuance; but these are of leffers, and the new bunches swelling up toward the Spring, do thrust off the old horns, being held either by the bougets of trees, by the weight of the hornes; or by the willing excusion of the beaith that beareth them. Domenicus and other (as Glinus and Achelans) give other reasons, but because they seem to be far fetched, I will omit them. Yet by the way, it is to be noted, that if a Hart be lidded or gelded when he is young, he never beareth horns, or very small ones; and if his horns be upon him at the time of gelding, they never waxe less, or greater, or fall off. The Hindes never bear horns at all, as some have affirmed, but I rather believe, Cæsar, Mercurianus, and Zemesius, who affirm upon their knowledge, that Hindes in some Countries have horns like the males: as likewise is observed in the Elephants of India. and for this cause the Poets expressed the Hinde which nourished Telepus with horns, and that which Hercules took with golden horns, and it is for certain, that in Ethiopia and Lybia, both sexes have horns.

The face of this beaith is shewy, his nostriles flar, and his neck very long; his ears; some greater, and some smaller; but in the Mount Elephas and Helpefns, they are fit. It is observ'd, that when a Hart pricketh up his ears, he wandeth sharp, very far and sure, and discovereth all treachery against him, but if they hang down and wag, he receiveth no danger. By their teeth is their age discerned, and they have four on both fides, wherewith they grinde their meat, and besides two other much greater in the male then in the female, and they bend downward to bite withall. All these beades have worms in their heads bred underneath their tongue in a hollow place, where the neck-beane is joyned to the head, which are not bigger then such as flies blow in rotten flie. They are ingendered together one with another, and they are in number twenty, as some would have it; but I was given to understand, that he that found a head of this Beait dissection, wherein were many more Wormes; and not contained in one place, but spread all over the head.

The breath is by the French-men called peculiarly Hampan, his blood is not like other Beasts, for it hath no Fibres or small veins in it, and therefore it is hardly concealed. His heart is very great, as it so falleth out in all fearful Beasts, having in it a bone like a Cross, as shall be afterward manifester. His belly is not of one fashion, as it falleth out in all other which chew the cud.

He hath no galls, which is one cause of the length of his life; and therefore also are his bowels so bitter, that the Dogs will not touch them, except they be very fat. The Aehlian Harts are said to be not so fat in their tails; and others say, that Harts have a gall in their ears. The Harts of Brillem and Ibarne, have their reins quadrupled or four-fold. The genital parts is all nervey, the tail small; and the Hinde hath udders betwixt her thighs with four spears like a Cow: Both male and female are wonderfull swift, and subtle, as shall be shewed in the discourse of their hunting. They are also apt and cunning to swim, although in their swimming they fee no land; yet do they wind it by their notes. They chew the cud like other Beasts. It is reported, that when a Hart is stung by a Serpent, that by eating Elaphoson; (that is, as some call it, Harts-eye; other Harts-thorn, or grace of God; others Wilde Ditan) it presently cureth the wound, and expelleth the poison: the same vertue they attribute to Paphadie, against the wound of a Durt.

Having thus entred into mention of their food, it is to be farther observed; that the males of this kinde will eat Dwawl or Night-shade, which is also called Deafs herb; and they also love above all other food wild Elde, so in the Summer time they keep for the most part in those places where these plants grow, eating the leaves only; and not the boughes or sprigs: but the Hinde will eat neither of both, except when the heat of a male in her belly, and then also by secret instinct of nature, the feedeth like a male. They will also eat Serpents, but whether for hatred to them, or for medicine they receive them, it is questionable. A Hart by his nose draweth a Serpent out of her hole, and therefore the Grammarians derived Elaphos, a Harts, from Elaminio tout opsius, that is of driving away Serpents.

I cannot afford to the opinion of Aelianus, that affirmeth the Serpents follow the breath of a Hart like some Philistre or amorous cup, for seeing that all Authors hold an holliety in nature betwixt them, it is not probable, that the Serpent loveth the breath of a Beait, unto whose whole body he is an enemy, with a perpetual antipathy. And if any reply, that the warm breath of a Hart, is acceptable to the cold Serpent, and that therefore the followeth it, as a Dog crepeeth to the fire, or as other beastes to the beams of the Sun; I will not greatly gain-fay it, seeing by that means it is most clear, that the breath doth not by any secret force, or vertue, extract, and draw her out of the den, but rather the comonquant quality of heat, which is not from the secret fire in the bones of the Harts throat, (as Pliny hath taught) but rather from her ordinary expiration, inspiration, and respiration. For it cannot be, that seeing all the parts of a Serpent are opposite to a Hart, that there should be any love to that which killeth her.

For my opinion, I think that the manner of the Harts drawing the Serpent out of her Den, is not as Aelianus and Pliny affirm, by feeding into the Cave a warm breath, which burneth and scorcheth the Beait out of her Den; but rather when the Hart hath found the Serpents nest, he draweth the air by secret and violent attraction out from the Serpent, who to save her life followeth the air out of her den, as when a Vessel is broach'd or venter'd, the Wine followeth the flying air; and as a Capping-glass draweth blood out of a seantifie place of the body; so the Serpent is drawn unwillingly to follow her destroyer, and not willingly, as Aelianus affirmeth.

Unto this opinion both Oribasius in his Commentaries upon the Aphorisms of Hippocrates, and Gruiterius his referrer do joyntly agree: but the Serpent being thus drawn forth, addeth
greater force to her poyson, whereupon the proverbial admonition did arise. 

Cave ne insidiae in serpentibus, cum estrella a lataribus abcelli corvi effugeris, ut enim poppet fracionum subeminent et venenum eun, that is, Beware thou meet not with a Serpent drawn out of her hole by the breath of a Hart, for at this time by reason of her wrath, her poyson is more vehement. After this fell fame manner, do the Sea-Rams, draw the Sea-Cats hid in the Subterraneous Rocks; for by smelting they prevent the Air that should come unto them for refrigeration.

There is many times strange conflicts betwixt the Hart and the Serpent, thus drawn forth; for the Serpent seeing her adversary, lifteth her neck above the ground, and gnatheth at the Hart with her teeth, breathing out very bitter hittings: on the contrary, the Hart derideth the vain endeavour of his weak adversary, reader to fight then powerful to harm him, sufferrith him to embrace both his neck and legs with his long and thin body, but at an inffant teareth it into an hundred pieces. But the most strange comates are betwixt the Harts and Serpents of Lybra, where the hatred is deeper; and the Serpents watch the Hart when he lyeth a sleep on the ground, and being a multitude of them, lay upon him together, softening their poysonful teeth in every part of his skin; some on his neck and breast; some on his sides and back, some on his legs, and some hang upon his privy parts, biting him with mortal rage, to overthrow their foe.

The poor Hart being thus oppressed with a multitude, and pricked with venemous pains, affayeth to run away, but all in vain, their cold earthy bodies and winding tails, both over-charged his strength, and hinder his pace: he then in a rage with his teeth, feet, and horns assailth his enemies, whole spears are already entred into his body, taring some of them in pieces, and beating other afunder: they never the less (like men) knowing that now they must dye rather than give over, and yeeld to their pitifuls enemy, cleave fast, and keep the hold of their teeth upon his body, although their other parts be mortally wounded, and nothing left but their heads, and therefore will dye together with their foe, seeing if they were afunder, no compaision can delay or mitigate their natural unappeasable hatred.

The Hart thus having eafe himself by the slaugther of some, (like an Elephant) at the fight of their blood, bethreith himself more busily in the eager battail, and therefore tredeth some under foot in the blood of their fellows, other he peruenct with rooth and horn, until he fee them all destroyed; and whereas the heads hang faft in his skin, for avoiding and pulling them forth, (by a divine natural instinct) he lyeth or runneth to the waters, where he findeth Sea-Crabs, and of them he makeeth a medicine, whereby he slacketh off the Serpents heads, cureth their wounds, and avendeth all their poyson; this valiant courage is in Harts against Serpents, whereas they are naturally afraid of Hares and Conies, and will not fight with them.

It is no lea strange that Harts will see Serpents, but the reason is, for medicine and cure; for sometimes the pors of his body are dulled and stubbed; sometimes the worms of his belly do ascend into the roof of his mouth, while he cheweth his cud, and there cleave fast: for remedy whereof the Hart thus affected, runneth about to seek for Serpents; for his devouring of a Serpents is a cure of this malady.

Pliny faith, that when the Hart is old, and perceiveth that his strength decayeth, his hair change, and his horns dry above custom, that then for the renewing of his strength, he first devoureth a Serpent, and afterward runneth to some Fountain of water and there drinketh, which caueth an alteration in the whole body; both changing the hair and horn: and the Writer of the Glofs upon the 42. Psalm, which beginneth, Like as the Hart desirseth the water sprayings, so longeth my soul after God's confirmation this opinion.

Vincentius Belloeucenius affirmeth, that Harts eat Serpents for to cure the dimness of their eye. But for the ending of this question, we muft confider that there are two kindes of Harts; one which by the drawing forth of a Serpent out of her hole, doth presently kill her by flaming her under feet, this eateh that Serpent, and runneth to springing water, after that he feelcth the poyson to make his body dull, and then by drinking doth vomit forth the poyson, and in the mean time looth both hair and horn; yet the Monks of Mofea affirm, that the Harts thus poysoned doth only cover her body in the cold water, and not drink thereof; for that were extaile unto her; but the feendeth forth certein tears, which are turned into a stone, (called Bezzah) of which shall be more said hereafter. The other kindes of Harts, when he findeth a Serpents, killeth it, and doth not eat it, and immediately after the vierry returneth to feed in the Mountains.

Harts are opposed by Wolves, for many Wolves together doth overcome a Hart; and therefore it is but a fable of Strabo, that the Wolves and Harts live tame together in the Woods of the Vneti. These kindes of Wolves are called Thor, and they especially fear these Wolves when they have loft their horns, and feedeth only in the night season, which caused Ovid to write thus;

Visa fugit nympha, velut perterrita fulvum
Cervum lupum, Crv. 06.

They are afraid also of the first and second kindes of Eagles, for with their wings they raise much dust about the Harts, and then they being halft blinde, the Eagles pull out their eyes, or else to beat their feathers about their faces, that they hinder their flight, and cause them to fall down headlong from the Mountains: they fear also the ganning of Foxes, and the Lynxes do likewise lye
of the Hart and Hinde.

When in wait to hurt them. There are above all other four-footed Beasts both ingenious and fearful, who although they have large horns, yet their defence against other four-footed Beasts is to run away. For this cause, in ancient times a fugitive Boy or Servant was called a Hart; and if he ran away twice, Cambanias, which Cambanias was a Spartan fugitive, that first ran to the enemy, and afterward from them came back again to Sparta. And Martial thus describeth Albéar, who being overcome by Philip King of Macedon ran away like a Hart.

The Epithets expressing the qualities of this Beast are many: as nimble, or agile, winged, or swift-paced, full of years, quick-footed, horned, wandering, fearful, flying, fugitive, light, wood- hunter, wise and lively. There are of them very audacious, for they will let upon men as they travel through the Woods: and it is observed, that the wrathful Hart hath few bunches on his horn, neither is it so long as others, but bunches at the root; yet all of them being pressed with Dogs or other wide Beasts, will fly unto a man for succour.

It is reported by Phìlìp Ideals Thbon, that in Lokba (a town of Saxoniy) there was a Hart, which before running time would every year leap over the walls, and run over Rocks and Mountains, and yet return home again, until the time that Duke Frederick dyed, and then the Hart went forth, but never returned again. The male when he feeth himself fat, liveth solitary and secret; because he knoweth the weight of his body will easily betray him to the Hunters, if he be hunted and purfued. The female commonly calveth seven the high ways, of purpose, to avoid noisome Beasts to her young one, who do more avoid the flight of man than herself. Also it is reported, that Mithridates had a Bull, a Horfe, and a Hart, for his guard, befide men, who were not to be bribed to fuffer Traytors to kill him, being a fleep. Moreover it is faid of Pelomenius Philadelphus, that having a Hinde-Calf given unto him, he brought it so tame and accustomed it to words, that at length it seemed to understand the Greek language: And Ælianus affirmed that many of the Harts of India, for that language.

When they are wounded with a Dart, and having gotten it out of their body by eating Dittany, they most carefully avoid the Sun-beams; left they shine upon the green wound, for then it will hardly be cured: but above all other arguments of their understanding, none is more firm and evident, than their fumming; for the Harts of Amanthus, Ælianus, and Carnef, (Mountains of Sibyl) when they are to swim over the Sea, to the fruitful green trees of Cypris, they come down to the Sea-shore, and there they tarry till they receive a fUCCESSful wind, and a calm water; which happening, the Captain or leader of them doth first of all enter into the water, and so the next folumthet, laying his head upon the Captains buttocks, and so consequently all the residue refting their head upon the precedent. In the hindmoft are the youngeft and weakest, that fo the violence of the flood being broken by the fringer which go before, the more infirm which follow may pafs with lefs difficulty. Thus fial they along without ffar or compafs to direct them, except their own fene of fmalting, using their legs for Oares, and their broad horns for fails. And if the fformol be weary, then flippeh he back to reft his head upon the hindmoft, and fo likewise the fcond and third, as they fee themselves enfeebled, until they arrive at the happy port of good paffure; where growing stronger, like Beasts fall to fighing for rule and government, but when the combate doth the victor and strongest, the residue do ever after yeild obedience to him. In like fort do the Harts of Epifus swim to Corny, and of Cifatino to the ifland of Curatilces.

They are deceived with mufick, for they do love that harmony, that they forbear their food to follow it. Also it is amazèd at any strange finge, for if a Hunter come behind a Horfe or Bullock, laying over his back his Bow and Arrows, they fland fmarling upon the new formed Bealf, until the Dart do end their lives.

At the time of their huf or rutting, they are above measure fierce, fighting naturally for the female, and sometimes wounding one another to death; and this falleth out most commonly in the latter end of August, at which time Artbana rifteth with the Sun, and then it is moft natural for the Hinde to conceive. In some places in October their huf arith, and also in May; and then whereas at other times the males live a part from the females, they go about like lafioious winters, feekng the company of their females, as it were at the Market of Venus.

The males in their raging defired huf, have a peculiar voyce, which the French call by a feigned word Revee; and the Germans, Bruni; and the Latins cauant Remover; and the Beafs so affected Obygione. When they finde the females, they are received with fear, then in short space one male will cover many females, continuing in this carnt appetite a month or two: their females do admit coquett, being herein like unto Cows, by reafon of the rigour of the males genetic: and therefore they fink down on their Bullocks when they feel the genital feed, as it hath been often observed in tame Harts, and if they can, the females run away, the males driving to hold them back within their fore-feets: but surely herein they differ from all other: it cannot well be faid that they are covered banding, lying, or going, (but rather running) for so are they filled with greatest celerity.

The History of Four-footed Beasts.

When one Month or six Weeks of their rutting is past, they grow tame again, laying aside all fierceness, and return to their solitary places, digging every one of them by himself a several hole or Ditch, wherein they lie, to allaw the strong favour of their hurt, for they stink like Goats, and their face beginneth to wax blacker then at other times; and in those places they live, until some flowers distill from the clouds; after which, they return to their pasture again, and live in flocks together as before.

The female being thus filled, never keepeth company with the male again until her burthen be delivered, which is eight months; for lo long doth the bear her young: before her Calving, the purgeth her self by eating Selena or Stir of the Mountain; and whereas the never purgeth until that time, then the emptieeth her self of pitiforous and flegmatic humour.

Then go they to the places near the high ways, and there they call forth their Calf, (for the caufes aforefaid) being more afraid of wide Beasts then Men, whom she can avoid by flying: which when they have feen, hem they and eat the Selena aforefaid, and the skin which cometh forth of her owne wombe covering the young one, finding in it some notable medicine, which the Græci caull Chorton, and not the herb Artem. and this she doth before the eye done to give her young one suck, (as Pliny affirmed.)

They bring forth one, or very seldom two, which lobby in a safeable fit for them of their own making, either in some rock, or other bulky inaccessible place; covering them, and if they be stubborn and wide, beating them with their feet untill they lie close and contented. oftentimes the leadeth forth her young, teaching it to run and leap over busses, stones, and small shrubs against the time of danger; and so continueth all the Summer time, while their own strength is most abundant: but in the Winter time, they leave and forfake them, because all Harts are feeble in the Winter season.

They live very long, as by experience hath been often mentioned; not only because they have no gall (as the Dolphin hath none) but for other caufes: also some affirm, that a Raven will live nine ages of a Man, and a Hart four ages of a Raven: whereunto Virgil agreeeth in these vers.

The history,

The Hart's

That is, as the life of a man is thenceforth and fix, so a Raven doth live nine times fo many years, (viz.) 528 years. The Hart liveth four times the age of the Raven, (viz.) 2112 years. The Crow exceedeth the Hart three times, (viz.) 6336. But the Phænta which is repaired by her owne athes, furmounteth the Crow nine times and lo liveth 37524 years. The which l have set down (not for truth) but for report, leaving every reader to the cheifiel matter of credit, as in his owne discretion he conceiveth most probable.

It is confecrated of all, that Harts live a very long life: for Pliny affirmeth, that an hundred years after the death of Alexander Magnus, there were certain taken alive which had about their necks golden Collars, with an infringement that they were put on by Alexander.

In Calabria (once caull'd Iapygia and Prouenia) there was Collar taken off from the neck of a Hart by Agathocles King of Sicily, which was covered with the fleft and fat of the Hart; and there was written upon it Didoones Diana: whereby it was conjectured, that it was put on by him before the siege of Troy; for which cause, the King brought the fame and did offer it up in the Temple of Jupiter.

The life was in Acedia, when Arteolus dwell in Lynceara; for he confidentely affirmed, that he saw an old scarfed Hinde, which was dedicated to Diana, having this inscription in her Collar: Nektos omnem dedit et Illin am Agapen. When Agape natured in Troy, then was I a young Calf taken. By which it appeareth, that a Hart livest longer then an Elephant, for indeed they live long before they grow to any perfection, their youth and weakefnes cleaving falt unto them, fo is it given to them to have a longer life, for continuance in ripeness and strengthe of years.

These Beasts are never annoyed with Feneas, because their fleeth allayeth all adventitious and extraordinary heat. If he eat Spiders he intantly dyeth thereof, except he eat also Wilde Ivie, or Sea-crabs. Likewise Naven-gentil and Oleander, kill the Hart. When a Hart is in his chafe, he is greatly pained in his bowels, by reason that the skin wherein they lie is very thin and weak, and apt to be brokenn with any small stroke: and for this caufe he often flayeth to ease himself.

There is a kinde of thorns called Catus, wherewithall if a young one be pricked in his legs, his bones will never make Pipes. Befides these Beasts are annoyed with Seals and Itches in their heade and skin, teared by the French by a peculiar name (Foyer): I will not stand upon the idle conceit of Albertus, that Wafpes and Emmets breed in the heads of Harts, for he multaketh them for the worm, before mentioned.

The skins of this Beall are used for garments in some Countries, and in most places for the bottoms of Cuffions, and therefore they chufe such as are killed in the Summer time, when they are fat and moist spotted; and the fame having their hair pulled from them, are used for Breeches, Buskins, and Gloves. Likewise Pliny and Sueton affirmed, that if a man fliep on the ground
Of the Hart and Hinde.

And the bosome of young ones are applied for making of Pipes. It is reported, that the blood of Harts burned together with herb-dragon, oranches, orgament, and mustick have the fame power to draw Serpents out of their holes, which the Harts have been alive: and if there be put unto it holy Pelitiracy, it will also distract and dissipate them again.

The head and tail of a Dragon, with the hair of a Lion taken from between the brows, and his marrow, the froath or white-mouth of a victorious Horfe, the nails of a Dog, and the nerves of a Hart and a Roe, bound up all together in a Harts skin: and this is as true as the wagging of a Dogs tail doth signify a tempest. To leave these trifles scarce worthy to be rehearsed, but only to shew the vanity of men, given over to lying devils; let us come to the other natural and medicinal properties not as yet touched.

The use and benefit of the flesh.

The head and tail of a Hare or Cony have the power of Triacile for expelling of evil humors, but the Liver is intolerable in food: the horns being young are meet for Princes, especially because they avoid poison. It was a cruel thing of King Ferdinand, that caused the young ones to be cut out of the Dams belly and baked in Pailsies, for his liquorous Epicureal appetite.

The whole nature and disposition of every part of this beast is against poison and venemous things (as before recited). His bloud itayeth the loosenes of the belly and all fluxes, especially fried with Oile, and the inferior parts anointeth therein, and being drunk in Wine it is good against poisoned wounds and all intoxications. The marrow of this beast is most approveable above all, and is used for sweet odour, against the Gout, and heat of men in Confusions, and all outward pains and weakness, as Servius comprized in one sentence saying:

Et cervina potest nulceare medulla rigorem

Like wise
Likewise the fat and marrow, mollifieth or disperseth all buncches in the flesh and old swellings; all Ulcers except in the fins and legs, and with Venus-navil, the Fistula, matterly Ulcers in the ears, with Rozen, Pitch, Goose-grace, and Goat-sweat, the cleaving of the lips: and with Calves sweat, the heat and pain in the mouth and jaws. It hath also vertue being drunk in warm water, to affwage the pain in the bowels and small guts, or Bloudy flux.

The gall of a Bull, Oil of bayes, Butter, and this marrow, by anointing, cureth pain in the knees and loins and other evils in the feet of man, in the hips, and in the belly when it is colitive: it procureth flowers of Women, cureth the Gowt, Pimplies in ones face, and Ringwormes. *Ashnut* prescribeth it to be given in sweet wine with wax, unto a Horse for an old Cough proceeding of cold, after purging and heating, by holding the Horse's tongue in ones hand while the medicine is thrust down his throat.

The fame in Sheeps milk with Rubrick and soft Pitch, drunk every day or eaten to your meat, helpeth the Puflick and Obftructions. *Anatolius* approved Bean meat sifted and sod with Harts marrow to be given to a Horse which flatten bloud for three daies together. Also mingled with the powder of Oylter fheils, it cureth Kibes and Chiblaines. A woman perfumed with the hairs of this beast, is preferred from abortements; and the fame perfume helpeth the difficulty of urine, and little pieces cut off from the hide with a tammifie put in water, and rubbing the body, helpeth the holy-fire. The powder of the bones burned, is an antidote against the falling evil, and the dispersing of the milt; and the bones beaten to powder, layeth the Flux of the belly.

It were endless to describe all the virtues ascrib'd to the horn, and therefore I will content my self with the recital of few. *Pliny* and *Salinus* prefer the right horns, *Aristotle* the left, and the spires or tops are more medicinal than the hard and folide ftem, but the horns found in the Woods loot by the beales and grown light, are good for nothing. The other have their uses both raw and burned, which may be thole which follow.

Take the horn and cut it into smallest pieces, then put it into an earthen pot anointed within with durt, and fo let it in a furnace untill it become white, then waft it like a mineral and it will help the running and ulcers in the eyes; and the fame also keepeth the teeth white, and the gums found. The young horns while they be soft being eaten, are an antidote against Henbane and other poisonfull herbs. The right horn hid by the Hart in the earth is good against the poison of Toades. The Harts horn hath power to dry up all humors; and therefore it is sold in eye falver; and *Orphius* promiseth to a bald man hair on his head again, if he anoint it with oil and powder of this horn: likewise the fame with the seed of black mirtle, Butter and Oil, restraineth the falling away of the hair being anointed upon the head after it is newly shaven: with Vinegar it killeth Ringwormes. The fame burned in the Sun, and afterward the face being rubbed and washed therewith thrice together, taketh away pimple-spots out of the face: the powder drunk in wine or anointed on the head killeth lice and nits; the fame with Vinegar, Wine, or Oil of Rofes, anointed upon the forehead, eatheth the head-ach if it proceed of cold.

A perfume made of this horn with *Caffronum*; and Lime or Brimstone, caufeth a dead childe strangled in his mothers womb to come forth; if the horn be taken raw and rubbed upon the gums, keepeth the cheeks from all annoyance of the tooth-ach, and falteneth the loofe teeth, as *Serus*us said:

Quad vero assumpsit ,notus de dente fricando
Cervino ex cornu cina efc.

*Galen* preferibilith the powder of this horn for the Jaundife, and for him that spitteth bloudy matter, and to stay vomit being taken in a reere Egge. It comforteth also a rheumatick stomach, and it is tried to cure the Kings evil, it pacifieth the milt, dryeth the Spleen, driveth all kind of Wormes out of the belly, being drunk with hony, and eatheth the Colick, expelleth away mothers, helpeth the Strangury, and the pain in the bladder, layeth Fluxes in women both white and red: being mingled with Barly meal, water, and twigs of Cedar, benefite many other such properties.

The tears of this beast after the hath been hunted with a Serpent, are turned into a flone (called *Blechabad*, or *Beclab*) of which we have spoken before: and being thus transubstantiated do cure all manner of venom (as *Avenciot* and *Cardinal Paczetti* affirm) after many trials, and *Serus*us also expresseth in this Difficjon:

Seminae*is cervi lacrymama mistere liquori
Conservat, atque aequat illine mi fconere calcutes.

The liver of this beast helpeth all fores in the feet, being worn in the shoes, the fame dried to powder with the throat or wind-pipe of the beast, and mingled with Hony, and so eaten helpeth the Cough, Puflick, fishing and short breathing. *Pliny* and *Sextus* affirm, that when a Hinde perceiveth herfelf to be with young, the devouereth or eateth up a certain flone, which is afterward found either in her excrements or ventricile, and is profitable for all Women with childe and in travel, for by that only fact, the Hinde is most speedily delivered without great pain, and feldome or never suffering abortment; and there is also a little bone found in the heart of every one of these
thee beasts, which perfiormeth the fame qualities, in head whereof they have such a thing to sell at Venice, holding it at great price: but Bradfow affirneth, that he opened the hearts of two Harts, and found in them a little gristle not much unlike to a crottle, whereof the one being of a Beast new killed, was very soft, but the other was much harder, because the beast was slain about six days before.

This bone is in the left side of the heart, upon which the Spleen moveth and sendeth forth her excrements by vapors, which by reason of their drieenes are there turned into a bone, and being first of all the lubstance of the Harts bloud: and it is good against the trembling of the heart, and the Hemorrhoides, but this bone cannot be found in any, except he be killed betwixt the middle of August and the twelfth of September.

The skinny feed of the Hind-Calf, is above all other commended against poison; and the Plateriat bittings of Serpents and of mad Dogs; likewise it stayeth all Fluxes of bloud, and spitting of bloud, and ejection of bloud: and it being eaten with Beets and Lentils, is profitable against the pain of the belly. The genital part and ilones are wholesome (being taken in wine) against all bittings of Vipers, Adders, and Snakes, and the fame virtue hath the natural feed lipped up in a rare Egg.

The genital hath also a virtue to encrease lust in every creature, it being either dried and drunk; or else bound fast to their privie parts. Likewise being warmed in water, and afterward dried to powder and so drunk, helpeth the Colick, and the difficulty of making water, if you put it into a little Treira.

The dung of Harts cureth the Droptie, especially of a Sublon or young Hart: the urine easeth the pain in the Spleen, the wind in the ventericles and bowels, and influted into the ears, healeth their ulcers. In the tip of the tail lyeth poison, which being drunk, causeth extasie and death, if it be not helpt by a vomit made of Bitter, Annife, and oil of Jefamine, or as Cardinall Penetraius taff, that the Harts eye is an Antidote to this evil: it may be known by a yellowish-green colour, and therefore it is called the gall, for nature hath appointed that place to receive all the venom of the whole Body.

I should here end the discourse of this beast, after the method already observed in the precedents: but feeing the manner of the taking hereof (being a sport for Princes) hath yet been touched but very little, it shall not be tedious unto me, to abfain from the necessery relation of the subfquent stories, for the delightful narration of the hunting of the Hart: to the end that as the former creatife hath but taught how to know a Bird in a bush, that which inueret may declare the feveral ways of catching and bringing the fame to hand.

This is a beaft standing amazed at every strange sight, even at the hunters bow and arrow, coming behind a flaking Horfe (as is already declared:) and moreover, like as the Roses are deceived by the hiffing of a leaf in the mouth of the hunter, fo alfo is this beaft, for while the hearkneth to a strange noife, imitating the cry of a Hind-Calf, and proceeding from one man, the receiveth a deadly stroke by the other: fo alfo if they hear any musical pippings, they stand still to their own destruction: for which caufe the Egyptians decipher a man overthrown by flattery, by painting a Hart taken by mufick; and Varro relateth upon his owne knowledge, that when he flopped in his Lordship bought of M. Fis, the Paltour or Forreftier after supper, took but a Harp in his hand, and at the found hereof, an innumerable flock of Harts, Boars, and other four-footed beafts came about their Cabenet, being drawn thither only by the mufick; in fo much as he thought he had been in the Roman Circus or Theater, beholding the playing spectacles of all the African beafts, when the Eddition Officers have their huntings: the like is also reported by Elisanius, faying that he addeth, that no toil or engine is fo affured or unavoidable to draw these beafts within a labyrinth as is mufick, whereby the Hunter geteth as it were the Hart by the ear, for ifthrough attention he hold down his ears as he doth in mufick, he driuifteth no harm, but if once he prick up his ears as he commonly doth, being chased by men and dogs, an infinite labour will not be fufficient to overtake and compafs him. It is reported that they are much terrified with the sight of red feathers, which thing is affirmed by Animus in thefe Verfes:

**Of the Hunt and Hinde.**

An curr fratre uiger dum eaper ania cerros
Circundis oscule, & multa indagine penne.

And Ovid alfo faying,

**Nec formidatis cerros includite peninis.**

And Lucan alfo;

**Sic dum pavidos formidinum cerros**
**Claudae etate mucutens aera penne.**

Of which thing the Hunters make an advantage, for when they have found the beaft, they let their nets where they imagine the beaft will flie, and then one of them sheweth to the beaft on the other side, the red feathers hanging on a rope, which scareth them in haste into the Hunters nets,
as S. Jerome tells thee in one of his Dialogues, saying,  Et aliarum morum cerebrum, dum vos potestas evincias solutus fortis immissus tibi locum commimini. And you, faith he, (speaking to the Lucifelian heretics) run away from the vain shaking of feathers, like the fearfull Harts, while in the mean time you are incloped in unavoidable and inextricable nets. And this caused Seneca to write, that the babe feareth a shadow, and wilde beasts a red feather.

Many times the young Calf is the caufe of the taking of his Dam: for the Hunter early in the morning before day light, watcheth the Hinde where the layeth her young one, until she go and refresh her self with palture; when he hath seen this, then doth he let loose his Dogs, and maketh to the place where the Hind-Calfe was left by his mother.

The silly Calfe lyeth immovable as if he were fastened to the earth, and so never flirring, but bleating and braying luffereth himself to be taken, except there be rainy weather, for the impatience of cold and wet will cause him to shift for himself: which if it fall out, the Dogs are at hard to overtake him, and so being taken is committed to the keeper of the nets.

The Hinde both hearing and seeing the thraldom of her poor fon, cometh to relieve him, without dread of Hound or Hunter, but all in vain, for with his dart he also poiffeleth himself of her; but if the Calfe be greater, and so be able to run with the Dam among the herds, they are mow hard to be taken, for in that age they run very fast, and the fear of Dogs increaseth their agility, in so much as to take them among the herds is impossible, every one fighting for them.

But the only way is to single one out of them from the flock, and so follow him until he be weary, for although he be very nimble, yet by reason of his tender age, his limbs are not able to continue long. The elder Harts are taken in snares and gins laid in ditches and covered with leaves, whereby the feet of this beast is snared in wood; this kind is described by Xenophon and Pallas, and is called in Greek, Polldirade; in Latin, Pedias, of which also the Poets make mention, as Virgil:

_Tune gruibus pedicat & reaia ponerre cervis._

And this kind is better described by Gratius, with whose words I will passe it over as a thing out of use.

_Nam fuit & laequis aliquis curvatis uinae.  
Cervino isere magis contraere nerva,  
Quidque dentatus ilignum robere clausit;  
Sepe habet imprudens alieni lucra labiris,  
Fraus tegit infulum habuit mentita serino  
Venator pedius, cum dissimilantibus armis._

Their manner is when they are chaced with Dogs to run away with speed, yet oftentimes stand still and look back, not only to hearken to the hunter, but also to rett themselves, for in their chase they are ever troubled in their belly (as is before declared) and sometime they grow so weary, that they stand still, and are pierced with arrows, sometime they run till they fall down dead, sometime they take themselves to the water and so are refreshed, or else to avoid the teeth of Dogs, they forfake the dry land, and perish in the floods, or else by that means escape footfree: wherefore it must be regarded by every good hunter to keep him from the waters, either among the woods or other rough places.

But herein the subtility of this beast appeareth, that when he is hunted, he runneth for the most part to the high ways, that so the favour of his fleps may be put out by the tredings of men, and he avoid the prosecution of the Hound. Their swiftnesse is so great, that in the Champaigne and plain fields they regard not Dogs, for which cause in France they poison Arrows with an herb called Zerium or Toca, and it is a kinde of Assenitis or Wolf-bane, which hath power to corrupt and destroy agility of body, and to stay celerity, and for their hunting in France by Dogs, it is most excellently described by Budoes and Robertus Stephanus in his French Dictionary.

This wilde, deceitful and fubtile beast, (say they) by windings and turnings do often deceive their hunter, as the Harts of Meandroes flying from the terrible cry of Dianates hounds, wherefore the prudent hunter must frame his Dogs, as Pythagoras did his Scholars, (Lucrez qui ne partent point) with words of Art, to set them on, and take them off again at his pleasure, wherefore he must first of all compass the beast, (En fan gifte) in her own lodging, and so raise her up in the fight of the Dogs, that so they may never lose her footing.

Neither must they set upon one, either of the herd, or that wandereth solitary alone, nor yet a little one, but partly by aspect or fight, and partly by their footings in the fow earth, and also by their dung (Les fumet) they judge of their game, for a good Woodman must not flick to gather up the Deers excrement or soil, and keep them (La trempes) in his hunting horn: such things must the Kings hunteynen and foresters observe, as also the quantity of his bed or lodging when they finde it; being thus informed of their game, then (Disoppel les oitem) they take off their Dog couplings, and some on horseback, other on foot follow the cry with greatest art, observation,
Of the Hart and Hinde.

Of the Hart and Hinde.

the Hart, with all dexterity to leap hedge, pale, ditch, and rocks; neither fearing thorns, woods, down-hills, but providing a fresh horse in cave the first tire, (Chevaux de relais) and leaping on him with speed, until he see (un grand cerf l'ecoyer du grand cerf) the great Hart having ten spears on his horns, and his little squire-hart to attend him, which the Dogs once perceiving, only follow the great Hart, taking for a prohibition to follow any other.

The Dogs are animated by the winding of horns, and voices of the hunters, like Souldiers to a battle by the voice of a trumpet and other instrumens: but sometimes the crafty great beast fenteth forth his little squire to be sacrificed to the Dogs and Hunters in head of himself, lying close in the main time, then mult the retreat be founded, (Rumpre le cier) the Dogs be broken off and taken in (Le limier) that is, leave again until they be brought to the fairer game, who aritheth in fear and rage, betaking himself to his forefoot legs, being purfued with all the cries of Hunters, ringing and echoing betwixt heaven and earth, defpaying him with the continual noise in his ears, no leffe dreadful and fearful then the voice of a paffing bell to a fick man, or the fight of the executioner to a condemned caitife, yet till he shriveth untill wearied and breathlesse, he be forced to offer up his bloud and fteeth to the rage of all the obfervant pedifquants of the hunting Gods Diana.

The vulgar fort call an old Hart a sutil and cunning beast, but the Nobles call him (sift sages) a wise Hart, who to avoid all his enemies runneth into the greatest herds, and so bringeth a cloud of error upon the Dogs, to keep them from any further prosecution: sometime also beating of some of the herd into his own footsteps, that so he may more easily escape and procure a labyrinth to the Dogs, and then after a little while he betaketh himself to his heels again, running full with the wind, not only for refrigeration, but because he may the more easily hear the voice of his pursuers, whether they be far or nere.

At last, being (for all this) found out again by the observance of the hunters, and skill of the Dogs, he flyeth into the herds of Cattel, as Kie, Oxen, or Sheep, leaping upon an Ox, and laying his body or the fore-part thereof upon him, as a rider upon a Horse, that so touching the earth only with his hinder hoofs, to leave a very small or no fent at all behind for the Hounds to discern.

The chief huntsman or {fergeant of the hounds unto Lewis the twelfth, called (Le grand veneur) affirmeth that on a time they having a Hart in chase, suddenly the Hounds fell at a fault, so as the beast was out of sight, and not a Dog would once flir his foot; whereas all the Hunters were amazed, like as in some jugling Apollonian trick, as though the hart had clean forsaken the earth, and with the wings of some fowl had been flown away; or as if the earth had opened her mouth to receive him into her prosecution, and had closed again over her head, or else some Witchcraft had call a mist before the Dogs and Hunters eyes: At last by calling about (as it is usual in such cafes) they found the fraud of the horned beast, which is worth the memory.

There was a great white thorne which grew in a shadowie steep place as high as a tree, and was inworned with other small shrubs about it, into which the said Hart leapt, and there stood aloft the boughs spreading from one another, and there remained, whether because he could not get off again, or else for that he was hired in that place, but sure he was there thrilth through and so died, and so had they all rather perish any other way then by the teeth and tearing in pieces of angry and greedy beasts.

Yet their maner is, that when they see themselves every where intercepted, to make force at him with their horns that cometh first unto him, except he be prevented by some sword or spear; which being done, the Hunter with his horn foundeth the fall of the beast, and then every one approacheth, huring with triumph for such a conquest, of whom the skillfullest openeth the beast, giving unto the Hounds such parts as belongeth to them, for their encouragement against another time; and for that purpose the Hunters dip bread in the skin and bloud of the beast, to give unto the Hounds their full satisfaction: and many such other things may the reader discern of this knowledge found in the Authors aforesaid, to whom I will commend him rather, then spend more time in this busines, better manifested by experience, then by any written document, yet I would with men to be sparing in this exercife, seeing it hath been seldom found that a man given to hunting, but he perished in his pleasure, as Albion did by his own Dogs: and therefore Alleius doth fitly compare together hunters and receivers of Theives and Robbers, calling them new Albions; who after they had receivd horns, must be destroyed by their own Dogs which they have nourished. The best ufe of these beasts is to keep them tame, as in Helvetia, where they hunt seldom, and to make use of them for nourishment rather then for sport, as it is reported of a holy man, who kept a Hinde so familiar with him, that in the Wilderness he was lived upon her milk.

Concluding this discourse with the words of the Poet, for the instruction of Dogs to this palethe and prudence of the beasts.

Sed frigifta oppositum trudentes pectora montem
Comminus obviamur ferro, graviterque rudentes
Cedunt, & magno laeti clamore repartim.

Of the DYCITIES.

Herodotus in his fourth book affirmeth, that among the African Shepherds toward the East there are bred in Baffaria Hystriches and Dyes, of which last there is not any mention among all other writers, except in Varinus and Hefychius, who affirm that among the Lacedemonians a Glead or Kite was called Dydu, but this spoken of Herodotus I conjecture to be some four-footed beast, being led with no other reason than that the other with whom he placed it, are generally known to be creatures of that kind and nature; wherefore I thought good to express the name of it in this place, desiring the Reader to accept so much thereof as is already known, and to search farther for the description of it, at the hands of them who are eye-witnesses of the wonders of Africa.

Of the DOG in general.

A Dog is called in Hebrew, Kebel; and Lemas according to Manster; in Chaldæ, Kalba; in Arabick, Kalbe; in Persia, Bag; the Saracens, Kip; or Keb; the Greeks, Kwin because of his love to man, and vulgarly at this day Skils and Skyle; the Malians, Spices; the Germans, Huns; the Italians, Canis; the French, Chien; the Spaniards, Perro or Cauvado, because his barking is as loud as an Artificial song, also Carthus, the Hyerns, Per or Pas; and the Latins, Canis.
Of Dogs.

There is no region or Countrey in the world, where these are not bred in some flore, as shall be manifested more at large, there are Dogs very great, some for hunting, some for War and defence, some for the Boar, Bull, or Bear, some for the Hare, Coney, or Hedge-hog: again some are smaller which are called Hounds, Bratches, Beagles, Shepherds Dogs, Hound-curs, Spannels both for the Water and Land; and some foiling Dogs for the pleasure of the rich.

In the first place there are to be handled the nature of Dogs in general, wherein they agree, and their common properties of nature, such as are not destroyed in the distinction of kinds, but remain like infaillible and invariable truths in every kind and Countrey of the world. To begin with that which is outward, it is to be observed that Dogs are generally rough, and their hair indifferently long (which in Winter they lose every year) is a signe of a good constitution; but if it grow over long, the mange-scar will follow: the outward proportion of the head altereth as the kind altereth, being sometime like a Lion, sometime like a Hedge-hog, some long with a broad snout, and sometime with a piked snout, but the brain decreaseth and increaseth with the Moon, there is no commissure or seam in his skull (like as is in a Mans) but it is a continued bone without separation inward or outward.

The best Dogs have flat nostrils, yet round, the mouth is long and slit, their teeth like faws, as it is in Fifthes and Serpents: those which are called Canine before, are only changed, as it also falleth out in a Lion, and thefe they lose or change, both males and females, in the fourth moneth of their age: about which time they have new ones come forth to thruff off their old. By their teeth is their age discerned, for while they are white and sharp, it affurreth the youth of a Dog, but when they grow blackish, or duskie, they betoken the elder age.

The breadth of a Dog is narrow and piked, his venticle small and narrow, for which cause he never esteth his bodiely excrements without pain, his bowels are like a Lions: he hath a long spleen like a Man, and a Hog: his yard and itones hang outward between his hinder-legs: a base natured cur striketh his tail betwixt his legs: his forelegs bend like the armes of a man, and he uteth them in head of Armes, having five distinct fingers, commonly called claws upon each foot before, and four upon each foot behind, which also have straight nails upon them, and that which hangeth higher upon the leg is crooked.

The females, because they bring forth many whelpes at a time, have underneath their bellies great paps, with many peans to suck at, in a double rank or row on both sides, and the generous Bitches have 12. other but 10. They bear their young within their belly next to the midrife, their fine is dry like a Wolves, and thereby his temperamen is known to be hot and dry, considered in it self, but compared with others it varyeth, for to a Mans, it is dry; to an Emmets, it is moist: again, in respect of a Man, it is hot; in respect of a Lion, it is cold.

The lower and thriller voice of a Dog, is called barking, the lower and fliller, is called whining, or fawning. It was a monitirous thing, that a Dog should speak, and a Serpent bark, as it is believed in antiquity both came to passe, when Iarquinius was driven out of his kingdom. It is not caufe-lefs that the barking of Dogs, hath attributed unto it divers qualities, as for a man to dream of the same, presage them some treafonable harm by enemies, so likewise if they fawn and claw upon a man.

Among the precedent tokens of Cæsars death, they set down in certain Verfes, the howling voices of Owls, the weeping drops of the Ivie tree, and the continual barks of Dogs, as followeth.

Trifia mille locis Stigias detis omnis labo,
Mille loci lacrymoaur erat—
Inque foro circumque domo & templorum
Nebulos ululatus canes, &c.

The Egyptians signify these things by a Dog, a Scribe, a Prophet, a Spleen, smeling, laughing, and weeping. A Scribe, because as the Dog is silent more then he barketh, so muft a perfect Scribe meditate more then he speaketh: for to bark at every one were to pleasure none, and to speak continually, were a signe of madnes. Again, a Prophet, because a Dog doth moit eagerly behold, and admire constantly at holy actions, and looth the eyes and ears of a Prophet be attendant upon heavenly things. The Spleen, because a Dog hath little or no spleen, and thereof cometh his madnes and death; whereof also it cometh that the fervants which have the charge of Dogs, being with them in their ficknefles and latter end, for the most part prove Splentick. Smelling, Neping, and Laughing, because the Splentick can do none of all thefe: but of this more afterward.

The voice of a Dog, is by the learned interpreted a raling and angry speech; whereof comach Canines facundia among Authors, for raling eloquence. It is the nature of a Dog when he maketh wanton to hold up his leg, if he be above fix moneths old, or have been at procreation; the females do it for the most part fitting; yet some of the generous spirits do also hold up the legs. They ever smell to the hinder parts of one another, peradventure thereby they difcern their kind and disposition of each other in their own natures. After they have run a course, they

They fly as doth a man, and therein dream very often, as may appear by their often barking in their sleep: but it must be diligently regarded of them that love to keep Dogs, that they permit them not to sleep much, especially after their meat when they are young, for as they are very hot, so in their sleep doth their heat draw much pain into their stomach and ventricle. The time of their copulation is for the most part at a year old, yet the females will lust after it at eighteen months old, howsoever they are not to be suffered, because it weakeneth their bodies, and dulleth in them all generosiety; therefore after one year they may safely be suffered to come together, and not before. Neither is it material, whether in Summer or Winter, but it is best in the beginning of the Spring, but with this caution, that Whelpes of a litter or of one and the same Bitch, be never suffered to couple; for nature rejoyneth more in variety.

For then they grow fast and begin to be proud; yet in ancient time, for the more ennobling of their race of Dogs, they did not suffer them to engender till the Male were four year old, and the female three; for then would the Whelpes prove more strong and lively. By hunting, labour and travel, the males are made more fit for generation, and they prove best which have their fires of equal age. They are not suffered to engender all their life long, but until ten and twelve year old, or rather eight in the male, and six in the female. Yet there have been found which in one and other sex, have continued in procreation till they were twenty year old, but this exceeded all natural reason. When they begin to be proud, if you give them leaven mingled with milk and salt, they will not stray and range abroad. At the time of their copulation, they cleave together for a certain space, as if their hinder parts were glazed, and so they are filled at one time. They bear their young the fifth part of the year, that is, about two moneths and odd days; but this reckoning is not general, for some kinds bear their young three moneths, and some more. They bring forth many at a time, sometime five, seven, nine, or twelve, for so many cels hath the female in her womb.

Albertus relateth that he saw a Bitch of the Malvive kind, which brought forth at three litters fifty Whelpes, that is nineteen at the first, eighteen at the second, and thirteen at the third; but sometime the bringeth forth but one, which is a good argument to prove that the is filled at the first lying. They are purged of their menstruous fluxes seven or fourteen days before they grow proud, and again, at their time of littering; at other times they suffer none.

The first they call forth of their wombe is commonly a male, which resemblith the father, the other males and females as it happeneth, (but it is accounted a prodigious thing to litter all males or all females) wherein nature yeldeth an excellent argument of divine providence, for the first born of all kinds hath more resembliance of the father then of the mother. They are also whelped blind, and so remain for nine or ten days, because through their multitude they cannot be perfected in the dams belly, which doth not happen to beasts which bear single, as Sheep and Goats. They use to carry them up and down in their mouths till they be seven days old, but not afterward, they have milk about five days before their littering. It is not good to preserve the first or second litter, but the third; and after they have littered it is good to give the Bitch Whay and Barly bread, for that will comfort her and encreaseth her milk; and in some places they take Goats milk and feedeth in it broken bones of meat, whereby they conceive that the Dam and Whelpes are much bettered for that nutriment: there is not any great regard of the nourishment of Dogs, for they will eat much and that often and divers things, except Dogs flesh, for that cannot be so dreefed and prepared by the art of man, but they finde it out by their nose and avoid it. It is good to let the Whelpes fuck two moneths before they be weaned, and that of their own dam, for it is not so good for them to suck another, and in the mean time exercise them to meat, as Milk, Whay, Bread, and fleth; also from the Spring untill the Sun entreth Cancer, at which time it is good to let them grow lean according to the Verles of Nemean.

--- Conficiem minusse saginam
Prefuerit, tenuesque magis retinere cibatur,
Ne gravis articulis depravet pendere males.
Nam tib membraim nuxus nodosque relaxant.

And afterward when they are fixe moneths old amend their diet again that they may grow strong.

Tunc rarus misere fero Cerealia dona,
Convention, fortemque dari de frigibus ejus.

Tardius.

Abentaus.

They will not eat Buck-mall wherewithal Hogs grow fat, for that breedeth in them the pain of the head. By eating the excrements of men they incur many diseases: they are mad drunk by the herb Oenama, as Crows be; they cannot endure Wine, but bread stoped in wine they devour, dried fleth and bread in Milk is their fattest food; if Cummin be now and then mixed in their bread, they are not much troubled with windes in their bellies. If you put a little Oil in their Water to drink

Drink or lap, they will prove more able and swift to run. If the refuse and loath his meat, take a little hot bread and give it him before meat, or dip brown bread in Vinegar, and so presse and squeeze the liquor thereof into his nose, and it will eafe him.

There is much ado to chuse a Whelp under the Dam that will prove the belt in the litter. Some observe that which feeth last, and take that for the belt; other remove the Whelpes from the kennel and lay them severall and apart one from the other, then watch they which of them the Bitch first taketh and carruyth into her kennel again, and that they take for the belt; or else that which vomiteth laff of all. Some again give for a certain rule to know the belt, that the fame which wegheth laff while it sucketh will prove belte according to the Verfes of Nemesian.

Pendere nam canali poteris pripendre vires,
Carpe religiosio levem gravimum pertinere curas.

But this is certain that the lighter whelp will prove the swifter, and the heavier will be the stronger. Other make this experiment, first they confine in the Puppies in the abilence of the Dam with a little circle of small ficks apt to burn, and flaming rags, then fet they them on fire about the whelpes, and that Puppy which leapeth over firft they take for the belt, and that which cometh out last they condemn for the world. As soon as the Bitch hath littered, it is good to chuse them you mean to preferve, and to call away the refuse; keep them black, or brown, or of one colour; for the spotted are not to be accounted of. And thus much of the outward parts and the choice of Dogs. The manifold attributes of Dogs among all Writers, do decipher unto us their particular nature; as that they are called tharp, biter, fierce, subtil, founding, bold, eared for attention, affaile, fpeedy, clamorous, wilde, faithful, horrible, rough, falling, cruel, ungentle, unclean, hurtful, biting, filthy, smelting, fent-follower, watchful, mad, hoarke, and quick-nofled; befide many fuch other bodies among the Grecy and Latine. And likewise you shall read of many particular Dogs, and their names appelleative, both in Greek and Latine, which may be remembered also in this place, to fhew what reckoning all ages have made of this beast: for it is necessary, that as soon as he beginneth to feed he prefently receive a name: fuch are thefe, of two syllables or more, as Sylex, Spende, Alke, Rome, Eacon, Acobantrs, Agre, Labto, Hylador, Alex, Alex (one of the firit Dogs) Ablum, Auren, Aura, Bria, Polu, Bremion, Canace, Hippaurs, Charon, Chorus, Harpa, Lusias, Chiron, Lyncta, Acras, Dromus, Glyome, Ebra, Hybris, Hylus, Maira, Melampus, Ornus, Lebtoros, Pha, beides infinite among the antients; but among the latter writers, Turc, Nibus, Falco, Ragenus, Serpens, Iebias, Pilafer, Leo, Lupus, Stella, Fulgur, Bellus, Kubinum, Satinus, and Furiia: fo that every Nation, and almost every man hath a proper and peculier name for his Dog, as well as for his Ox.

There is not any creature without reafon, more loving to his Master, nor more ferviceable (as shall appear afterward) then a Dog, inducing many of them patiently at the hands of his Master, and using no other means to pacifie his displeasure, then humiliation, proffition, affentation, and after beating, turneth a revenge into a more fervent and hot love. In their rage they will fet upon all intrangers; yet herein appeareth their noble spirit, for if any fall or fit down on the ground and cast away his weapon, they bite him not; taking that declining for fubmiffive pacification. They meet their Master with reverence and joy, crouching or bending a little, (like fhamelf and modell perrons;) and although they know none but their Master and familiar, yet will they help any man against another Little beall. They remember voices, and obey their leaders hiffing or whiffing.

There was a Dog in Vnace which had been three years from his Master, yet knew him again in the Market place; difterning him from thousands of people preffent. He remembret any man which gave him meat: when he fought upon a man he wringeth his skin in the forehead. The Dog which is broad faced like a Lion, is most full of stomack and courage; yet the tongue or skin of an Hyena (by natural infinct) maketh him run away: sometimes they will agree with Wolves, for they have engendered together, and as the Lute strings made of a Wolf and a Lambe cannot agree in musick, but of ones them will break, so allo will a Dogs and a Lamb.

Adianus thinketh that Dogs have reason, and use Logick in their hunting, for they will call about for the game, as a difputant doth for the truth, as if they should fay either the Hare is gone on the left hand, or on the right hand, or straight forward, but not on the left or right hand, and therefore straight forward. Whereupon he runneth forth right after the true and infallible footstepes of the Hare. There was a Dog in Africa in a chip, which in the abilence of the Mariners came to a pitchier of oil to eat some of it, and the mouth of the pot being too narrow for his head to enter in (because the pot was not full) he devieth to call flint stones into the vefsel, whereby the Oile rofe to the top of the Pitcher, and fo he eat thereof his fill, giving evident testimonie thereby, that he difterned by nature, that heavy things will sink down, and light things will rise up and flie aloft.

There is a Nation of people in Ethiopia (called Nehe) which have a Dog in fuch admirable estimation, that they give unto him the honor of their King; for they have no other King but he. If he faunt, they take him for well pleafed; if he bark or flie upon them, they take him for angry: and by his

Solina, Adianus;
The History of Four-footed Beasts.

Of dogs and dog-like animals, Pliny and Giraldis, in their history of the world, relate many curious facts, not only about dogs, but also about other animals. Among the Egyptians, dogs were considered sacred, and were kept as sacred animals. The Greeks and Romans also kept dogs as sacred animals, and sacrificed them in temples. However, Pliny and Giraldis relate that the Romans sacrificed dogs in the temple of Aesculapius, because they were nourished by their milk, and Jupiter himself was considered a god of dogs. The Greeks and Romans believed that dogs were sacred because they were the protectors of the home, and because they were considered to be a symbol of loyalty and fidelity.

As among the Carins, whereupon came the proverb of Carinsum Sacrificium, for they sacrificed a dog in a field of a goat, and the young puppies or whelps were also accounted amongst the most available sacrifices, for the pacifying of their Idols gods.

The Romans and Greeks also had a custom to sacrifice a dog in their Lyceum and Lupercal seats, which were kept for the honour of Pan, who defended their flocks from the wolf, and this was performed in February yearly, either because the dogs were enemies to wolves, or else for that by their barking, they draw them away in the night time from their City; or else beacause they reckoned that a dog was a pleasing beast to Pan, who was the keeper of Goats; so also the Greeks did offer a dog to Hecate that fohath three heads, one of a Horse, another of a Dog, and the third head in the midst of a wide man: and the Romans to Genebla, for the sake of the cattle and welfare of all of their household affairs.

Their household Gods (called Larini) were pictured and declared to the people sitting in Dogshkins, and Dogs sitting beside them, either because they thereby signified their duty to defend the house and household; or else as Dogs are terrors to Thieves and evil beasts, so thefe by their affilience were the punishers of wicked and evil persons: or rather that these Larini were wicked spirits prying into the affairs of every private household, whom God used as executors of his wrathful displeasure upon godless men.

There were Gods sacrificed in the Temple of Aesculapius, because he was nourished by their milk; and Jupiter himself was considered a god of dogs; because he taught the Aesculapians first of all to hunt away noisome beasts by the help of Dogs: so also they sacrificed a Dog to Mars, because of the boldness of that creature. To conclude, such was the innumerable vanity of the Heathens in their gods and sacrifices, as it rather derogated perpetually oblivion then remembrance, for they joyed the shapes of men and beasts together (such Asiniius) to make gods, Omnipotentium deum modestos & iteratos Anthis, such were their Gymnosophi, Ophthrophi, Anthis, Hecest; that is as much to say, as half Men, half Dogs, half Serpents, but generally all Monsters: and for the many imaginary virtues the ancients have dreamt to be in Dogs, they also in many places have given unto them solemn funerals in their hallowed Cemeteries, and after they were dead they ceased not to magnifie them, as Alexander, which built a City for the honour of a Dog.

All this notwithstanding, many learned and wise men in all ages have reckoned a Dog but a safe and an impudent creature: for the Flamen Diael of Jupiter in Rome, was commanded to abstain from touching of Dogs, for the same reason that they were prohibited and not permitted to enter into the Caille of Alburn, and Isle of Delos, because of their publick and shameles copulation: and also that no man might be terrified by their presence from supplication in the Temples. The foolishnes of a Dog appeareth in this, that when a Ione or other thing is cast
at him, he followeth the itone and negligence the hand that threw it; according to the saying of the Poet:

ArrIxat a tepidicenaturus, marisque fatigat.
Nec persecutari mutua damnæ factis,
Sic plerique sunt exus ubiær bufus,
Et quis nulla grantus noxæ, dente petant.

Marcellus.

Likewise men of impudent wits, shameless behaviors in taking and eating meat, were called Cynick; for which cause Abins new spake unto Cynicks in this sort, You do not O Cynici lead abominable and frugal lives, but resemble Dogs: and whereas this four-footed beast differeth from other creatures in four things, you only follow him in his viler and baser qualities, that is, in barking and licene of railing, in voracity and nudity, without all commendation of men.

The impudence of a Dog is eminent in all cafes for it to be understood, for which cause that audacious Aristophan lion of Cidimæus was called a Dog, and the Furies of ancient time were pictured by black Dogs, and a Dog called Etinsys: Cerberus himself with his three heads signified the multiplicity of Devils; that is, a Lions, a Wolves, and a fawning Dogs; one for the Earth, another for the Water, and the third for the Air: which cause Hierocles in slaying Cerberus, is said to overcome all temptation, vice and wickedness. For so did his three heads signify. Other by the three heads understand the three times; by the Lion the time present; by the Wolf, the time past; and by the fawning Dog, the time to come.

It is delivered by Authors, that the root of Oliander, or else a Dogs tooth bound about the arme, do restrains the fiery and rage of a Dog: also there is a certain little bone in the left fide of a Toade (called Apoysn) for the virtue it hath in it against the violence of a Dog. It is reported by Pliny, that if a live Rat be put into the portage of Dogs, after they have eaten thereof, they will never bark any more; and Aelius affirmeth so much of the Weasils tail cut off from him alive, and carried about a man; also if one carry about him a Dogs heart or liver, or the skin wherein Puppies lie in their dams belly (called the Secundine) the like effect or operation is attributed to them against the violence of Dogs.

There is a little black stone in Nile about the bigenfs of a Bean, at first sight whereof a Dog will run away. Such as these I saw at Lyons in France, which they called Sea-beans, and they prescribed them to be hanged about a Nurse's neck to encrease her milk. But to conclude the difcourse of the bafeines of a Dog, those two proverbs of holy Scripture, one of our Saviour Mat. 7. Give not that which is holy to Dogs; and the other of St. Peter, 2 Epistle Chap. 2. The Dog is returned to the vomit; do sufficiently convince, that they are emblems of vile, cursed, railing, and filthy men; which elseem not holy things, but eat again their own vomits.

The skins of Dogs are drested for Gloves, and close Boots, the which are used by such as have Ulcers and swelling Legs or Limbs, for by them the afflicted place receiveth a double relief: first, it refiteth the infent humours; and secondly, it is not exasperated with Woolen. The Turks colour their Dogs tails with red, and it is a custom of Hunters to take Dogs and tie them in the Woods unto trees by their itones, for by crying they provoke the Panther to come unto them.

It is not to be doubted but that the flefh of Dogs is used for meat in many places, although the opinion of Kefis be true and confonant to reason, that all devouring creatures, as Dogs, Foxes, and Wolves, have no good flefh for meat, because they engender melancholy; and yet Kefis thinketh, that it is like to the flefh of a Hare, especially young Whelpe were held among the Romans a delicate meat, and were used by their Priests; and among Whelpe they attributed most virtue to their flefh which were eaten before they did see, for by them came no evil humor at all, as is often set down in Plutarch.

Peter Martyr and Staliger do affirm of Casanella and Lucatana, and other Islands of the new World, that the people there do eat a kind of Dog which cannot bark: These Dogs are vile to look upon like young kids. The inhabitants of Casio, which are fierce, angry, wide, cruel, audacious, diffamible, active and strong, do also feed upon Dogs, both wide and tame; and it is thought that their meat is a little furtherrance to their inclination, for such is the natural disposition of Dogs. And Seilbergewri in the Book of Peregrinations affirmeth also, that the Tartaros in Issibhar do after the same manner feed upon the flefh of Dogs: from hence it cometh, that men relishing a Dog in a plain forehead and narrow, are said to be foolish: in a smooth and stretched out flatterers; thole which have great voices like a Ban-dog, are strong; thole which have fiery eyes like Dogs, are impudent and shameless: thin lips with narrow folding corners, in Dogs is a token of generosity, and in men of magunanimity: whose teeth hang over their canine teeth, are also adjudged rakers, and virulent speakers: and as Carnarius observeth, vain glorious braggards: A wide mouth, betokeneth a cruel, mad, and wicked disposition: a harpe nose, an angry minde: a round, blunt, and solid Nose, signifieth a Lions tomach and worthines. A harpe chin, vain bishing and wantonnesse; they which are small in their girtting stead about their loins, do much love hunting.
The History of Four-footed Beasts.

Stobaeus in his wicked discourse or dispraise of Women affirmeth, that the curt, sharp, smart, curious, dainty, clamorous, implacable and wanton-rowling-eyed Women, were derived from Dogs: and Hesiod to amend the matter, when Jupiter had fashioned Man out of the earth, he commanded Mercury to infuse into him a Canine minde, and a clamorous inclination: but the Proverb of Solomon Chap. 3o. concludes the excellency of a Dog saying, There be three things which go pleasantly, and the fourth ordinarly hit pace aright: The Lion which is the strongest among beafts, and seareth not the sight of any body; a hunting Dog strong in his joints, a Goat, and a King against whom there is no rising up: by all which is deciphered a good King; for the Lion riseth not against beafts; except he be provoked; the Dog riseth not against his friends, but wilde beafts; and the He-goat goeth before his flock like a guide and keeper.

Of the GRAT-HOUND, with a narration of all strong and great hunting DOGS.

Among the divers kinds of hunting Dogs, the Gray-bound or Grecian Dog, called Thracius or Elatic (by reason of his swiftness, strength and sagacity to follow and devour wilde beafts of great stature) deserveth the first place; for such are the conditions of this Dog, as Plato hath observed, that he is reasonably fent unto to finde out, speedy and quick of foot to follow, and fierce and strong to take and overcome: and yet silent, coming upon his prey at unawares, according to the observation of Gratius;

Sic Canis illa suos tacitura superavit hostes.

Like the Dogs of Acaarnania, which set upon their game by stealth. Of these are the greatest Dogs of the world, which in this place are briefly to be remembered.

These have large bodies, little heads, beaked noses, but flat, broad faces above their eyes, long necks, but great next to their bodies, fiery eyes, broad backs, and most generous stomachs, both against all wilde beafts and men also. Their rage is so great against their prey, that sometimes for wrath they lose their eye-fight. They will not only set upon Bulls, Boars, and such like beafts, but also upon Lions, which Munsters note and in this verse;

Et trasculentus Helor cortex leonibus audens.

The greatest dogs of this kind are in India, Scythia, and Hircania, and among the Scythians they join them with Affes in yoke for ordinary labour. The Dogs of India are conceived by Tygres, for the Indians will take divers females or Bitches, and restore them to trees in woods where Tygres abide.
Of Dogs.

abode: whereunto the greedy ravening Tyger cometh, and infantly devoureth some one or two of them, if his lust do not restrain him, and then being so filled with meat (which thing Tygers seldom meet withal) presently he burneth in luft, and so lineth the living Bitches, who are apt to conceive by him: which being performed, he retires to some secret place, and in the mean time the Indians take away the Bitches, of whom come these valorous Dogs, which retain the stomachs and courage of their father, but the shape and proportion of their mother, yet do they not keep any of the first or second litter, for fear of their Tygrian stomachs, but make them away and re-serve the third litter.

Of this kind were the Dogs given to Alexander by the King of Albania, when he was going into India, and presented by an Indian, whom Alexander admired, and being devious to try what virtue was contained in so great a body, caused a Bore and a Hart to be turned out to him, and when he would not so much as pitch to them, he turned Bears unto him, which likewise he disdained, and so not from his kennel, wherewith the King being moved, commanded the heavy and dull Beast (for so he termed him) to be hanged up; his keeper the Indian informed the King, that the Dog respected not such Beasts, but if he would turn out unto him a Lyon, he should see what he would do.

Immediately a Lyon was put unto him, at the first flight whereof he rote with speed (as is never before he saw his match or adversary worthy his strength) and breathing at him, made force upon him, and the Lyon likewise at the Dog; but at the last, the Dog took the chaps or shote of the Lyon into his mouth, where he held him by main strength, until he stung him, do the Lyon what he could to the contrary: the King devious to save the Lyons life, willed the Dog should be pulled off, but the labour of men and all their strength was too little, to loosen those cruel and deep biting teeth which he had fastened. Then the Indian informed the King, that except some violence were done unto the Dog to put him to extremity, he would sooner dye then let go his hold; whereupon it was commanded to cut off a piece of the Dogs tail; but the Dog would not remove his teeth for that hurt: then one of his legs were likewise severed from his body, whereat the Dog seemed not appalled; after that another leg, and so consequently all four, whereby the trunk of his body fell to the ground, still holding the Lyons mouth within his mouth; and like the spirit of some malicious man, chuffing rather to dye then spare his enemy. At the last, it was commanded to cut his head from the body, all which the angry Beast endured, and so left his bodies head hanging fast to the Lyons jaws: whereas the King was wonderfully moved, and sorrowfully reproved his rathlessness in destroying a Beast of so noble a spirit, which could not be daunted with the presence of the King of Beasts: chuffing rather to leave his life, then depart from the true strength and magnanimity of minde. Which thing the Indian perceiving in the King, to mitigate the Kings sorrow, presented unto him four other Dogs of the same quantity and nature, by the gift whereof he put away his passion, and received reward with such a recompence, as well be pleased the dignity of such a King, and also the quality of such a present.

Pliny reporteth also, that one of these did fight with singular courage and policy with an Elephant, and having got hold on his side, never left till he overthrew the Beast, and perished underneath him. These Dogs grow to an exceeding great stature; and the next unto them are the Albanian Dogs. The Arcadian Dogs are said to be generated of Lyons. In Caucaia, one of the Fortunate Islands, their Dogs are of an exceeding stature.

The Dogs of Cret are called Disponis, and fight with wilde Boars: the Dogs of Epirus called Chianides, of a City Chion, are wonderfully great and fierce; they are likewise called Molossi, of the people of Epirus so termed, there are fained to be derived of the Dog of Cephalus, the first Grayhound whom stories mention: and the Poets say, that this Gray-hound of Cephalus, was first of all fashioned by Vulcan in Menocephal brais, and when he liked his proportion, he so quickened him with a foul, and gave him to Jupiter for a gift, who gave him away again to Europa, the also to Minos, Minas to Pocrias, and Pocrias gave it to Cephalus: his nature was so refitable, that he overtook all that he hunted, like the Trumesium Fox. Therefore Jupiter to avoid confusion, turned both the incomprehensible Beasts into Horses. This Molossus, or Molossi Dog, is also framed to attend the folds of Sheep, and doth defend them from Wolves and Theeves, whereof Virgil writeth thus:

\[ V\mathbf{e}l\mathbf{e}c\mathbf{t} o\mathbf{r} \mathbf{t} a c t o l u s \ a c r e m a q u e \ M o l l i s s u m \\
P u f f e f r e p r i n g i u m, \ u n q u a m \ c o t t o d i t u s \ t i l l s \\
N \dot{\mathbf{a}} m v e n m \ \mathbf{f} a b u l i a \ f u r e m \ i n c u r s u l i q u e \ l i p u r u m \\
A u t \ i m p a r a t u s \ a t e r g a h o r b i a l b e r o s. \]

These having hold, will hardly be taken off again, like the Indian and Persian Dogs, for which cause they are called incommodefit, that is, modi nefcius, such as know no mean, which caused Horace to give counsel to keep them tyed up, saying:

\[ T e n e m a t c c r e s \ l o r a m \ m o l l o s s e s. \]

The people of Epirus do use to buy these Dogs when they dye, and of this kind were the Dogs of Seylla, Nicoside, and Euplidet. The Hircanian Dogs are the same with the Indians. The Patsonian, Persisan, and Median, are called Synthese, that is companions, both of hunting, and fighting, as Pliny writeth:

\[ I n d o c l i s i o d a t p r o t i a M o l h u s. \]
The Dogs of *Lycia*, and *Lacus*, are also very great, and fight with *Bores*. There are also a kind
of people called *Cynoct*, near *India*, so called, because for one half of the year they live upon the
milk of great Dogs, which they keep to defend their Country from the great oppression of
wilde *Cardel*, which descend from the *Woods* and Mountains of *India* unto them yearly, from the Sum-
mer solstice to the middle of Winter, in great numbers or *Hyraxes*, lice *Bees* returning home to
their Hives and *Honey-combs*: Thee *Cattel* set upon the people, and destroy them with their
horns, except their Dogs be present with them, which are of great *Fur* and *Strength*, that they
easily tear the wilde *Cattel* in pieces, and then the people take such as be good for meat to them-
seves, and leave the other to their Dogs to feed upon: the residue of the year they not only hunt
with these *Dogs*, but also milk the females, drinking it up like the milk of *Sheep* or *Goats*. Thee
great *Dogs* have also devoted men, for when the servant of * duges* the *Cynick*, ran away from
his master, being taken again and brought to *Delphi*, for his punishment he was torn in pieces by
*Dogs*. *Euripides* also is laid to be slain by *Dogs*; whereupon came the proverb *Cudos diges*, a *Dogs*
revenge: for King *Achilles* had a certain Dog which ran away from him into *Thracia*, and the
*Thracians* (as their manner was) offered the same *Dog* in sacrifice, the King hearing thereof, laid
a punishment upon them for that offence, that by a certain day they shoul pay a talent; the people
breaking day, sull forned *Euripides* the Poet (who was a great favourite of the Kings) to mediate for
them, for the release of that fine: whereunto the King yielded: afterward as the said King
returned from hunting, his *Dogs* fragling abroad, met with *Euripides*, and tore him in pieces, as if
they fought revenge on him, for being bribed against their fellow which was slain by the *Thracians*.
But concerning the death of this man, it is more probable, that the *Dogs* which killed him, were
set on by *Aristarch* and *Cratinus*, two *Thefalonians* Poets, his emulators and corrvalls in *Poetry*,
which for the advancement of their own credit, cared not in most *Favage* and *Barbarous* manner, to
make away a better man than themselves. There were also other famous men which perished by *Dogs*:
as *Alcman*, *Thersites*, and *Lacus*; of *Thersites*, Ovid writeth thus:

\[dique sì illis quibus eft Laconis Deos\]
\[Ante diem rapto non autocum Thrase.\]

And of *Lacus* and *Alcman* in this manner;

\[Qua re creautem spectantes membra Diane,\]
\[Sunt creautae tarenti diripere Lacinum.\]

*Lucian* that scoffing *Apostate*, who was once a *Christian*, and afterward endeavoured all his wit to
rival at *Christian* Religion, even as he hated and rent his first profession, so was he rent in pieces
by *Dogs*; and *Stercodiius* the *Philosopher* of *Athens*, having been long sick, and under the hands of
*Physicians*, he often times anointed the body with *Bugilis* fewer, and on a day having so anointed
himself, lying abroad sleeping thereon, the *Dogs* came, and for the desire of the *fat* tore his body
in pieces. I cannot here forget the memorable story of two Christian *Martyrs*, *Gorgonia* and *Do-
ruces*, which were put to death under *Diocletian* in the ninth persecution, and when they were dead,
their carcases were cast unto hungry *Dogs* of this *kind*, kept for such purposes, yet would not the
*Dogs* once form such ill at them, or come neer to touch them; and because we may judge that
the raving nature of these *creatures* was restrained by divine power: We also read that when
*Benignus* the *Martyr*, by the commandment of *Aurelian*, was also thrown alive to be devoured of
these *Dogs*, he escaped as free from their teeth, as once *Daniel* did from the *Lions* den. I may
also add unto thee the *Dogs* of *Alani* and *Ilyris*, called *Moffini*, who have their upper lips hang
over their nether, and look fierce like *Lyons*, whom they resemble in neck, eyes, face, colour, and
nails: falling upon *Beares*, and *Boars*, like that which *Anthologius* speaketh of, that leaped into
the *Sea* after a *Dolphin*, and so perished; or that called *Lydia*, slain by a *Boar*; whose *Epitaph* *Mar-
tial* made as followeth:

\[Amphitheatralis inter mutritia magistris\]
\[Venatrix flubus afera blandu domi,\]
\[Lydia diebore, domino fulissima dextro,\]
\[Quin non Erigones malius habere Cantem,\]
\[Nec qui Dicteu Cephalum de gente scutis,\]
\[Luciferus pariter venit ad afera decem,\]
\[Non me longa dies, nec immutis absultiis aest,\]
\[Quallt Duluschis fata fiere canit,\]
\[Fulmineo sibiunctus apri fum duce premit,\]
\[Quantus erat Calydon, at Erymantheum,\]
\[Nec querer, in inara quemvis sito rapita per membrum,\]
\[Non putata, fatu nobilioris miri.\]

The French

*Dog*.

There be in *France* certain great *Dogs* (called *Auges*) which are brought out of *Great Britain*, to
kill their *Beares*, *Wolves*, and wilde *Boars*; these are singularly swift and strong, and their leaders,
the better to arm them against the teeth of other Beasts, cover some of their parts with thick clouts, and their necks with broad collars, or else made of Badgers skins. In Gallia Narbon., they call them Libanter, and the Pelasgians call all made Dogs for the Wolf, and such like Beasts, Veltri: and particularly for the Bear and Bore, Glarezi, for Hares and Wulf, Podonibusell, and Dogs of a middle scantling between the first and the second, 111.

Gray-hounds are the keen of these kinds, and yet swift and fierce as any of the residue, resuming no kind of Beast, if he be turned up thereunto, except the Porcupine, which calls her sharp pens into the mouth of all Dogs. The bilt Gray-hound hath a long body, strong and reasonable great, a neat sharp head, and pendent eyes, a long mouth, and sharp teeth, little ears and thin gristles in them; a straight neck, and a broad and strong break, his fore-legs strong and short, his hinder-legs long and straight, broad shoulders, round ribs, flethy buttsck, but nor fat, a long tail, strong and full of finew, which Nemesian describeth elegantly in these verses;

Sit cervibus altae,
Castrum sub finge deceter prana carinam:
Remibus empl psa validit diduque coras
Sit rigido, multanoque gerat sub pellere latu.
Quod fermin sursum ficta se eigo ab alto:
Curisque fumit molles fluent in curvis ormis.
Elegi tunc curse facltem, facileque recunf,
Dum superant vires, dona loft juvenis.

Of this kind, is that able to be chosen among the whelps, which weigheth lightest; for it will be foone at the game, and go hang upon the greater beasts hindering their swifniness, untill the stronger and heavier Dogs come to help: and therefore beides the marks, or necessary good parts in a Gray-hound already spoken of, it is requisite that he have large sides, and a broad mid-riff or film about his heart, that so he may take his breath in and out more easily: a small belly, but if he be great, it will hinder his speedy course; likewise that he have long legs; thin and soft hairs; and thefe mutt the Hunter lead on the left hand if he be a foot, and on the right hand if he be on Horleback.

The bilt time to try them, and train them to their game, is when they be twelve months old, however some hunt them att ten months, if they be males, and at eight, if they be female; yet is it better not to strain them, or permit them to run any long course till they be twenty months old, according to the old verfe;

Libera tunc primum conuesa
Caras ligari,
Iam cum biis denro Phare repente habito,
Sec parsus walles flatais sepulcri Thule.
Nec curas virtute parum, &c.

Keep them also in the lean or flip while they are abroad, untill they be able to pursue their course, I mean, the Hare or Deer, and loofen not a young Dog, till the game have been on foot a good tenon, lefl he be greedy of the prey he strain his limbs till they break. When the Hare is taken, divide some part thereof among your Dogs, that so they may be provoked to speed by the sweetnes of the fleth.

The Lacomedon Gray-hound was the bilt breed, they were first feed of a Fox and a Dog, and therefore they were called Alpecidet, these admite copulation in the eighth moneth of their age, and somettimes in the fixt, and fo continue bearing as long as they live, beaing their burthen the fixth part of a year, that is, about fixty days, one or two, more or lefs; and they better conceive, and are more apt to procreation while they are kept in labour, then when they lie idle without hunting. And these Lacomedon Dogs differ in one thing from all other Dogs whatsoever, for whereas the male out-liveth in vulgar Dogs of all Countries the female, in thefe the female out-liveth the male, yet the male performeth his labour with more alacrity, although the female have the sharper sense of finelling.

The noblest kind of Dogs for the Hare keep home, unless they be led abroad, and seldom bark: they are the bilt which have the longest necks, for which cause they use this artificial invention to stretch their necks; they dig a deep hole in the earth, wherein they set the Gray-hounds meat, who being hungry, thrulhet down his head to take it, and finding it but a small reach, stretcheth his neck above the measure of nature, by custom whereof, his neck is very much lengthened. Other place the Gray-hound in a ditch, and his meat above him, and so he reacheth upward, which is more probable, It is the property of these Dogs to be angry with the leffer barking Curs, and they will not run after every trifling Beast, by secret instinct of nature, differing what kind of Beast is worthy or unworthy of their labour, disdaining to meddle with a little or vile creature. They are nourished with the same that the smaller hunting Dogs are; and it is better to feed them with milk then whey. There are of this kind called Veltri, and in Italian, Veltra; which have been procressed by a Dog and Leopard, and they are accounted the swiftest of all other. The Gray-hounds which are most in request among the Germans, are called Windpills, alluding to compare their swifness with
The History of Four-footed Beasts.

with the winde, the fame are also called *turkeywind* and *Herzbrand*, and *Falco* a *Falcon*, is a common name whereby they call these Dogs. The French make most account of such as are bred in the Mountains of *Dalmatia*, or in any other Mountains, especially of *Turkey*; for such have hard feet, long ears, and brittle tails.

There are in England and Scotland, two kindes of hunting Dogs, and no where else in all the world; the first kinde they call in Scotland, *An Rache*, and this is a foot-smelling creature, both of wilde Beasts, Birds, and Fishes also, which lie hid among the Rocks; the female hereof in England, is called a *Brach*. The second kinde is called in Scotland, a *Slath-bound*, being a little greater then the hunting Hound; and in colour for the most part brown, or fandy-spotted. The sense of smelling is so quick in these, that they can follow the foot-steps of theves, and perfue them with violence until they overtake them; and if the theef take the water, they call in themselves also, and swim to the other side, where they finde out again aforeth their former labour, untill they finde the thing they seek for: for this is common in the Borders of England and Scotland, where the people were wont to live much upon theft; and if the Dog brought his leader unto any house, where they may not be suffered to come in, they take it for granted, that there is both the stolen goods, and the theef also hidden.

The Hunting Hound of Scotland called *RACHE*, and in English a *HOUND*.

The *SLYTH-HOUN D* of Scotland, called in Germany a *SCHLATT HVND*.
Of Dogs.

The English Blood-Hound.

We are to discourse of leffer hunting Dogs in particular, as we finde them remembered in any Histories & descriptions, Poets or other Authors, according to the several Countries of their breed and education; and first for the English Dogs, their nature and qualities hereafter you shall have in a several discourse by it self. The Blood-hound differeth nothing in quality from the Sceith Shuf-hound, saving they are greater in quantity, and not alway of one and the same colour; for amongst them they are sometime red, sanded, black, white, spotted; and of such colour as are other Hounds, but most commonly brown or red.

The virtue of smelling called in Latine, Sagacitas, is attributed to these as to the former hunting Hound, of whom we will first of all discourse, and for the qualities of this Hound, which maketh the Beast admirable, Plautus seemeth to be of opinion, that it received this title from some Magicians or Sage Wirds (called Sage) for this be faith, speaking of this Beast: Canem hanc effe quidem Mejis par suit: nesam edepol sagax babes: It is also attributed to Mice, not for smelling, but for the sene of their palace or stable; and also to Geese: In a Dog it is that sensation which searcheth out and defcreveth the roults, fourms, and lodgings of wilde Beasts, as appeareth in this verse of Livius Andronicus.

Cum primis fida Canum-vis
Dirige euripetos ad custa culobia canes.

And for this cause it hath his proper Epithets, as Olora canum vis, promissa canum vis, & maribus apes, & uides: Poets now called this kinda Hounds, for so did Persius before him, and the Grecians, Spurbund; and Leisihund, laghund, because their ears are long thin, and hanging down, and they differ not from vulgar Dogs in any other outward proportion, except only in their cry or barking voyce.

The nature of these is, being set on by the voyce and words of their leaders, to call about for the fitting of the Beast, and so having found it, with continual cry to follow after it till it be weared, without changing for any other; so that sometimes the Hunters themselves take up the Beast, as least wise the Hounds seldom fail to kill it. They seldom bark, except in their hunting chase; and they then follow their game through woods, thickets, thorns, and other difficult places, being alway obedient and attentive to their leaders voyce, so as they may not go forward when he forbideth, nor yet remain near to the Hunters, whereunto they are framed by Art and discipline, rather then by any natural instinct.

The White Hounds are said to be the quickest fent and surest nosed, and therefore best for the Hare; the black ones for the Boar, and the red ones for the Hart and Roe: but hereunto I cannot agree, because their colour, (especially of the two later) are too like the game they hunt; although there can be nothing certain collected of their colour, yet is the black Hound harder and better able to endure cold, than the other which is white. In Italy they make account of the spotted one, especially white and yellowish, for they are quicker nosed: they must be kept tyed up till they hunt, yet so as they be let loose now and then a little to ease their bellies, for it is necessary that their kennel be kept sweet and dry.

It is questionable how to discern a Hound of excellent sense, (yet as Blondus saith) the square and flat nose is the best sign and index thereof: likewise a small head, having all his legs of equal
equal length, his breath not deeper than his belly, and his back is plain to his tail, his eyes quick, his ears long hanging, but sometimes stand up; his tail nimble, and the beak of his nose alway to the earth, especially such as are most silent or bark least.

There are some of that nature, who when they have found the Beast they will stand still until their Hunter come, to whom in silence by their face, eye, and tail, they shew their game. Now you are to observe the divers and variable disposition of Hounds in their finding out of the Beast: some, when they have found the footsteps go forward without any voyage or other shew of ear or tail. Again, another sort, when they have found the footings of the Beast, prick up their ear a little, but either bark, or wag their tails; other will wag their tail, but not move their ears, other again wring their faces, and draw their skins through over much intention, (like sorrowful persons) and so follow the scent, holding the tail immovable.

There be some again, which do none of these, but wander up and down, barking about the surest marks, and confounding their own foot-steps with the Beasts they hunt, or else forfake the way, and so run back again to the first head; but when they see the Hare, they tremble and are afraid, not daring to come near her, except the run away first: thes with the other, which hinder the cunning labours of their colleagues, tripping to their feet, and running before their betteres, deface the beast mark, or else hunt counter, (as they term it) take up any false scent for the truth, or which is more reprehensible, never forfake the high ways, and yet have not learned to hold their peace: unto these also you may add those which cannot discern the footings or pricking of the Hare, yet will they run speedily when they see her, or else at the beginning set forth very hot, and afterward tyrne, and give over lazily; all these are not to be admitted into the kernel of good Hunds.

But the good and approved Hounds on the contrary, when they have found the Hare, make shew thereof to the Hunter, by running more speedily, and with gullure of head, eyes, ears, and tail, wind- ing to the Hares mule, never give over prosecution with a gallant noise, no not returning to their leaders, left they lose advantage: they have good and hard feet, and are of lately Romacks, not giving over for any hare, and fear not the rocks or other mountain places, as the Poet expresseth;
Of Dogs.

There are divers Countrey Dogs like unto thefe, as the Geloni and Gnosii, which caufed Ovid to reckon and call Lebolares one of Alcinous Dogs Gnosius; whom Oppianus compareth to the Polypterus fish, which swimming in the waters the leaves of Olives, by the fent is drawn to the land to eat them. The Spanifh Dogs whom the French call Epagnexs, have long ears, but not like Brachies, and by their noses hunt both Hares and Conies, they are not rough, but smooth haired. The Tufcan Dogs are commendèd by Nemesian; notwithstanding, they are not beautiful to look upon, having a deep shaggy hair, yet is their game not unpleafant.

Quin & Tuscurum ton et extrema volupias
Saepè Canum : formas e ilis loci obfina vile, &c.
Hand tamen injucunda dabunt tibi mures prædes, &c.
Aquæ etiam leporum secreta subliia manifest.

The Umbrian Dog is sharp nosed, but fearfull of his sport, as Gratius expreffeth.

Ant axit Umbro
Nare fagax et cale feris,--
At fugit adversus idem quos efferet bofies,
Tanit foret virtus; & tantum vellet in armis.

The Etolian Dogs have also excellent smelling noses, and are not flow or fearful, whom Gratius expreffeth as followeth:

At clangore citat, quos nondum confpixit apros,
Ardua quaenique Canis de flirpe (malignum
Officium) &c.
Qua fujtra nimius prosperat favor,--
Mitrum quem celere & quantum noire merentur.

The French Dogs are derived or propagated of the Dogs of Great Britain, and are swift and quick fentied, but not all, for they have of divers kindes, as Gratius expreffeth in thefe words;

Magnaque diversis exultit gloria Celsi.

They are very swift, and not sharp nosed, wherefore they are mingled in generation with the Umbrian Dogs, and therefore he celebrateth in many verfes, the praisè of the brift Hunter (as he taketh him.) Hayno Banius and his Dog Metegen, and afterward the Dog Petronius: but it may be, that by Metogen, he meaneth the Dogs of Lybia, because there is a City of that name: and by Petronius the Dogs of Italy, for Petronia is a river that falleth into Tiber.

The Grammarians call a Dog engendered of a Hound, and an ordinary French Dog, Vertigus, a Tumbler: because he jetteth himfelf to hunting, and bringeth his prey to his Muler, whereupon the Romans made this Difliption:

Non sibi, fed Domino venatur vertigus acer,
Illefum leporem qui tibi dente feret.

The Water Spagnel.

Such are also other smelling Dogs, called in the German tongue (Lochweide) that is, Terriers or Beagles: these will set upon Foxes and Badgers in the earth, and by biting expel them out of their dens; whereof Aeniose reporteth a wonder, that one of them followed a Fox under the ground in Exturia: and there made so great a noise by barking, that the Hunters went aloft into the Cave, where they saw many strange things which they related to the chief Magistrate.

Unto all these smelling Dogs, I may also add the water Spagnel, called in French, Parteil; and
and in Germany (Wolfeshound: thes) who is taught by his Master to seek for things that are lost, (by words and tokens) and if he meet any person that hath taken them up, he ceaseth not to bay at him, and follow him till he appear in his Maiters presence. Thes also will take water-fowl, and hunt Otters and Beavers, (although Hounds also will do the same) and watch the stroke of a Gun when the Fowler shooteth, and instantly run into the water for the dead fowl, which they bring to their Maiter. They use to shear their hinder parts, that so they may be the less annoyed in swimming; whose figure is in the bottom of the former page described.

I may here add the Land-Spagnel, attending a Hawk, who hath no proper name in English, except from the fowl he hunteth; for which cause the French call them Dogs of the Quails; and the Germans, Vulpes-hund; a fowl Hound; although all Birds little fear Dogs, except the Buitard, who hath a heavy body, and is not able to fly far; yet are these taught by Falconers to retrieve and raise Partridges, for they firft take them into the fields, and shew them Partridges, whom after they have favoured twice or thrice, by custom they remember, and being uncoupled, will better themselves into all corners to finde them, being after a while very proud of employment, and very understanding in their game: they are for the most part white or spotted, with red or black: the Polonians call them (Polonitzi) and a Poet describeth them thus:

Nare sagax alius, campisque undique volueres
Quart, & audacem luc indeffenis & illinc.
Disrurrit.

Of the mixtv kinde of Dogs calld in English MANGRELS or MONGRELS.

Thee we call Mangrels, which though they be on both fides propagated by Dogs, yet are they not of one kinde: for as once Dogs coupled with Afles, Leopards, Lyons, Tygers, Apes, or any fuch Bealls, according to the olde Verfe;

Canis congeneres Lupus, Vulpis, Hyana, Tygiris.

So now it is ordinary for the Gray-hound to couple with the Malatve, the Hound with the Gray-Hound, the Malatve with the Shepheards Dog, and the Shepheards Dog with any other Car or Beagle: of these kinde we will now speaken in order. And it is not to be omitted, that this commixtion of kindees have been invented by Hunters for the amendment of some natural fault, or defect they found in the Monophyll, that is, one fingle kinde, and fo hereby they added some qualities to their kinde which they wanted before either in strength of body, or craft of wit: for they derive both of thefis from their Sires, wherefore Oppianus declareth, that in the commixtion of Dogs, the Ancients coupled together thefe kinde, the Arcadian with the Kleian, the Cretofian with the Pountian, the Carian with the Thracian, the Lacedemonians with the Tyrrhenian, the Sarthian with the Iberian, and the Gallican Dogs with the Umbrian, because they want the quick fene of smelling: according to thefe verses:

Quandam inconfultis mater dabat Umbros Gallis
Senfum agilem, texere animos de parte Gelone
Hyrcanos vana tantum Galudonis lingue
Exhibit vtition patre emendata Malorsi.

These Dogs so generated are peculiarly teemed in Greek, Hybris, and Hybrida, as Paphyrius writeth. The French Wolves were wont to have a Dog for their Captain or Leader, and it is ordinary for Wolves and Dogs to couple together, as by experience it hath been oberved: And it is certain, that Malatve Dogs had their firft beginning from this copulation, wherefore Virgil calleth one of thefe Dogs Lyeisca.

---Referenceis Lupum torvo ore Lyeisca.

The Dogs which are bred of Tboes, are commended for their rare qualities and understanding parts in the time of Wars, by Hagonas Bovis in thefe verses;

Hic & semiferam ibson de sanguine prolem
Seu nonis voces, seu mult ad pigorga maris
Et subere asfus, & parvis dismure lateris
Vulpins specie.
The Dogs of Hircania do of themselves run into the Woods, (like adulterers) and seek out the Tygers to engender with them, which thing Gratian rememberth elegantly in many verses:

— Utque gravis sucedere Tigri
Aera canis, majore sill de juvenis fprum,
Excitat fuis magnus pugnae adopta.

In the rank of these Mangrels, I may add in the next place those Dogs, called by the Gratian, Symmaphai, and syntomophies, because they attended upon men in their travels and labors to defend them, and are taught to fight for them, both against men and other beasts; wherein they are as ready to take knowledge of violence offered to their Master, and also to revenge or hinder it, as a reasonable creature can be. These are called of the Latines, Canes socii defensores; foiable Dogs: of which there betwixt some, the first, is lefser, being of rough and long curled hair, his head covered with long hair, of a pleasant and tractable disposition, never going far from his Master, such was the Dog of Tibur, and the Dog of Cedrus the Poet, called Chiron, wherein heareth maketh mention: whose benevolence and ready minde toward their keepers and nourishers may appear by this story of Cololphonis.

Upon a feast, he with a Servant, and a Dog, went to a certain Mutt to buy Merchandise, and as they travelled, his Servant which carried the purse, diversed a little out of the way, to perform the work of nature, and the Dog followed him: which being done, he forgot to take up the Purse of mony that had fallen from him to the ground in that place, and so departed; the Dog seeing the purse, lay down beside it, and stood not a foot: afterward the Mutt and master went forward; missing their Dog, and not their money, until they came to Mutt or Fair, and then for want of mony were constrained to return back again without doing any farther thing: wherefore they resolved to go back again; the same way they came, to see if they could hear of their mony, and at last, when they came to the place where the servant had left the purse, there they found both Dog and mony together; the poor Cur scarce able to see or stand for hunger: when he saw his Master and the servant came unto him, he removed from the earth, but life not able to carry any longer in his body, at one and the same time in the presence of his friends and nourishers, he also dyed, and took of them both his last farewell, through the faithful custody of their forgotten goods; for which it is apparent, that one part of their faithful disposition is, to keep their nourishers goods committed unto them, as shalbe afterward more at large manifested.

Their watchful care over their Masters may appear also by these stories following, for the Dogs of Xanippus followed their Master to the Ship, as at what time he was forewarned by the Oracle to depart out of Albani, by reason of the Persians was in Greece, and so they failed with him to Salamine; and as they failed by the way he commanded one of them to be cast into the Sea, who continued swimming after the Ship until he dyed, for which cause his Master buried him.

When Gelson the Syracusan in his sleep had a fearful dream, that he was stricken with fire from Heaven, and with imprefition of fear, cried out very lamentably; his Dog lying beside him, and thinking that some peril or thef had been violence to his Master, he presently leaped up to the bed, and with shouting and barking awakened him, and so was he delivered from a horrible fear, by the barking of his Dog.

The Tyrians which have the black and the first purple in the world, are said in History to have it by the first occasion of Hercules Dog. Hercules falling in love with a Nymph called Tyra, and travelling toward her with his Dog, he saw the purple fish creeping upon a stone, the hungry Dog caught the fish to eat it and having devoured it, his lips were all dyed or coloured with the same: when the Virgin saw that colour upon the Dogs lips, she denied the love of Hercules, except he could bring her a garment of that colour, whereupon the valiant man knowing by what occasion the Dogs lips received such a tincture, went and gathered all the purple fishes and worms he could finde, and prelling their blood out of them, therewith coloured a garment, and gave it to the Nymph; for reward whereof, he poiffessed the Virgin, being by this means the first inventor of the Phidian tincture.

Among these are to be remembered those loving Dogs, who either have fought for their Masters and defend them, or else declared them that murdered their keepers, or that which is more admirable, leaped into the burning fires which confumed the dead bodies of their nourishers. Such an one was the Dog of Cedrus, who being slain in a certain civil War at Rome, and his enemies coming about him to cut off his head, his poor Dog interposed his body between the blows, and would not suffer any foe once to reach his Master, until by more then five hundred footsteps the Dog was cut in pieces, so living and dying a most faithful companion and thankful friend to him that fed him.

The like was a Dog of Darius the last King of the Persians, after he was slain by Beus and Nabuzarans in the battle against Alexander, & so did the Dog of Silanus fight for his Master against thieves, and when he was slain, he departed not from the body, but kept it warily from Dogs, Birds or wild Beasts, sitting upon his privy parts, and covering them until the Roman Captains came and buried it.

But most admirable was the love of a certain Dog to his Master punished with death, for the fact against Germanicus. Among other, this Dog would never go from the prison, and afterward when his Masters dead body was brought in the presence of many Romans, the Curruftered most lamentable and sorrowful cries; for which cause one of the company threw unto him some meat, to see
fee if that would stop his mouth, and procure silence: but the poor Dog took up the meat, and carried to his masters mouth, not without the singular parrion of the beholders: at last the body was taken up and cast into the river Tiber, the poor Dog leaped in after it, and endeavoured by all the means his weakness could afford, to keep it from sinking, in the presence of an innumerable multitude, which without tears could not look upon the loving care of this brute beast.

The Dogs of Gelon, Hieron, Lyctus, Pyrrhus King of Epirus, Palus the Tragedian, and Theodorus, leaped into the burning fires which consumed their masters dead bodies. 

As King Pyrrhus by chance travelled in his Country, he found a Dog keeping a dead corps, and he perceived that the Dog was almost pined, by tarrying about the body without all food, wherefore taking pity on the beast, he cauèd the body to be interred, and by giving the Dog his belly full of meat, he drew him to love him, and so led him away: afterward as Pyrrhus murthered his fouldiers, and every one appeared in his presence, the Dog also being beside him, he faw the murthers of his master, and fo not containing himself; with voyage, tooth, and nail, he fet upon them: the King fpiepecting that which followed, examined them if ever they had seen or known that Dog, they denied it, but the King not satisfied, charged them that fully they were the murthers of the Dogs (Matter, for the Dog all this while remained fierce against them) and never barked before their appearance, at the lait their guilty confequences brake forth at their mouths and tongues end, and fo confeced the whole matter.

As King Pyrrhus by chance travelled in his Country, he found a Dog keeping a dead corps, and he perceived that the Dog was almost pined, by tarrying about the body without all food, wherefore taking pity on the beast, he cauèd the body to be interred, and by giving the Dog his belly full of meat, he drew him to love him, and so led him away: afterward as Pyrrhus murthered his fouldiers, and every one appeared in his presence, the Dog also being beside him, he faw the murthers of his master, and fo not containing himself; with voyage, tooth, and nail, he set upon them: the King spiepecting that which followed, examined them if ever they had seen or known that Dog, they denied it, but the King not satisfied, charged them that fully they were the murthers of the Dogs (Matter, for the Dog all this while remained fierce against them) and never barked before their appearance, at the last their guilty conseqences brake forth at their mouths and tongues end, and so confeced the whole matter.

The like was of two French Merchants which travelled together, and when they came into a certain Wood, one of them rofe against the other for defire of his money, and so flew him and buried him. His Dog would not depart from the place, but filled the Wood with howlings and cries; the murthers went forward in his journeys, the people and inhabitants near the said Wood, came and found both the murder and the dogs, and the Dog, which was murthered till the Fain was done, and the Merchants returned, at which time they watched the high ways, having the Dog with them, who seeing the murthers, unally made force at him without all provocation, as a man would do at his mortal enemy; which thing caused the people to apprehend him, who being examined, confeced the fact, and received condign punishment for so foul a deed.

To conclude this discourse with one memorable story more out of Blondus, who relateth that there was a certain woman near Paris, who was beloved of two young men, one of them on a day took his taffe and his Dog, and went abroad (as it was thought, of purpose to go to his love) but it happened that by the way he was murthered and buried, and the Dog would not depart from the grave of his Master: at the lait, he being mislaid by his father and brethren, one of them went also to seek him, and see what was become of him, and so finding, found the Dog lying upon his grave, who bowled pitifully when he saw his Master's brother: the young man cauèd the ground to be opened, and so found the wounded corps of his brother, which he brought away, and cauèd to be buried till the murtherer could be describèd: afterward in process of time, the Dog in the presence of the dead mans brethren espied the murtherer, and presently made force upon him very eagerly; which the brethren suspecting, apprehended him, and brought him before the Governors of the City, who examining him with all the policies they could invent, what should be the occasion, why the Dog should so eagerly fly upon him at all times, whenever he was brought into his presence, could not get any confession of the fact from him: then the Magistrate adjudged, that the young Man and the Dog should combate together.

The Dog was covered with a dry fod skin in leaf of armour, and the murtherer with a spear, and on his body a little thin linnen cloath, both came forth to fight, and so the man presently made force at the Dog, who leaping up to the face of the murtherer, took him fell by the throat, and overthrew him, whereas the wretch amazed, cried out, saying, take pity on me you reverend Fathers, and pull off the Dog from my throat, and I will confess all; the which they performed, and he likewise deuoted the cauè and manner of the whole murther, for which thing he was deservedly put to death. And thus far of the leffer sociable Dogs, now followeth the second kinde of the greater.

The greater sociable Dogs of defence are such as fouldiers use in wars, or else are acclimated to keep house or cattell. This kinde ought to be horrible, fierce, strange and unacquainted with all, except his Master, so that he be always at daggers drawing, and ready to fight with all which shall but lay their hands upon him, for which cause he ought to be instruèd from his littering or infancy by art or continual discipline, to supply in him the defects of nature: let him be often provoked to wrath by bores, and afterward as his growth, let some strainger set upon him, with weapon, as taffe or sword, with whom let him combate till he be wearied, and then let him tear some piece of the provokers garment, that so he may depart with a conceit of victory; after the fight tye him up, and suffer him not to straggle loose abroad, but feed him thus tyed up, so shall he in
short time prove a strong defender, and eager combatant against all men and beasts which come to deal with him. Of this fort they nourish many in Spain, and in other places.

Such an one was the Dog of Præsens the Tyrant of Thrasybul, being a very great and fierce Beast, and hurtful to all, except them who fed him daily. He used to let this Dog at his chamber door to watch and guard him when he slept, that who so ever was afraid of the Dog, might not approach near without exquisite torments. Angus gave one of these to the Poet Eupoleus, who taught him by manysignes and gestures for the love of his meat, to observe his fervant Ephebus, if at any time he stole money from him. And at the last, the sly Dog observed the fervant so narrowly, that he found him robbing his Maiters cofferes: wherefore he instantly fell upon him and tore him in pieces. The which Dog afterward died for sorrow of his Maiters death; whereupon Elianus faith, that the place of his death in Ægina was called the place of mourning, to the day of his writing.

Nicomedes King of Byzantium, had one of these Molossian great Dogs, which he nourished very tenderly, and made it very familiar with himself: it fell out on a time, that this King being in dalliance with his wife Diotisale, in the presence of the Dog, and the again hanging about the Kings neck, kissing and provoking him to love with amorous gestures, the Dog thinking he had been offering some violence to his master the King, presently flew upon her, and with his teeth pulled her right shoulder from her body, and so left the amorous Queen to dye in the arms of her loving Husband: which thing caused the King to banish the Dog forever out of his sight, for sorrow whereof he soon after dyed; but the Queen was most nobly buried at Nicomedos in a golden Sepulcher: which was opened in the reign of the Emperour Michael, son of Theophilus, and there the womans body was found whole and not putrefied, being wrapped in a golden vellure, which taken off, and tried in a furnace, yeelded above an hundred and thirteen pounds of pure gold.

When a Dragon was sitting upon Orpheus, as he was occupied in hawking by his Dogs he was sav'd, and the Dragon devoured. And when Calus one of the Senators of Placentia being sick, was set upon by certain lewd fellows, he received no wound till his Dog was slain.

There was never any thing more strange in the nature of Dogs, then that which happened at Rhodes besieged by the Turk, for the Dogs did there defend betwixt Christians and Turkis; for towards the Turks they were most eager, furious, and unappeasable, but towards Christians, although unknown, most eafe, peaceable and placidious, which thing caused a certain Poet to write thus:

His enure sedem quis nostris serva sub are
Arus & Carpebii defendit littera ponti.

There were two hundred of these Dogs which brought the King of Carmania from battellm, refcuting him from all that reached. The Cypriotes and Cappadenion, or Cyprian Dogs fought in all their battells: so likewise the Cypriotes, Herriesian, and Magnesian Dogs: these also the Spaniards used in India, to hunt out the naked people, falling upon them as fiercely as ever they would upon Bores, or other wide Beasts, being pointted unto by their leaders finger. And for this cause was it, that Vespasian in his Capitol at Rome, on an Indian Lord, and three other his wicked companions to be cast unto Dogs for their unnatural lust: but the Inhabitants of Carmania and Carib, do drive away the Dogs, for through their admirable activity in eathing darts, they pierce the Dogs ere they come near them with pouioned arrows. And thus much for the great warlike defensive Dogs.

In the next place followeth the Shepheard Dogs called by Virgil, Perserius Canis: and this cannot properly be termed a dumb keeper: for there is no creature that will more stir, bark, and move noile, then one of these against thief or wilde beast. They are also used by Horsemen, Swine-heards, and Goat-Heards, to drive away all annoyancees from their Cattel, and also to guide & govern them, in executing their masters pleasure upon signs given them, to which of the stragling Beasts they ought to make force. Neither is it requisite that this Dog be so large or nimble as is the Grey-hound, which is appointed for Deer and Hares.

But yet that he be strong, quick, ready, and understanding, both for brauling and fighting, so as he may fear away and also follow (if need be) the ravinge Wolf, and take away the prey out of his mouth; wherefore a square proportion of body is requisite in these Beasts, and a tolerable lightnes of foot, such as is the Village Dog, used only to keep houses, and hereof also they are the best who have the greatest or loudest barking voyces, and are not apt to leap upon every stranger or beast they see, but reserve their strength till the juft time of employment.

They approve also in this kinde above all other, the white colour; because in the night time they are the more easilie discerned from the Wolve, or other noisome beast; for many times it falleth out, that the Shepheard in the sty-light, firketh his Dog instead of the Wolf: these ought to be well faced, black or dusky eyes, and correspondent nostrils of the fame colour with their eyes, black ruddy lips, a crooked cannoyle noile, a flat chap with two great broches,or long straight sharp teeth growing our thereof, covered with their lips, a great head, great ears, a broad breaf, a thick neck; broad and folid shoulders, straight legs, yet rather bending inward thenstanding outward; great and thick feet, hard crooked nails, a thick tail which groweth lower to the end thereof, then at

The colour of this Dog.

Of Mariners Dogs on shipboard.

Of the VILLAGE-DOG, or HOUSE-KEEPER.

His Village Dog ought to be fatter and bigger than the Shepherds Dog, of an elegant, square and strong body, being black coloured, and great mouhted, or barking bignly, that fo he may the more terrifie the Theef, both by day and night, for in the night the beaft may feize upon the robber before he defierne his black skin, and therefore a fotted, banded, party coloured Dog is not approved. His head ought to be the greatest part of his body, having great eyes hanging down, and black eyes in his head, a broad breath thick neck, large shoulders, ftrong legs, a rough hair, short tail, and great nails: his difpofition muft not be too fierce, nor yet too familiar, for fo he will laun upon the Theef as well as his Masters friend. Yet it is good that fome time he rate againft the household fervants, and alway againft ftrangers, and fuch they muft be as can wind a stranger afar off, and defcry him to his Mafter by barking as by a watch-word, and fetting upon him, when he approacheth near if he be provoked. Blondus commendeth in this kinde, fuch as sleep with one eye open and the other shut, as any fmall noife or firit wake and raife him. It is not good to keep many of these curfit Dogs together, and then few which he kept muft be tied up in the day time, that fo they may be more vigilant in the night when they are let loose. There are of this kind which Mariners take with them to Sea, to preferve their goods on Ship board, they chufe them of the greatefl bodies and lowdelt voice, like the Croatian Dog,efembling in hair and bignefs, and fuch as are very watchful,according to the faying of the Poet:

Exagianti & lar, & turba Diaies fures,
Pervigilantique lares, pervigilantique Canes.
Of Dogs.

And such also they nourish in Towers and Temples; in Towers, that so they may defcry the approaching enemy when the Souldiers are asleep; for which cause, Dogs seen in sleep, signify the careful and watchful wife, servants, or Souldiers, which foresee dangers and preserve publick and private good.

There was in Italy a Temple of Pallas, wherein were referred the axes, instruments, and armour of Diomedes and his Colleagues, the which Temple was kept by Dogs, whose nature was (as the Author faith) that when Greece came to that Temple, they would fawn upon them as if they knew them; but if any other Courteymen came, they thowed themselves wilde, fierce, and angry against them. The like thing is reported of a Temple of Vulcan in Rhea, wherein was preserved a perpetual and unquenchable fire, for the watching whereof, were Dogs designed; who would fawn and gently flatter upon all those which came softly and religiously to worship there, leading them into the Temple like the familiars of their God; but upon wicked and evil disposed lead persons, they barked and raged, if once they endeavoured so much as to enter either the Wood or Temple; but the true cause hereof was, the imputation of some impure and deceitful, unclean, diabolical spirits. And by the like infinuit, Sepio Africanus was wont to enter into the Capitol, and command the Chappel of Jupiter to be opened to him, at whom no one of the Keepers Dogs would ever stir, which caused the Men keepers of the Temple much to marvel, whereas they would rage fiercely against all other, whereupon Strabo made these Veres, fallly imputing this demonical illusion to divine revelation.

Quid tacitus linguam quos veri baud aetna Cretae
Nec temper mendax, sit aurora templae tuentes,
Partereque baud uti solites, (mirebile dictu)
Doxa Tyaneae Aratos seniis ad ora,
Non magico cane, sed quod divinitus illis
Infinit vis animo, virtutis gnara latentes.

The like strange thing is reported of a Temple or Church in Creosio, dedicated to the Virgin Mary, wherein every night are an assembly of Dogs, which unto this day (faith the Author) meet voluntarily at an appointed hour, for the custody of the Temple, and those ornaments which are preferred therein against Thieves and Robbers; and if it fortune any of the Dogs be negligent and slack at the hour aforesaid, then will he bark about the Church till he be let in, but his fellows take punishment of him, and fall on him, biting and rending his skin, yea sometime killing him; and these Dogs have a fer diet or allowance of dinner, from the Canons and Preachers of the Church, which they duly observe without breach of order; for to day two of them will go to one Canons house, and two to another, and so likewise all the residue in tourns successively visit the several houses within the Cloister yard, never going twice together to one house, nor preventing the refection of their fellows; and the story is reported by Antonius Schnebergen for certain truth, upon his own knowledge.

Of the MIMICK, or GETULIAN-Dog, and the little MELITEAN-DOGS of Gentlewomen.

Here is also in England two other sorts of Dogs, the figure of the first is here expressed, being apt to imitate all things it feeth, for which cause some have thought that it was conceived by an Ape; for in wit and disposition it resembeith an Ape, but in face sharpe and black like a Hedge-hog, having a short recurved body, very long legs, shaggy hair, and a short tail; this is called of some (Canis Lucernarius) these being brought up with Apes in their youth, learn very admirable and strange feats, whereof there were great plenty in Egypt in the time of King Psamemy, which were taught to leap and play, and dance, at the
The History of Four-footed Beasts.

The hearing of music, and in many poor men's houses they served in stead of servants for divers ules.

These are also used by Players and Puppet-Mimicks to work strange tricks, for the sight whereof they get much money: such one was the Mimicks dog, of which Plutarch writeth that he saw in a publick spectacle at Rome before the Emperor Vespasian. The Dog was taught to act a play, wherein were contained many person's parts, I mean the affections of many other Dogs: at last there was given him a piece of bread, wherein, as was said, was poison, having virtue to procure a dead sleep, which he received and swallowed: and presently after the eating thereof he began to reel and stagger to and fro like a drunken man, and fell down to the ground, as if he had been dead, and so lay a good space not stirring foot nor limb, being drawn up and down by divers persons, according as the gesture of the Play he acted did require, but when he perceived by the time and other signes that it was requisite to arise, he first opened his eyes, and lift up his head a little, then stretched forth himself like as one doth when he riseth from sleep; at the last he got up and runneth to him to whom that part belonged, not without the joy and good content of Caesar and all other the beholders.

To this may be added another story of a certain Italian about the year 1403, called Andrew, who had a red Dog with him of strange feats, and yet he was blind. For standing in the Market place, compassed about with a circle of many people, there were brought by the handers by many Rings, Jewels, Bracelets and pieces of gold and silver, and there within the circle were covered with earth, then the Dog was bid to seek them out, who with his nose and feet did presently find and discover them; then was he also commanded to give to every one his own Ring, Jewel, Bracelet, or money, which the blind Dog did perform directly without stay or doubt. Afterward the handers by, gave unto him divers pieces of coin, stamped with the images of sundry Princes, and then one called for a piece of English money, and the Dog delivered him a piece, another for the Emperors coin, and the Dog delivered him a piece thereof; and so consequently every Princes coin by name, till all was reeloled: and this story is recorded by Abubus Urperiensis, whereupon the common people said, the Dog was a Devil or else possessed with some Pythonical spirit: and so much for this Dog.

There is a Town in Sicily, called Melitae, from whence are transported many fine little Dogs called, Melitei Canes, they were accounted the Jewels of Women, but now the said Town is possessed by Fifer-men, and there is no such reckoning made of these tender little Dogs, for these are not bigger then common Ferrets, or Weasills, yet are they not small in understanding, nor mutable in their love to men: for which cause they are also nourished tendrily for pleasure, whereupon came the proverb, Melitae Castris, for one nourished for pleasure, and Canis digna throno, because Princes hold them in their hands fittting upon their etate.

Theodosius the tumbler and dancer had one of these, which loved him so well, that at his death he leaped into the fire after his body. Now a dayses, they have found another breed of little Dogs in all Nations, beside the Melitean Dogs, either made fo by art, as inclowing their bodies in the earth when they are Whelps, so as they cannot grow great, by reason of the place, or else, leftring and impairyng their growth, by some kind of meat or nourishment. These are called in Germany, Bracken Schaffhund and Guttenhund; the Italians, Battali; other Nations have no common name for this kind that I know. Martial made this Dithicon of a little French Dog; for about Lions in France there are flore of this kinde, and are fold very dear; sometimes for ten Crowns, and sometimes for more.

Deliciarum pasus vis, et aliis cattel," Nartani brevi est, pagina tota mibi.

They are not above a foot; or half a foot long, and alway the leffer the more delicate and precious. Their head like the head of a Mouse but greater, their nose sharp, their ears like the ears of a Cony, short legs, little feet, long tail, and white colour, and the hairs about the shoulders longer then ordinary, is not commended. They are of pleasant disposition, and will leap and bite without pinching, and bark prettily, and some of them are taught to climb uprigh hold up their fore legs like hands; other to fetch and carry in their mouths, which is caft unto them. There be some wanton women which admit them to their beds, and bring up their young ones in their own boomes, for they are so tender, that they seldom bring above one at a time, but they lose their life. It was reported that when Grego in Syracusae was to go from home among other Gofts, the gave her maid charge of two things, one that she should look to her childe when it cryed, the other that she should keep the little Dog within doors.

Publius had a little Dog (called Ifa) having about the neck two silver bells, upon a silken Collar, which for the neatness thereof, seemed rather to be a picture then a creature; whereof Martial made this elegant Epigram, comprehending the rare voice and other gestures in it.

Ifsa
Marcellius Empiricus reciteth a certain charm, made of the rinde of a wilte Eightree, held to the Spleen or Liver of a little Dog, and afterward hunged up in the smoeak to dry, and pray that as the rind or bark dryeth, so the Liver or Spleen of the Dog may never grow: and thereupon the Dog (faith that foolish Empirick) shall never grow greater, then it was at the time that the bark was hanged up to drying. To let this trifle go, I will end the discourse of these little Dogs with one story of their love and understanding.

There was a certain noble Woman in Sicily, which understanding her husband was gone a long journey from home, sent to a lover (I thould say an Adulterer) the had, who came, and by bribery and money given to her servants, she admitted him to her bed, but yet privately, more for fear of punishment, then care of modesty: and yet for all her craft, she mislurtrued not her little Dog, which did see every day where she locked up this Adulterer: at last, her husband came home, before her lover was avoided, and in the night the little Dog seeing his true Mafter returned home, ran barking to the door and leaped up thereupon (within which the Whoremonger was hidden) and this he did omtimes together, fauning and scraping his Lord and Mafter also: in so much as he mislurtrued (and that unjustly) some strange event: at last, he brake open the door, and found the Adulterer ready armed with his sword, wherewithal he flew the good man of the house unawares: and so enjoyed the Adulterate woman for his wife: for Mutther followeth if it go not before Adultery. This story is related by Elianus to let forth a virtue of these little Dogs, how they observ the actions of them that nourish them, and also some decription betwixt good and evil.

The Dogs of Egypt are most fearful of all other, and their estome is to run and drink; or drink of the River Nile running, for fear of the Crocodiles: whereupon came the Proverb, of a man that did any thing flightly or hastily, Ut canis et nilo bibit. Aleibiades had a Dog which he would not fell under 28 thousand Sesterces, that is, seven hundred French Crowns; it was a goodly and beautiful Dog, yet he cut off his tail, whereof he gave no other reason, being demanded why he so blemished his beast, but only that by that fact he might occasion to the Athenians to takle of him.

The Dogs of Caramania can never be tamed, for their men also are wilde and live without all Law and Civility: and thus much of Dogs in special. In the next place I thought good to inhere into this story the Treatise of English Dogs, first of all written in Latin by that famous Doctor in Physick John Cury, and since translated by A. F. and directed to that noble Gesner, which is this that followeth, that so the Reader may chufe whether of both to affect bet.

The Preamble or Entrance into the Treatise Following.

Wrote unto you (well beloved friend Gesner) not many years past, a manifold history containing the divers forms and figures of Beasts, Birds, and Fishes, the sundry shapes of Plants, and the fashions of Herbs, 

I wrote moreover unto you severaly, a certain abridgement of Dogs, which in your discourse upon the forms of Beasts in the second order of noble and tamable beasts, where you make mention of Scottish Dogs, and in the winding up of your Letter written and directed to Doctor Turner, comprehending a Catalogue or rehearsal of your Books not yet extant, you promised to set forth in print, and openly to publish in the face of the world among luch your works as are not yet come abroad to light and sight. But becaus certain circumstances were wanting in my brevity of English Dogs (as seemed unto me) I stayed the publication of the same, making promise to send another abroad, which might be committed to the hands, the eyes, the ears, the minds, and the judgements of the Readers.

Wherefore that I might perform that precisely, which I promised solemnly, accomplish my determination, and satisfy your expectation: which are a man defires and capable of all kind of knowledge, and very extant to be acquainted with all experiments: I will express and declare in due order, the grand and general kind of English Dogs, the difference of them, the use, the properties, and the divers nature of the same, making a tripartite division in this fort and manner. All English Dogs be either of a gentle kind serving the game, a homely kind apt for sundry necessary uses, or a curtilk kind, meet for many toies.
The History of Four-footed Beasts.

Of these three sorts or kinds to mean I to entreat, that the first in the first place, the last in the last room, and the middle fort in the middle fear be handled. I call them universally all by the name of English Dogs, as well because England only, as it hath in it English Dogs, so it is not with the Scots, as also for that we are inclined and delighted with the noble game of hunting, for we Englishmen are addicted and given to that exercise and painful patience of pleasure, as well for the plenty of flesh which our Parks and Forests do offer, as also for the opportunity and convenient leisure which we obtain; both which the Scots want. Wherefore seeing that the whole estate of kindly hunting consists principally in these two points, in chasing the beast that is in hunting, or in taking the bird that is in bowline. It is necessary and requisite to understand that there are two sorts of Dogs by whose mean the feats within specified are wrought, and these practices of activity cunningly and curiously composed, but two kinds of Dogs, one which rouzeth the beast and continueth the chase, another which springeth the bird, and bewarreth the flight by pursu. Both which kinds are termed of the Latin by one common name, that is, Canes Venatici, hunting Dogs. But because we Englishmen make a difference between hunting and bowline, for they are called by these several words; Venatio, & Autopium, so they term the Dogs whom they use in these fundry games by dives names, as those which serve for the beast, are called Venatici, the other which are used for the fowl are called Autopium.

The first kinde called Venatici I divide into five forts, the first in perfect smellding, the second in quick syping, the third in swifness and quickness, the fourth in smellding and nimblenes, the fift in subtilty and deceitfulness, herein these five forts excell.

Of the DOG called a HARIER; in Latin, Leverarius.

That kinde of Dog whom nature hath endued with the virtue of smellding, whose property it is to use a luftiness, a readiness, and a courteousnesse in hunting, and draweth into his nostrils the air or sent of the beast purfied and followed, we call by this word Sagax, the Greacious by this word Insemen of tracing or chaising by the foot, or Rinelatin, of the nostrils, which be the instruments of smellding. We may know these kines of Dogs by their long, large and bigging lips, by their hanging ears, reaching down both sides of their chaps; and by the indifferent and meaurable proportion of their making. This sort of Dogs we call Leverarius, Hariers, that I may comprise the whole number of them in certain specialties, and apply to them their proper and peculiar names, for so much as they cannot all be reduced and brought under one fort, considering both the fundry uses of them, and the difference of their service whereto they be appointed. Some for the Hare, the Fox, the Wolf, the Hart, the Buck, the Badger, the Otter, the Polecat, the Lobfter, the Weafile, the Cony, &c. Some for one thing and fomne for another.

As for the Cony, whom we have lastly yet dunit, we use not to hunt, but rather to take it, sometime with the net, sometime with a Ferret, and thus every several fort is notable and excellent in his natural quality and appointed practice. Among those fundry sorts, there be some which are apt to hunt two different beasts, as the Fox other whiles, and other whiles the Hare, but they hunt not with such outward and good luck after them, as they do that whereas nature hath formed and framed them, not only in external composition and making, but also in inward faculties and conditions, for they swave oftentimes, and do otherwise then they should.

Of the DOG called a TERRAR; in Latin, Terrarius.

Another fort there is which hunteth the Fox, and the Badger, or Gray only, whom we call Terrar, because they (after the manner and custom of Ferreets in searching for Conies) creep into the ground, and by that means make afraid, nip, and bite the Fox and the Badger in such sort, that either they tear them in pieces with their teeth, being in the bofom of the earth, or else hate and pull them perforce out of their lurking Angles, darke dungeons, and close caves, or at the least through conceived fear, drive them out of their hollow harbors, so much that they are compelled to prepare speedy flight, and being desirous of the next (albeit not the safest) refuge, are otherwise taken and intrapped with snares and nets laid over holes to the same purpose. But these be the least in that kinde called Sagax.

Of the DOG called a BLOOD-HOUND; in Latin, Sanguinarius.

The greater sort which serve to hunt, having lips of a large size, and eares of no small length, do not only chafe the beast whilsts it liveth (as the other do of whom mention above is made) but being dead also by any manner of cautiousness, make recourse to the place where it lyeth, having in this point an allowed and influable guide; namely, the scent and favour of the blood sprinkled here and there upon the ground. For whether the beast being wounded, doth notwithstanding enjoy life, and escapeth the hands of the huntman, or whether the said beast being slain is conveyed cleanly out of the Park (so that there be some signification of blood shed) these Dogs with no
Of Dogs.

...lefe facility and cainlines, then avidity and greedines can dicloie and bewray the same by smeling, applying to their purfuite, agility and nimblenes, without reductufles; for which considera-
tion, or a singular specialty they delvered to be called Sanguinaries Blood-hounds. And albeit per-
adventure, it may chance, (as whether it chanceth seldom or sometime I am ignorant) that a piece of thefeth be dubitably foine, and cunningly conveyed away with fuch provifoes and preca-
ventures, as thereby all appearance of bloud is either prevented, excluded, or concealed, yet thefe kinde of Dogs by certain direction of an inward affured notice and privity mark, perfue the deed-
doors, through long lanes, crooked reaches, and wary ways, without wandering away out of
the limits of the land whereon thefe desperate purloiners prepared their speedy paffage. Yea,
the natures of thefe Dogs is fuch, and fo effectual is their foregift, that they can bewray, separate,
and pick them out from among an infinite multitude and an innumerable company, creep they
never so far into the thickeft throng, they will finde him out notwithstanding he lie hidden in
wilde Woods, in clofe and overgrown Groves, and lurk in hollow holes apt to harbour fuch un-
gracious guests.

Moreover, although they fhould paffe over the water, thinking thereby to avoid the purfuite of
the Hounds, yet will not thefe Dogs give over their attempt, but preuming to swim through the
stream, perferue in their purfuite, and when they are arrived and gotten the further bancke, they
hunt up and down, and in and out they, from place to place fluft they, until they have attainted
to that plot of ground where they paffed over. And this is their pratife, if perdy they cannot at
the firft time smeling, finde out the way which the deed-doers took to escape. So at length get
they that by art, cunning, and diligent endeavours, which by fortune and luck they cannot otherwise
Chapter, To contemptuion bei delegation, to be as it were naturally infilled into thefe kind of Dogs.
For they will not paffe or breathe forth from their purfuite until fuch time as they are apprehended
and taken which committed the fact.

The owners of fuch Hounds use to keep them in clofe and dark kennels in the day, and let
them loose at liberty in the night feafon, to the intent that they might with more courage and
boldnes pratife to follow the felon in the evening and solitary hours of darknes, when fuch ill
dispofed varlets are principally purpofed to play their impudent pranks. Thefe Hounds (upon
whom this present portion of our treatife runneth) when they are to follow fuch fellows as we have
before rehearfed, ufe not that liberty to range at will, which they have otherwise when they are
in game, (except upon necessery occafion whereon dependeth an urgent and effectual perforvi-
ation) when fuch purloiners make fpeedy way in flight, but being restrained and drawn back from
running at random with the leame, the end whereof the owner holding in his hand is led, gui-
ded and directed with fuch swifness and howynes (whether he go on foot, or whether he ride on
horeback) as he himfelf in heart would with for the more eallie apprehension of their ventu-
rous varlets.

In the borders of England and Scotlant, (the often and accubomed fealing of Cattel fo procuring)
thefe kind of Dogs are very much ufed, and they are taught and trained up firft of all to hunt Catt-
el, as well as the fmallier as of the greater growth: and afterwards (that quality relinquifhed and left)
they are learned to purfue fuch perfons as plant their pleaflure in fuch pratifes of
purloining as we have already declared. Of thefe kind there is none that taketh the Water natur-
ally except it pleafe you to fuppos of themwhoffollow the Otter, which inimes hauing the
land, and sometime ufe the water. And yet neverthelbels all the kinde of them boyling and broyling
with greedy defire of the prey which by swimming paffeth through river and flood, plunge amids
the water and paffe the stream with their paws.

But this property proceedeth from an earnest defire wherewith they be inflamed, rather then
from any inclination, illuing from the ordainance and appointment of nature. And albeit some
of this both in English be called Brache, in Scotifh, Raucke, the caufe thereof refleth in the the-fes,
and not in the general kinde. For we Englifhmen call Bitches belonging to the hunting kind of
Dogs, by the term above mentioned. To be short, it is proper to the nature of Hounds, none
to keep filience in hunting until fuch time as there is game offered. Other fome foon as they
smell out the place where the beafe lurketh, to bewray it immediately by their imporitate barking,
notwithstanding it be far and many furlongs off, cowching clofe in his cabin. And thefe Dogs
the younger they be, the more wantenonly bark they, and the more liberally; yet oftentimes with-
out neceffity, fo that in that, by reafon of their young years and want of pratifice, small certainty is
not to be repofed. For continuation of time, and experience in game, minifreth to thefe Hounds, not only
running in running, but also (as in the refl) an assured foresight what is to be done princip-
ally, being acquainted with their Mafteres watchwords, either in revoking or imbouldening them
to ferve the game.
The History of Four-footed Beasts.

Of the Dog called the G A S E - H O U N D, in Latin, Agaeum.

This kind of Dog which pursueth by the eye, prevailseth little, or never a whit, by any benefit of the nose, that is by smelling, but excelleth in periscopie and sharpness of sight altogether, by the virtue whereof, being singular and notable, it hunteth the Fox and the Hare. This Dog will chase and separate any beast from among a great flock or herd, and such a one will it take by election as is not lanck, lean and hollow, but well spred, smooth, full, fat, and round, it followes by direction of the eyesight, which indeed is clear, conflant, and not uncertain; if a beast be wounded and go astray, the Dog keepteth after it by the redferenes of the eye, if it chance peradventure to return and be mingled with the residue of the flock, this Dog ppeth it out by virtue of his eye, leaving the rest of the Cattell untouched, and after he hath set fire upon it, he separateth it from among the company, and having so done, never ceaseth untill he have wearied the Beast to death.

Our Countrymen call this Dog Agaeum, a Gase-hound, because the beams of his sight are so fleetfully fetted and unmoveably fastned. These Dogs are much and usually occupied in the Northern parts of England more then in the Southern parts, and in fieldy lands rather then in bushie and woody places, horsemens use them more then footmen, to the intent that they might provoke their horses to a swift gallop (wherewith they are more delighted then with the prey itself) and that they might accoumone their Horse to leap over hedges and ditches, without fup or stumble, without harme or hazard, without doubt or danger, and to escape with safety of life. And to the end that the riders themselves, when necessitie so confraineth, and the fear of further mischief incourset, might save themselves undamified, and prevent each perilous tempt by preparing speedy flight, or else by swift pursuite made upon their enemies, might both overtake them, encounter with them, and make a slaughter of them accordingly. But if it fortune so at any time that this Dog take a wrong way, the Master making some usual figne and faimiliar token, he returneth forthwith, and taketh the right and ready race, beginning his chase aiffreth, and with a clear voice, and a swift foot followeth the game with as much courage and nimblenesse as he did at the first.

Of the Dog called the GRAY-HOUND, in Latin, Leporarius.

We have another kind of Dog; which for his incredibl swiftnes is called Leporarius, a Grayhound, because the principal service of them dependeth and confisteth in harling and hunting the Hare, which Dogs likewise are indued with no leffe strength then lightnes in maintenance of the game, in foring the chase, in taking the Buck, the Hart, the Doe, the Fox, and other beafts of semblable kinde ordained for the game of hunting. But more or leffe, each one according to the measure and proportion of their diuerse, and as might and ability of their bodies will permit and suffer.

For it is a spare and bare kind of Dog, (of flesh but not of bone) some are of a greater fort, and some of a leffer, some are smooth shamed, and some ereuned, the bigger therefore are appointed to hunt the bigger beafts, and the smaller serveth to hunt the smaller accordingly. The nature of the Dogs I finde to be wonderful by the testimonies of all Histories. For, as John Strach the Historiographer in his 4th. reporteth, A Gray-hound of King Richard the second that wore the Crown, and bare the Scepter of the Realm of England, never knowing any man, besides the Kings person, when Henry Duke of Lancaster came to the Caille of Flint to take King Richard, the Dog Vorfaking, his former Lord and Master came to Duke Henry, proued upon him with such reemblances of good will and conceiued affection, as hefavoured King Richard before: he followed the Duke, and utterly left the King. So that by these manifold circumstances a man might judge his Dog to have been lightened with the lamp of foreknowledge and understanding, touching his old Masters miferies to come, and unhappinesse night at hand, which King Richard himself evidently perceived, accounting this deed of his Dog a Prophecy of his overthrow.

Of the Dog called the LEVINER, or LYEMMER; in Latin, Lovarius.

Another sort of Dogs be there, in smelling singular, and in swiftnesse incomparable. This is (as it were) a middle kinde betwixt the Harrier and the Gray-hound, as well for his kind, as for the frame of his body. And it is called in Latin, Lovarius, a Leviate, of lightnesse, and therefore may well be called a Light-hound; it is also called by this word Lovarius, a Lure, wherewith it is led. This Dog for the excellency of his conditions, namely smelling and swifft running, doth follow the game with more esgerenes, and taketh the prey with a jolly quicknes.
Of the DOG called a TUMBLER, in Latin, Vertagus.

His sort of Dogs, which compasseth all by crafts, fraudes, and subtilities and deceits, we Englishmen call Tumblers, because in hunting they turn and tumble, winding their bodies about in a circle, and then fiercely and violently venturing upon the beast, doth suddenly gripe it, at the very entrance and mouth of their receptacles, or cloysters before they can recover means, to save and succour themselves. This Dog with another craft and subtility, namely, when he runneth into a Warren, or fetcheth a course about a Conyburrough, he hunts not after them, he frays them not by barking, he makes no counteract or shadow of hatred against them, but dissembling friendship, and pretending favour, paffeth by with silence and quietness, marking and noting their holes diligently, wherein (I warrant you) he will not be overhot nor deceived. When he cometh to the place where Conies be of a certainty, he cowetheth down close with his belly to the ground, provided always by his skill and policy, that the wind be never with him but against him in such an enterprise; and that the Conies spy him not where he lurketh. By which means he obtaineth the fcent and favour of the Conies, carried towards him with the wind and the air, either going to their holes or coming out, either passing this way, or running that way, and so provideth by his circumvention, that the silly simple Cony is debarred quite from his hole (which is the haven of their hope, and the harbour of their health) and fraudulently circumvent and takea, before they can get the advantage of their hole. Thus having caught his prey, he carrieth it speedily to his Master, returning his Dogs return in some convenient lurking corner.

These Dogs are somewhat lighter then the Hounds, and they be lacquer and leaner, beseide that they be somewhat prick eared. A man that hath mark the form and fashion of their bodies, may well call them mugger Gray-hounds if they were somewhat bigger. But notwithstanding they countervail not the Grey-hound in greatness, yet will he take in one dayes space as many Conies as shall strife to as big a burthen, and as heavi a load as a horse can carry for deceit and guile is the instrument whereby he maketh this spoil, which pernicious properties supply the places of more commendable qualities.

Of the DOG called the THEEVISH DOG, in Latin, Canis furax.

He like to that whom we have rehearsed, is the Theevish Dog, which at the mandate and bidding of his Master seereeth and seetheth abroad in the night, hunting Conies by the air, which is levened with the favour and conveyed to the sense of smelling by the means of the wind blowing towards him. During all which space of his hunting, he will not bark, lest he should be prejudicial to his own advantage. And thus watcheth and snatcheth up in course as many Conies as his Master will suffer him, and beareth them to his Masters standing. The Farmers of the Countrey and uplandish dwellers, call this kind of Dog a Night-Car, because he hunteth in the dark. But let us much seem sufficient for Dogs which serve the game and disport of hunting.

Of Gentle DOGS serving the Hawk, and first of the SPANIEL, called in Latin, Hispaniolus.

Such Dogs as serve for fowling, I think convenient and requisite to place in the second Section of this treatise. These are able to be reckoned and accounted in the number of the Dogs which come of a gentle kind: and of those which serve for fowling, there be two sorts, the first fowling game on the land, the other fowling game on the water. Such as delight on the land, play their parts, either by swiftnes of foot, or by often quefting, to search out and to bring the bird for further hope of advantage, or else by some secret sign and privy token bewray the place where they fall. The first kind of such serve the Hawk, the second the net or train. The first kind have no peculiar names assigned unto them, fave only that they be denominated after the bird which by natural appointment he is allotted to take; for the which consideration, some be called Dogs for the Falcon, the Phefian, the Partridge, and fuch like. The common sort of people call them by one general word, namely Spaniels; as though these kind of Dogs came originally and first of all out of Spain. The most part of their skins are white, and if they be marked with any spots they are commonly red, and somewhat great therewithal, the hairs not growing in such thicknes but that the mixture of them may easily be perceived. Oterofome of them be reddish and blackish, but of that sort there be but a very few. There is also at this day among us a new kind of Dog brought out of France (for we Englishmen are marvellous greedy gaping gluttons after novelties, and covetous cormorants of things that be seldom, rare, strange, and hard to get) and they be speckled all over with white and black, which mingled colours incline to a marble bloom, which beautifieth their skins, and affordeth a feemly show of comelines. These are called French Dogs, as is above declared already.
The **DOG** called the **SETTER**; in Latin, *Index*.

Another sort of Dogs be there, servicable for fowling, making no noise either with foot or with tongue, while they follow the game. These attend diligently upon their Master and frame their conditions to such becks, motions, and gestures, as it shall please him to exhibit and make, either going forward, drawing backward, inclining to the right hand, or yeelding toward the left, (in making mention of fowles, my meaning is of the Patridge and the Quail:) when he hath found the bird, he keepeth sure and silent silence, he layeth his fleps, and will proceed no further; and with a close, covert, watching eye, layeth his belly to the ground and doth creepeth forward like a worm. When he approacheth neer to the place where the bird is, he lies him down, and with a mark of his paws, betrayeth the place of the birds last abode, whereby it is supposeth that this kind of Dog is called *Index*, Setter, being indeed a name most consonant and agreeable to his quality. The place being known by the means of the Dog, the fowler, immediately openeth and spreadeth his net, intending to take them; which being done, the Dog at the customed beck or usual sign of his Master riseth up by and by, and draweth neerer to the fowle, that by his presence they might be the authors of their own infringing, and be ready intangled in the prepared net, which cunning and artificial devise in a Dog (being a creature domesitical or housefowl servant, brought up at home with offals of the trencher, and fragments of victuals) is not so much to be marvilled at, seeing that a Hare (being a wilde and skippish beast) was seen in England to the astonishment of the beholders, in the year of our Lord 1564, not only dancing in measure, but playing with his former feet upon a tabaret, and observing just number of strokes (as a practitioner in that art) besides that nipping and pinching a Dog with his teeth and claws, and cruelly thumping him with the force of his feet; this is no trumpery tale, nor tripe toy (as I imagine) and therefore not unworthy to be reported, for I reckon it a requital of my travell, not to drown in the seas of silence any special thing, wherein the providence and effectual working of nature is to be pondered.

Of the **DOG** called the **WATER SPANIEL**, or **FINDER**; in Latin, *Aquaticus seu Inquisitor*.

That kind of Dog whose service is required in fowling upon the water, partly through a natural towardness, and partly by diligent teaching, is indued with that property. This sort is somewhat big, and of a measurable greatness, having long, rough, and curled hair, not obtained by extraordinary trades, but given by nature's appointment; yet nevertheless (friend Gefier) I have described and set him out in this manner, namely powdred and notted from the shoulders to the hindermost legs, and to the end of his tail, which I did for use and custom sake, that being as it were made somewhat bare and naked, by shearing off such superfluity of hair. They might achievable the more lightsheen, and swiftness, and be lesse hindered in swimming, so troublesome and neerless a burden being shaken off. This kind of Dog is properly called *Aquaticus*, a Water Spaniel, because he frequenteth and hath usual recourse to the water where all his game lyeth, namely water fowls, which are taken by the help and service of them, in their kind. And principally Ducks and Drakes, whereupon he is likewise named a Dog for the Duck, because in that quality he is excellent. With these Dogs also we fetch out of the water such fowl as being true to death by any venemous Worm, we use them also to bring us our bolts and arrows out of the water (filling our mark) whereat we directed our levell, which otherwise we should hardly recover, and oftentimes they retire to us our shafts which we thought never to see, touch, or handle again, after they were lost: for which circumstances they are called *Inquisitores*, searchers and finders. Although the Duck otherwise notably deceiveth both the Dog and the Master, by diving under the water, and also by natural subtility, for if any man shall approach to the place where they build, breed and sit, the Hens go out of their nests, offering themselves voluntarily to the hands, as it were, of such as draw near their nests. And a certain weaknes of their wings pretended, and infirmity of their feet distembered, they go slowly and so leafearily, that to a man thinking it were no matter to take them. By which deceitful trick they do as it were entice and allure men to follow them, till they be drawn a long distance from their nests, which being compassed by their provident cunning, or cunning providence, they cut off all inconveniences which might grow of their return, by using many careful and curious caveats, leaving their often hunting bewray the place where the young duckings be hatched. Great therefore is their desire, and earnest is their study to take heed, not only to their brood, but also to themselves. For when they have an inking that they are espied, they hide themselves under turves or fedges, whereas with they cover and shroud themselves so closely and socraftily, that (notwithstanding the place where they lurk be found and perfectly perceived) there they will harbour without harm, except the Water Spaniel by quick finelling discover their decepts.
Of the **DOG** called the **FISHER** in Latin, *Canis Piscator*.

The Dog called the Fisher, whereof *Hætor Borium* writeth, which seeketh for Fith by fineling among rocks and stones, assuredly I know none of that kind in England, neither have I received by report that there is any such, albeit I have been diligent and busied in demanding the question as well of Fishermen as also hunters in that behalf, being careful and earnest to learn and understand of them if any such were, except you hold opinion that the Beaver or Otter is a Fith (as many have believed) and according to their belief affirmed, as the bird *Papine*; is thought to be a fish, and so accounted. But that kind of Dog which followeth the fish to apprehend and take it (if there be any of that disposition and property) whether they do this thing for the game of hunting, or for the heat of hunger, as other Dogs do which rather then they will be famished for want of food, covet the carcasses of carrion and purifled fishes. When I am fully resolved and disburthened of this doubt, I will send you certificat in writing. In the mean season I am not ignorant of that both *Elianus* and *Actius*, call the Beaver *Rus occupatior* a water Dog, or a Dog-fish, I know likewise thus much more, that the Beaver doth participate this property with the Dog, namely, that when fishes be scarce they leave the water and range up and down the land, making an infigitable slaughter of young Lambs until their pangs be replenished, and when they have fed themselves full of Fiefh, then return they to the water from whence they came. But albeit so much be granted that this Bever is a Dog, yet it is to be noted that we reckon it not in the beadrow of English Dogs as we have done the rest. The ser Calife, in like manner, which our Countrymen for brevity sake call a Seel, other more largely name a *Sea-Veale*, maketh a spoil of fishes between rocks and banks, but it is not accounted in the Catalogue or number of our English Dogs, notwithstanding we call it by the name of a Sea-Dog, or a Sea-Calf. And thus much for our Dogs of the second sort, called in Latin, *Aescapatus*, serving to take fowl either by land or water.

Of the delicate, neat, and pretty kind of Dogs called the **SPANIEL GENTLE**, or the **COMFORTER** in Latin, *Milisius*, or *Fotor*.

Here is besides those which we have already delivered, another sort of Gentle Dogs in this our English foil, but exempted from the order of the residue, the Dogs of this kind doth *Callimaclus* call *Milisius* of the Island *Milia* in the sea of *Sicily* (which at this day is named *Milia*) an Island indeed, famous and renowned with courageous and pious Soul'diers, valiantly fighting under the banner of Christ their unconquerable Captain) where this kind of Dogs had their principal beginning.

These Dogs are little, pretty, proper, and fine, and sought for to satisfie the delicatenes of dainty dames and wanton womans wis, instrumens of folly for them to play and daily withall, to trifle away the treasure of time, to withdraw their minds from more commendable exercices, and to content their corrupted concupiscences with vain disport (a silly thrift to flunck irksome idlenes.)

These puppies the smaller they be, the more pleasure they provoke, as more meet playfellows for mincing midtreffes to bear in their bofomes, to keep company withal in their Chambers, to succour with sleep in bed, and nourish with meat at bord, to lay in their laps, and lick their lips as they ride in their Wagons: and good reason it should be so, for courteous with finesnes hath no fellowship, but featnes with neatnes hath neighbourhood enough. That plausible proverb verify'd upon a Tyrant, namely, that he loved his Sow better then his Son, may well be applied to these kind of people, who delight more in Dogs that are deprived of all possibility of reason, then they do in children that be capable of wisdom and judgement. But this abufe peradventurereigneth where there hath been long lack of ifue, or else where barrennes is the belt blosson of beauty.

The virtue which remaineth in the **SPANIEL GENTLE**, otherwise called the **COMFORTER**.

Notwithstanding many make much of those pretty puppies called Spaniels Gentle, yet if the question were demanded what property in them they sipe, which should make them so acceptable and precious in their sight, I doubt their answer would be long a coming. But seeing it was our intent to travell in this treatise, so that the Reader might reap some benefit by this reading, we will communicate unto such conjectures as are grounded upon reason. And though some suppose that such Dogs are fit for no service, I dare say, by their leaves, they be in a wrong box. Among all other qualities therefore of nature, which be known, (for some conditions are covered with continual and thick clouds, that the eye of our capacities cannot pierce through them) we finde that these little Dogs are good to asswage the sicknes of the stomache, being oftentimes thereunto applied as a plaister preventative, or born in the bome of the diseased and weak person;
The History of Four-footed Beasts.

which effect is performed by their moderate heat. Moreover the disease and fickness changeth his place and entrench (though it be not precisely marked) into the Dog, which to be truth, experience can testify, for these kinde of Dogs sometimes fall sick, and sometimes die, without any harme outwardly inforced, which is an argument that the disease of the Gentleman, or Gentlewoman or owner whatsoever, entrench into the Dog by the operation of heat intermingled and infected. And thus have I hitherto handled Dogs of a gentle kind whome I have comprehended in a triple division. Now it remaineth that I annex in due order, such Dogs as be of a more homely kinde.

Dogs of a course kinde serving many necessarie uses, called in Latin Canes rusticci, and first of the Shepherds Dog, called in Latin, Canis Pastoralis.

The first kinde, namely the Shepherds bound, is very necessarie and profittable for the avoiding of harnes, and inconveniences which may come to men by the means of beafts. The second fort serve for succour against the snares and attempts of mischievous men. Our Shepherds Dog is not huge, vait and big, but of an indifferent stature and growth, because it hath not to deal with the bloudthirsti Wolfe, sithence there be none in England, which happy and fortunate benefit is to be ascribed to the puissant Prince Edgar, who to the intent that the whole Countrey might be evacuated and quite cleared from Wolves, charged and commanded the Welfmen (who were pelted with these butcherly beafts above measure) to pay him yearly tribute (note the wisdom of the King) three hundred Wolves. Some there be which write that Ludward Prince of Wales paid yearly to King Edgar three hundred Wolves in the name of an exaction (as we have said before.) And that by the means hereof, within the compass and term of four years, none of those noisom and pestilential beafts were left in the coasts of England and Wales. This Edgar wore the Crown royal, and bare the Scepter imperial of this Kingdom, about the year of our Lord Nine hundred fifty nine. Since which time we read that no Wolf hath been seen in England, bred within the bounds and borders of this Countrey, marry there have been divers brought over from beyond the Seas, for greedines of gain and to make money, for gazong and gazing, flaring and flanding to fee them, being a strange beast, rare, and seldom seen in England. But to return to our Shepherds Dog. This Dog either at the hearing of his Masters voice, or at the wagging and whilting in his hift, or at his thrill and hoarse hifling bringeth the wandering weathers and straying Sheep into the self same place where his Masters will and wish is to have them, whereby the Shepherd repareth this benefit, namely that with little labour and no toil or moving of his feet he may rule and guide his flock, according to his own desire, either to have them go forward, or to stand still, or to draw backward, or to turn this way, or take that way. For it is not in England, as it is in France, as it is in Flanders, as it is in Syria, as it is in Tartaria, where the Sheep follow the Shepherd, for here in our Countrey the Shepherd followeth the Sheep. And sometimes the straying Sheep when no Dog runneth before them, nor goeth about and byde them, gather themselves together in a flock, when they hear the Shepherd whistle in his hift, for fear of the Dog (as I imagine) remembering this (if unreasonable creatures may be reported to have memory) that the Dog commonly runneth out at his Masters warrant which is his whilte. This have we oftentimes diligently marked in taking our journey from Town to Town, when we have heard a Shepherd whistle we have rained in our horse and stood still a space, to see the proof and tryall of this matter. Furthermore, with this Dog doth the Shepherd take Sheep for the slaughter, and to be healed if they be sick, no hurt or harm in the world done to the simple creature.

Of the MASTIVE, or BANDOG, called in Latin, VILLAINUS, or CAPTENARUS.

His kind of Dog called a Mavtive or Bandog is vait, huge, stubborn, ugly, and eager of a heave and bountious body, and therefore but of little swiftnes, terrible, and frightful to behold, and more fierce and fell then any Arcadian cur (notwithstanding they are said to have their generation of the violent Lion.) They are called Villaités, because they be appointed to watch and keep farm-places and Countrey Cottages fequeftrd from common recours, and not abutting upon other houles by reaon of distanc, when there is any fear conceived of Theeves, Robbers, Spoilers, and Night-wanderers. They are serviceable against the Fox and Badger, to drive wilde and tame Swine out of Medowes, Palfures, Glebelands, and places planted with fruit, to bait and take the Bull by the ear, when occasion doth requireth. One Dog or two at the utmost is sufficient for that purpose, be the Bull never fo monstrosus, never fo fierce, never fo furious, never fo Itern, never fo untamable. For it is a kind of Dog capabale of courage, violent and valiant, striking cold fear into the hearts of men, but standing in fare of no man, in so much that no weapons will make him frinck, nor abridge his boldnes. Our Englishmen (to the intent that their Dogs might be more fell and fierce) affilfe nature with art, use and customs, for they teach their Dogs to bait the Bear, to bait the Bull and other fuch like cruel and bloody Beasts (appointing an over-feer of the game) without any Collar to defend their throats; and oftentimes they train them
Of Dogs.

them up in fighting and wresting, with any man having for the safeguard of his life, either a Pikestaffe, a Club, or a sword, and by using them to such exercises as these, their Dogs become more furious and strong. The force which is in them surmounteth all belief, the falt hold which they take with their teeth exceedeth all credit, three of them against a Bear, four against a Lion are sufficient, both totrie mastered with them, and utterly to overmatch them. Which thing Henry the seventh of that name, King of England (a Prince both politick and warlike) perceiving on a certain time (as the report runneth) commanded all such Dogs (how many so ever were in number) should be hanged, being deeply displeased, and conceiving great disdain, that an ill favoured rafcal Cur should with such violent villany, assault the valiant Lion King of all beats. An example for all subjects worthy remembrance, to admonish them, that it is no advantage to them to rebell against the regiment of their Ruler, but to keep them within the limits of loyalty. I read an History answerable to this of the selfs fame Henry, who having a notable and an excellent fair Falcon, it fortuned that the Kings Falconers, in the presence and hearing of his grace, highly commended his Majefties Faucon, faying, that it feared not to intermeddle with an Eagle, it was so venturous a Bird and so mighty; which when the King heard, he charged that the Falcon should be killed without delay, for the felt fame reason (as it may seem) which was rehearsed in the conclusion of the former history concerning the fame king. This Dog is called in like manner, Catena, a Caena, of the chain wherewith he is tied at the gates in the day time, left being lofe he should do much mischief, and yet might give occasion of fear and terror by his big barking. And albeit Cicero in his Oration had pro S. Ræx, be of this opinion, that such Dogs as bark in the broad day light should have their legs broken, yet our Countrymen on this side the Seas, for their carelesness of life letting all at cinque and fice are of a contrary judgement. For Theeves rogue up and down in every corner, no place is free from them, no not the Princes palace, nor the Countrymans cottage.

In the day time they practice piltering, picking, open robbing, and privie healing, and what legerdemain lack they? not fearing the shameful and horrible death of hanging.

The caufe of which inconvenience doth not only issue from nipping need and wringing want, for all that fleat are not pinch’d with poverty, some fleat to maintain their excessive and prodigal expenses in apparel, their lewdness of life, their wantonnes of manners, their wilful idlenes, their ambitious bravery, and the pride of the sawy Saloones me galatroton, vain glorious and arrogant in behaviour, whose delight dependeth wholly to mount nimbly on horse-back, to make them leap lustily, springing and prance, gallop and amble, to run a race, to winde in compass, and so forth, living altogether upon the fatten of the spoil. Other fome there be which fleat, being thereto provok’d by penury and need, like matterles men applying themselves to no honest trade, but ranging up and down, impudently begging and complaining of bodily weaknes where is no want of ability. But valiant Valentine the Emperor, by wholesome lawes provided that such as having no corporall tickness, fold themselves to begging, pleased poverty with pretended infirmity, and cloaked their idle and slothful life with colourable shifts and cloudy cozening, should be a perpetuall flave and drudge to him, by whom their impudent idlenes was betray’d, and laid against them in publick place, left the inufferable slothfulness of such vagabonds should be hurteous to the people, or being fo hateful and odious, shou’d grow into an example.

Alfred likewise in the Government of his Common-wealth, procured such encreafe of credit to justice and upright dealing by his prudent Acts & Statutes, that if a man travelling by the high way of the Countrey under his dominion, chanced to loft a budget full of Gold, or his capcase faried with things of great value, late in the evening, he shou’d finde it where he loft it, safe, found, and untouched the next morning, yet (which is a wonder) at any time for a whole moneth space if he sought for it, as Inopus Crepledanes in his history recorded. But in this our unhappy age, in thefe (I lay,) our devilish days, nothing can escape the claws of the spoiler, though it be kept never so sure within the house, albeite the doors be lockt and bounted round about. This Dog in like manner of the Cretians is called Oikures.

Of the Latinists, Canis Cattus; in English, the Dog-keeper.

Borrowing his name of his service, for he doth not onely keep Farmers houes, but also Merchants manifions, wherein great wealth, riches, substance and costly flute is repoded. And therefore were certain Dogs found and maintained at the common cofts and charges of the Citizens of Rome in the place called Capitolium, to give warning of Theeves coming. This kind of Dog is called,

In Latin, Canis Lanarius, in English, the Butchers Dog.

So called for the necelity of his use, for his service affordeth great benefit to the Butcher as well in following as in taking his Cattel, when need constraineth, urgeyth, and requireth. This kinde of Dog is likewise called,

In Latin, Molossius, or Molossus,

after the name of a Country in Epirus called Molossia, which harboureth many stout strong and sturdy Dogs of this sort, for the Dogs of that Country are good indeed, or else there is no trueth to be had in the testimony of writers. This Dog is also called,

In Latin, Canis Mandatorius, a Dog messenger, or Carrier,

upon subflanciall consideration, because at his Mafter's voice and commandement, he carry-
eth letters from place to place, wrapped up cunningly in his leather collar, fastned thereto, or fowed close therein, who left he should be hindered in his passage, ufeth these helps very skilfully, namely reliance in fighting that he be not overmatched, or else swiftness and readiness in running away, if he be unable to bucklie with the Dog that would fain have a snatch at his skin. This kinge of Dog is likewise called,

In Latin, Canis Lunarius; in English, the Mooner.

Because he doth nothing else but watch and ward at an inch, waiting the wearesome night season without slumbering or sleeping, bawing and wawing at the Moon (that I may use the word of Nonius) a quality in mine own opinion strange to consider. This kind of Dog is also called,

In Latin, Aquarius; in English, a Water-drawer.

And these be of the greater and the weightier fort, drawing water out of wells and deep pits, by a wheel which they turn round about by the moving of their burchentous bodies. This Dog is called in like manner,

Canis Coroanarius in Latin, and may aptly be Englished, a Tinkers Cur.

Because with marvellous patience they bear big budgets fraught with Tinkers tools, and metal meet to mend kettles, porrage-pots, skillets, and chafters, and other such like trumpery requisite for their occupation and loytering trade, eating him of a great burthen, which otherwise he himself should carry upon his shoulders; which condition hath challenged unto them the foremost name. Besides the qualities which we have already recounted, this kind of Dogs hath this principal property ingrained in them, that they love their Masters liberally, and hate strangers disputfully; whereupon it followeth that they are to their Masters in travelling a singular safeguard, defending them forcibly from the invasion of villains and Thieves, preferring their lives from loife, and their health from hazzard, their fleth from hacking and bewing, with fuch like desperate dangers. For which consideration they are meritoriously termed,

In Latin, Canes defensoris; Defending Dogs in our mother tongue.

If it chance that the Master be oppressed, either by a multitude, or by the greater violence, and so be beaten down that he lie groveling on the ground, (it is proved true by experience) that this Dog forfaketh not his Master, no not when he is stark dead: But inducing the force of amification and the outrageous temptles of the weather, most vigilantly watcheth and carefully keepeth the dead carcasse many days, indevouring furthermore, to kill the murtherer of his Master, if he may get any advantage. Or else by barking, by howling, by furious jarring, snarring, and such like means betrayeth the malefactor or as defirous to have the death of his aforeaid Master rigorously revenged.

An example hereof fortune within the compass of my memory. The Dog of a certain wayfaring man travelling from the City of London directly to the Town of Kingsme (most famous and renowned by reason of the triumphant coronation of eight several Kings) passing over a good portion of his journey, was assaulted and set upon by certain confedrate Thieves lying in wait for the spoile in Come-packe, a perillous bottom, compassed about with Woods too well known for the manifold murders and midnight robberies there committed Into whole hands this paffenger chance to fall, so that his ill luck colt him the price of his life.

And that Dog whose fire was English, (which Blondius regretteth to have been within the banks of his remembrance) manifeftly perceiving that his Master was murthered (this chanced not far from Paris) by the hands of one which was a fiuter to the fame woman, whom he was a woorer unto, did both bawry the bloody Butcher, and attempteth to tear out the villains throat, if he had not fought means to avoid the revenging rage of the Dog. In fires also which fortune in the silence and dead time of the night, or in stormy weather of the said seafon, the older Dogs bark, baul, howl, and yell, (yea notwithstanding they be roughly rated) neither will they stay their tongues till the houhofd servants awake, rise, search, and see the burning of the fire, which being perceived they une voluntary silence, and cease from yelping. This hath been, and is found true by trial, in sundry parts of England.

There was no fainting faith in that Dog, which when his Master by a mischance in hunting stumbled and fell, toppling down a deep ditch being unable to recover of himself, the Dog signifying his Masters mischapp, rescue came, and he was haled up by a rope, whom the Dog seeing almost drawn up to the edge of the ditch, cheerfully saluted, leaping and skipping up upon his Master as though he would have embraced him, being glad of his presence, whose longer absence he was loath to lack. Some Dogs there be, which will not suffer fiery coles to lie scattered about the hearth, but with their paws will rake up the burning coles, muffing and fying with theirselves how it might conveniently be done. And if so be that the coles call too great a heat, then will they bury them in ashes and so remove them forward to a fit place with their noles. Other Dogs be there which execute the office of a Farmer in the night time. For when his Master goeth to bed to take his natural sleep; And when,

A hundred bars of brasse and iron bolt,  
Make all things safe from stears and from revolt;  
When Janae keepes the gate with Argus eye,  
That dangers none approach, no mischief rise,  

As VirgIL vaunteth in his Verses: Then if his Master biddeth him goe abroad, he singereeth not, but rangeth
Of Dogs.

Of Dogs. 139
rangeth over all his lands thereabout, more diligently, I wvs, then any Farmer himself. And if he finde any thing there that is strange and pertaining to other persons besides his Master, whether it be man, woman, or beast, he driveth them out of the ground, not medling with any thing that do belong to the possession and use of his Master. But how much faithfulness, so much diversity there is in their natures.

For there be some, which bark only with free and open throat, but will not bite, some which do both bark and bite, and some which bite bitterly before they bark.

The first are not greatly to be feared, because they themselves are fearful, and fearful Dogs (as the Proverb importeth) bark most vehemently.

The second are dangerous, it is wisdom to take heed of them, because they found as it were, an Altarum or an afterclap, and these Dogs must not be over much moved or provoked, for then they take on outrageously, as if they were mad, watching to set the print of their teeth in the flesh. And these kinde of Dogs are fierce and eager by nature.

The third are deadly, for they fly upon a man without utterance of voice, snatch at him, and catch him by the throat, and most cruelly bite out collops of flesh. Fear these kinde of Curs, (if thou be wise and circumspect about thine own safety) for they be stout and Rubborn Dogs, and set upon a man at a sudden unawares. By these signs and tokens, by these notes and arguments our men discern the towards Curs from the courageous Dog, the bold from the fearful, the butcherly from the gentle and tractable. Moreover they conjecture, that a Whelp of an ill kinde is not worth keeping and that no Dog can serve the fundry ues of men to aptly and conveniently as this sort, of whom we have so largely written already. For if any be disposed to draw the above named services into a Table, what man more clearly, and with more vehemency of voice giveth warning either of a wailful Beast, or of a spoiling thief then this, who by his barking (as good a a Barking Beacon) forewarneth hazards at hand. What manner of Beast stronger? What servant to his Master more loving? What companion more truly? What Watchman more vigilant? What venger more confant? What Messenger more speedy? What Water-bearer more painful? Finally, what Pack-horse more patient? And thus much concerning English Dogs, first of the gentle kinde, secondly of the courser kinde. Now it remaineth that we deliver unto you the Dogs of a Mungrel or Curritsh kinde, and then will we perform our task.

Containing CVRS of the Mungrel and Rascal sort, and first of all the DOG called in Latine, Admonitor, and of us in English, Watcher, or Warner.

Of such Dogs as keep not their kinde, of such as are mingled out of fundry sorts, not imitating the conditions of some one certain spice, because they resemble no notable shape, nor excels any worthy property of the true, perfect and gentable kinde, it is not necessary, that I write any more of them, but to banish them as unprofitable implements, out of the bounds of my Book; unprofitable I say, for any use that is commendable, except to entertain strangers with barking in the day time, giving warning to them of the House, that such and such be newly come, whereupon we call them admonishing Dogs, because in that point they perform their Office.

Of the DOG called TURNESPI T, in Latine, Veruorsator.

Here is comprehended, under the Curs of the courser kinde, a certain Dog in Kitchin-service excellent. For when any meat is to be roasted, they go into a wheel; which they turning round about with the weight of their bodies, so diligently look to their business, that no drudge nor scullion can do the feat more cunningly. Whom the popular fort hereupon call Turn-spits, being the laft of all those which we have first mentioned.

Of the DOG called the DANCER, in Latine, Saluator or Tympa nista.

Here be also Dogs among us of a Mungrel kinde, which are taught and exercised to dance in measure at the Musical sound of an instrument, as at the just stroke of the Drum; at the sweet accent of the Cittern, and tuned strings of the harmonious Harp, showing many pretty tricks by the gelligence of their bodies; as to stand bolt upright, to lye flat upon the ground, to turn round as a ring, holding their tails in their teeth, to beg for their meat, and sundry such properties, which they learn of their Vagabundical Masters, whose instrument they are to gather gain withall in the City, Countrey, Town, and Village. As some which cary old Apes on their shoulders in coloured jackets to move men to laughter for a little lucre.
Of other D O G S, a short conclusion, wonderfully ingendred within the coast of this Country.

Of these there be three sorts; the first bred of a Bitch and a Wolf, called in Latin, Lyofoes; the second of a Bitch and a Fox, in Latin, Lactens; the third of a Bear and a Bandog, Vicanus.

Of the first we have none naturally bred within the borders of England. The reason is for the want of Wolves, without whom no such Dog can be ingendred. Again, it is delivered unto thee in this discourse; how and by what means, by whose benefit, and within what circuit of time, this Country was clearly discharged of ravening Wolves, and none at all left, no, not the least number, or to the beginning of a number, which is an Unutie.

Of the second sort we are not utterly void of some, because this our English soil is not free from Foxes, for indeed we are not without a multitude of them, insomuch as divers keep, foster and feed them in their houles among their Hounds and Dogs, either for some malady of minde, or for some sickness of body) which peradventure the favour of that subtil Beall would either mitigate or expell.

The third which is bred of a Bear and a Bandog, we want not here in England, (A strange and wonderful effect, that cruel enemies should enter into the work of copulation, and bring forth so savage a Cur.) Undoubtedly it is even so as we have reported, for the fiery heat of their fleth, or rather the pricking thorn; or most of all, the tickling luft of lecherie, beareth such fwing and fway in them, that there is no contrary to the time, but of contraint they must joy to engender. And why should not this be confonant to truth? Why should not these Beals breed in this land, as well as in other forien Nations? For we read that Tygers and Dogs in Arcadia, that Lyons and Dogs in Francia, and that Wolves and Dogs in Cumanum, and that Wolves and Dogs in Francia couple and procreate. In men and women also lightned with the Lantern of reaflon (but utterly void of vertue) that foolish, frantic, and fiellly actioa (yet naturally feated in us) worketh so effectually, that many times it doth reconcile enemies, fet foes at frindship, unanimity, and atonement, as Moria mentioneth. The Ae Dane which is bred of a Bear and a Dog,

Is fierce, is fell, is stout and strong,
And bites free to flesh and bone.
His furious force indureth larg,
In rage he will be vul’d of none.

That I may use the words of the Poet Gratius. This Dog exceedeth all other in cruel conditions, his leering and steering looks, his stern and savage vifage, maketh him in fight fearful and terrible. He is violent in fighting, and wherefoever he fet his tenderhook teeth, he taketh such fure and fast hold, that a man may sooner tear and rend him asunder, then loose him and separate his chaps. He paffeth not for the Wolf, the Bear, the Lyon, nor the Bull, and may worthily (as I think) be companion with Alexanders Dog which came out of India. But of thefe, thus much, and thus far may seem sufficient.

A fart to Out-landifh D O G S in this conclusion, not impertinent to the Authors purpoife.

Us and cuftome hath entertained others Dogs of an Out-landifh kinde, but a few and the fame being of a pretty bigness, I mean Iland Dogs, curled and rough all over, which by reafon of the length of their hair make shew neither of face nor of body: And yet these Curs, for tooth, because they are so strange, are greatly fet by, esteemed, taken up, and many times in the room of the Spanish gentle or comforter. The nature of men is so moved, nay, rather maried to novelties without all reaflon, wit, judgement or perseverance, Eromen allatias, parornen jugennis.

Out-landifh toys we take with delight,
Things of our own Nation we have in despight.

Which fault remaineth not in us concerning Dogs only, but for Artificers also. And why? it is manifest that we disdain and content our own Work-men, be they never fo skilful, be they never fo cunning, be they never fo excellent. A beggerly Beall brought out of barbarous borders, from the uttermost Countreys Northward, &c. we flare at, we gaze at, we muse, we marvel at, like an Ais of Cumana, like Tules with the brazen thanks, like the man in the Moon.

The which default Hiperates marked when he was alive, as evidently appeareth in the beginning of his Book Pari Agmen, fo entituled and named:

And we in our work entitled De Ephemeris Britannicae, to the people of England have more plentifully expreffed. In this kinde which is most blockifh, and yet most wafhip, the fame is most esteemed, and not among Citizens only and jolly Gentlemen, but among luffy Lords also, and Noble-
Noblemen. Further I am not to wade in the flood of this discourse, because it was my purpose to satis-
fy your expectation with a short treatise (most learned Comrade) not wearisome for me to write, nor tedious for you to peruse. Among other things which you have received at my hands hereto-
fore, I remember that I wrote a several description of the Cretian Dog, because there are but a few of them, and therefore very seldom seen. As touching Dogs of other kinds you your self have taken earnest pain in writing of them both lively, learnedly, and largely. But because we have drawn this libel more at length then the former which I sent you (and yet briefer then the nature of the thing might well bear) regarding your most earnest and necessary studies; I will conclude, making a rehearsal notwithstanding (for memory fake) of certaine specialties contained in the whole body of this my brevity. And because you participate principal pleasure in the knowledge of the common and usal names of Dogs (as I gather by the course of your letters) I suppose it not amiss to deliver unto you a short table containing as well the Latin as the English names, and to render a reason of every particular appellation, to the intent that no scruple may remain in this point, but that every thing may be fitted to the bare bottom.

A Supplement or Addition, containing a demonstration of Dogs Names how they had their Original.

The names contained in the general Table, forso much as they signifie nothing to you being a stranger, and ignorant of the English tongue, except they be interpreted: as we have given a reason before of the Latin words, so mean we to do no les of the English, that every thing may be manifest unto your understanding. Wherein I intend to observe the same order which I have fol-
lowed before.

Sagex, in English, Hund, is derived of our English word hunt. One letter changed in another, namely T into D, as Hunt, Hund, whom if you conjecture to be named of your Country word Hund, which signifieth the general name (Dog) because of the similitude and likeness of the words. I will not stand in contradiction (Friend Geiner) for so much as we retain among us at this day many Dutch words, which the Saxoni left at such time as they enjoyed this Country of Britain. Thus much also understand, that as in your language Hund is the common word, so in our natural tongue (Dog) is the universal, but Hund is particular and a special, for it signifieth such a Dog only as fervet to hunt, and therefore it is called a Hund.

Of the Cafe-bound.

The Cafe-bound called Latine, Agaeus, hath his name of the sharpness and seldemness of his eye-sight. By which vertue he compasseth that which otherwise he cannot by smelling attain. As we have made former relation, for to gaze is earnestly to view and behold, from whence floweth the derivation of this Dogs name.

Of the Gray-bound.

The Gray-bound called Leporarius, hath his name of this word Gre, which word foundeth, Grac-
dus in Latin, in English, Degree. Because among all Dogs there are the most principal, having the chiefest place, and being simply and absolutely the best of the gentle kindes of Hounds.

Of the Lymmer or the Lyemmer.

This Dog is called a Lymner, for his lightnefs, which in Latin foundeth Levitas. Or a Lymmer, which word is borrowed of Lyemme, which the Latinis name Lutos: and wherefore we call him a Lymner of this word Levitas: (as we do many things besides) why we derive and draw a thousand of our terms out of the Greek, the Latine, the Italian, the Dutch, the French, and the Spanish tongue: (Out of which Fountains indeed, they had their Original issue.) How many words are buried in the grave of forgetfulness; grown out of use; wretted away; and perverly corrupted by divers defaults; we will declare at large in our Book entituled, Symphonias vocum Britannicarum.

Of the Tumbler.

Among Hounds the Tumbler called in Latine, Verterae: which cometh of this word Tumbler, flowing first from the French Fountain. For as we lay Tumble, so they Tumbler, referring our ferne and signification, which the Latinis comprehend under this word Vertere. So that we see this much, that Tumber cometh of Tumbler, the Vowel I, changed into the Liquid L, after the manner of our speech. Contrary to the French and the Italian tongue: In which two Languages a Liquid before a Vowel for the most part is turned into another Vowel; as may be perceived in the example of these these two words, Impire & piano, for Impire & piano, I before E, changed into I, and L, before A, turned into T. Also I thought convenient for a tale.

After such as serve for hunting, orderly do follow such as serve for hawking and fowling, among which the principal and chiefest is the Spaniel, called in Latin, Hispainius, borrowing his name of Hifpania, wherein we English men not pronouncing the Aspiration H, nor the Vowel I, for quickness and readiness of speech, lay roundly a Spageln.
The History of Four-footed Beasts.

Of the Setter.

The second fort is called a Setter, in Latin, Index. Of the word (Set) which significeth in English that which the Lattains mean by this word Locum designare, the reason is rehearsed before more largely, it shall not therefore need to make a new repetition.

Of the Water Spaniel or Finder.

The Water Spaniel consequently followeth, called in Latin, Aquaticus; in English a Water Spaniel, which name is compound of two simple words, namely Water, which in Latin loundeth Aqua, wherein he swimmeth, and Spain, Hispania, the Countrey from whence they came; not that England wanteth such kinds of Dogs, (for they are naturally bred and ingendered in this Countrey) but because they bear the general and common name of these Dogs since the time they were first brought over out of Spain. And we make a certain difference in this fort of Dogs, either for something which, in other qualities is to be preferred, as, for an example in this kind called the Spaniel, by the apposition and putting to of the word Water, which two coupled together found Water Spaniel. He is called a Finder, in Latin, Inquisitor: because that by serious and secure seeking, he findest such things as be lost, which word Finde in English is that which the Lattines mean by this Verb Invenire. This Dog hath this name of his property, because the principal point of his service consisteth in the premisses.

Now leaving the view of hunting and hawking Dogs, it remaineth that we run over the residue, whereof some be called fine Dogs, some courie, otherfrom Mungrels or Rascals. The first is Spaniel gentle called Canis Melitus, because it is a kind of Dog accepted among Gentils, Nobles, Lords, Ladies, &c. who make much of them, vouchsafing to admit them fo far into their company, that they will not only lull them in their laps, but kiss them with their lips, and make them their pretty play-fellows. Such a one was Corgari little puppy mentioned by Teoscris in Syracusis, who taking his journey, straitly charged and commanded his Maid to fee to his Dog as charily and wary as to his childe: To call him in always that he warded not abroad, as well as to rock the babe a sleep, crying in the Cradle.

This Puppety and pleasant Cur, (which some frumpingly term Ftyng Hound) serves in a manner to no good use, except (as we have made former relation) to succour and strengthen quailing and quailing stomachs, to bewray badwery, and filthy abominable lewdness (which a little Dog of this kinde did in Sicilia) as Melinus in his 7. Book of Beasts, and 27. chapter recordeth.

Of Dogs under the courier kinde, we will deal first with the Shepheard Dogs, whom we call the Bandog, the Tydog, or the Martive, the first name is imputed to him for service, Quamum patior familiaris, because he is at the Shepheard his Masters commandment. The second a Ligamento of the band or chain wherewith he is tyed. The third a Segnos, of the fattnes of his body.

For this kinde of Dog which is utually tyed, is mighty, grofs, and fat fed. I know this that Augstinius Niphus calleth this Mofinius, (which we call Mafiorus) and that Albertus writeth how the Lycenis is ingendred by a Bear and a Wolf. Notwithstanding the self same Author taketh it for the most part pra Medias, of a Dog of such a Countrey.

Of Mungrels and Rascals somwhat is to be spoken: and among these, of the Wappe of Turnspit, which name is made of two simple words; that is, of Turn, which in Latin loundeth Vertere, and of Spit which is Versa or speoe, for the English word adhereth closer to the Italian imitation Verso a covert, Turnspit. He is called also Waupe, of the natural noise of his voyage Wau, which he maketh in barking. But for the better and reader found, the vowel U, is changed into the consonant P, so that for Waupe we say Wappe. And yet I wot not well that Natus Borroweth his Bashari of the natural voyage Bash as the Grecoins do ther Bauen of Wau.

Now you when understand this, that Safure in Latine signifies Dayfare in English. And that our Dog is thereupon called a Dancer, and in the Latine, Salutator; you are so far taught as you were defirous to learn: and now I suppose, there remaineth nothing, but that your request is fully accomplished.

Thus (Friend Geofier) you have, not only the kinds of our Country Dogs, but their names also, as well in Latine as in English, their Offices, Services, Diverities, Natures, and Properties, that you can demand no more of me in this matter. And albeit I have not satisfieth your mind peradventure (who supposeth all speed in the performance of your request employed, to be meer delays) because I laid the setting forth of that unperfect pamphlet, which five years ago I lent to you as a private friend for your own reading, and not to be printed and fo made common, yet I hope (having like the Bear lickt over my money) I have waded over in this work to your contentation, which delay hath made somewhat better, and Deuterai prontitudes, after wit more meet to be purfed.

Now it is convenient to shut up this treatise of Dogs, with a recital of their several diseases and cures thereof; for as all other creatures, so this beast is annoyed with many infirmities. First, therefore if you give unto a Dog every seventh day, or twice in seven days bathro or potage, where-in Iu b is sod, it will preserve him found without any other medicine, for this herb hath the same operation in Dogs to make wholesome their meat, that it hath in Sheep to cleanse their paste. The small fruits of Ellebor which are like to Onions, have power in them to purge the belly of Dogs: Other give them Goats-milk, or Salt betacm small, or Sea crabs beaten small and put into water, or

Staves-
Of Dogs.

Staves-ace, and immediately after his purgation, sweet Milk. If your Dog be obstrued and stopped in the belly, which may be discerned by his trembling, sighing, and removing from place to place, give unto him Oaten meal and water to eat, mingled together and made as thick as a Pulsel, or leavened Oaten bread, and sometime a little Whay to drink.

The Ancients have observed that Dogs are most annoyed with three diseases, the swelling of the throat, the Gout, and madness; but the later Writers have observed many noyme infirmities in them. First, they are oftentimes wounded by the teeth of each other, and also of wilde Beasts: for cure whereof, _Blenda_ ou of _Maximum_ writeth these remedies following: First, let the finew, _fibra_, or gristles of the wound be laid together, then sow up the lips or upper skin of the wound with a needle and thread, and take off the hairs of the Dog which made the wound, and lay thereupon, until the bleeding be franched, and fo leave it to the Dog to be licked; for nature hath so framed the Dogs tongue, that thereby in short space he cureth deep wounds.

And if he cannot touch the fore with his tongue, then doth he wet his foot in his mouth, and so oftentimes put it upon the main: or if neither of these can be performed by the Beast himself, then cure it by cauting upon it the ashes of a Dogs head, or burned salt, mingled with liquid pitch poured thereupon. When a Dog returning from hunting is hurt about the snows, by the venomous teeth of some wilde Beast, I have seen it cured by making incision about the wound, whereby the poynoned blood is evacuated, and afterward the sore was anointed with Oyl of Saint Johns-wort. Wood-worms cure a Dog bitten by Serpents. When he is troubled with Ulcers or rindes in his skin, pieces of Pot-fhears beaten to powder and mingled with Vinegar and Turpentine, with the fat of a Goose; or else Water-wort with new Lard, applied to the fore, easeth the same: and if it swell, annoy it with Butter.

For the drawing forth of a thorn or splinter out of a Dogs foot, take Colts-foot and Lard, or the powder thereof burned in a new earthen pot; and either of these applied to the foot, draweth forth the Thorn, and cureth the sore: for by _Disforider_ it is said, to have force to extract any point of a Spear out of the body of a man. For the Worms which breed in the Ulcers of their heels, take _Unguentum Egiptiacum_, and the jucye of peach leaves: There are some very skilful Hunters which affirm, that if you hang about the Dogs neck flocks of Citrine, as the wood dryeth, so will the Worms come forth and dy. Again, for this evil they waie the wounds with water, then rub it with Pitch, Thyme, and the dunc of an Oxe in Vinegar, afterward they apply unto it the powder of Elebof. When a Dog is troubled with the Mango, itch or Ring-worms, first let him blood in his forlegs in the greatest ven: afterward make an Ointment of Quick-filver, Brimtone, Nettle-seed, and twice so much old Sowet or Butter, and therewithall anoint him, putting thereunto if you please the decoction of Hops and Salt-water.

Some do wash Many Dogs in the Sea-water; and there is a Cave in Sicily (faith _Gratianus_) that hath this force against the scabs of Dogs, if they be brought thither, and bathe in the running water which seemeth to be as thick as Oyl. Fleegn or melancholy doth often engender these evils, and so after one Dog is infected, all the residue that accompany or lodge with him, are likewise poynoned: for the avoind thereof, you must give them Fumitory, Sorrel, and Whay sod together; it is good also to waie them in the Sea, or in Smiths-water, or in the decoction aforesaid.

For the taking away of Warts from the feet of Dogs, or other members, first rub and criacafe the Wart violently, and afterward anoint it with Salt, Oyl, Vinegar, and the powder of the rinde of a Gourd; or else lay unto it Aloeos beaten with Multard-feed, to eat it off, and afterward lay unto it the little stories or iron chips, which fly off from the Smiths hot iron while he beateth it, mingled with Vinegar, and it shall perfectly remove them.

Against Ticks, Lyece, and Fleas anoint the Dogs with bitter Almonds, Staves-ace, or roots of Maple, or Cipers, or frotth of Oyl, if it be old; and anoint also their ears with Salt-water, and bitter Almonds, than shall not the flies in the Summer time enter into them. If Bees or Wasps, or such Beasts flying a Dog, lay to the fore burned Rue, with Water; and if a greater Fly, as the Hornet, let the Water be warmed. A Dog shall be never infected with the Plague, if you put into his mouth in the time of any common Pehilence, the powder of a Storks claw, or Ventricle, or any part thereof with Water: which thing ought to be regarded, (for no creature is so soon infected with the Plague as is a Dog and a Mule) and therefore they must either at the beginning receive medicine, or else be removed out of the air, according to the advice of _Gratianus_:

_Sed variis vitis, nec in omnibus una polles_,
_Dice victor, & quae tutela est proxima, tenta._

_Wolf-wort, and _Aposmon_, whose leaves are like the leaves of Ivy, and smell strongly, will kill all Beasts which are littered blinde; as Wolves, Foxes, Bears, and Dogs, if they eat thereof: So likewise will the root of _Chameleum_ and _Meseron_, in Water and Oyl, it killeth Mice, Swine, and Dogs. _Ellebus_ and _Squilla_, and _Eupa Lupina_, have the same operation. There is a Gourd (called _Zingiber_ of the Water) because the taste thereof is like to Ginger, the Flower, Fruit, and Leaf thereof killeth Affes, Moles, Dogs, and many other four-footed Beasts. The Nuts _Vomica_, are poynon to Dogs, except their ear be cut prettily and made to bleed. It will caufe them to leap strangely up and down, and kill him within two hours after the tayling, if it be not prevented by the former remedie. _Thephraflus Chryfipus_ affirmeth, that the water wherein _Sperage_ hath been
The History of Four-footed Beasts.

Concerning Venus Blondus. If a Dog grow lean, and not through want of meat, it is good to fill him twice or thrice with Butter, and if that do not recover him, then it is a sign that the worm under his tongue annoymeth him, {which} must be presently pulled out by some Nautl or Needle} and if that satisifie not, he cannot live, but will in short time perish. And it is to be noted, that Oaten bread leavened, will make a flaggish Dog to become lusty, agile, and full of spirit. Dogs are also many times bewitched, by the only light of Inchanters, even as Infants, Lambs, and other creatures, according to Virgil's: 

\[Nec sit teveos ocula misi fatima agnos.\]

For the bewitching spirit entereth by the eye into the heart of the party bewitched: for remedy whereof, they hang about the neck a chain of Corral, as for holy Herbs I hold them unprofitable.

To cure the watry eyes of Dogs, take warm water, and first wash them therewith, and then make a plaister of meal and the white of an Egge, and so lay it thereunto. By reason of that saying, Eccl. 20. cap. Eribis et giftis blindis the eye of Idus, even as a dumb Dog turneth away Correlitum. Some have delivered, that green Crow-foot forced into the mouth of a Dog, maketh him dumb, and not able to bark: When a Dog becometh deaf, the Oyl of Roses with new pressed Wine infused into his ears, cureth him: and for the Worms in the ears, make a plaister of a beaten Spunge and the white of an Egge, and that shall cure it.

The third kinde of Quinancie (called Synanche) killeth Dogs, because it bloweth upon their chips, and incluseth their breath. The Cough is very noyome to Dogs, wherefore their keepers must infite in to their Nefkris two cups of Wine, with bruified sweet Almonds: but Tardinus for this diseafe, prescribed great Parfley sod with Oyl, Honey, and Wine, and so given to the Dog. For the shortness of the breath, bore him through the ear, and if there be any help, that will prevail.

If a bone thick in the mouth of a Dog, hold up his head backward, and pour Ale into his mouth until he cough, and so shall he be eafed. When a Dog hath furieous, and falleth to loath his meat, he eateth the herb Canaria, and is relieved (both against his turrier, and also the bitings of Serpents.) For the Worms in the belly, he eateth Wheat in the flake. The Gowt maketh the Dogs legg grow crooked, and it is never so cured; but that after a course or too they grow lame again. When his skin fleyeth from his nails, take meal and water, and binde them thereunto for a remedy: and these are for the most part, those diseases wherewithall Dogs are infected, and the other are either cured by heat, or by eating of grais: and so for this part, I conclude both the sickness and cure of Dogs, with the laying of Gratius:

\[Mille tenent pestes, curaque potentia major.\]

Of the bitings of mad Dogs and their cure. Concerning the madness of Dogs, and their venemous bitings, we are now to speak: and first of all, no reasonable man ought to doubt, why the teeth of a mad Dog should do more harm then of a sound and healthy one: because in rage and anger, the teeth of every Beast and creature, receive venom and poyson from the head (as it is well observed by Augustus) and so at that time finathing their teeth, they do more harm then at other times. Against the simple biting of a Dog, it is sufficient but to use the urine or a Dog, for there is not much venom in those wounds; and the urine also will draw out the prickles of a Hedge-hog, because such wounds have in them but little poyson. Also (as Actius prescribeth) it is very loveraign in such wounds, first of all to cover and rub the sore with the palm of ones hand, and then pour into it Vinegar and Nitre, so as it may descend to the bottom of the wound, and afterward lay unto it a new spunge wetted in the same Vinegar and Nitre, and let it be continued for the space of three days, and by the working thereof it shall be whole.

Also it is generally to be observed in all the bitings of men by Dogs, that first of all it is requisite, that the wound be well rubbed over by the palm of the hand with Vinegar, then pour into the wounds Vinegar mixed with water or with Nitre, laying also a spunge thereupon, and so binde it up on the place, having first wetted the cloaths wherewithall you binde it with the said Vinegar mixed, so let it remain bound up three days together, and afterward follow the common course of curing, as in every vulgar wounds, or else, lay thereunto Pellitory of the Wall, mingled and beaten with Salt, changing it every day, until the crust or upper skin fall away.

It is also good sometines, the holes being small, to wet Lint in Vinegar, and to purge the wound with powder of Anise-feed, or Cumin; laying the Lint upon the Anise for two or three days. The same being thus purged, take a medicine of the equal parts of Hony, Turpentine, Butter, Goose-grease Marrow of a Hart, or Calf, melted betwixt the teeth of a man, and lay it thereunto, for it also cuezeth the bitings of men: but if the fore be inflamed, then lay unto it Lentils sod with the parings of Apples, and dryed, or the crumbs of bread with the juyc of Beets, and a little Oyl of Roses, made like a plaister.

Divers Authors have also prescribed these outward medicines against the bitings of Dogs in general, namely Vinegar spunged, the Leone of Vinegar, with Nigella Roman,a Vino Hair, Alabatter, Brine with Lint, Garlick mixed with Hony, and taken into the body, Leone of Wine, Almonds
Almonds both sweet and bitter mingled with Honey, dryed Anise-seeds burned, the leaves of black Hore-hound, or Archangel beate with Salt, Scallions with Honey and Pepper of the cafe, the juice of Onions with Rue and Honey, or raw Onions with Honey and Vinegar, but sod ones with Honey and Wine, (if they be green) let them ly to the wound three days: the ashes of Vine-trees with Oyl, ashes of a Fig-tree with a Sear-cloth, befide infinite other elaborate medicines, drawn from Trees, Fruits, Fields, and Gardens, and all other creatures; as if Nature had only frowen to provide flundy ready curers for this evil above all other.

Leaving therefore the simple bitings of Dogs, let us proceed to the madness of Dogs and their bitings, wherein the greater danger must be considered, with greater circumjpection of remedies. First therefore, the Ancients have derived Rabies, or Ravies, madness, of the hoarfares of voyage, (because a Dog at that time hath no perfect vocy.) But it is more probable, that Rabies cometh of Rapiendo, because when a Dog beginneth to be oppressed herewith, he biteth, fnaicetheth, runneth to and fro, and is carried from home and Mafter, to his own perdition: this by the Græcians is called Lytra, and Cynolofias.

By this evill, not only Dogs perih, but all other creatures (except a Goole) bitten by them: and a man doth not escape without great perill. For Albertus relatereth a story, of a man whose arm was bitten by a mad Dog, and after twelve years the fore brake forth again, and he dyed within two days; and the reafon hereof was (as in all likelihood that of Cælus) that when one and the fame nature infecteth each other, as Dogs do Dogs, and men do men, then by reafon of their fimilitude and natural sympatry, they receive the consuming poifen with all speed; but if another nature infect that, wherewith in inclination and passion, there is a diffimilitude and antipathy, (as is betwixt a Dog and a Man) then will the poifen receive greater opposition, and be fo much the longer before it receive predoimnate operation, because the firft overcometh Nature by treafon, againit which there is no refilience; and the second by open force and proclamation of War,againit which all the strength and force of nature is combined and oppofed.

Hereof alfo it came to pafs, that the Noble Lawyer Baitius, playing with his Dog at Trent, was bitten by him in his lip, and negleeting the matter (because he never lufpected the Dogs madness) after four moneths the poifen wrought upon him, and he perifhed miserably. Thoue Beasts which have teeth like faws, (as Dogs, Wolves, and Foxes) go mad by nature, without the bitings of others, but thoue which have no fuch teeth (as Affes and Mules,) fall not mad at any time until they be bitten by other.

Also it hath been obferved, that sometimes a mad Dog hath bitten, and there hath followed no harm at all, whereas the reafon, because poifen is not equally in all his teeth; and therefore biting with the inner and holefomer, the wound became not perilous.

A man bitten with a mad Dog, fellath prefently when he cometh under the shadow of a Corne-tree; as it is affirmed by moft Phyficians, for that Shadow feteth the poifen on fire: but a man falling mad, of all creatures avoideth a Dog, and a Dog moft of all fellath upon men. There are many things which ingender madness in Dogs, as hot wheaten bread dipped in Bean-water, melancholy breed within them, and not purged by Canaria or other herbs, the menilurif polls of Women, and the pain of their teeth. Their madness is moft dangerous in the Dog-days, for then they both kill and perifh mortally; for at that time their fpitte or fome, falling upon mans body, breeds great danger; and that if a man tread upon the Urine of a mad Dog, he fhall feel pain by it if he have a fore about him: from whence it came to pafs, that a lone bitten by fuch a Dog, was a common proverb of difcord. Also it is obferved, that if a wound be drefsed in the prefence of man or woman, which hath been bitten by a mad Dog, that the pain thereof will be encreafe: and which is more, that abfmortion will follow upon Beasts with young, or Egges covered by the Hen, by their prefence: But for remedy, they wasf their hands and Princkle themfelves, or the Beasts with that wafer, whereby the evill is to be cured.

If the gall of a mad Dog, about the bignefs of a Lentill seed be eaten, it killeth within feven days, or else doth no harm at all, if it pafs feven days without operation. When a mad Dog had suddenly tore in pieces a garment about ones body, the Taylor or Botcher took the fame to mend, and forgetting himself, put one fide of the bread into his mouth to ftretch it out to the other, and fell mad immediately. Men thus affected, fear all wafters, their virile member continually flandeth, they fuffer many Convulfions, and oftentimes bark like Dogs.

There was a certain Mafon at Zurch, who had his finge grievously bitten with a mad Dog about the prouche, wherein he laid Garlick, Rue, and Oyl of Scorpion, and fo it seemed to be healed, wherefore he took no counsel of any Phyfician. About August following, he was taken with a Fever, being first very cold, then very hot, and fo continued sweating for a day or two, and could not endure the cold air. He fïrft hungered, yet when water or drink was brought him, he was fo afraid thereof that he could not drink: his sweat was cold, and when he fçelt any cold air, he cryed out for fear it had been water: thus he remained trembling, and offering to vomit at the fit of water, many times howling, and so perfified after two days ended.

When a Dog is mad it may be known by thefe fignes, for he will neither eat nor drink; he looks awry and more fadly then ordinary; his body is lean, he calleth forth thick leem out of his noftrels or mouth; He breatheth gaping, and his tongue hangeth out of his mouth. His ears is limber and weak, his tail hangeth downward: his pace is heavy and flagging until he run, and then it is more raffy, intemperate and uncertain. Sometimes running, and prefently after flanding till
again: he is very thirsty, but yet abstineth from drink, he barketh not, and knoweth no man, biting both strangers and friends. His head hangeth downward; he is fearful, and runneth into secret places from his whelps or fellows, who often bark at him, and will not eat of bread upon which his blood hath fallen. His eyes grow very red; he many times dyeth for fear of water: some dieteth by laying Nuts or grains of Corn to the bitten place, and afterward take them away and call them to Hens or Poultry, who for hunger will eat them, and if after the eating the foul live, the Dog will not be mad; but if it dye, then for certainty the Dog will fall mad. The which passions do also agree with them that are bitten by him; and it is not to be forgotten, that the bites of the female bring more danger then the males.

The bodies of them that are thus wounded grow very dry, and are prelled with inward burning Feavers, if by Musick and delightful sports they be not kept waking; many times they dye suddenly, or else recover for a small time, and then fall into a relapsed malady.

Some give this to be the cause of their fear of water, because their body growing dry, feemeth to forget all participation with humidity: but Rufus affirmeth, this cometh from melancholy, where-withall these persons are most commonly affected: which agreeeth with an imagination they have, that they see Dogs in the water, and indeed it cannot be but their own countenance, which in these passions is very red, doth wonderfully afflicth them, both in the water, and in all looking glaffes.

When a certain Philosopher (being bitten by a mad Dog) entred into a Bath, and a strong apparition of a Dog presented itself unto him therein, he strove against this imagination with a singular confidence courageous to the contrary, saying within himself, "Quid Cani commune est cum Balneis? what hath a Dog to do in a Bath? and I went in and overcame his disease: which thing had seduced, that a man hath recovered this malady after he fell into fear and trembling, except Eudemus and Theisme, who observing the requifite of a friend of his, entred likewise into the water, and after many torments was recovered.

To conclude, some men in this extremity suffer most fearful dreams, profusion of feed, hoarneſses of voyage, shortnes of breath, retention of urine, which also changeth colour, being sometimes black, sometime like milk, sometime thick, sometime thin as water, rumbling in the belly, by reason of crudity, redneſses of the whole body, ditention of nerves, heavines of mindes, love of darkenes, and fuch like. Yet doth not this operation appear presently upon the hurt, but sometimes at nine days, sometimes at forty days, sometimes at half a year, or a year, or even, or twelve years as hath been already said.

For the cure of these Dogs, and first of all for the preventing of madness, there are sundry inventd observations. First, it is good to put them up, and make them to fast for one day, then purge them with Helleboris, and being purged, nourith them with bread of Barley-meal. Other take them when they are young whelps, and take out of their tongue a certain little worm, which the Grecians call Lytta; after which time they never grow mad, or fall to vomiting, as Gratius noted in these verses:

Namque sibi nodis qua lingua tenacibus bere
Vernicium dicecre, maiaque immedia pestis, &c.

Iam teneris elementa mali, caufasque residunt.

But immediately it being taken forth, they rub the tongue with Salt and Oyl. Columella teacheth that Shepheards of his time, took their Dogs tails, and pulled out a certain nerve or finew, which cometh from the Articles of the Back-bone into their tails, whereby they not only keep the tail from growing deformed and over-long, but also contently believed, that their Dogs could never afterward fall mad; whereunto Pliny agreeeth, calling it a ca twitch or gelding of the tail, adding, that it must be done before the Dog be forty days old. Some again lay, that if a Dog taste of a Womans milk which the giveth by the birth of a Boy, he will never fall mad. Nemeian aperfeth the cure hereof to Cafforum dryed and put into milk, but this is to be understood of them that are already mad, whose elegant veres of the caufe, beginning, and cure of a mad Dog, I have thought good here to express:

Exhalaris seu terra sinus, seu maxis aer
Caula mali; seu cum gelidis non effucl humors;
Torrida per venom concorsint feminam fumma.

Whatsoever it be, he thus warranteth the cure.

Tunc virosa tibi fomes, multumque domabis
Caftores, adritu folidis lenterecer cognes.
Ex hore luc troto pulbis bellae feratur
Admirantis, diu facies concorsint urumque.
Max lobitis liquides fenfim fuperadd fluores,
Ut non cunctantes banius infundere comae
Inferto paffis, furiaflaque repeller triferes.

But to come to the cure of such as have been bitten by mad Dogs: First I will let down some compound medicines to be outwardly applied to the body: Secondly, some simple or un compounded medicines: In the third place such compounded and un compounded potions, as are to be taken inwardly against this poiyon.

For the outward compound remedies, a plainer made of Opponax and Pitch, is much commended, which Menippus used, taking a pound of Pitch of Isautis, and four ounces of Opponax (as Amatus do prescribe) adding withall, that the Opponax must be dissolved in Vinegar, and afterward the Pitch and that Vinegar must be boiled together, and when the Vinegar is conformed, then put in the Opponax, and of both together make like syrups or plasters, and strew them into the wound, to let them remain many days together, and in the mean time drink an Amidote of Sea-crabs and Vinegar, (for Vinegar is always presious in this confection.) Other use Papiloa, Onyons, Rue, Salt, ruff of Iron, White bread, fees of Horehound, and Triacle: but the other plainer is most forcible to be applied outwardly, above all medicines in the world.

For the simple and un compounded medicines to be taken against this sore, are many: As Goose-geafe, Garlike, the root of wilde Roses drunk; bitter Almonds, leaves of Chwickseed, or Pumpernel, the old skin of a Snake pounded with a male Sea-crab, Betony. Cabbage leaves, or flats, with Parncps and Vinegar, Lime and Sewet, powder of Sea-crabs with Hony; powder of the shells of Sea-crabs, the hairs of a Dog laid upon the wound, the head of the Dog which did bite, mixed with a little Euphorbium; the hair of a Man with Vinegar, dung of Goats with Wine, Walnuts with Hony and Salt, powder of Fig-tree in a Sea-cloth, Fitches in Wine, Euphorbium; warm Horfe-dung, raw Beasts chewed in the mouth, Fig-tree-leaves, green Figs with Vinegar, fennel flats, Gentiana, dung of Pulled, the liver of a Buck-Goat, young Swallows burned to powder, also their dung; the urine of a Man, an Hyna, skin, Flower-deluce, a Sea-hearb called Kukjile, Spilium with Salt, the flesh and shels of Snails, Leek-feeds with Salt, Mints, the tail of a Field-mouse cut off from her alive, and the suffered to live, roots of Burs, with Salt of the Sea-Plantain, the tongue of a Ram with Salt, the flesh of all Sea-fishes, the fat of a Sea-call and Vervine, beside many other superfluous Amulets which are used to be bound to the arms, necks, and breasts, as the Canine-tooth bound up in a leaf and tied to the arm; a Worm bred in the dung of Dogs hanged about the neck; the root of Gentiana in an Hyna, skin, or young Wolfs skin, and such like; whereof I know no reason beside the opinion of men.

The inward compound potions or remedies against the bitings of Dogs may be such as these. Take Sea-crabs, and burn them with twigs of white Vine, and fave their ashes, then put to them the poxyder of Gentian root well cleaned, and small beaten, and as oft as need requirith take two spoonfuls of the first, and one of the second, and put them into a cup of pure and unmixed Wine, and do drink it for four days together, being well beaten and stirred, as the Wine be as thick as a Caudle; and there is nothing more forcible then Sea-crabs, Hiera, Digestion, powder of Walnuts in warm rain Water, Triacle, Carbomin, Pills, Spurge-feeds, and a decoction of Indian thorn with Vervine given in water. These may be use for several compound inward remedies against these poiyons, and now follow the simple.

First eating of Garlike in our meet, drinking of Wormwood, Rams flesh burned and put into Wine: fo drunk. There is an Herb called Aspho, by reason of the power it hath against this evil, which being bruished and drunk, cureth it. The liver of a Boar dried and drunk in Wine, hath the same operation. Jews lime drunk in water, Leeks and Onyons in meet, Dogs blood, the head, the ven
The History of Four-footed Beasts.

under the tongue (commonly supposed to be a worm) and the liver of the Dog which hath done the hurt, are also precribed for a remedy of this evil: but especially the liver or rennet of a young Puppy, the rind of a wilde Fig-tree, a dram of Celastrum, with Oyl of Rofes, Centuary, or Chamomile; the root of a wilde Rofe; (called Gymnobotron and Gymnobotron) Eullor; the brain of a Hen drunk in some liquor, Sorrel, Honey, Mints, and Plantaine: but Pimpinella Germanica is given to all Cattell which are bitten by a mad Dog. Besides many other such like, which for brevity sake I omit, concluding against all superstitious curing by Incantaments or suppos'd Miracles, such as is in a certain Church of S. Lambert, in a City of Picardy, where the Mafs Preists, when a man is brought unto them having this evil, they cut a crofs in his forehead, and lay upon the wound a piece of S. Lamberts foile burning, (which they say (though falsely) is referred to this day without diminution) then do they row up the wound again, and lay another plaister upon it, precribing him a dyet; which is to drink water, and to eat hard Egs, but if the party amend not within forty days, they bide him hand and foot in his bed, and laying another bed upon him, there strangle him, as they think without all fin) and for preventing of much harm that may come by his life, if he should bite another. This story is related by Alphius, and it is worth the noting, how mutuer accompanyeth superstitious humane inventions, and the vain presumptuous confidence of Crofs-worshippers: and thus much of the madnes of Dogs, and the cure thereof in men and cattell.

In the next place, the conclusion of this tedious discourse followeth, which is, the natural medicines arising out of the bodies of Dogs, and so we will vye them up for this time.

Whereas the inward parts of men are troubled with many evils, it is deliver'd for truth, that if little Melitaen Dogs, or young fucking Puppies, be laid to the breath of a child or man that hath infectious passions or pains in his entrails, the pain will depart from the man into the beast; for which cause they burned them when they were dead. Serenus doth express this very elegantly, saying:

Quin etiam catulum laborant apportare membri
Conserve, omne malum transurrente fertur in illum.
Cui tamen essentia mundus debetur humendi,
Humani quis contiuit melia tanta sequuntur.
Et iunctum vitium ducit de conjuge conjus.

Amatus, Hippocrates.

If a Whelp be cut asunder alive, and laid upon the head of a mad melancholick woman, it shall cure her, and it hath the same power against the Spleen. If a woman grow barren after the birth born children, let her eat young Whelp flesh, and Polypus fish fed in Wine and drink the broth, and she shall have ease of all infirmities in her stomack and womb. Water distill'd out of Whelps, caufeth that pieted or shaven places shall never have more hair grow upon them.

With the fat of whelps, bellowed and fed till the flesh come from the bones, and then taken and put into another Veffel, and the weak, refulcute, or paralytike members being therewith anointed, they are much eafed if not recovered. Alphius saith, he made experience of Puppies fed alive in Oyl, whereby he cured his Gowy legd Horfes, and therefore it cannot chuse but be much more profita-ble for a man.

The skin of a Dog held with the five fengers, flyeth Diftillations; it hath the same operation in gloves and stockins, and it will also eafe both Ach in the belly, head, and feet, and therefore it is used to be worn in the shoes against the Goyt.

The fleth of mad Dogs is falted, and given in meat to them which are bitten by mad Dogs for a fingular remedy. The bloud is commended against all intoxicating powfons and pains in the small guts, and it cures thiefs. The fat is used against deafness of the ears, the Goyt, Nits in the head, and incontinency of urine, given with Alum. A plaister made of the Marrow of a Dog and old Wine, is good against the falling of the fundament. The hair of a black Dog eatheth the Falling sickness, the Brains of a Dog in Lint and Wool laid to a mans broken bones for fourteen days together, doth confolatate and joyn them together again, which thing caused Serenus to make thefe excellent verses:

Infandum diuìa cunctis procul abit amicia,
Sed fortuna potens omne convertit in hofter,
Vis indupta novi fi parerit offa fragore,
Compendet cerebrum blandis Canis addere fratellis,
Linea deinde superfusque inducunt melius lanis,
Sapius & saevus confugerent pinguis aeteri,
Sue sestem creantem revoluerent cum felibus.

The brain-pan or skull of a Dog close asunder, is applie'd to heal the pain in the eyes; that is, if the right eye be grieved, thereunto apply the right side of the skull; if the left eye, the left side.

The vertices of a Dogs head made into powder are both many and unspakeable, by it is the biting of mad Dogs cured; it cureth spots and bunches in the head; and a plaister thereof made with Oyl of Rofes, hasteth the running in the head; it cureth also all tumors in privy parts, and in the fea, the chippings in the fengers, and many other diseases.
Of the Elephant.

The powder of the teeth of Dogs, maketh Childrens teeth to come forth with speed and ease, and if their gums be rubbed with a Dogs tooth, it maketh them to have the sharper teeth, and the powder of these Dogs teeth rubbed upon the gums of young or old, eateh Tooth-ach, and abateth swelling in the gums. The tongue of a Dog is most wholesome both for the curing of his own wounds by licking, as also of all others. The Remedy of a Puppsey drunk with Wine, dissolveth the Colick in the same hour wherein it is drunk: and the Vomit of a Dog laid upon the belly of a Hydropick man, caueth water to come forth at his stool. The gall healeth all wheels and blisters after they be pricked with a Needle, and mingled with Mincemeit it caueth pain in the eyes, and taketh away white spots from them: likewise infused into the ears, openeth all stoppings, and cureth all inward pains in them.

The Spleen drunk in Urine, cureth the Spleenrick; the milk being taken from the Dog alive, hath the same vertue to help the milte of man. The skin of Bitches wherein they conceive their Puppies (which never touched the earth) is precious against difficulty in Child-birth, and it draweth the Infant out of the womb. The milk of a Bitches first whealing, is an antidote against poyson, and the same caueth hair never to come again, if it be rubbed upon the place where hairs are newly pulled off: Alfo infused into the eyes, driveth away the whiteness of them. Likewise there is no better thing to anoint the gums of young children withall, before they have teeth, for it maketh them to come forth with ease: it eateh likewise the pain of the ears, and with all speed healeth burnt mouths by any hot meat: Ora ambisba tibi fanba b elle Canino.

The urine of a Dog taketh away spots from the eye, and being mingled with Salt of Nitre, wonderfully eateh the Kings Evil. The dung of Dogs (called by the Apothecaries Album Gramum) because the white is belt, being ingendiend by eating of bones, and therefore hath no ill favour; Gulen affirmeth, that his Matters in Physick, used it against old forces, Bloody fluxes, and the Quaistes; and it is very profitable to blanch the blood of Dogs; and also against the inflammations in the breast of Women mingled with Turpentine. It was well prefcrib'd by Aseum, to expell congealed blood out of the stomach and bladder, being taken thereof fo much in powder as will lye upon a Golden Noble.

Of the Ethiopian EAL.

There is bred in Ethiopia a certain strange Beast about the bignefs of a Sea-horse, being of colour black or brownish: it hath the cheeks of a Bear, the tail of an Elephant, and horns above a cubit long, which are moveable upon his head at his own pleasure like ears; now flanding one way, and anon moving another way, as he needeth in fighting with other Beasts, for they stand not fifte, but bend flexibly; and when he sighteth, he alway stretcheth out the one, and holdeth in the other, of purpose as it may seem, that if one of them be blunted and broken, then he may defend himself with the other. It may well be compared to a Sea-horse, for above all other places it loveth the waters.

Of the ELEPHANT.

Here is no creature among all the Beasts of the world, which hath so great and ample demonstration of the power and wisdom of Almighty God as the Elephant: both for proportion of body and disposition of spirit; and it is admirable to behold the industry of our ancient fore-fathers, and noble desire to benefit us their posterity, by searching into the qualities of every Beasts to discover what benefits or harms may come by them to mankind: having never been afraid either of the wilder, but they tamed them; the fiercest, but they ruled them; and the greatest, but they also fet them upon. Witnesses for this part the Elephant, being like a living Mountain in quantity and outward appearance, yet by them so handled, as no little Dog became more服eable and tractable.

Among all the Europeans the first poffeffor of Elephants, was Alexander Magnus, and after him Antigonus, and before the Macedonians came into Asia, no people of the world, except the Africans and the Indians, had ever seen Elephants. When Fabrinius was sent by the Romans to King Pyrrhus in Ambaffage, Pyrrhus offered to him a great sum of money, to prevent the War, but he refused private gain; and preferred the service of his Country: the next day he brought him into his presence, and thinking to terrifie him, placed behind him a great Elephant, shadowed with cloth of Arms, the cloth was drawn, and the huge Beaf infantly laid his trunk upon the head of Fabrinius, sending forth a terrible and direful voice: whereas Fabrinius laughing, perceiving the policy of the King, gently made this speech:

Nego beri aumum, nego bude b sita me terribil.

I was neither tempted by Gold yesterday, nor terrifieè by the sight of this Beaff to day: and so af. Eutropius.

terward Pyrrhus was overcome in War by the Romans, and Mutilus Caius Demetrius did first of all bring Elephants in Triumph to Rome, calling them Licorne Bover, Oxen of the Wood, about O 3
The History of Four-footed Beasts.

Julius Capit.

Of the several names in divers languages.

The original of the Cafer.

The 472. year of the City; and afterward in the year of Rater building 502. when Metellus was high Priest, and overthrew the Carthaginians in Sicily, there were 142 Elephants brought in Ships to Rome and led in triumph, which Lucius Pius afterward, to take away from the people opinions of the fear of them, cau'ed them to be brought to the stage to open view and handling, and so flain; which thing Pompey did also by the slaughter of five hundred Lions and Elephants together; so that in the time of Cordianus, it was no wonder to see thirty and two of them at one time.

An Elephant is by the Hebrews called Behemah, by way of excellency, as the Latins for the same caufe call him Belona, the Caledonians for the same word, Deut. 14, translate Biura; the Arabians, Khiniz; the Persians, Birdad; and the Sepugnati, Kente; but the Greeks vulgarly Elephant, not Quafi Elephan, because they joyn copulation in the water, but rather from the Hebrew word Dephiā, signifying the Ivory tooth of an Elephant (as Munster well observeth.) The Hebrews also use the word Schön for an Elephants tooth. Moreover Hesychius call an Elephant in the Greek tongue Perisfai; the Latins do indifferently use Elephas and Elephantus; and it is said that Elephantus in the Punic tongue, signifieth Cajar: whereupon when the Grandfather of Julius Caesar had slain an Elephant, he had the name of Caesar put upon him.

The Italians call this beast Loffante, or Lionfante; the French, Elefante; the Germans, Helfant; the Bytians, Sloan. We read but of three appellative names of Elephants; that is of one, called by Alexander the great Ajax, because he had read that the buckler of great Ajax was covered with an Elephants skin, about whose neck he put a Golden collar, and fo fent him away with liberty. Attis- clus one of Alexanders succeffors had two Elephants, one of them he likewise called Ajax, in imitation of Alexander, and the other Partholos, of which two this story is reported by Antipater. That when Attisclus came to a certain forod or deep water, Ajax which was always the Captain of the flue, having found the depth thereof, refus'd to paffe over, and turn'd back again, then the King fpake to the Elephants and pronounced, that he which would paffe over should have principality over the flue: whereupon Partholos gave the adventure, and paffed over safely, and received from the King the fliver trappings and all other prærogatives of principality; the other feeing it (which had alway been chief till that time) preferred death before ignorney and difgrace, and fo would never after eat meat but famish'd for sorrow.

They are bred in the hot Eastern Countries, for by reason they can endure no cold, they keep only in the East and South. Among all, the Indian Elephants are greatest, strongest, and talleft, and there are among them of two forts, one greater (which are called Profi) the other smaller (called Texile.) They be also bred in Africa, in Lybia, much greater then a Nijean Horfe, and yet every way inferior to the Indian; for which caufe, if an African Elephant do but fee an Indian, he trembleth, and laboureth by all means to get out of his light, as being guilty of their own weaknes.

There are Elephants also in the Ille Taprobane, and in Sumatra in Africa. They are bred in Lybia, in Ethiopia, among the Troglodytes, and in the Mountain Atlas, Syrtes, Zamas, and Sala, the seven Mountains of Tyrantias, and in the Country of Basman, subject to the great Cham. Some Authors affirm, that the African Elephants are much greater then the Indian; but with no greater reafon then Columela writeth, that there be as great beasts found in Italy as Elephants are; whereunto no found Author ever yeelded.

Of all earthly creatures an Elephant is the greatest; for in India they are nine cubits high, and five cubits broad; in Africa fourteen or fifteen full spans, which is about eleven foot high and proportionable in breadth, which caus'd Belonas to write, that one Elephant is as big as three Flings; and among thefe the Males are ever greater then the Females. In the Kingdom of Melinda in Africa, there were two young ones not above fix months old, whereof the leaff was as great as the greatest Ox, but his flieath as much as you shall finde in two Oxen; the other was much greater.

Their colour is for the molt part mouse-colour, or black; and there was one all white in E보hipias. The skin looketh pieded and fcarby; it is molt hard on the back, but fofter underneath the belly, having no covering of hair or grifilles, nor yet help by his tail to drive away the flies, for that eftill doth this beaft feel in his great body, but alway hath crevices in his skin, which by their favour do invite the little flies to a continual leaff, but when by stretching forth they have received the swarines, by thinking together again, they incline the flies, and fo kill them: fo that thefe crevices in his skin, are unto him in leaft of a main, tail, and hair: yet there are fome few hairs which grow fatterning upon his hide, whereas fome have been brought out of America into Germany, which were two palmes long, but not fo flieath as Swines.

Their skin is fo hard and flieath, that a hard sword or iron cannot pierce it. Their head is very great, and the head of a man may easily enter into their mouth, as a finger into the mouth of a Dog; but yet their ears and eyes are not equivalent to the residue of their proportion: for they are fmal like the wings of a Bat or a Dragon, tho'ef of the E 보hipias Sumbr wants eare altogether. Their eyes are like the eyes of Swine, but very red; they have teehs of either fide four, wherewith they grind their meat like meal, and they have alfo two other which hang forth beyond the reft of the teeth, in the males downward, and these are the greater and crooked; but in the females upward, and they are the smaller and straight: the one of them they keep always sharp, to revenge injuries, and with the other they root up plants and trees, for their meat; fo that nature hath armed both sexes with
with these for their chiefest defence; and with these the females are calved at the first, and induced from the mothers' belly, and appear so soon as they come forth; the males not so quickly, but rather after the manner of Bores and Sea-horses, they hang out of their mouths, and grow to be ten foot long, whereof they make pools of fows in some Countreys, and call them Ebora, that is, young Ivory; which caused Martial to write thus;

Grandia tenuitum partem qui corpora queares
An Lybicis primitis justus tui usque tristes.

There is a certain Book extant, without the name of the Author, written of Judea or the Holy land, wherein the Author affirmeth that he saw an Elephant's tooth sold to a Venetian Merchant for fix and thirty Ducats, it being fourteen span long, and four spans broad, and it weighed so heavy, that he could not move it from the ground.

Vartomarus also faith, that he saw in the Isle of Sumatra, two Elephants' teeth, which weighed three hundred fix and thirty pounds. This is certain, that the teeth of those Elephants which live in the Marshes and watry places, are so smooth and hard, as they seem intricable, and in some places they have holes in them, and again certain bunches as big as hazel-bones, which are so hard, as no art or instrument can work upon them.

The Elephants of the Mountains have leffer and whiter teeth, fit to be applied to any work, but the belft of all, are the teeth of the Compositel and field Elephants, which are whited and footted, and may well be handled without all pain. The teeth of the females are moreRewelved for the male, and thence they lose every tenth year; which fallimg off, they bury and cover in the earth, reeling them down by sitting upon them, and then heal them over with earth by their fee, and so in short time the grasse growth upon them: for, as when they are hunted they know it is no other caufe then their teeth; fo also when they lose their teeth, they desire to keep them from men, let the virtues of them being discovered, they which bear them should enjoy the leffe peace and securitie.

It is admirable what devies the people of India and Asia have invented by natural observation, to finde out these buried teeth, which unto us living in the remote parts of the world, we would judge impossible by any ordinary or lawful course, except we should turn up the earth of a whole Countrey, or go to work by diabolical conjunction; yet have they found out this facile and ready course. In the woods or fields where they suspect these teeth to be buried, they bring forth pots or bottles of water, and dis perse them, here one, there another, and so let them stand, and tardy to watch them, fo one sleepeoth, another fingeth, or belloweth his time as he pleaseth; after a little time, they go and look in their pots, and if the teeth lie near their bottles, by an unpeable and secret attractive power in nature, they draw all the water out of them that are neer them, which the watchman taketh for a sure fign, and so diggeth about his bottle, till he finde the tooth: but if their bottles be not emptied, they remove to seek in another place.

These Ivory teeth have been alway of great estimation among all the Nations that ever knew them, the Ethiopians payed for a tribute unto the King of Persia every third year twenty of these teeth hung about with gold and Jet-wood. These are fold by weight, and there be many which deceive the world with the bones of Fifies in stead hereof, but the true Ivory is paler and heavier, and falling upon the ground will easily break, whereas the bones of Fifies are more tenacious, light and strong. It is like to the Cheruit wherein Darius was entombed, and the Marble called Lapin Corallium, Coral stone: like unto this is the Alagi Bone, and the Padun Jewell. With this Ivory they make images and statues for their Idol gods, as one for Peres in Athens, for Eulpipus in Epi dupolis, for Verus under the name of Urania by Plutarch, whereupon he calleth Elephantine, for Apollo at Rome: and therefore Pausanius wondereth at the Greeks that spared no cost for the vain worship of their gods, for they brought of the Indians and Ethiopians Ivory to make their Images with more pomp and ostentation: besides of Ivory they make the hafts of knives, and also the steel combes, and Solomon as appeareth 3 Reg. 10. had a throne of Ivory covered all over with gold, for the costs and charge whereof he could not expend lesse then thirty thousand talents.

The greatness of these appeareth by their use, for Pelibius reporteth by the relation of Galby, a Noble man and a great traveller in Africa, that with them they made pots for houses, and racks to lay their Cattels meat upon, and likewise bowls to enclose them. Apelles made an Ink of Ivory, which was called Elephants inke, and he painted therewith. It hath been affirmed by Albinus and some writers following Pliny, that these teeth are horns, and that Elephants are horned beasts, which errror rofe upon the occasion of these words of Pliny: Elephas et erutes carere tantum cornibus affirmatur, in Santorum litorum reciprocitos delinit Octavus; where Albinus finding a resemblance between Rams and Elephants in their white horns, was contented to apply that name to them both, which appertaineth only to one; for Pliny himself lib. 18. treweh his meaning by another speech, of their whetting their horns upon trees, and Rhincoceros upon stones: for except he had named horns in the first place it might have been questioned whether Rhincoceros had any horns, but rather teeth in the second place.

But whatsoever were the words or opinion of Pliny, it is most certain, that after Herodotus and other ancient writers, it is furer to call these teeth then horns, and I will briefly set down the reasons.
reactions of Phthisiarus, that will have them to be teeth; and afterward of Grapaldus, Aluinus, and
Pantanius, that would make them horns, and so leave the Reader to consider whether opinion he
thinketh most agreeable to truth. First, that they are not horns, it is allowed that horns fall off
and grow every year again, especially of Harts, and grow forth of their heads; but teeth which
are called Fanne or Gang-teeth, standing out of the mouth, fall off together, and are given for weapon
and defence to beasts, and such are the Elephants. Again, a horn hath a certain line or circle near the
root, which is covered every year, but this cometh up like a flabby substance, without all circle or
cover, and therefore it cannot be a horn. Moreover, those creatures are said to have horns that
have cloven hoofs, this hath no cloven hoof, but only five distinct fingers upon a foot. Lastly, all
homed beasts have an empty hollowness in their horns (except Harts) but this is found and full
throughout, except a little paffage in the middle like a hole into a tooth: and thus say they which
have them called teeth.

Now on the contrary, those which will have them horns, make these arguments. First, as the
Elephants have their horns grow out of their eye-licks, the Rhinocerotes or Ethiopian Bulls out of
their nose, so as it is not unnatural for the Elephant to have his horns grow out of his mouth. Again,
horns fall off and come again in old beasts, but teeth do not so, and therefore these are horns and
not teeth; the power of fire cannot alter teeth, but these teeth break if you go about to change
their proportion or figure, but horns of OXen and Elephants may be stretched, bended, altered,
straightened, and applied to what fashion you ever will. Again, teeth grow out of the gums and
cheek-bone, as it is apparent, but horns grow out of the scull and temples, and so do the Elephants,
as by observation every man may discern. Lastly, as nature hath given another shape and greater
proportion of body to Elephants then to any other beasts, so also it is not unreasonable that it
vary in the placing of his horns, for they grow downward, and the very mole and quantity of
his body is sufficient to arm him against the fear of death. Thus they argument for the horns
of Elephants.

The Poets have a pretty resemblance of dreams, comparing true dreams to horns, and false
dreams to Ivory, because falsehood is ever more burnished, then naked and ragged truth. And
besides the eye of man is transluuent, and containeth in it a hornie substance, and by the eye we
always receive the best assurance, but by the mouth (signified by teeth) are many falsehoods ven-
ted; and for that horns turn upward to heaven, the fountain of truth, but the teeth of an Elephant
grow downward towards the earth the mother of error. And for this saufe Aeneas by Virgil
and Homer, is said to come in at the hornie gate of Sommvs, and to go forth at the Ivory: Virgis
Veres are these:

Sunt gemina Somni porta, qu'am altera suntur
Cornua, quae erit faciili datir exitum umbrit.
Altera candentis perfetis nitentis Elephanto,
Sed falsa ad calum mittunt insomnia moneis.
His abi dim nutum Aenei,ique Styliam
Propeque ditis, portasque emittit omnes.

And here we will leave, and prosecute no further this discourse of their horns and teeth, but pro-
tected to the other outward parts of this beast.

The tongue is very small though broad, his trumpet called Probofis and Primaly, is a large hollow
thing hanging from his nose like skin to the groundward; and when he feedeth it lyeth open, like
the skin upon the bill of a Turkey-cock, to draw in both his meat and drink, using it for a hand,
and therefore improperly it is called a hand. For by it he receiveth of his keeper whatsoever he
giveth him, with it he overholloweth trees, and wherefoever he swimmeth, through it he draweth
breath. It is crooked, griply, and inflexible at the root next to the nose: within it hath two
passages, one into the head and body by which he breatheth, and the other into his mouth: where-
by he receiveth his meat: and herein is the work of God most wonderful, not only in giving unto it
such a divers proportion and anatomy, but also giving him reason to know this benefit of it, that so
long as he is in the water and holdeth up that trunk, he cannot perish.

With this he fighteth in war, and is able to take up a small piece of money from the earth: with
it he hath been seen to pull down the top of a tree, which twenty four men with a rope could not
make to bend. With it he driveth away his Hunters when he is chased, for he can draw up therein
a great quantity of water, and shoot it forth again, to the amazement and overthrow of them that
persecute him. The Morii say that he hath two hearts, one wherewithal he is intenched, and another
whereby he is pacified.

But the truth is, as Aristote in the dissection of the heart observed, there is a double ventricle and
bone in the heart of an Elephant. He hath a Liver without any apparent gall, but that side of the
Liver being cut, whereon the gall shoul d lie, a certain humour cometh forth like a gall. Wherefore
Aelianus faith, he hath his gall in his Dawg-gut, which is so full of finnes, that one would think he
had four bellies; in this receiveth he his meat, having no other receptacle for it. His intrails are
like unto a Swines, but much greater.

His Liver four times to greare as an Oxes, and so all the retidine except the Mit. He hath two
pappes a little beside his brest under his shoulders, and not between his hinder legs or loins, they
Aristote,
are very small and cannot be seen on the side. The reasons hereof are given, first that he hath but two pappes, because he bringeth forth but one at a time, and they stand under his shoulders like an Ape, because he hath no hoots but distinct feel like a man, and also because from the breast floweth more abundance of milk.

The genital part is like a Horsef, but lesser then the proportion of his body affordeth: the flones are not outwardly seen, because they cleave to his reins. But the female hath her genital between her thighs: the forelegs are much longer then the hinder legs, and the feet be greater. His legs are of equal quantity, both above and beneath the knees, and it hath angle bones very low. The articles do not ascend so high as in other creatures, but kept low near the earth. He bendeth his hinder legs like a man when he stretch, but by reason of his great weight he is not able to bend on both sides together, but either leaning to the right hand or to the left, and fo leapeth: It is falsely that they have no joints or articles in their legs, for when they please they can use, bend, and move them, but after they grow old, they use not to lie down or strain them, by reason of their great weight, but take their rest leaning to a tree: and if they did not bend their legs, they could never go any ordinary and slayed pace. Their feet are round like a Horsef, but so as they reach from the middle every way two fpanes length, and are as broad as a bushel, having five distinct toes upon each foot, the which toes are very hitte claven, to the intent that the foot may be stronger, and yet parted, that when he treadeth upon soft ground, the weight of his body preffe not down the leg too deep. He hath no nails upon his toes, his tail is like an Oxes tail, having a little hair at the end, and the residue thereof peeled and without hair: He hath not any brilley hairs to cover his back. And thus much for their several parts and their ues.

There is not any creature so capable of underhanding as an Elephant, and therefore it is requisite to terary somewhat the longer in expressing the several properties, and natural qualities thereof, which sundry and variable inclinations, cannot choose but bring great delight to the Reader. They have a wonderful love to their own Country, so as although they be never so well delighted with divers meats and joyes in other places, yet in memory thereof they fend forth tears, and they love also the waters, rivers, and marishes, so as they are not unfithly called Bipartit, such as live by the rivers sides: although they cannot swim by reason of their great and heavy bodies, until they be taught. Also they never live solitary, but in great flocks, except they be sick or watch their young ones, and for either of these they remain adventurous unto death, the elder leadeth the herd, and the second driveth them forward, if they meet any man they give him way, and go out of his sight.

Their voice is called by the word Batire, that is, to bray, and thereupon the Elephants themselves are called Barri; for his voice cometh out of his mouth and nothirs together, like as when a man speakesh breathing, wherefore Aishale calleth it Kaucity, or hoarâfins, like the low found of a Trumpet, this found is very terrible in battails as shall be afterward declared.

They live upon the fruits of Plants and roots, and with their trunks and heads, overthrow the tops of trees, and eat the boughs and bodies of them, and many times upon the leaves of trees he devoureth Chamaeleons, whereby he is poisoned and dyeth, if he eat not immediately a wilde Olive. They eat earth often without harm, but if they eat seldorn, it is hurtful and procureth pain in their bellies: so also they eat flones. They are so loving to their fellows, that they will not eat without one another, but having found a prey, they go and invite the residue to their feates and cheer, more like to reasoneable civil men, then unreasonable brute beate. There are certain noble Melons in Ethiopia, which the Elephants being sharp smelling beasts, do winde a great way off, and by the conduct of their noses come to thole Gardens of Melons, and there eat and devour them. When they are tamed they will eat Barlie either whole or ground: of whole at one time is given them certain Macedonian Bulhuels, but of Mens six, and of drunk either wine or water, thirty Macedonian pints at a time, that is, fourteen gallons; but this is observed, that they drink not except in war, when they are to fight, but water at all times, whereof they will not taft, except it be muddy and not clear, for they avoid clear water, loathing to see their own shadow therein; and therefore when the Indians are to passe the water with their Elephants, they chuse dark and cloudy nights wherein the Moon affordeth no light. If they perceive but a Mouse run over their meat, they will not eat thereof, for there is in them a great hatred of this creature. Also they will eat dryed Figs, Grapes, Onions, Bulruethes, Palmes, and Ivy leaves: There is a Region in India, called Phalacrus, which signifies Balde, because of an herb growing therein, which caueth every living thing that eateth thereof, to lote both horn and hair, and therefore no man can be more industrious or wary to avoid those places, then is an Elephant, and to forbear every green thing growing in that place when he passeth through it.

It will forbear drink eight dayes together, and drink wine to drunkennets like an Ape. It is delighted above measure with sweet favors, ointments, and smelling flowers, for which cause their keepers in the Summer time lead them into the medowes of flowers, where they of themselves will by the quickness of their smelling, chuse out and gather the sweeteft flowers, and put them into a basket if their keeper have any; which being filled; like dainty and nest men, they also desire to water, and fo will go and seek out water to wash themselves, and of their own accord return back again to the basket of flowers, which if they find not, they will bray and call for them. Afterward being led into their stable, they will not eat meat until they take of their flowers, and dress the stems of their mangers therewith, and likewise strew their room or standing place,
Of the Elephant.

155

place, pleasing themselves with their meat, because of the favour of the flowers stuck about their cratch, like damne fed porfons which set their dishes with green herbs, and put them into their cups of wine.

Their pace is very slow, for a child may overtake them by reason of their high and large bodies (except in their fear) and for that cause cannot swim: as also by reason that the toes of their feet are very short and singly divided. When they are brought into a Ship, they have a bridge made of wood, and covered with earth, and green boughs are set on either side, so that they imagine they go upon the land until they enter into the Ship, because the boughs keep them from sight of the Sea. They are most chaff, and keep true unto their males without all inconstancy love or separation, admitting no adulteries amongst them, and like men which tafT of Venus not for any corporal lust, but for desire of their successors in their families; so do Elephants without all unchast and unlawful lust, take their venerable complements, for the continuation of their kinde, and never above thrice in all their days, either male or female suffer carnall copulation (but the female only twice.) Yet is their rage great when the female provoketh them, and although they fight not among themselves for their females, (except very seldom) yet do they do burn in this fury, that many times they overthrow trees and hoores in India by their tusks, and running their head like a Ram against them, wherefore then they keep them low and down by subraction of their meat, and also bring some stranger to beat them. There was a certain running Hunter sent into Madagascar, by the Roman Emperor, to hunt and take Elephants; on a day he saw a goodly young Elephant in copulation with another, and instantly a third approached with a direful braying, as if he would have eaten up all the company, and as it afterward appeared, he was an arrival to the female, which we saw in copulation with the other male: when he approached near, both of them set themselves to combat, which they performed like some unfizable waves of the Sea, or as the hills which are shaken together by an earthquake, wherein each one charged the other most furiously for their love, to the terror and admiration of all the beholders, and so at last became both disarmed of their teeth and horns by their often blows; before one had overcome the other, and so at last by the hunters were parted asunder, being ever afterward quiet from such contentions about their females for copulation.

The Indians separate the flaves of the females far asunder from the males, because at that time they overthrow their hoores. They are modest and shamefast in this action, for they seek the Deferts, Woods, and secret places for procreation, and sometimes the waters, because the waters do support the male in that action, whereby he ascendeth and descendeth from the back of the female with more ease: and once it was seen, that in Virgins (a Country of the Confsents) two Elephants did engender out of India, otherwise they couple not out of their own Countries. When they go to copulation, they turn their heads towards the East, but whether in remembrance of Paradise, or for the Mandragoras, or for some other cause I cannot tell: the female seated while she is covered. They begin to engender, the male at fix, ten, twelve, fifteen or twenty year old, the female not before ten years old. They couple but five days in two years, and never after the female is filled till they have been clear one whole year; and after the second copulation, he never more toucheth his female. At that time the male breatheth forth at his nose a certain flat humour like a menstrual thing, but the female hath them not till her place of conception be opened: and alway the day after her filling, she watheth herself before she return to the flock.

The time of their going with young is according to some, two years, and according to other, three; the occasion of this diversitie is, because their time of copulation cannot certainly be known, because of their secrecy, for the greater bodies that bests have, they are the leffe fruitful. She is delivered in great pain, leaning upon her hinder legs. They never bring forth but one at a time, and that is not much greater then a great Cow-calf (of three months old,) which the nouriseth six or eight year. As soon as it is Calved, it feeth and goeth, and flicketh with the mouth, not with the trunk, and so groweth to a great stature.

The females when they have calved are most fierce, for fear of their young ones, but if a man come and touch them, they are not angry, for it seemeth they understand that he toucheth them not for any desire to take or harm them, but rather to stroke and admire them. Sometimes they go into the water to the belly, and there calve for fear of the Dragon; the male never forsaith her, but keepeth with her for the like fear of the Dragon, and feed and defend their young ones with singular love and constancy unto death; as appeareth by the example of one, that heard the braying of her calf fallen into a ditch, and not able to arise, the female ran unto it, and for halfe fell down upon it, so crushing it to death, and breaking her own neck with one and the same violent love.

As they live in herds, so when they are to passe over a river or water, they send over the least or youngest first, because their great bodies together should not cause the deep water to swell or rise above their height; the other stand on the bank and observe how deep he wadeth, and so make account that the greater may with more assurance follow after the younger and smaller, then they the elder and taller, and the females carry over their Calves upon their forefeet, and long eminent teeth binding them fast with their truncks, (like as with ropes or male gurs, that they may not fall) being sometime holpen by the male; wherein appeareth an admirable point of natural wisdom, both in the carriage of their young, and in fending of the leffer foremost, not only for the reason aforesaid, but also because they being hunted and prosecuted, it is requisite that the greatest and

and strongest come in the rear and hindmost part, for the safeguard of the weaker, against the fury of their persecutors, being better able to fight then the foremost, whom in natural love and policy, they set farthest from the danger.

Marius which had been thrice Consul, affirmed, that he saw Elephants brought on board at Puteoli in Italy: they were cau’d to go out of the Ship backward, all along the bridge that was made for them, that to the fight of the Sea might terrifie them, and cau’d them more willingly to come on land, and that they might not be terrifie’d with the length of the bridge from the continent. Pliny and Solinus affirm, that they will not go on shipboard, until their keeper by some intelligible signe of oaths, make promise unto them of their return back again.

They sometimes, as hath been said, fight one against another, and when the weaker is overcome, he is so much abased and cast down in minde, that ever after he feareth the voice of the conquerour.

They are never so fierce, violent, or wilde, but the fight of a Ram tameth and dismayeth them, for they fear his horns; for which cause the Egyptian picture an Elephant and a Ram to signify a foolish King that runneth away for a feartull fight in the field. And not only a Ram, but also the grunting clamour or cry of Hogs: by which means the Romans overthrew the Carthaginians and Pyrrhus which trusted overmuch to their Elephants. When Antipater besieged the Megarians very hastily with many Elephants, the Citizens took certain Swine and anointed them with pitch, then let them on fire and turned them out among the Elephants, who crying horribly by reason of the fire on their bodies, did discomfit the Elephants, that all the wit of the Macedonians could not restrain them from madnes, fury, and flying upon their own company, only because of the cry of the Swine. And to take away that fear from Elephants, they bring them up with them when they are tamed, young Bigges and Swine ever since that time. When Elephants are chafed in hunting, if the Lions see them, they run from them like Hinde-calves from the Dogs of Hunters, and yet Ipheciras layeth, that among the Elephians or western Egyptian, Lions set upon the young Calves of Elephants and wound them; but at the fight of the mothers, which come with speed to them, when they hear them cry, the Lions run away, and when the mothers finde their young ones imbred in their own blood, they themselves are so enraged that they kill them and so retire from them, after which time the Lions return and eat their flesh. They will not induce the favour of a Mouse, but refuse the meat which they have run over; in the river Ganges of India, there are new Wormes of sixty cubits long having two arms; these when the Elephants come to drink in that river, take their trunks in their hands and pull them off. There are Dragons among the Ethipians, which are thirty yards or paces long, these have no name among the inhabitants but Elephant-killers. And among the Indians also there is an ascribed and native hateful hostility between Dragons and Elephants: for which cause the Dragons being not ignorant that the Elephants feed upon the fruits and leaves of green trees, do secretly convey themselves into them or to the tops of rocks: covering their hinder part with leaves, and letting his head and fore part hang down like a rope, on a fuddain when the Elephant comeath to crop the top of the tree, she leapeth into his face, and diggeth out his eyes, and because that revenge of malice is too little to satisfy a Serpent, she twinneth her gable like body about the throat of the amazed Elephant, and so strangleteth him to death.

Again they marke the footsteps of the Elephant when he goeth to feed, and so with their tails, net in and entangle his legs and feet: when the Elephant perceiveth and feeleth them, he butteth down his trunk to remove and untie their knots and gins; then one of them thrutcheth his poisoned tilling head into his Nostrils, and so stops up his breath, the other prick and gore his tender belly-parts. Some again meet him and flic upon his eyes and pull them forth, so that at the last he must yield to their rage, and fall down upon them, killing them in his death by his fall, whom he could not repuls or overcome being alive: and this must be understood, that forasmuch as Elephants go together by flocks and herds, the subdi Dragons let the foremost pafl, and fet upon the hindmost, that so they may not be oppreft with multitude.

Also it is reported that the blood of an Elephant is the coldest blood in the world, and that Dragons in the scorching heat of Summer, cannot get any thing to cool them, except this blood; for which cause they hide themselves in rivers and brooks whither the Elephants come to drink, and when he putteth down his trunk they take hold thereof, and instantly in great numbers leap up unto his ear, which is naked, bare and without defence: whereabout they suck the blood of the Elephant until he fall down dead, and so they perish both together.

Of this blood cometh that ancient Cinclaria, made by commixture of the blood of Elephants and Dragons both together, which alone is able, and nothing but it, to make the best representation of blood in painting. Some have corrupted it with Goats-blood, and call it Milton and Minnow, and Memnona: it hath a molt rare and singular vertue against all poisons, beitie the unmatchable property afofaid.

These Serpents or Dragons are bred in T-generation, in whose heads are many precious stones, with such natural fells or figurative impression, as if they were framed by the hand of man, for Podistipus and Tetrass affirm, that they have seen one of them taken out of a Dragons head, having upon it the lively and artificial flame of a Chariot.

Elephants are enemies to wilde Bulls, and the Rhinoseros, for in the games of Pompey, when an Elephant and a Rhinoseros were brought together, the Rhinoseros ran infinitely and when his horn upon a stone,

The Centurion a main battel Jugurtha and his skill, was

the Shieid, being for the defence, to the tooth, and the Gryphins which overcome almost all beasts, are not able to stand with the Lions or Elephants.

The females are far more strong, cheerful, and courageous than the males, and also they are apt to bear the greater burthens; but in War the male is more graceful and acceptable, because he is taller, giving more assured ensigns of victory and fortitude: for their strength is admirable, as may be conjectured by that which is formerly recited of their trunk, as Varti-man affirmed, that he now three Elephants with their only heads, drive a great Ship out of the Sea-water where it was fastened unto the shore. When he is most loaded he goeth full, for he can carry a wooden Tower on his back with thirty men therein, and their sufficient food and warlike instruments.

The King of India was wont to go to war with 30000 Elephants of war, and before these he had also followed him 3000 of the chiefest and strongest in India, which at his command would overthrow Trees, Horses. Wals, or any such thing flaying against him: and indeed upon these were the Indians wont to fight, for the defence of their Coast and Country. The farthest region of that continent is called Partalis, inhabited by the Ganguides and Calinge, the King whereof was wont to have seven hundred Elephants to watch his Army, and no mean Prince in all India which was not Lord of many Elephants. The King of Padrope kept in flippend, eight thousand every day, and beyond his Territory was the King of Molwdt and Mainilde, which had four hundred Elephants. These fight with men, and overthrow all that come within their reach, both with their trunks and teeth.

There were certain officers and guides of these Elephants, which were called Elphantarches, who were the governors of sixteen Elephants, and they which did institute and teach them Martial discipline, were called Elephantagni. The Military Elephant did carry four persons on his bare back, one fighting on the right hand, another fighting on the left hand, a third which fought backward from the Elephants head, and a fourth in the middle of these holding the reins and guiding the beast to the defecration of the Souldiers, even as the Pilot in a Ship guideth the stern, wherein was required an equal knowledge and dexterity, for they understand any language quickly: for when the Indian which ruled them said, Strike here on the right hand, or eile on the left, or refrain and stand still, no reasonable man could yeeld reader obedience. They did suffer by iron chains, first upon the Elephant that was to bear ten, fifteen, twenty, or thirty men, on either side two panniers of iron bound underneath their belly, and upon them the like panniers of wood hollow, wherein they place their men at armes, and covered them over with small boards, for the trunck of the Elephant was covered with a mail for defence, and upon that a broad sword, and two cuibs long; this (as also the wooden Caiffe or panniers aforeaid) were fastened first to the neck, and then to the rump of the Elephant. Being thus armed, they entered the battel, and they threw unto the beast that made them more fierce wine, red liquor made of Rice, and white cloth, for as the fight of any of these, his courage and rage increaseth above all measure; then at the sound of the Trumpet he beginneth with teeth to strike, tear, beat, spoile, take up into the air, call down again, flamp upon men under feet, overthrow with his trunk, and make way for his riders to pierce with Spear, Shield, and Sword; so that his horrible voice, his wonderful body, his terrible force his admirable skill, his ready and inclinable obedience, and his strange and seldom seen face, produced in a main battel no mean accidents and overturns. For this cause we read how that Pyrrhus first of all produced Elephants against the Romans in Lucania: afterward Afrubal in Africa, Parthicum in the Exit, and Ingurus in Numidas.

Against this new kinds of Cattle-fighting, and Souldier-bearing beasts, on the contrary they invented new kinds of stratagems, as is before set down, and also new instruments of war, for a Centurion in Lucania with a new devised sharp Sword cut of the trunk of this beast, again other invented, that two armed Horfes should draw a Chariot, and in the same armed men with Javelins and sharp Spears, the speedy Horfes should with all force run upon the Elephants, and the spear-men directing their course and weapons, some upon the beast, others upon the riders: did not only wound the beast, but also by celerity of the Horses, escape all danger.

Other again went against him armed Souldiers, having their Armour made full of sharp pricks or piercing piked Nailes; so that when the beast did strike at them with his trunck, he received grievous wounds by his own blows. Again there were certain young men Souldiers, armed with light armour, which being mounted upon swift Horfes, could call Darts with fingual facility, and without the reach of the beast, many times wounding him with long Spears, and so by
example of the Horfe-men, the Foot-men, grew more bold, and with piles in the earth annoyed the belly of the beast, and utterly vanquishing it and the rider. Again, they devis'd things to call flones, whereby they beat off the riders, and many times overthrew the Caffle-bearer, as it were by some violent Stroke of a Cannon-flot; neiter was there ever any more efficacious way to dissuade these monfter-ferning Soul'diers, then by calling of ftones; and lathily they would suffer their Elephants and their riders by poor hopes and appearances of fear, to enter into the midft among them, and so be-gut and inclofe them, that they took the Elephants alive; and alfo more Soul'diers of Darts car-ry'd in Chariots with the strong courfe of Horses, did fo annoy them, that whereas their bodies were great and unwieldy, not nimble to flir out of place, it became more efficacious to kill an Elephant then a Horfe, because many Soul'diers at one time could pierce fo a mark with unrefiitable wea-pons 

And these things are related by Vegetius.

At the laft the fight with Elephants turn'd into a publick game or paftime, both to fee them fough withall by men, and alfo among themselves. When certain prisoners of the Romans were taken by Ammian, he firft contrai'd them to skirmifh among themselves, and fo flew one another except only one; and he was by the like commandement forced to fight with an Elephant, but upon con-dition of liberty if he escaped alive; and thereupon joynd combate, and flew the Elephant, to the great grief and amazement of all the Carthaginians; but going home, according to agreement, Ambal fearing that by this act tho'f great beasts would grow into contempt, fent certain Horfe-men to kill him by the way.

Their trunk or hand is moft eafe to be cut off; for if it happen'd in the adlity or temple-office of Claudius, Antonius and Pli.'mam being Confuls, and afterward in the Circus, when the Luculi were the confons officers. And when Pompey was Conful the fcond time, there were 17 or 20 which at one time fought within the Circus, at the dedication of the Temple of Venus the Victoria, where the Getulians fought with them with Spears and Darts; for there had happened an ad-mirable accident; one of the Soul'diers who having a hurt in his feet did creep upon his knees be-twixt the legs of the Elephants, and caft up the Darts over his head into the beasts belly, which fell down round about him, to the great pleasure of the beholders, fo that many of the Elephants perifi'd rather by Art then the strength of the Soul'dier. No jeffe was the Miracle of another ftain with one froke, for a pile ran into his temples through his eye, and there fack for falt, that it could not be pull'd forth again; which thing was afterward affay'd by Julian Caesar, and in the third time of his Confulship, there were twenty Elephants, which in the Games fought with five hundred men, and fo many with Towers on their backs, bearing three-four men in every Tower.

To conclude, Elephants are afraid of fire, and Martial made this Epigram of a Bull flain by an Elephant, which was wont to domineer in all their triumpft games, wherewith I will conclude this difcourse.

---

The taking of Elephants.

In the next place it is good to relate the fory of the taking and taming of Elephants, for in Lyba about the Therobyke, the hunting and taking of Elephants have given many names to Seve-rall Towns, as Elephanitia, and Elephantis, Epithera, Pilothera, and the hunting of Elephants by Pratemen, by the Port Saba, the City Daraba, andLyba. In Africk they take them in great ditches, whereinto when they are fallen, the people pretently with bouches, mattocks, leaves, and digging down of high raifed places, take them out again, and fo turn them into a valley wrought by the labour of man, moft firmly walled on both fides, where with famine they tame him; for when he would gently take a bough at the hand of a man, they adjudged him tame, and grew familiar with him, leadiing him away without all fcruple.

But the Indians ufe a more ingenious and fpeedy means to tame them, which is this: first, they dig alfo a great ditch, and place fuch meat therein as the beafl lovet, who winding it, and coming thereunto, for defire thereof falleth into the foffe or ditch: being fo fallen in, and not able to come forth again, one cometh to him with Whips, beating him very grievously for a good space, to the great grief of the beafl, who through his inclining can neither run away nor help himself; then cometh another during this time of punifhment, and bala'ent the firft man for beating the beafl, who departeth prefently as one afraid of his rebufc, the other piteth the beafl, and fpknk-eth him, and fo goeth away; then cometh the whipper again, and fcorgeth the Elephant as before and that more grievously to his greater torment for a good space together; whereupon the time fulfilled, the other cometh again and fightheth with the whipper, and forcibly femeth to drive him away, and relieve the poor beafl; and this they do fucceflively three or four times; fo at the laft, the Elephant groweth to know and love his deliverer, who by that means draws him out and leadeth him away quietly: While this thing is doing, the ftiner and whipper ufeith a fharp-edged and unwonted kind of habit; fo as he may never be known by the Elephant after he is tamed, for fear of revenge: of which you fhall hear more afterward, in the farther diſcourse and opening the nature of this beafl.

---

Pliny.

Alberius.
Of the Elephant.

Artanius and Strabo relate another way whereby the Indians take their Elephants, which because they write upon their own eye sight, of the things they knew sufficiently, I have thought good to express the device: Four or five Hunters first of all chase out some plain place, without Trees or Hills, but declining, by the space of some four or five furlongs, this they dig like a wide ditch as aforesaid, and with the earth then, take up, they raise walls about it like a trench, and in the fides of the trench they make certain dens with holes, to convey in light to the Watchmen, whom they place therein, to give notice and obviate when the Elephants are inclofed; then make they a narrow bridge covered with earth at the farther end of the trench, that the beafts may dread no fallacy; and for the more speedy effecting and compafting their defire, they also inclufe in the trench three or four tame female Elephants, to entice and draw into them the wilde ones.

Now these beafts in the day time feed not so boldly as in the night, and therefore they cannot easily be deceived or taken in the light; but in the night great flocks of them follow the Captain (as we have already thowed) and going near this trench, partly by the voice, and partly by the favour and smell of the females, they are drawn into the trench; then the Watchmen with all speed, pull down the bridge, and other of them go into the next Townes to call for help, who upon the firit notice thereof, come to the place mounted upon the beft and strongest tame Elephants, and fo compaffe them about, giving meat in their preffence to the tame, but beftieving the inclofed, they keep them from all meat and food, until they be fo weakned that they dare enter in among them, but in this manner, they turn in their tame Elephants, and go under their bellies, and fo when they come near the wilde Elephants, they fpeedily convey themselves under his belly, and lay unavoidable fetters upon their feet: then provoke they the tame ones to beat and fight with the wilde, who by reafon of the manacles upon their feet are easily overthrown and fall to the ground; being on the ground, they put halters upon their necks made of raw Oxe hides, and fo bind them to the tame and domestical Elephants: And while they lie on the ground, they get upon them, and to the intent that their Riders may be without danger of harm by them, they cut the skin of their necks round about in a circle, with a sharp fword, and upon the wound they tie and fallen a rope, that fo the pain may conftain the beaft to quiet, fo that by this they begin to feel their own weaknes, and leave off their wildenes, betaking themselves to the mercy of their new Mufters.

But thus raised from the earth again, and yoaked by the necks and legs to the named Elephants, they are safely led home into flables, where they are fattened to great pillars by their necks, and if they refuse to eat their meat, with Tymbrels, Cymbals, Harpes, and other musical instrumens, they are fo entifeled from fallen wildenes, that they forget their firit natures, and yeild all loving obedience to men, as to their victorious conquerors and unrefiftable Mufters.

These beafts by their fagacity and natural infininct, do sometime forefee their own peril, and discover the trains and secret intentions of the Hunters, fo as they cannot be drawn into the ditches and foffes by any allurements; but prefaging their own misfortunes, turn back again upon their Hunters, even through the midit of them, and fo felect to fave themselves by flight, overthrowing their enemies that dare approach unto them. At which time there is a fierce fight, to the great slaughter many times both of men and beafts; for the men to flay his flay, bend their fpears, and charge their darts and arrows, to flrike the Elephant directly on the face, and if the beaft perceive that he hath overthrown any man infantsly he maketh to him, taketh him in his teeth, lifting him up into the air, and cafting him down again, fiampeft upon him, wounding him many times with his teeth or horns, whereby he puttheth him to cruel tormentes, and leaveth him not till he be dead.

And when they invade or set upon a man, they spread forth their broad ears, (which are fathioned like the wings of Oftriches) as the fails of a flip, and drawing up their trunk under their teeth their noefes fland forth like the beak of some fhip, and fo ruth they with unrefiftable violence upon the weak bodies of men, overturning them in no other fort, then a mighty great Hulk or man of war, the little Oares or Whirries in the Sea.

And as the Trumpets in war give the signes of fghting, fo do thofe fend forth fuch terrible yelling and roaring clamors, as bringeth no mean affonmon to his perfecutors: belde the lamentable and mournful voices of men, by them wounded and fallen to the earth; fome having their knees and bones broken, other their eyes trod out of their head, other their noefes preffed flat to their faces, and their whole vifages fo disfigured and disfavoured in a moment, that their nearest friends, kindred and acquaintance cannot know them. Thofe alfo fill the fpaceous air with direful cries, that are heard a great way off, into the Towns and Cities adjoyning, having no other means to efcape out of the way, and from the teeth of the beaft, except he frike his tooth into some root and then it flick falt until the poor overthrown man can creep alide and fave himfelf by flight.

In this conflict, sometime the Elephants, and fometimes men are the conquerors, by bringing upon the beafts divers terrorys and manacles, out of which they are not very eafily delivered: fo men alfo have their trumpets, and fo make the woods and fields ring with them, the ratting of their Armour and Shields, and their own howling and whooping, kinding fires on the earth, cafting both fire, brands and burning Torches into the face of the Elephant, by all which the huge
beast is not a little disfigured and terrified. So that being bereft of their wits, they turn back and run into the ditch which they so carefully avoided before.

But if their rage proceed uncontrolled, and men be forced to yield unto them, forth they go into the woods, making the trees to bend unto them as a Dog or an Orx doth the flanging corn at harvest; breaking off their tops and branches, which hinders their course and flight, as another beast would crop off the ears of corn; but where they are taller than the woods, there they strain every joint and member in them to get ground and overgo their Hunters; which they may perform and attain more easily, because of their customary abode in those places: and when they are escaped out of the sight of their followers, and make account that they are freed from further persecution, then cast they off all fear, and compound their distracted senses into a remembrance of meat, and so gather their food from Palms, Trees or bushes; afterward betaking themselves to rest and quietness.

But if their Hunters come again into their sight, they also again take them to their heels, until they have gotten more ground from them, and then they rest again; and if the Sun decline, and light of day fail the Hunters, and darknes make an end of the chase; then do they compass in the beasts way, and set the wood a fire, (for Elephants fear fire as much as Lions:) So that by all this it appeareth, that the fabulous tales of Gabinius the Roman writer of Elephants, are not to be believed, when he affirmeth, that Elephants will fight against and resift the violence of fire.

The Troglophuge hunt and take Elephants after another manner, for they climb up into the trees, and there sit till the flocks of Elephants passe by, and upon the last, the Watch-man suddenly leapeth (with great courage) taking hold upon his tail and fo sliding down to his legs, and with a sharp Axe which he hath hanging at his back cutteth the nerves and sinews of his legs with so great celerity, that the beast cannot turn about to relieve it self, before he be wounded and made unable to revenge her harm, or prevent her taking; and sometimes the falleth down on the wounded side, and Casteth the Hunter watch-man to death, or else with her force in running, dasheth out his brains against a tree.

The Elephants-eaters (called Elephantoophagus) do observe the like policy, for by health and secretly they set upon the hindmost, or else the wandering solitary Elephant, and cut his sinews, which caueth the beast to fall down, whom presently they befand, and afterward they eat the hinder parts of this beast so call'd down and taken.

Other among the aforesaid Troglophuge, use a more easie, running and leffe perillous kind of taking Elephants; for they set on the ground very strong charged bent-bowes, which are kept by many of their strongest young men, and so when the flocks of Elephants passe by, they shoot their sharp arrows dipped in the gall of Serpents, and wound some one of them, and follow him by the blood, until he be unable to make resistance. There are three at every bow, two which hold it, and one that draweth the firing. Other again, watch the trees whereunto the beast leaneth when he sleepeth, near some waters, and the same they cut half asunder, whereunto when he declineth his body, the tree is overthrown and the beast also, and being unable to ride again because of the short nerves and no flexions of his legs, the head, the lyeth till the Watch-man come and cut off his head.

Arifiotle describeth another manner of taking Elephants in this sort; The Hunter (that he getheth upon a tamed Elephant, and followeth the wilde one till he have overtaken it, then commandeth he the tame beast to strike the other, and so continueth chasing and beating him, till he have wearyed him and broken his untameable nature. Then doth the rider leap upon the wearyed and tyred Elephant, and with a sharp pointed Sickle doth govern him after the same one, and so in shortest space he groweth gentle. And some of them when the rider alighteth from their backs, grow wilde and fierce again; for which caueth they binde their forelegs with strong bands, and by this means they take both great and small old and young ones; but as the old ones are more wilde and obstinate, and so difficult to be taken, so the younger keep so much with the elder, that a like impossibility or difficulty interpolteth itself from apprehending them.

In the Ceylon lake, there are certain fishes (called Oyarimbhi out of whom is made such a fine glew, that it will not be dissolved in ten days after it hath taken hold, for which cause they use it in the taking of Elephants.

There are in the Island Zeira many Elephants, whom they take on this manner: In the Mountains they make certain cloysters in the earth, having two great trees standing at the mouth of the cloysters, and in those trees they hang up a great par-calls gate, within that cloyster they place a tame female Elephant at the time of their usual copulation: the wilde Elephants do speedily wind her, and make to her, and so at the last having found the way betwixt the two trees, enter into her; sometime twenty, and sometime thirty at a time: then are there two men in the said trees, which cut the rope whereby the gate hangeth, so it falleth down and includeth the Elephants; where they suffer them alone for six or seven days without meat, whereby they are fo infibled and famished, that they are not able to stand upon their legs.

Then two or three strong men enter in among them, and with great lances and clubs, belabour and cudgel them, till by that means they grow tame, and gentle; and although an Elephant be a monstrous great beast and very subtil, yet by these and such like means do the inhabitants of India and Ethiopia, take many of them with a very small labour to their great advantage.
Against these flights of men, may bepopoled the tubul and cautious evasions of the beast, avoid- ing all the footsteps of men, if they smell them upon any herb or leaf, and for their flight with the Hunters, they observe this order. First of all, they det them foremost which have the leaft teeth, that so they may not be afraid of combate, and when they are weary, by breaking down of trees they escape and fly away. But for their hunting, they know that they are not hunted in India for no other cause, then for their teeth, and therefore to discource the Hunters, they set them which have the worst teeth before, and reserve the strongest for the second encounter: for their wisdom or natural dexterity is herein to be admired, that they will dispose themselves in all their battles when they are in charge, that ever they fly by course, and inclofe the youngest from peril, so that laying under the belly of their Dams they can fearce be seen: and when one of them flyeth they all flye, to their usual resting places, iriving which of them shall go foremost: And if at any time they come to a wide and deep Ditch, which they cannot pass over without a bridge, then one of them descengeth, and goeth down into the Ditch, and standeth transfere and croffe the fame, by his great body filling up the empty parts, and the residue passe over upon his back as upon a bridge.

Afterward when they are all over, they tarry and help their fellow out of the Ditch or Trench again, by this light or devise, one of them putth down to him his leg, and the other in the Ditch wendeth histrunk about the fame, the residue stands by cast in bundles of sprigs with their mouths, which the Elephant waryly and speedily putth under his feet, and so raieith himself out of the Trench again, and departeth with his fellows.

But if they fall in and cannot finde any help or means to come forth, they lay aside their natural wide disposition, and are contented to take meat and drink at the hands of men, whose presence before they abhorred: and being delivered they think no more upon their former condition, but in forgetfulness thereof, remain obedient to their deliverers.

Being thus taken, as it hath been said, it is also expedient to express by what art and means they are incarcerated and tamed. First of all therefore when they are taken, they are fastened to some Tree or Pillar in the earth, so as they cannot neither kick backwards nor leap forward, and there hunger, thirst, and famine, like two moost strong and forcible Riders abate their natural wildenes, strength, fear and hatred of men: Afterward when their keepers perceive by their dejection of mood, that they begin to mollified and altered, then they give unto them meat out of their hands, upon whom the beast doth cast a far more favorable and cheerful eye, considering their own bondage, and at the least necessity frameth them unto a contented and tractable course and inclination.

But the Indian by great labour and industry take their young Calves at their watering places, and so lead them away, inciting them by many allurements of meat to love and obey them, so as they grow to understand the Indian language, but the elder Indian Elephants do very hardly and seldom grow tame, because of their remembrance of their former liberty, by any bands and oppression; nevertheless by instrumetal musick, joyned with some of their Countrey fongs and ditties, they abate their fiercenes, and bring down their high untractable stomachs, so as without all bands they remain quiet, peaceable and obedient, taking their meat which is before them.

Pliny and Solinus prescribethe jouce of Barly to be given to them for their mitigation, whereunto also agreeeth Deiocrites (calling that kind of drink Zythm) and the reason hereof is, because of the tart sharpnes of Barly water it fland a little while; and therefore also they prescribe Vinegar and ashes to rub the beasts mouth, for it hath power in it to pierce flones, all sharp things penetrate deep into his feth, and alter his nature; the invention whereof is attributed to Democritus.

Being thus tamed, they grow into civil and familiar uests, for Cesar ascended into the Capitol bewixt four hundred Elephants, carrying at either side burning Torches, and Hellogaboles brought four Waggons drawn with Elephants in Vaticanum, and men commonly ride upon them for Amusement neare the River Indus, a Boy of thirteen year old riding alone upon an Elephant, spurrning and pricking him as freely as any man will do a lean horse.

They are taught to bend one of their hinder legs to take up the Rider, who also must receive help from some other present landers by, or else it is impossible to mount on the back of so high a Palmy. They which are not accustomed to ride upon these beasts, are affected with vomiting and catting, like men when they first of all take the Sea. They are ruled without bridle or reins, only by a long crooked piece of wood bending like a Sickle, and nailed with sharp nails, no man can sit more safely and more forty upon a Horse or Mule then they do which ride upon the Elephants. The Indian with their lesser Elephants (which they call baird Elephants) plow their ground and corn.

The common price of Elephants is at the least five hundred Nobles, and sometimes two thousand. The Indian women are moost chaste and continent, yet for an Elephant they take a great pride to be hired for whores, for they imagine that the fame and received opinion of their beauty doth countervail and cover the shameful losse of their honesty (as Arranuus writeth in his book of Indus.)

Since the time that Elephants have been tamed, their natures and dispositions have been the better observed and discoverd; for they willingly obey their keepers, learning all sorts of Arms, to take

The fubility of Elephants a- gainst their Hunters.

The price of Elephants. Their obedience and tractable geule. nes.
The History of Four-footed Beasts.

When the Prizes of Germanicus Caesar were played, there were many Elephants which acted strange feats or parts, four of them went upon Ropes and over the Tables of meat, whereon they set their feet so warily that they never touched any of the ghasts, the boards or standing coups being fully furnished. And allo they learned to dance after Pipes by measure, sometyme dancing foely, and sometyme apace, and then again leaping upright, according to the number sung or played upon the instrument; and they are apt to learn, remember, meditate, and conceive such things as a man can hardly perform.

Their industrious care to perform the things they are taught, appeareth herein, because when they are secret and alone by themselves, they will practice leaping, dancing, and other strange feats, which they could not learn suddenly in the presence of their Masters: as Pliny affirmeth for certain truth of an Elephant which was dull and hard of understanding, his keeper found him in the night practising those things which he had taught him with many fripes the day before, and could not prevail by reason of the beast's slow conceit.

There was an Elephant playing upon a Cymbal, and others of his fellows dancing about him, for there was fastened to either of both of his forelegs one Cymbal, and another banded to his trunk, the beast would obverse jult time, and strike upon one, and then the other, to the admirati

On the reverence of Elephants to Kings.

The King of Indians was watched with four and twenty Elephants, who were taught to forbear sleep, and to come in their tours at certain hours, and so were they most faithful, careful and in

The three kinds of Elephants.

They have also a kind of Religion, for they worship, reverence, and observe the course of the Sun, Moon, and Stars: for when the Moon shineth, they go to the Waters wherein she is apparent, and when the Sun ariseth, they salute and reverence his face; and it is observed in Ethipoia, that when the Moon is changed until her prime and appearance, these beasts by a secret motion of nature, take boughs from off the trees they feed upon, and first of all lift them up to heaven, and then look upon the Moon, which they do many times together, as it were in supplication to her. In like manner they reverence the Sun rising, holding up their trunk or hand to heaven, in congratulation of her rising.

Luba was wont to say, that this beast was acceptable to those Gods which ruled Sea and Land, because of their reverence to Sun and Moon, and therefore Præmonstratenses, offered four Elephants in a sacrifice (to recover the quietnes of his minde) thinking that the Gods would have been
been well pleas'd therewith, but finding that his fearful dreams and visions departed not from him, but rather his disquietudes increased, fearing that the gods were angry with him for that action, he made four Elephants of brass, and dedicated them to the Sun, that so by this deed he might purchase pardon for the former offence.

This Religion of theirs, also appeared before their death, for when they feel any mortal wounds, or other natural signs of their latter end, either they take up the duff, or else some green herb, and mix it up to Heaven in token of their innocency and imploration of their own weaknesses: and in like manner do they when they eat any herb by natural instinct to cure their dilapidations: first they lift it up to the Heavens (as it were to pray for a divine blessing upon it) and then devour it.

I cannot omit their care, to bury and cover the dead carcasses of their companions, or any other of their kind; for finding them dead, they pafs by not them till they have lamented their common misery, by calling duff and earth on them, and also green bushes, in token of sacrifice, holding it execrable to do otherwise: and they know by a natural instinct some affured fore-tokens of their own death. Besides when they wax old and unfit to gather their own meat, or fight for themselves, the younger, of them feed, nourish, and defend them, yet they raise them out of Ditches and Trenches into which they are fallen, exempting them from all labour and penit, and interpreting their own bodies for their protection: neither do they forfear them in sickness, or in their wounds, but stand to them, pulling out Darts of their bodies, and helping both like skilful Chirurgions to cure wounds, and also like faithful friends to supply their wants.

Again, how much they love their young, which is a natural part of religion we have shewed before. Aristippus supposes that they have a kind of divination or divine understanding of law and equity, for when King Boedon condemned thirty men to be torn and trampled in pieces by Elephants, and tying them hand and foot to blocks of wood, cast them among thirty Elephants, his servants and Officers could not by all their wit, skill, or provocation make the Beasts touch one of them: so that it was apparent, they scorned and disdain'd to serve any mans cruel disposition, or to be the ministrants of tyranny and murdure. They moreover, have not only an observation of chastity among themselves, but also are revengers of whoredom and adulterers in other, as may appear by these examples in History.

A certain Elephant seeing his Master absent, and another man in bed with his Mistress, he went unto the bed and flew them both. The like was done at Rome, where the Elephant having slain both the adulterer and adulteress, he covered them with the bed-clothes until his Keeper returned home, and then by signs drew him into his lodging place, where he uncovered the Adulterers, and trenched his bloody tooth that took revenge upon them both for such a villany: whereas the Master wondering, was the more pacified, because of the manifest-committed iniquity. And not only thus deal they against the woman, but they also spare not to revenge the adultery of men; yea of their own Keeper: for there was a rich man which had married a wife not very amiable or lovely, but like himself for wealth, riches, and possessions, which he having gained, was full of all things. His heart to love another, more fitting his lustful fancy, and being desirous to marry her, stripped his rich ill-favoured Wife, and buried her not far from the Elephants stable, and so married with the other, and brought her home to his house: the Elephant abhorring such detestable murdure, brought the new married Wife to the place where the other was buried; and with his teeth digg'd up the ground and threw her the naked body of her predeceesor, intimating thereby unto her secretly, how unworthily she had married a man, monafter with of his former wife.

Their love and concord with all mankind is most notorious, especially to their Keepers and Women: for if through wrath they be incensed against their Keepers, they kill them, and afterward by way of repentance, they convalesce themselves with mourning: And for the manifesting of this point Aristipan tells a notable story of an Indian, who had brought up from a cell a white Elephant, both loving it, and being beloved of it again, he was therewith carried with great admiration. The King hearing of this white Elephant, sent unto the man for it, requiring it to be given to him for a present; whereas the man was much grieved, that another man should possess that which he had so tenderly educated and loved, fitting him to his bow and arrows, and the like; he resolved in his Elephant's love, refused to deny the King, and to flint for himself in another place: whereupon he fled into a Desert region with his Elephant, and the King understanding thereof, sent messengers after him to take away the Elephant, and wishing to bring the man back again, to receive punishment for his contemn.

When they came to the place where he was, and began to take order for their apprehension, the man attended into a deep place, and there kept the Kings messengers off from him by calling of horses, and to do also did the Beast, like as one that had received some injury by them, at last, they got near the Indian, and call him down, but the Elephant made upon them, killing some of them and defending his Master and nourisher, put the residue to flight, and then taking up his Master with his trunk, carried him safe into his lodging, which thing is worthy to be remembered, as a noble understanding part both of a loving friend and faithful servant.

The like may be said of the Elephant of Porus, carrying his wounded Master the King in the battle he fought with Alexander, for the Beast drew the Darts gently out of his Masters body without all pain, and did not cast him until he perceived him to be dead, and without blood and breath, and then did first of all bend his own body as near the earth as he could, that if his Master had any life
Their love to their keepers and all men that harm them not.

Their love of beautiful women.

Plutarch.

left in him, he might not receive any harm in his alighting or falling down. Generally, as is already said, they love all men after they be tamed, for if they meet a man erring out of his way, they gently bring him into the right again, yet being wide are they afraid of the foot-steps of men if they winde their treadinges before they fee their peracons, and when they finde an herb that yieldeth a sufficienc of a mans presence, they smell thereunto one by one; and if all agree in one favour, the Iaff Beaff lifteth his voyce and cryeth out for a token and watch-word to make them all fly away.

Cicero affirmeth that they come fo near to a mans disposition, that their small company or nation feemeth to over-go or equall most men in men and understanding.

At the sight of a mighty woman they leave off all rage and grow meek and gentle; and therefore Elasimus faith, that there was an Elephant in Egypt, which was in love with a woman that fold Corrals, the self same woman was wooed by Aristophanes; and therefore it was not likely, that she was chosen of the Elephant without singular admiration of her beauty, wherein Aristophanes might fly as never man could, that he had an Elephant for his rival, and this also did the Elephant manifest unto the man: for on a day in the market, he brought her certain Apples, and put them into his bosom, holding his trunk a great while therein, handling and playing with her breasts. Another likewise loved a Syrian woman, with whose aspect he was suddenly taken, and in admiration of her face broked the fame with his trunk, with testimonie of farther love: the Woman likewise failed not to frame for the Elephant amorous devices with Beads and Corrals, Silver, and such things as are grateful to those brute Beasts, so he enjoyed his laboure and diligence to her great profit, and her love and kindnes without all offence to his contentment, which caused Haraz to write this verse:

Quid ibi vis mulier nigra dignissima baris?

At last, the woman dyed, whom the Elephant miffing, like a lover distracted betwixt love and sorrow fell beside himself and so perished. Neither offered any man to marvel at such a passion in this Beast, who hath such a memory as is attributed unto him, and understanding of his charge and bufines, as may appear by many examples: for Antipater affirmeth that he saw an Elephant that knew again, and took acquaintance of his Master which had nourished him in his youth, after many years absence.

When they are hurt by any man, they seldom forget a revenge, and so also they remember on the contrary to recompense all benefits, as it hath been manifested already. They observe things done both in weight and measure, especially in their own meat. Agoras writeth that an Elephant was kept in a great mans house in Syria, having a man appointed to be his Overfeer, who did daily deatau and the Beaff of his allowance: but on a day as his Master looked on, he brought the whole measure and gave it to him: the Beaff seeing the same, and remembering how he had served him in times past, in the presence of his Master exactly divided the Corn into two parts, and so laid one of them aside: by this fact shewing the fraud of the servant to his Master. The like story is related by Plutarch and Elasimus, of another Elephant, discovering to his Master the falsehood and privy theft of a unjust servant.

About Lyka in Aflricke there are certain springs of water, which if at any time they dry up, by the teeth of Elephants they are opened and recovered again. They are most gentle and meek, never fighting or biting Man or Beast, except they be provoked, and then being angered, they will take up a man in their trunk and call him into the air like an arrow, so as many times he is dead before he come to the ground. Plutarch affirmeth, that in Ramse, a boy pricking the trunk of an Elephant with a goad, the Beaff caught him, and lift him up into the air to shot him away and kill him: but the people and Banders by seeing it, made so great a noise and cry thereat, that the Beaff let him down again fair and softly without any harm to him at all; as if he thought it sufficient to have put him in fear of such a death.

In the night time they seem to lament with sighs and tears their captivity and bondage, but if any come to that field, like unto modest persons they refrain suddenly, and are ashamd to be found either murmuring or sorrowing. They live to a long age, even to 200 or 300 years: if sicknes or wounds prevent not their life: and some but to a 120 years: they are in their belte strength of bodie at three score, for then beginneth their youth.

Iuba King of Lyka writeth, that he hath seen tame Elephants which have descended from the Father to the Son, (by way of inheritance) many generations: and that Ptolemaeus Philadelphus had an Elephant, which continued alive many Ages, and another of Seleucus Nicomachus, which remained alive to the last overthrow of all the Antiochi.

The Inhabitants of Taxila in India affirm, that they had an Elephant at the least three hundred and fifty years old, for they said it was the fame that fought so faithfully with Alexander for King Porus, for which cause Alexander called him Aias, and did afterward dedicate him to the Sun, and put certain golden chains about his teeth with this inscription upon them: Alexander filius Ioucis Asiatic Sitel: Alexander the son of Jupiter consecrateth this Aias to the Sun. The like story is related by Iuba, concerning the age of an Elephant, which had the impression of a Tower on his teeth and was taken in Atlas 400 years after the fame was engraven.

There are certain people in the world which eat Elephants, and are therefore called of the Nomades (Elephantophagi) Elephant-eaters, as is already declared: there are of these which dwell in Darabas.
Darabes, near the Wood Eumen, beyond the City Saba, where there is a place (called the hunting of Elephants. The Tragelapho live also hereupon, the people of Attick call Afebebe, which live in Mountains, do likewise cut the flesh of Elephants, and the Adiabene or Megabari. The Namerue have Cities running upon Charriots, and the people next under their Territory, cut Elephants in pieces, and both fell and eat them.

Some use the hard flesh of the back, and others commend above all the delicacies of the world the reins of the Elephants; for that is a wonder that Elamites would write, that there was nothing in an Elephant good for meat, except the trunk, the lips, and the marrow of his horns, or teeth. The skin of this Beast is exceeding hard, not to be pierced by any dart; whereupon came the Fable, Nec con bando etratus Elphas infuriatus, the Indian Elephant careth not for the biting of a Gat, to fence a sufficient ability to repel all evil, and that Notholites must not revenge small injuries.

It cannot be but in such huge and vast bodies there should also be nourish'd some diseases, and that many (as Strabo faith) who are first of all there is no creature in the world able to endure cold or Winter, for their improbity of cold bringeth inflammation. Also in Summer, when the fame is hottest, they cool one another by calling dirty and filthy water upon each other, or else run into the roughlest Woods of greatest Shadow. It hath been shewed already, that they devour Chameleon ons, and thereof pensil, except they eat a wide Olive.

When they suffer inflammation and are bound in the belly, either black Wine, or nothing will cure them. When they drink a Leach they are grievously pained: for their wounds by darts or otherwise, they are cured by Sweets-Beth, or Drinky, or by Opia, or by the flower of the Olive. They fall many times, for which I know no other cure, but to tyse them up full in Iron chains. When they are tyred for want of sleep, they are recovered by rubbing their shoulders with Salt, Oyl and Water. Cows milk warmed and infused into their eyes, cureth all evils in them, and they presently like reasonable men acknowledge the benefit of the medicine.

The medicinal virtues in this Beast are by Authors observed to be these: The blood of an Elephant and the ashes of a Werful cure the great Leprofie: and the same blood is profitable against all Rhumatie fluxes, and the Scitizias. The flesh dried and cold, or heavy fat and cold is anomorable: for if it be fried and steeped in Vinegar with Fennel-feed, and given to a Woman with child, it maketh her presently suffer abortion. But if a man taste thereof and steeped with the feed aforesaid, it curseth an old cough. The fat is a good Antidote either by Ointment or Perfume: it cureth also the pain in the head.

The Ivory or tooth is cold and dry in the first degree, and the whole substance thereof corroboreth the heart and helpeth conception: it is often adulterated by Fitches and Dogs bones burnt, and by white Marble. There is a Spadum made of Ivory in this manner; Take a pound of Ivory cut into pieces, and put into a raw new earthen pot, covering and glewing the cover with loine round about, and so let it burn till the pot be thoroughly harden: afterward take off the pot, and beat your Ivory into small powder, and being so beaten, sift it, then put it into a glass, and pour upon it two pound of distilled Rose-water, and let it dry. Thirdly, beat it unto powder again, and sift the second time, and put into it again so much Rose-water as at the first, then let it dry, and put thereunto as much Camphir as will by upon three or four single Goat's, and work it all together upon a Marble stone into little Cakes, and so lay them up where the air may not corrupt and alter them. The vertue hereof is very precious against spitting of bloud, and the Bloudy-flux; and also it is given for refrigeration without danger of binding or attraction.

After a man is delivered from the Lethargy, Peltitude, or sudden forgetfulness, let him be purged and take the powder of Ivory and Hiera Raffh, drunk out of sweet water: This powder with Hony-Attick, take away the apetis in the face: the fame with white Mits drunk with water, refiltheth and avoideth the Leprofie at the beginning. The powder of Ivory burnt and drunk with Goats-bloud, doth wonderfully cure all the pains, and expell the little stones in the reins and bladder: Combes made of Ivory are moist wholefome, the touching of the trunk cureth the Headach: The Liver is profitable against the Falling-evil, the same vertue hath the gall (if he have any) against the Falling-evil.

The fame by anointing, cureth a lowifie skin, and takeaway that power which breedeth these vermin: the fame perfumed cælah Agae, helpeth a woman in travaill, and driveth Gnats or marfihes out of a house.

Of the EILK.

As the Elephant last handled, could not live in any Country of the world, but in the hot Eastern, and Southern Regions; so the Elk on the contrary is most impatient of all heat, and keepeth not but in the Northern and Cold Countries. For Poland, and the Countreys under that Climate will not proferve an Elk alive, as it hath been often tried by experience: for which cause, they are not found but in the colder Northern Regions; as Russia, Prussia, Hungary, and Lithuania, in the Wood Holynia, and among the Burjuffles-Scythians, but most plentiful in Scandinavia, (which Porfulfus callith the Celtey) for all the Ancients called the Kingdoms of Germany, and the North, Celeriae, Countries inhabited by the Celtey.
The Figure of the \textit{E L K} with \textit{Horns}.

This Beast is called in Greek, \textit{Alke}; and in Latine, \textit{Alces}, or \textit{Ace}; which was a name of one of \textit{Able-}
ans Dogs in \textit{Ovid} : the \textit{Turks, Valemrians}, the \textit{Hungrians}, \textit{Lajar}, the \textit{Illyrians} and \textit{Polarians}, \textit{Los}; in
the singular, and plurally, \textit{Loffe}, for many Elks. \textit{Albertus Magnus} calleth it \textit{Alcher} and \textit{Ally}, and after-
ward \textit{Lipurrurus, a Horie-Hart}. The \textit{Germans, Elch, Elleud, and Elist}, by a \textit{Metrothesis} of \textit{Alke}, or
\textit{Ace} : and for my part I take it to be the same Beast which \textit{Piny} calleth \textit{Macblis}, for there is nothing
attributed to an \textit{Elk} which also doth not belong to \textit{Macblis}.

The \textit{E L K} without \textit{Horns}.
I finde not any unreconcileable difference among Authors concerning this Beast, except in Cæsar, 
lib. 6. of his Commentaries, who by the relation of others, (not by his own sight) writeth that 
there are Elks in the Hercynian Wood, like unto Goats in their spotted skins, who have no horns, 
no joints in their legs to bend withall, but sleep by leaning unto trees like Elephants, because when 
they are down on the ground, they can never rise again. But the truth is, that they are like to 
Roes or Harts, because Goats have no spotted skins, but Deer have, and there may easilie be a flip 
from Caprea, a Roe, to Capre, a Goat: and Cæsar himself confesseth, that the similitude is in their spotted 
skins, which are not compatible in Goats, but in Roes.

And whereas he writeth that they have no Horns, the error of this relation may be this, that either 
he had only seen a young one before the horns came forth, or else an old one, that had lately 
lost his horns; and by this I suppose that the authority of Cæsar is sufficiently answered, so as we 
may proceed to the description of this Beast collected out of the ancient Writers, Paufanias, 
Polemeus, Cæsar, and Solinus, Pliny, and the later Writers confenting with them in all things, (excepting 
Cæsar in the two things aforesaid.) Albertus Magnus, Mathew, Mabutus, Sib. Moniplier, Erasmus, 
Stella, Johannes, Bonarius, Baron of Balice, a Polonium, Johannes Kemmanus, io. Pontianus, Antonius Schonehergerus, Christopherus Wifjurger, and that most worthy learned man Georgius Joachimius of Rheatis, and 
Baron Sigismund.

Paufaniasippoloth it to be a Beast betwixt a Hart and a Camel, and Albertus, betwixt a Hart and a 
Horse; who therefore as it has been said, calleth it Equi-corvus, a Horse-Hart; but I rather by 
the horns afterward described, and by the foot which Bonarius had, do take and hold it to be as big 
every way as two Harts, and greater then a Horse, because of the labour and qualities attributed 
thereunto: whereunto also agree Albertus.

In Swadd and Riga they are tamed, and put into Coaches or Chariots to draw men through great 
snows, and upon the ice in the Winter time they alle are most swift, and will run more miles in one 
day than a Horse can at three. They were wont to be prefects for Princes, because of their singular 
strength and swiftness; for which cause Alcitus related in an emblem, the answer of Alexander to 
one that asked him a question about cerenity whether hee doth not alway make walle; which Alex- 
ander denied by the example of the Elk in their Verbes:

Alcaest genio infinita suffinet Alex, 
Uniguis & [modern] fort [anabolomenos].
Conspicul Axiondromus fci respondisse regani, 
Qui in obstricta tempore geltis brevi,
Nunquam iniqua diversus volect quod & indicat Alex,
Fortius hic dubitatis, osce anum fiet?

- Pliny affirmeth (in my opinion) very truly that this Beast is like an Oxe, except in his hair, which 
is more like to a Hart, his upper lip is so great, and gatten over the neather so far, that he can- 
not este going forward, because it doubleth under his mouth, but as he eateth he goeth backward 
like a Sea-crab, and so gathereth up the graps that lay under his feet. His mane is divers both up. 
on the top of his neck, and also underneathe his thorax it buncheth like a beard or curled lock of 
hair, howbeit, they are alway maned on the top of the neck. Their neck is very short, and doth 
not answer to the proportion of the residue of his body, and therefore I have expressed both figures 
of the Elks.

Their fore-head is very broad, two spars at the leath: it hath two very large horns, which we 
have here also express, both for the right side and the left: so as they bend toward the back, 
in the plain edge, and the spires or pikes it forward to the face: both males and females have 
horns, they are solid at the root, and round, but afterward branched, and grow out of their 
eyes, its are broader then a Harts, and are also very heavy, for they weigh at the leath twelve 
pounds, and are not above two foot long, and the breadth measured from the longest pike to the 
other opposite side, about ten inches: the root next to the skin, is more then a man can well gripe 
his hand, and therefore here is expressd the figure of both horns, both in male and female; for 
there is no difference in their natures that I can learn, and their horns they lose every 
year. His ears and back are very long, and hanging down, the colour for the most part like 
a Hart; and sometimes white and Monilier affirmeth, that in the Summer they are of ruffier 
colour, and in the Winter brown or backish-coloured. His fore-legs without all joynets to bend, 
wherein resembling an Elephant, and therefore at leapest coming to Poffs or Trees, and not 
lying on the ground. His hooves are cloven like a Harts, and with the fore-feet he pierceth 
the Dogs that hunt him, for he fighth not with his horns, but with his fore-legs. It is a melanc- 
holic Beast, and fearful to be seen, having an ambling pace, and keeping in the wet, watry, and 
marshy places, delighting in nothing but in moisture. The fleth is fat and sweet, but ingrate- 
ful to the palate, and engendereth melancholy. The Germanus call his Beast Ellewd, which in 
their language signifieth miserable or wretched, and in truth if the report thereof be not false, it 
is in a most miserable and wretched cafe, for every day throughout the year it hath the Falling- 
fickeus, and continueth in the pangs thereof until the hoof of his right fore-foot touch his left ear, 
which comes not to pas but by the extremest torments of the body, for while the members are 
reached and stretched with many strains and Convulsions (as it falleth out in that sickness)

The sickness 
by of Elks.
by chance the aforesaid foot rubbeth the laid ear, and immediately thereupon the Beast is delivered from his pangs: whereby we are to admire the works of our Creator, which having laid so heavy an infirmity upon this poor Beast, wherewith he is dayly tormented, yet hath he also provided a remedy for that evil in the hoof of his own foot, making the torments of the disease to be the Apothecary for applying the remedy to the place of cure.

They live in herds and flocks together in Scandinavia, and when the waters are frozen up, the wilde Mountain-Wolves set upon them in great multitudes together, whom they receive in battle upon the Ice, fighting most fiercely and cruelly till one part be vanquished: In the mean time the Husbandmen of the Country observe this combat, & when they see one side go to the wall, they persecute them, & take the victors part, for it is indifferent to take either the one side or the other; but most
most commonly the Elks are conquerers by reason of their fore-feet, for with them they pierce the Wolves or Dogskins, as with any sharp pointed Spear or Javelin.

Some have been of opinion that these are wilde Aces, but they are led hereinto with no reason, except because they are used for travel and burden as is before said, for there is no proportion or resemblance of body betwixt them: besides, they have cloven hoofs, for the most part, although Spermannus Baro affirm, that there are some of this kinde which have their hoofs whole and undivided. Being wilde it is a most fearful creature, and rather desireth to lie hid in secrect, than to fly, except pursued by Hunters; and there is no danger in hunting of this Beast, except a man come right before him, for on his sides he may safely strike and wound him; but if the Beast fallen his fore-feet on him, he cannot escape without death. Notwithstanding it is a Beast (as hath been said) as great as two Harts, yet is it above measure fearful, and if it receive any small wound, or shot, instantly it falleth down and yeeldeth to death, as Sermon hunting, with Spermann the Second King of Elms in the Woods of Lutania, tried with his own hand, for with his hunting Spear he pierced one a very little way in the skin in the presence of the King, who presently fell down dead.

In some Countries of ancient time (faith Pausanias) they took them on this manner. They having found out the field or hill where the Beasts are lodged, they compass it in by the space of a thousand paces round in circle with wails and toils invented for that purpose, then do they draw in their nets round like a purse, and so inclose the Beasts by multitude. who, commonly smelling his Hunters, hideth himself in some deep ditch or cave of the earth; for the nature of this Beast hath framed to it self a most sharp fragacity, or quick scent of smelling, being not herein inferior to any of the best Dogs in the world, because it can a great way off discover the Hunters, and many times while men are abroad in hunting of other Beasts, this is suddenly start out of her lodging place, and so discovers, chased, and taken.

Other again take it by the means that they take Elephants, for when they have found the trees wherunto they lean, they so cut and flaw them, that when the Beast cometh, he overthroweth them, and falleth down with them, and so is taken alive.

We read that there were Elks in the triumph of Aurelian at Rome, and in the games dedicated by Apollo and Diana, and celebrated by Valesius Pudicivius, were many Elephants, Elks, and Tygers. Likewise there were ten Elks at Rome under Cordianus. When they are chased eagerly, and can finde no place to retire themselves in, and secrct, they run to the waters, and therein stand, taking up water into their mouths, and within short space do so, as he that being quenched or fotted out of them, upon the Dogs, the heat thereof so opprefteth and faldeth them, that they dare not once approach or come nigh her any more.

The greatest vertue of medicine that I can learn or finde to be in this Beast, is in the hoof, for that worn in a Ring, it refiliseth and freeth a man from the Falling evil, the Cramp, and cureth the fits or pangs, if he be put on when he is in his formin extremity: also scraped into powder and put into Wine and drunk, it is used in Polonia against the same evil. In like sort they mingle with Triacle, and apply it to the heart, or else hang it about their neck for an Amulet to touch their skin against that disease: and because that both in ancient time, and also now adays, this Beast is feidom seen, and more seldom taken, the hoof thereof being so often approved for the iles before said, the rarity (I say thereof) maketh it to be sold very dear, which would be (if they could be found or taken) in more plentiful manner.

Some Mounte-banks fell in spent thereof a Bugles hoof, but it may easily be described by scrapeing, for (it is faid) it smelleteth very sweet, whereas a Bugles fauour eth very ill and strong. It is observed also, that it hath not this vertue except it be cut off from the Beast while he is yet alive, and that in the months of August and September, at what time these Elks are most of all annoyed with the Falling-sicknes, and then it hath strongest vertue to cure it in others.

Others affirm, it wanteth his operation if it be cut off from a young one, which never tasted of carnal coopsation, and so hath not been dulled thereby: but howsoever, this is certain, that some times it cureth, and sometime it faileth, and as there can be given no good reason of the cure, so I rather ascribe it to a superflitious conceit or belief of the party that weareth it, rather then to any hidden or affaired work of nature. The skins of this Beast are dreefed by Tawyers, with the fat of fishes and Alum, to make breast-plates, and to shelter one from rain, and they sell them for three or four Nobles a piece, but in Cracovia for fifteen Florens. It may be discerned from a Harts skin by blowing upon it, for the breath will come through like as in a Buffe, and the hairs also of this Beast have also hollow passages in them when they grow upon the back of the Beast, or else soon after the skin is taken off.

Some alfo use the Nerves against the Cramp, binding the offended member therewith, and herewith do we conclude this story of an Elk, referring the reader to the tale of Acida related before in Cacus, if he have desire to know it for the affinity betwixt the name thereof, and Alces an Elk.
The names in Greek.

The etymology of *Ibys* a Ferret.

Ferrets swim not.

The Latin names.

Their courage and nature in the earth, Scaliger.

Whether Ferrets be *Ibys*.

Of the *Ferret*.

I take it to be most true without all exception, that the *Græcius* call a Ferret *Gaula agria*, a wilde Weasit, *Ibys* and *Ferretius*, although *Eymology* and *Hesychius* ascribe the reason of this latter name to her lodging under Oaks and Olive-trees. *Ibys* also was a common name of all Weasils, to those *Græcius* which never knew or saw any other than one kind of them, or as Scaliger against Cardan will have it to signify a wilde *Canis* Weasil, and not a tame kind, being domestical and living in houses, and that these differ only from one another in place and manner of living, and not in colour, stature or qualities. And where *Aristophanes* citeth it among other Beasts which are devourers of fish; in my opinion there is no Beast that more defireth Fith, then Ferrets and Cats; and for this cause it hath his name *Ibys guesi Ichthiun*, of eating of Fish; and yet I cannot consent unto them which will have it descend and hunt Fith in the waters, like Oters or Beavers: for it abhorreth both swimming or diving, but neer to the waters it hunteth Fith, where for the most part being wilde it remaineth.

The *Latines* call this Beast *Viverra*, and *Furo*, and *Ferretius*, and *Furetus*: because (as shall be afterward manifested) it preyeth upon Comies in their holes, and liveth upon Weasils, and in the earth will kill a Conie fix times as big as her self, but being abroad on the land, in the open air is nothing so wilde, strong or full of courage. From *Ibys* is derived *Ibises*, and the German *Iitis*, for a Ferret: this is called by the French *Furon*, *Ferret*, and *Fufon*, and by the Spaniards, *Feron*, and *Faram*, and from the English *Ferret* is the German *Fret*, derived by a common Syncope, and in the time of *Georgius Agricola*, it was called in Germany, *Furette*, and *Fretel*; and the English word feemeth also to be derived from *Fretta in Latine*, which by a like Syncope is contracted of *Viverra*, as to any different learned man it may appear at the first sight of derivation.

But herein feemeth an unreconcilable difference, that it is reported of the *Ibys* by *Gaza*, the interpreter of *Aristotle*, that it was most greedy of Honey, and for that cause it will seek out the Hives of Bees, and enter them without all fear of stings. But when *Pline* speaketh of *Ibys*, he doth not call it *Viverra*, or once attribute unto it the love of Honey, but rather the hatred and loathing thereof, in so high a degree, that if he tait of it, it falleth into Consumptions, and hardly escapeth death. And these things Scaliger alledgeth against Cardan, only to prove that *Ibys* and *Viverra* are two distinct Beasts, and that *Cardan* was miftaken in affirming, that they were but several names, expressing one and the same Beast.
Of the Ferret.

The answer whereunto may be very eafie, for although Pliny leaveth without rehearftal their love of Honey, it doth not necessarily follow, that they love it not (as Aristotle before him conftantly affirmed) and Scaliger nameth no Author, nor bringeth any reafon to demonstrate their hate of Honey, or any harm which injucent them by eating thereof: and therefore againft his authority may Strabo be oppoited, who in his third Book, speaking of the Conies of Spain, and of their Hunters and Harriers, out of their holes, he taketh and nameth indifferentily without all dijinition and exceptiion, Viperes, and Ibyx, for the one and other. Niphus tranflateth Ibyx, a Martel, but without reafon; for the fame man finding in Ariflotle, that there is war betwixt Loculuts and Serpents, which is fitly called Ophiomachia; whereas Aristotle nameth Afis, a Locult, he falleth in doubt whether it were not better to be Ibyx, a Martel, or as other copies have it Apis, an Apefe, which can by no means agree unto them, for there is a kind of Locultus (called Ophiomachum) becaufe of their continual combates with Serpents. And therefore not to fland any longer upon this difference, omitting alfo the conjecture of TertuJ, which confoundeth Ibyx with Milites, a Glend or Kyte, which cannot fland reasonable, because Hermer faith, there was a kind of Caps made of the hairs of Ibyx, nor yet of Albeorus his new found name of Aneforius, nor Alvicens his Rase, or the French, Filius, which is a Poul-Cat.

I will defend to the defcription of the parts and qualities, wherein the Authors themselves at variance, make their own reconvocation, by attributing the fame things to the Ibyx, and Ferret, except that of an obfure Author, which faith that Ibyx is Analemor, as big as a Greyhound, and that it is wifer and more induftrious in his youth and tender age, then in his perfection of strength and years.

These Ferrets are lefier then the Malicean or Gentlewomen's Dogs, and they were firft of all brought out of Africa into Spain, and therefore are called by Strabo, African Wefliffs, becaufe of their fimilitude with Wefliffs: for Spain, Italy, France, and Germany, have not this Beaf bred among them, but brought them out of other Countries. But in England they breed naturally of the quantity afofareid, and they are tamed to hunt Cones out of the earth. It is a bold and audacious Beafe, enmy to all other, except his own kinde, drinking and flucking in the bloud of the Beaf it biteth, but eateath the fift. When the Warener fetheth it down to hunt, he firft of all maketh a great noife to fray all the Cones that are abroad into their holes, and fo having frighted them, pitcheth his Nets, and then puttheth his tame Ferret into the earth, having a long lirring or cord with Bels about her neck, whose mouth he muzzleth, fo that it may not bite the Cony, but only terrify her out of her boroufh and earth with her presence or claus; which being performed, she is by Dogs chaflèd into the nets, and there overwhelmed, as is afofareid in the history of the Cones.

Their body is longer for the proportion then their quantity may afford, for I have feen them two flans long, but very thin and fmall. Their colour is variable, fometyme black, and white on the belly, but moft commonly of a yellowifh fandy colour, like Hermeline or Wool, dyed in urine. The head little like a Mufes, and therefore into whatfoever hole or chink the putteath it in, all her body will eafily follow after. The eyes fmall, but fiery, like red hot iron, and therefore the teete moft clearly in the dark. Her voyce is a whying cry, neither doth change it as a Cat: She hath only two teeth in the neither chap, flanding out, and not joined or growing together. The genital of the male is of a bony fubfance, (wherein Pliny and Scaliger agree with Cardan and Strabo for the Ibyx alfo) and therefore it alway handeth fliffe, and is not lefter at one time then at other. The pleasure of the fene in copulation is not in the yard or genital part, but in the nerves, muscules, and tu- ficles wherein the faid genital runneth. When they are in copulation, the female lyeth down or bendeth her knees, and continually cryeth ex Cath, either becaufe the Male pincheth and claweth her skin with his fharp nails, or elfe becaufe of the rigidity of his genital. And when the female defireth copulation, except the be with convenient fpeed brought to a male, or heuffered to come to her, the fwelleth and dyeth. They are very fruitful in procreation, for they bring forth feven or eight at a time, bearing them in their little bellies not above forty days. The young ones newly luttered are blinde 30 days together, and within forty days after they can fee, they may be set to hunting. The Noble men of France keep them for this pleafure, who are greatly given to hunt Cones, and they are fowld there for a French crown. Young boys and scholars alfo use them to put them into the holes of rocks and walls to burn out birds, and lifewise into hollow trees, where out they bring the Birds in the claws of their feet.

The number
of their young
ones.

They are nourifhed being tamed with Milke, or with Barley bread, and they can fat a very long time. When they go, they contrac their long back and make it fland upright in the middle, round like a bowl. When they are touched, they smell like a Martel, and they sleep very much: being wide, they live upon the bloud of Conies, Hens, Chickens, Hares, or other fuch things, which they can finde and over-matter. In their feep alfo they dream, which appeareth by whyning and crying in their feep. Whereas a long fly (called a Fryer) flying to the flaming candles in the night, is accounted among poiyons, the Antidote and relifter thereof is by Pliny affirmed to be a Goals gall or liver, mixed with a Ferret, or wide Wefill, and the gall of Ferrets is held praiifed againft the poiyon of Alpese, although the feeth and teeth of a Ferret be accounted poiyon. Lifewise the gall of a Ferret is commended againft the Fallinge disease, and not only the gall (faith Marcellus) but the whole body, if it be rolled, dreffed, and eaten falling, like a young pig. It is said by Rafis and Albeorus, that if the head of a Wolf be hanged up in a Dove-cote, neither Cat, Ferret, Wefill, Stoa, or other noyfome Beaf dare to enter therein. These Ferrets are kept in little hustches, in houfes, and

The medicines
of Ferrets.
The difference of a Poul-Cat, from the Wilde-Cat, is because of her strong stringing favour, and therefore is called Furtius, of Furtore, because of his ill smell: for all Weasels being incensed and provoked to wrath, smell strongly, and especially the Poul-Cat; likewise when in the Spring time they endeavour procreation, for which cause among the Germans, when they would express an infamous Whore or Whoremaker, they say they think like an Ito, that is a Fitch or Poul-Cat. The French call this Beast Putois, and Futois, as it is to be found in Cerius Figular; the Sauvans, Foutette; the Illyrians and Bohemians, Tberz; and the Polvians, Vildred; and Scalger calleth it in Latine (Gatton saxum) by another name then Furtonis. It is greater then an ordinary Weasif, but leffer then the wilde Martel, and yet commonly fatter: the hairs of it are neither smooth and of one length, or of one colour; for the short hairs are somewhat yellowish, and the long ones black, so as one would think that in many places of the body, there were spots of divers colours, but yet about the mouth it is most ordinarily white.

The skin is fift, harsh, and rugged in handling, and therefore long lafiting in Garments, yet because the Beast is alway fat, the favour of it is so rank, that it is not in great request, and moreover it is said, that it offendeth the head, and procureth aching therein; and therefore it is sold cheaper then a Fox skin, and the fattest is alway the worst of all. The Skinners approve the skins of Fitches and Martels best, which are killed in Winter, because their flesh and luft is much lower, and therefore rendereth a les hurtfull smell then at other times. The tail is not above two hands or palms long, and therefore shorter then is a Martel. In all other parts of the body it equalleth a Martell, or exceedeth very little, having thinner necks, but larger and greater bellies, the tail, legs, and breed, are also of a blacker colour, but the belly and sides more yellow. Some have delivered that the left legs thereof are shorter then the right legs, but this is found untrue by daily experience: They keep in the tops of houses and secret corners, delighting to kill and eat Hens and Chickens, whole craft in devouring his prey is singular; for to the intent that the fily creatures to be devoured may not bewray them to the Houfe-keepers, the first part that they lay hold upon with their mouths is the head of the Hen and Chicken, and by that means stayeth his crying by cropping off the head. Some of these Fitches wander and keep in the Woods, and thereby live upon Birds and Mifs, and such things; some again live by the Sea fides in Rocks, and they take Fishes like Beavers and Otters; and some creep into the Caves of hollow trees, where they eat Frogs, and most of all they delight to be near flas of Carrell, Hay-houfes, and houses, where they meet oftentimes with Eggs, wherein they delight above all other kinds of meat. And thus much for this Beast.
A Fox is called in Hebrew, Ṣeḇuṭ; and in Chaldee, Ṭhaaṭ; and therefore in Psa. 61, where the Hebrew readeth Šeḇuṭāh, there the Chaldee translitereth it Šeelāja; the Arabians call him Ṣab- lah; and Avicen calleth a Fox sometime Ḫābél, and also Ḫālāhāt; the Greek Septuagints, Ἀλπηκός; and vulgarly Ἀλπης, and Ἀλπος; the Latin, Vulpes, and Vulpecula of Volpes, his tumbling-pace; the Italians, Volpe; the French, Regnard; and a little Fox Regnable; the Spaniards, Capó; of ravening; the Germans, Fuchs; the Flemings, Vos; and the Thyrions, Lifis.

The Epithets expressing the nature hereof among Writers, both Poets and others, are these: crafty, wary, deceitful, thinking, strong-smelling, quick-smelling, tyed, warlike or contentious, wicked and rough; the Græcius very colored, and subtil for slaughter; and therefore Christ called Herod a Fox, because he understood how by crafty means he sought to entrap and kill him: and all the Ancients
Ancients called such kinde of men Volpiniere, which every Nation under Heaven doth imitate.

There are store of Foxes in the Alpine regions of Helvetie, and amongst the Captains they abound, so that their multitude maketh them tame, comming into the Cities, and attending upon men like tame Dogs. The Foxes of Savoia are very ravenous, for they kill the strongest Rams and Goats, and also young Calves; and in Egypt they are leffer then in Greece, and most commonly all Foxes are of nativity like a Shepherds Dog. Their colour is reddish and more white toward the head: In 

The Foxes are both black and white, viz. about the river Woga, black and ash-coloured, and in the Province of Ufita; all black, and these are of the smaller sort, which are nourished to make caps of their skins, and are therefore fold at twenty or thirty Florens a skin. In Spain they are all white, and their skins are often brought by the Merchants to be fold at Francis Mart.

In the Septentrional or Northern Woods, there are black, white, and red Foxes, and such as are called Cawgerere, that is Cross-bearings Foxes, for on their backs and othertwhat their shoulders there is a black cross, like an Aeffe: and there are Foxes alfered over with black spots, and all these are of one and the fame malignant and crafty nature: and these (faith George Fabricius) are dilinguished by their regions or habitation: for it is most commonly feen, that Foxes which keep and breed toward the South and West, are of an ash colour, and like to Wolves, having loose hanging hairs, as is to be feen both in Spain and Italy; and there are noted by two names among the Germans, from the colour of their throat. One kinde of them is called Koler, whose throat feemeth to be sprinkled and darkned with cole-duft, upon white, so as the tops of the hair appear black, the foot and flank being white.

The other Birkfeintche, because their throat is all white, and of this kinde the moft splendit white, is most precious. A fecond there is (called Krenzschufche) because of the cross it bareth upon his back and shoulders down to his fore-feet, being in other parts like the former, except the throat which is blacker then any of the other before I spoken of, and these are not bred in Germany, but brought thither from other Nations.

A third kinde is of a bright slate-colour (called Blauwfeintche) and this colour hath given a different name to Foxes, which they call Blauwshimmel, but in the Foxes it is much more mingled, and their Foxes which have rougher and deeper hair are called Braundfeintche.

The Mufcovains and Tartarians make most account of the black skins, because their Princes and great Nobles wear them in their garments: yet are they more easily adulterated, and counterfeited by the fume or smoke of Torchet made of pitch. The white and blew skins are left esteemed, because the hair falleth off, and are also leffer then the other: the red ones are most plentiful: and Sceliger affirmeth that he saw skins brought into France by certain Merchants, which had divers white hairs disposed in rows very elegantly upon them, and in divers places they grew also single. In Norvegia and Suetia, as there are white Hares and Bears, so there are also white Foxes; in Volcofa they are black, as is affirmed by Sigismundus Laber, the picture of the Cross-bearing-Fox which is less then the former is here following express'd and set down.

The Cruigeran F O X.

Serpets, Apes, and Foxes, and all other dangerous harmful Beasts, have small eyes, but Sheep and Oxen which are simple, very great eyes. The Germans when they describe a good Hore, they decipher in him the outward parts of many Beasts, from whom (it feemeth) he partaketh his generosiety, and from a Fox they ascribe unto him short ears, a long and bulthy tail, an eatie and foil treading step, (for these belong to a Fox.) The male Fox hath a hard bony genital, his tail is long and hairy at the end, his temperament and conftitution is hot, as appeareth both because of his resemblance or fimilitude with Dogs and Weafls, and also his rank and strong smeling flavour: for being dead, his skin hath power in it of heating, and his fat or-oyl after a decoction is of the fame force and condition.

The greatest occasion of his hunting is the benefit of his skin, for his fleefh is in all things like a Dogs, and although Calen, Merimacian, and Stibius affirm, that in the Autumn or lattter part of the year, some men use to eat the fleefh of Foxes, (especially being Cubs) that is young, tender, and not smelling: but Asius and Kaflus affirm, (and that with great reason) that their fleefh, and the fleefh of Hig-hogs and Hares, is not agreeable to the nature of man.

But their skin retaineth the qualities of the hot Beaff being pulled off, by reason of the long and soft hair growing thereupon; and the skins of Cubs which are preferred before the elder, are of least value, because their hair is apt to fall off, which being thin doth not admit any deep rootings of the hair. The Thraciates in the time of Xenophon, wore Caps of Foxes skins upon their heads and ears, in the coldest and hardest Winters, and from hence it cometh, that in some Authors the covers of mens heads, (commonly called in Grecæ, Periephalæ) are termed Alpecias, or Alpecis: and for this purpose in Germany at this day, they flit about the skin of Foxes tails, and few it together again, adding to it a sufficient number till it be framed into a Cap: but the skin of the belly and sides is of more previous estimation, because it is more soft and smooth, and therefore is sold for twice so much as the other parts,
In the Summer time the skins are little worth, because that then the beasts are troubled with the Alopecia; that is, the falling off or looseness of the hair; and therefore then also they are dangerous to be used, because of that disease: men which have the Gout, shrinking up of the finews, or other old fluxions of the Rheumes in their legs, can use no better or more wholesome thing then to wear buskins of the skins of Foxes; the Scythians make them shoes, and foal them with the backs of Fox and Mufe skins, upon which they go. The Latins have a proper word for the voice of a Fox, which is, Gannus Gannire, to Ganne, and it is also metaphorically applied to men, when by shrieking clamors they trouble others; as 'Lerence in Adelph. Quid ile gannit? Quid vult? And Plauto also, Gannit odiose omni toti famile; and for this voice did Maccusian write his Verdes.

The voice of Foxes.

But yet as Albertus and Confessianus have truly observed, that in the time of his hunting he will bark like a little Dog, and the Harts are greatly afraid of this ganning of Foxes.

It hath been already shewed in the story of the Badger, how the Fox by laying his excrement in the Badgers den, geteth the fame to his own use; for the abode of Foxes in the day time is in the caves and holes in the earth, and come not abroad till the night. These dens have many caves in them, and passages in and out, that when the Terriers shall set upon him in the earth, he may go forth some other way: and forasmuch as the Wolf is an enemy to the Fox, he layeth in the mouth of his den, an Herb (called Sea-onion) which is so contrary to the nature of the Wolf, and he so greatly terrifies therewith, that he will never come near the place where it either groweth or lyeth; the same is affirmed of the Turtle to save her young ones, but I have not read that Wolves will prey upon Turtles, and therefore we reject that as a fable.

When Aristophanes was converted by the Locavermianus, and included into a rock or quarry of flones, Pliny, he escaped out of their hands, by digging another passage out of it then where he was put in; saying, that it was a shame for a Man to have left wit then a Fox. When they are in their dens, they lie upon their bellies with their hinder legs stretched forth at length, like as a man when he sleepeth on his belly, and therefore it seemeth that their legs are so framed to creep and pierce under the earth and dig out their way after their own pleasure.

This is such a devouring beast, that it forfaketh nothing fit to be eaten, for it killeth Hares and Conies, and with his breath draweth field Mice out of their holes, like as a Hart draweth out Serpents with his breath, and devoureth them. He devoureth also all kind of Pullen, they also eat Grapes, Apples, and Pears; whereupon came the proverb in Plautus, Tan ficelis sinus quam vultur pyron conef; Thou shalt as easily overcome him, as a Fox catch a Pear: which is applied to any easy or dispatchable business. In Arabia, and Syria Palestina, they are so ravenous, harmful, and audacious, that in the night by ganning and barking, they invite one another (as it were) by a Watchword, to assemble in great multitudes together, for to prey upon all things, and they fear not to carry into their dens, old shoes and vessels, or instruments of husbandry: for which cause, when the Husbandmen hear thereof, they gather all things into their houses and watch them.

But as it falleth out in all glutinous ravening persons, that while they strive to fill their bellies, they poison their lives, so also it fareth with Foxes, for nature hath so ordained, that if a Fox eat any meat wherein are bitter Almonds, they die thereof if they drink not presently; and the same thing do Aloeis in their meat work upon them, as Sculler affirmeth upon his own sight or knowledge. Apocynum or Bear-foot gives to Dogs, Wolves, Foxes, and all other beasts which are littered
littered blind, in fat or any other meat killeth them, if vomit help them not, which falleth out very seldom, and the seeds of this herb have the same operation. It is reported by Democritus, that if wile Rue be secretly hung under a Hens wing, no Fox will meddle with her; and the same writer also declareth for approved, that if you mingle the gall of a Fox, or a Cat, with their ordinary food, they shall remain free from the dangers of these beasts.

When they engender, they do admit coxulation, they are joined like Dogs, the male upon the female: and the female when she perceiveth her womb filled, the departeth and liveth very secret, for it falleth out very seldom that a female or Bitch fox is taken great with young. She bringeth forth ordinarily four at a time, and those blind and imperfect, without Articles in their legs, which are perfected and framed by licking, for Bears, Wolves, Lions, Foxes, Dogs, and Hares which are Musurara and Undogus, that is, fruitful, bearing many at one time, and also Cloven or flat-footed into many claves, have not the benefit or nature to perfect their young ones in their wombs.

Kites, Vultures, and Eagles lie in wait to destroy the Foxes Cubs or Whelps. Foxes do not only engender with their own kinde, but also with Wolves, Dogs, or any other beasts of equal proportion, both of quantity and time of going with young; so the Leonian Dogs are engendred by a Dog and a Fox; and the Hyena, of a Wolf and a Fox (as Albertus affirmed) and the Simia Lupae of an Ape and a Fox, as is already in the story of Ape's declared.

There be also many evils wherewithal Foxes are annoyed, and first of all he falleth sometime into madness as a Dog, and the same evils follow a mad Fox, which already are manifest to accompany a mad Dog, and that more often in Summer then in Winter.

When a Fox feeleth himself sick, nature hath taught him to eat the gum of Pinetrees, wherewithal he is not only cured, but also receiveth length of days. They are also vexed with the falling away of their hair; called therefore Alopecia, because Foxes are most commonly vexed therewith, and as we see in Plants, that some of them dry and confuse through want of moisture to feed them, other are suffocated and choked by abundance, and as it were drowned in humidity: so it happeneth in the earth, which groweth out of the body of beasts, and the heads of men, no otherwise than Plants out of the earth, and are therefore to be nourished by humour; which if they fail and wax dry, the hair allo shorteneth with them, and as it were rottest away in length: but if they abound and overflow, then do they loosen the roots of the hair, and cause them to fall off totally.

This disease is called Alopecia, and the other Oppolij, because it is not general, but only particular in one member or part of the body or head, and there it witteth or indenteth like a Serpents figure.

Michael Verus affirment, that sometime the liver of the Fox inflameth, and then it is not cured but by the ulcerous blood flowing to the skin, and that evil blood cautheth the Alopecia, or falling away of the hair, for cause (as is already said) a Foxes skin is little worth that is taken in the Summer time.

The length of their life.

The length of the life of a Fox is not certainly known, yet as Stumpfius and others affirm, it is longer than the life of a Dog. If the urine of a Fox fall upon the graffe or other herbs, it dryeth and killeth them, and the earth remaineth barren ever afterward. The favour of a Fox is more strong then of any other vulgar beast, he flinketh at nose and tail, for which cause Martial calleth it Olidam Vulpec, an Olent or smelling beast.

His olidam clam: sus aget in retia vulpin.

The hunting and taking of Foxes.

Touching the hunting or taking of Foxes, I approve of Xenophont, who avoucheth, Laporum capturam venaticos studio quam vulpinium aliquam, that is, the hunting of the Hare is a more noble game or patience then the hunting of the Fox.

This beast is more fearfull of a Dog then a Hare, for the only barking of Dogs cautheth him to rife many times from his den or lodgings out of the earth, or from the middle of bushes, briars, and bramblest, wherein he hid himself: and for his hunting this is to be observed, that as in hunting of a Hare it hath been already related, the Hunter must drive the beast with the winde, because it hindereth his refrigeration: for in hunting of a Fox he drive him against the winde, and then he preventeth all his crafty and subtilst agitation and deviles; for it layeth his speed in running, and also keepeth his favour fresh alway in the nofe of the Dogs that follow him: for the Dogs that kill a Fox mult be swift, strong and quick fented, and it is not good to put on a few at once, but a good company together, for be assured the Fox will not lose his own blood till he hazzard some of his enemies, and with his tail which he witteth every way, doth he delude the Hunters: when the Dogs are preffed neer unto him, and are ready to bite him, he striketh his tail betwixt his legs, and with his own urine wetteth the fame, and so inflammeth it into the Dogs mouths, whereof when they have tafted, to many of them asit toucheth will commonly leave off and follow no farther.

Their teeth are exceeding sharp, and therefore they fear not to assault or contend with beasts, exceeding their stature, strength, and quantity. Sometime he leapeth up into a tree, and there standeth to be seen and bayed at by the Dogs and Hunters, like as a Champion in some Fort or Castle, and although fire be cast at him, yet will he not defend down among the Dogs; yet he endureth
endureth to be beaten and pierced with Hunters spears, but at length being compelled to forfaketheihsold and give over to his enemies, down he leapeth, falling upon the crew of barking Dogs, likeaflash of lightning, and where he layerth hold there he never looefeth teeth, or affiageth wrath, till other Dogs have torn his limbs, and driven breath out of his body.

If at any time he take the earth, then with Territor Dogs they ferret him out of his den again.

In some places they take upon them to take him with nets, which seldom proveth, because with his teeth he tearoth them in pieces; yet by Calendius this devise is allowed in this Verse:

Et laqueo Vipers & decisae fuisar.

But this must be wrought under the earth in the caves, dens, or burrowes, made of purpose, which is to be performed two manner of wayes, one by placing the Gin in some perth of wood, so as that as soon as the beast is taken by the Neck, it may presently fly up and hang him, for otherwise with his teeth he will tear it afunder and escape away alive: or else that near the place where the rope is fastened, to flap upon the head of the Fox, there be placed some thick collar or brace, so as he can never bite it afunder.

The Foxes have a kind of Gin to take by the legs (which they call Haufpiele) and I have heard of some which have found the Foxes leg in the same Gin, bitten off with his own teeth from his body, rather putting himself to that torment with his own teeth, then to expect the mercy of the hunter; so were away upon three feet: and other have counterfeited themselves dead, referring their breath and winking, not flirring any member when they lay the Hunter come to take them out of the Gin, who coming and his leg forth, not suspecting any life in them, so soon as the Fox perceiveth himself free, away he went and never gave thanks for his deliverance; for this cause Bionius faith truly, that only wife and old Hunters are fit to take Foxes, for they have so many devices to beguile men, and deliver themselves, that it is hard to know when he is safely taken, until he be throughly dead.

They also use to set up Gins for them baited with Chickens in butcher and hedges; but if the setter be not at hand to soon as the Fox is in the Gin, it is dangerous but that the beast will deliver itself. In some places again they set up an iron toole, having in it a ring for the Fox to thrust in his head, and through that sharp pikes, at the farther end whereof is placed a piece of flesh, so that when the hungry Fox cometh to bite at the metal and thrusteth in his head, the pikes stick full in his neck, and he inevitably inured. Moreover, as the harmfulness of this beast hath troubled many, so also they have devised more engins to deceive and take him; for this cause there is another policy to kill him by a bow, full bent, with a sharp arrow, and so tenderly placed as a trap for a Mouse, and as soon as ever the Fox treadeth thereon, presently the arrow is discharged into his own bowels, by the weight of his foot.

Again, for the killing of this beast they use this sleight, they take of Bacon-grease or Bacon as much as ones hand, and rost the same a little, and therewith anoint their flooze-foles, and then take the liver of a Hog cut in pieces, and as they come out of the wood where the beast lodgeth, they must scatter the said pieces in their foot-reps and draw the carcasse of a dead Cat after them, the favour whereof will provoke the beast to follow the foot-reps, then have they a cunning Archer or handler of a Gin, who obsereth and watcheth in secret till the beast come within his reach, and so giveth him his great and deadly wound.

But if the Fox be in the earth, and they have found his den, then they take this course to work him out. They take a long thing like a Bee-live, and open at one end, and iron wiers at the other like a grate, and at the open end is set a little door to fall down upon the mouth, and to incline the Fox when he entretineth in by touching of a small rod that supporteth that door. This frame is set to the Foxes dens mouth, and all the other passagges watched and stopped. The Fox having a desire to go forth, and seeing light by the wiers, misdemeen no harm, and entretineth into the hive which is wrought close into the mouth of his den, and being entred into it, the rod turmeth the door fall at the lower or entrance, and so the Fox is trapped, to be disposed of at the will of the taker.

Foxes are annoyed with many enemies; and to begin with the leaf, the small flies, called Gnats, do much trouble and infect them; again against whom the Fox ueth this policy: He taketh a mouthful of straw or soft hay, or hair, and goeth into the water, dipping his hinder parts by little and little, then the flies betake themselves to his head, which be keepeoth out of the water, which the Fox feeling, dippeoth or diveth into the same under water to his mouth, wherein he holdeth the hay as aforefaid, whereunto the flies runne for sancturary or dry refuge, which the Fox perceiving, suddenly calleth it out of his mouth, and runneth out of the water, by this means eating himself of all those enemies.

In like manner, as all beasts are his enemies, and he friend and loving to none, so with strength, courage, and policy, he dealteth with every one, not only against the beasts of the Land, but also against the monsters of the Sea. When he findeth a nest of Waspes in the earth, or in other places, as in trees, he layeth his tail to the hole, and gathereth into it a great many of them, which he presently dasheth against the wall, or tree, or stones adjoining, and so destroysth them, and thus he continue till he have killed them all, and so maketh himself executor to their heaps of hony.
The History of Four-footed Beasts.

Gillim.

His manner is when he perceiveth or seeth a flock of fowl to fly in the air, to rowl himself in red earth, making his skin to look bloody, and lie upon his back, winking with his eye, and holding in his breath as if he were dead, which thing the birds, namely Crows, Ravens and fuch like observing, because of the hatred of his person, they for joy alight and triumph at his overthrow, and this the Fox endureth for a good reason, till opportunity serving his turn, and some of the fowl come near his howt, then suddenly he catcheth some one of them in his mouth, feeding upon him like a living and not a dead Fox, and doth devour and eat him, as the Leopard doth devour and eat Apes, and the Sea frog other little fishes.

In like fort he receiveth the Hedge-hog, for when the Hedge-hog perceiveth the Fox coming to him, he rowleth himfelf together, like a foot-ball, and doth appear as outward except his prickles, which the Fox cannot endure to take into his mouth, and then the cunning Fox to compass his defire, licketh gently the face and howt of the Hedge-hog, by that means bringing him to unfold himfelf again, and to stand upon his legs, which being done, he infinitely devoureth, or else poisoneth the beast with the urine that he renders upon the Hedge-hogs face; and at other times he goeth to the waters, and with his tail draweth fishes to the brim of the River, and when that he observeth a good booty, he calleth the Fishes clean out of the water upon the dry land, and then devoureth them.

All kindes of Hawkes are enemies to Foxes, and Foxes to them, because they live upon Carrion, and fo in the Province of Ula. Avicen faith a Fox and a Crow fight together a long feafon, and the Crow with his talons fo he gripping the Foxes mouth that he could not bark, and in the mean time the beast and picked his head with her bill until he bled again. The Eagles fight with Foxes and kill them; and Olaus Magnus affirmeth, that in the Northern Regions they lay Eggs and hatch their young in those skins which they themselves have stripped off from Foxes and other beasts.

* The Kites, Vultures, and Wolves, are Enemies to Foxes, because they are all flesh-devouring creatures, but the Fox which hath so many enemies, by strength or subtleties overcometh all. Whereupon Persius calleth a subtil man a Fox, saying,

Afinam vulpi modo subs pectore uniprem.

The medicinal ues of this beast are these, First, (as Pliny and Marcellius affirm) a Fox fed in water till nothing of the Fox be left whole except the bones, and the legs or other parts of a gory body washef and daily bathed therein, it shall drive away all pain and grief, strengthening the defpective and weak members; so also it cureth all the shrinking up and pains in the finews: and Galen attributeth the fame virtue of an Hysana sod in Oil, and the lame perfon bathed therein, for it hath such power to evacuate and draw forth whatsoever evil humour aboundeth in the body of man, that it leaveth nothing hurtful behind.

Nevertheless, such bodies are soon again repleni{h}ed through evil diet, and relapsed into the fame diseafe again. The Fox may be boil'd in fresh or salt water with Annife and Thyme, and with his skin on whole and not flit, or else his head cut off, there being added to the decoction two pintes of Oil.

The fleth of a Fox fed and layed to a fore bitten by a Sea-hare, it cureth and healeth the fame. The Foxes skin (as is alreadie faid) is profitable against all moift Fluxes in the skin of the body, and also the Gout, and cold in the finews. The ashes of Foxes flesh burnt and drunk in wine, is profitable against the thartherns of breath and flippings of the Liver.

The blood of a Fox disjected and taken forth of his urine alive, and fo drunk, breaketh the stone in the bladder; or else (as Merypius faith) kill the Fox, and take the blood and drink a cupful thereof, and afterward with the fame wafh the genital parts, and within an hour the stone shall be voided: the fame virtue is in it being dried and drunk in Wine with Sugar.

Oxen are and Foxes blood infused into the Nostrils of a Leathargick Horfe, cureth him. The fat is next to a Buls and a Swines, for as the fat or lard of Swine may be ufed for the fat of Foxes, and the fat of Foxes for the Swives greafe in medicine. Some do herewith anoint the places which have the Cramp, and all trembling and flaking members. The fat of a Fox and a Drake inclofed in the belly of a Goose, and fo roll'd, with the dripping that cometh from it, they anoint paralytie members.

The fame with powder of Vine twigs mollified and fod in fie, attenuate it and bringeth down all swelling tumours in the fleth. The fat alone healeth the Aegretas and loofene{f}s of the hair; it is commended in the cure of all Sores and Ulcers of the head; but the gall and fame with Mustard-feed is more approved. The fat is also reftor'd for the cure of pain in the ears, if it be warmed and melted at the fire, and fo intiffled; and this is ufed against ringing in the ears. If the hairs rot away on a Horfe tail, they recover them again by washing the place with Urine and Bran, with Wine and Oil, and afterward anoint it with Foxes greafe. When Sores or Ulcers have procured the hair to fall off from the head, take the head of a young Fox burned with the leaves of black Orchades and Alcyonium, and the powder caft upon the head recovereth again the hair.

If the brain be often given to Infants and focking children, it maketh them that they shall remain free from the falling evile. Pliny prefcribeth a man which twinkles with his eyes, and cannot look fdeftantly, to wear in a chain the tongue of a Fox; and Marcellus bideth to cut out the
Of the Gennet-cat.

The tongue of a live Fox, and so turn him away, and hang up that tongue to dry in purple thread, and afterward, put it about his neck that it troubled with the whitness of the eyes, and it shall cure him.

But it is more certainly affirmed, that the tongue either dried or green, laid to the flesh wherein is any Dart or other sharp head, it draweth them forth violently, and renteth not the flesh, but only where it is entred. The Liver dried and drunk cureth often fighting. The same or the Lights drunk in black wine, openeth the paffings of breathing. The same washeth in wine and dried in an earthen pot in an Oven, and afterward seasoned with Sugar, is the belt medicine in the world for an old Cough, for it hath been approved to cure it, although it hath continued twenty years, drinking every day two spoonfuls in wine.

The Lights of Foxes drunk in water after they have been dried into powder, helpeth the Pliny.

Milt; and Myrepia affirmeth, that when he gave the same powder to one almost suffocated in a Plunifie, it prevailed for a remedy. Archigeus preferreth the dried Liver of a Fox for the Splenietick with Oxymel: and Mercurian for the Milt drunk after the same manner: and Sextus adviseth to Sextus, drink it simply without composition of Oxymel.

The Gall of a Fox infilled into the ears with Oil, cureth the pain in them; and mixed with Hony Attick and anointed upon the eyes, taketh away all dimmes from them, after an admirable manner. The Milt bound upon the tumors and bunches of the breed, cureth the Milt in man body. The reins dried and mingled with Hony, being anointed upon kernels, take them away. For the swelling of the chaps, rub the reins of a Fox within the mouth. The genitales because of their grizzly and bony substance, are approved for the dispersing of the stone in the bladder.

The fiones take away pimples and spots in the face. The dung pounded with Vinegar, by anointment cureth the Leprofe speedily.

These and such other virtues medicinal both the elder and later Physicians have observed in a Fox, wherewithal we will conclude this discourse; saying that many writers have devized divers witty inventions and fables of Foxes, under them to express vicces of the world, as when they let a Fox in a Fryers weed, preaching to a fort of Hens and Geese, following the fiction of Archigebus Fox, to signifie how irreligious Palsors in holy habits beguile the simple with fubtility. Also of a Fox teaching a Hare to lay his Creed or Creed betwixt his legs, and for this caufe almighty God in his word comparath fale Prophets to Foxes, Ezek. 13. destroying the young Grapes and Plants. The Weafl brought a Fox into a Garner of Corn through a little hole, and when he had filled his belly, he affayed to come out again at the same place, but in vain, because his body swelled with over eating, and therefore he was constrained to come out as empty and hungry as he came in: whereupon this conference was betwixt them:

Forti per amysiam tuinis Vulpecula rimam, 
Repertis in cameram fretomentis, pulsa tursus 
Festas pleno tentamab corpore fuffra. 
Cui muscela procul, St vit., att, effungere ishine,
Muro cardum repetes aritium, quem macra jwifti.

Of the Generation called Genetha.

This beast is called Genisataz, either for the similitude it holdeth with a Cat, or else because it hath been believed that it was engendered by a Cat, but I rather do affent that the right name thereof is Gennetta or Gelnetha, because they are bred in Spain with the Gennet horfes, and fo taketh his name from the place. Albertus (though a learned man, yet many times he was deceived in the names of beasts) called this creature Genetha, and the Germanus call it Ein Genethakat. The quantity or figure hereof is greater than a Cat, but leffer then a Fox, and therefore I think it about the mold or bigness of a young Fox of fix moneths old. It is a meek and gentle creature, except it be provoked; for in Contentimply they are kept tame, and are suffered to go up and down from house to house like Cats. Being wide, they love the valleys and low places, especially the Marithes or land near the waters, for the steep rocky mountains they cannot endure. And thel Cardan taketh to be of the Weafl kind, because the forme and disposition thereof, especially to the tame and Dometi- cal Weafl, and in Spain they are calld Fornat, being black and aif-coloured, distinguished and vari- ably interlined with many spots.

But Scaliger who was delighted to contradict Jeron Cardan, cannot endure to hear of this com- parison betwixt Weafls and Ginnet-cats, because he faith, the skin of a Gennetta is bigger then three Weafls, and that it reenbileth a Weafl in nothing except in the ears; but Cardan comparison toucheth not the quantity, but only the outward form and qualities, and he himself disagreeeth not that it is equal in quantity to an Otter. But certainly the skin thereof is admirable and beautiful to behold, and if they were not common, but rare and seldom found beasts, it is no question but the price thereof and due estimation would excell many others: For the abundance
dance of spots, their natural and uniform order, their shining splendor and brightnes, give place to no other party-coloured beast, as you may observe in the true figure thereof here declared.

Of the skin.

In the next place I have thought good to express the figure of the skin taken off, which skin, from the head to the top of the tail, was about four spans and one palm long, and the tail was as
long as the body being severed from the skin: the latitude or breadth thereof in the middle, was about one fpan in breadth, the middle of the belly, and the upper part of the neck, were ash coloured, and in the tail were eight black circles and so many white, one successively following the other; the whole body ashered with black spots, and the relidue yellowish white.

The skin smelt sweetly and somewhat like to a Musk-cat, and from Lyons in France they are Oppinat1 brought into Germany, three or four of them being sold for a Noble. It is very probable that it is a little kind of Panther or Leopard: for there is a little Panther which hath such spots, and besides of such a stature and harmless disposition, whose skin in old time was preciouly used for garments, and the favour thereof was very pletant, and therefore I superfede any further discourfe hereof, till we come to the declaration of the greater beast.

Of the GOAT, Male and Female.

The male or great Goat-Buck, is called in Hebrew, Aud, and the leffer Seir, and Zair. The several Chaldean transliteration, Gen. 13. Jerahim, and Numb. 15. Ez; the Arabian, Ten and Mean; the Phcenien, Alpern, and Efin; the Gentiles, Tragos, or devouring or ravening in meat, according to the Verfe;

Tragos ab Edundo quad grana faciata pane.

Alfo Chimon and Enrebem; the Latins, Herus, and fometime Capar, which word properly signifies a gelded Goat, as Merifus fefteth in this Verfe:

Dum jugular hicrum,fallus et fips Capar.

The Indians, Beecho; the Germans, Beck, and for dilinction falk, Grifbock, and Reelebok, and Bezek; the Spaniards, Cabon; the French, Bex, the Hijrins, Koezel.

The reafon of the Latin word Herus, is derived of Hirtus (signifying rough) by reafon of the roughnefs of their bodies. And it is further to be understood, that the general kind of Goats (which the Latins diluting with Herus, Capra, and Haedus, that is, by their lex, or by their age; the Hebrews call them singularly Eze, and plurally Esem, Numb. 15, for a Goat of a year old, you shall read Iskhiufeth. The Chaldean in the general word Duz, the Arabian, Schwab; the Pfhemon, Bex, and wherous Levit. 16, Seir is put for Capar a gelded Goat, where the Chalde rendeth it Zepbarab; the Arabian, Aud, and the Pfhemon Buzalet. And in the fame Chapter you shall read Azaeze, which David kindereth for the name of a mountain near Szie, where Goats ufe to feed and lodge: and the Siponians tranflate it Apoquamun, signifying emiflion or rending away, and for this caufe I fuppofe, that when the Scape-goat was by the Priet lent out of the Temple, he went to that mountain, and therefore the word Koezel feemeth to be compounded of Eze, a Goat, and Azael, that is, he went; for the Scape-Goat went and carried away the evil.

The Gentiles call the female Goat Aba, which feemeth to be derived of Ez the Hebrew word. The Atumnus, Palb, and Metatumb, as I find in Abincus, the Sarazens, Afg.; the Indians, Peace, changing B from the male into P, and the Spaniards, Capron; the French, Clever or Chiemare, the German, Gris; Attumnus, the Hijrins, Koeza; and the Tafmen at this day call a female Goat Zeezi. And this may fuiteth for the names of both male and female.

Their nature is to be declared feverally, except in thofe things wherein they agree without difference: and firft of all, the male is rightly termed Dux et maritus Capronus, the guide and husband of the females, and therefore Virgins faith of him not improperly, Vir gregis ipse Capar. The Her-goat is the husband of the flock and except in his genitals and horns, he differeth not in any proportion or bufidence from the female. His horns are longer and stronger then are the females, and therefore upon propagation he striketh through an ordinary piece of Armor or Shield at one blow: his force and the sharpnes of his horns are fo prenable. He hath many attributes among the learned, as left-fided, aged, greedy, bearded, swift, long-legged, horn-bearer, captain of the flock, heavy, rough, hoarfvoiced, rugged, unarmed, unclean, strong-fmelling, lecherous, brisker, wanderer, vile, wanton, sharp, blinking, two-horned, and fuch like: whereby his nature and qualities are fo deciphered, as it needeth no long treatize of explication.

There is no beaft that is more prone and given to luft then is a Goat, for he joyneth in copulation before all other beafles. Seven days after it is cauned and kiddeed, it beginneth and yeeldeth feed, although without proof. At seven months old it engendereth to procreation, and for this caufe that it beginneth to foone, it endeth at five years, and after that time, is reckoned unable to accomplifh that work of nature. When the Ephraim will declare fecondity or ability of generation, they do it by picturing of a male Goat.

That which is most strange and horrible among other beaftes is ordinary and common among thefe, for in them feare the Brotheer joyneth with the Sifter, and a Camel can never be brought to cover his Dam: but among thefe the young ones being males, cover their Mother, even while they fuck their milk. If they be far, they are leffe venereous than being maclent or lean. Herodorus declarcth that in his time a Goat of Mnefias in Egypt, had carnal copulation with a woman in the open night.
fight of men, and afterward was led about to be seen. When they desire copulation they have a proper voice wherewithal (as it seemeth) they provoke the female to love. This is called it in Italy, Biooari and Biccarie, which the Venetians apply to all lecherous companions as commonly as a proverb, and this they never use but at that time. By reason of his lust, his eyes sink deep into the corners of their holes (called Hirqui) and Apuleius with other Grammarians do derive the word Hircus, whereby this beast is called, from that disposition.
By drinking salt water they are made defirous and apt to procreation. At that time they fight mutually one with another for their females, and it is a term among the late writers, to call those men Hirfi, Goats, which are contented to permit other men to lie with their wives in publick, before their own faces for gain, because they imagine that such is the property of Goats. But I know not with what reason they are moved hereunto, for there is a memorable story to the contrary.

In Sibiri there was a young man called Crotbus, which being not able to retain lust, but forfaken of God, and given over to a reproue lust, committeth buggery with a female Goat, the which thing the maffier Goat beheld and looked upon, and disdained, concealing his mind and jealousy for the pollution of his female. Afterward finding the said young man asleep, (for he was a Shepherd) he made all his force upon him, and with his horns dafted out the buggurers brains. The man being found dead on this manner, and the Goat which he had ravished delivered of a monter, having a Mans face, and a Goats legs, they call it Stevaniur, and place it in the rank of idol Gods, but the wretched man himself was bared with more honour then becomed, for they gave him a noble funeral, and finding a River in Aesvilia which mingled water with another, they called it Crotbus, after the name of that unnatural and beastly monter; whereupon also came the Italian Crotbus which Strabo remembret. By which story it is evident, that jealous rivalry refeth as well in Goats as in Men of more reasonneable capacity and understanding.

The females desire of copulation is no leffe then the males, for while they suck they admit the male, and at the seventh month they conceive. The firstt of their admission to procreation is about the end of Autumn (according to Columella his opinion.) They are not filled the first day of copulation, but the second or third, and thofe which are joyned in November do bring forth their young in the Spring when all things grow fresh and green: wherefore if they chance to be slack, and not willing to engender or couple, their keepers, if this flighth or policy, to procure and flir up their lust. They rub their udders with Nettles uncll they contrain blood, and afterward with a handful of Salt and Nitre, or else with Pepper or Myrrhe; after which rubbing, their desire of copulation much increaseth, and it maketh the female to provoke the male and undergo him more willingly; and this thing also procureth in them abundance of milk (as Arifate affirmeth) he had been tryed by making experiment thereupon of the breasts of Women, Virgins, and Widows: And generally all the keepers of Cattel do herewith rub their genitals, for the furthering and provoking in them carnal copulation, with the things aforesaid.

They being filled and with young, they carry them in their belly five moneths before deliverance. After three years old the female ceaseth to retain in her self or confer to her Kids the strength of nature, and the male after four, so that it is not a part of good husbandry to keep their young which they bring forth after those years, but rather to kill them and make them away. So also it is not good to keep their flirlings, or thofe which are first of all engendred, but rather the second or third feed of procreation. Some of them bring forth twins, and some more, as it is reported of the Goats of Egypt, which bring forth five at a time, because they drink of the fruitful river of Nile, for the Goats of the Country do give thereof to their Cattel, and fetch it into all parts of that region, and in Libya they breed twice a year, bringing sometime three, four, or five at once, but three at a time are never to be kept, but killed and eaten, for they are accounted not worth their bringing up; only cold maketh them to suffer abortments, and sometimes they bring forth monsters like to other Cattel (for all little beasts are more apt to engender monsters then the greater.)

Concerning the time that they bear young, it is in Italy eight years, and being fat they are not apt to conceive, wherefore they make them lean before they admit them to their bucks. One male is sufficient for ten females, and some (faith Parre) provide but one for 1 5 (as Menas) and other but one for 20 (as Murus.) There is no creature that fmeath so strongly as doth a male Goat, by reason of his immediate lust, and in imitation of them the Latin call men which have strong breaths (Hircifi) Goats: wherefore Plutus faith to an old lecherous fellow which could not keep his lips from flavoring of women,

Cun fis jam atatis plenus, anima fatida,
Sens hircis u ofulere mulierem.

And therefore Tibenius Caesar who was such a filthy and great-smelling old man, was called (Hircus vestus) an old Goat, in the Atellanum Comadie. They conjecture of men that have hairy legs to be unchast and full of lust, by reason of their similitude with a Goat, and thofe which have a thirl and clamorous voice, the Greeci call Margoi, (that is, blockheads.) Thofe which have eyes like to Goats they call Argos, Goat-eyes, that is very red eyes. The Egyptians affirm that their female Goats when Sirius the Star in the beginning of Dog-days rieth with the Sun, do continually look upon the East, and that their attentiv observation is a most certain argument of the relation, that is the appearance and departure of the said Dog days. The like things do the Lybian report of their Goats concerning that Star, and moreover that they foresee and forethow change of weather, for they depart from their stables, and run wantonly abroad before flowers, and afterward having well led of their own accord return to their foldes again.

Concerning the description of their several parts, it is good to follow the direction of Colinius first to look to their age (as is before faid) if men defire to provide Goats for herd-bleed and poly,
The History of Four-footed Beasts.

profit, so as their Kids may be like them, and they bear young or continue procreation eight years at the least. And for their outward parts, let them be firm, great, well compacted, full of muscles, and the superfiices of their whole body be soft and equal, without bunches or indentures: therefore a thick hair, two dogs hanging under their snout or chin, are good signs of the belt Goats.

Lorentius.

There are two kinds of Goats, one horned, and of this sort the long sharp-horned beasts, with broad foreheads, are the most approved, and by the circles of their horns their age is discerned: But the unhorned are best for breed, procreation and milk, and such are the Caspian Goats, which are for the most part white, flat nosed, and little of growth. Their eyes are very deep in their heads, and therefore
therefore their fight sharp, strong and continual seeing bright and clear in the night, but the colour of their eyes variable, like to the colour of their bodies; The males have more teeth then the females, for the females want their upper teeth: But males and females have large beards under their chins, and this is called Armacis (Latin Eryngius) but the reason hereof is, because that when a Goat is taken by the beard and drawn out of the fold, all the residue it stand amazed, and so also when any of them hath eaten Sea-holly (call Eryngium) so that Arisfolie confoundeth Eryngium for Armacum, and so taketh one for another. Once in Lemnos there was a male Goat which had so much milk wrung out of his paps growing betwixt his legs, that therewith a Calf, by licking it received the feedings, but afterward the male Kid begotten by the same Goat had the like udders, whereas the owner being much amazed, because it was a prodigious thing, for his satisfaction asked counsel at the Oracle, from whom he received this answer, that it betokened nothing but plentiful encrease of his Cattel. The females have two udders under their loins next to the small of their belly, except the Lybian Goats, and their udders lie under their breast or forepart of their belly, like an Apes. In Naxos the Goats have greater Gales then in any other part of the world, and the forepart is held prodigious; On the contrary, in Chaleon the Goats have no Gales at all. They have many bellies and a round Milt, which thing no other horned-beast hath, except a Sheep. The males have harfer hairs then their females, and the Lybian Goats have hair as long as women's, and very rough curled, which the inhabitants shear off every year, and therewith the Ship-wrights make cable ropes; but in Cilicia and Persia, they shear them and make the fluffe called Zamibot; and another kinde of Cloth called Mathalase. In Arabia they make Tents of Cloth compiled of Asles and Goats hair, and it seemeth that Cilicia received his name of this kinde of Cloth, which is called in Latin Ciliciun, or else that this Cloth was first invented among them, whereupon it received that denomination; but among the Grammarians and Poets, Lana Caprins (Goats wooy) grew to a proverb, to signifie a thing of no weight or moment, as it is in Horace;

After rixatur de lana soci caprina, Propagnt suis armatus

There are another sort of Goats which are called Syrian Goats, and of some Mambrin Goats, and most commonly Indian Goats, because they are most noble in that Country, and that in Cythia; and likewise in the Region of Damias, for Mambrin is a Mountain near Hebron, from whence it is probable, that the word Mambrin cometh; wherefore I have thought good to express the figure both of the greatest of that kinde, as it was taken by Antonius Maja Brasovals, Physitian to the Noble Duke Hercules de Esre, as Ferraria, by one of these Goats brought thither to be seen.
These figures were found pictured in an old manuscript in Germany, which book did intreat of the Holy Land. The greater Goat I conjecture to be the same which Les Afer calleth Adimain, and is found in Mauritania, being as tall as an Asle, and hath very long broad ears pendant, and under them next to their necks two things like dugs or paps, which hang down from their throat, and there are most fruitful in milk, and with these the Lybians plow, and keep them in stead of Kie and other Cattel, for they milk them, and of their milk make Butter and Cheese. Their hair is very short, and they very gentle and familiar; so that the said Les affirmeth, that when he was a young man, and loved those rath and wanton sports wherewithal youth are delighted, he got upon one of these, and rode quietly upon the back of it above a quarter of a mile. They keep, being wilde, in the Deserts of Lybia, and if at any time they fly or wander into Numidia, and the fields thereof, it is accounted by the people and inhabitants a prodigious and monstrous thing.

The latter kind I conjecture to be the right Mambrine or Syrian Goat, although some of the late writers call it an Indian Goat; the reason is, because (as hath been said) they call all strange beasts by the names of Indians, if they finde them not in their own Countrey. The ears of it are large and broad, as the picture described, and such ears have the Goats of Gallia-Narbon, being at the least as broad as a mans span; they are of colour like wilde Goats, their horns very sharp, and standing not far distant one from the other, and have fiones like a Stone Horse, being in all other parts not unlike to the vulgar and common Goat.

Some curious herdsmen (as Alcemon and Archelaus) have delivered to the world, that Goats take breath through their ears; and Philes approveth their conceit, because he had seen an experiment of a Goat, that his mouth and nostrils being flopped shut, nevertheless he seemeth not to be troubled for want of breath: and for this also is allledged the authority of Oppianus, who writeth of certain Goats (called Agari) that they have a certain hole or passage in the middle of their head, between the horns, which goeth directly unto the liver, and the fanned slopped with liquid Wax, suffocateth or sufficeth the beast.

If this be true (as I would not any way extenuate the authority of the writer) then it is very likely that some have (without difference) attributed to all kinds of Goats that which was proper to this kinde alone, for the former opinion is not reasonom: Nevertheless I leave every man to his own liberty of believing or refusing.

There is no beast that breatheth so perfectly and so sure as a Goat for he is not only holp in this sense with his ears, but also hath the Organ of hearing in part of his throat, wherefore when the Egyptians describe a man which hath an excellent ear, they express him by a Goat. There are some kindes of Goats in Libya which have whole hoofs like a Horse, and these are only found in that Region. In all other Nations of the World they are cloven footed.

The use of their several parts is singular, and first of all to begin with their skin, the people of Sardinia (as faith Nymphius) nourish Goats for their skins, whereof they make them garments, being dressed with the hair upon them; and they affirm strange virtue in them, namely, that they heat their bodies in the Winter, and cool them in the Summer; and the hairs growing upon those skins are a cubit long, therefore the man that weareth them in Winter time, turneth the hairy side next to his body, and is warmed by it; and in Summer the raw side, and to the hair keepeth the Sun from piercing his skin and violence of heat: And this also is usit in Suecia, where the women wear garments of Goats hair in the Winter, and also make their childrens coats thereof, according to Virgils laying in Maroeto.
The Sandals which men were wont to wear on their feet in the East Countries, were also made of Goats skins, and there was a custom in Albus, that men for honour of Bovillus, did dance upon certain Bottles made of Goats skins, and full of wind, the which were placed in the midst of the Theatre, and the dancer was to use but one leg, to the intent that he might often fall from the slippery bottles, and make the people sport; whereunto Virgil alluded this saying:

Mullibus in pratis antillos salutre pro utris.

There is also a Ladanum tree in Carmania, by the cutting of the bark whereof there issueth forth a certain gum, which they take and preferveth in a Goats skin; their use in War wherein the Soldiers were wont to be all Winter, and therefore we read that Claudius the Emperor had given him thirty tents of Goats skins for his Soldiers attend upon the Judges, and the Mariners also by these defended themselves from the violence of storms upon the Sea; and so I leave this part of the beast, with remembrance of that which is written in holy Scripture, Heb. 11. that the people of God in ancient times did flee away from the rage of superstition, being anapparelled, or rather meanly disguised in Goat skins, being charitably helped by the beasts, that were cruelly put to death by wretched men.

In the next place the milke of Goats cometh to be considered, for that also hath been, is, and will be of great account for Butter and Cheefe, which the Writers call Tropazia, and Virgil celebrateth the singular commendation both of the Wool and of the Milke, in these Verses;

Hae quoque non cura nos levior tuenda,
Nec minus usus erit, quamvis Miletia magno
Vellera mutavent Tyrios incella subures.
Denitor biso /abeles, biso lario copia laetis;
Rgo magis egressus summavertis ubere multibus,
Letis magis præ sistis manubunt flamina manuar.
Nec minus interea barbat, intanque menta
Cynipit tandent hiroi sestusque commantes
Utsum in Castrorum & miseris velamina natias.

Therefore their milk is profitable for Butter, although inferior to a Cows, yet equal to a Sheeps, and the herdmen give their Goats salt before they be delivered of their young, for this maketh them to abound in milk. Others with Goats milk preferve their Wine from corruption by sourness, first they put into their Wine the twentieth part so much as is of the Wine, and so let it stand in the same vessel covered three or four days, afterward they turn it into a sweet and fresh vessel, and so it remaineth preferve from all annoyance of sourness.

Cheeses made of Goats milk were wont to be called Velabrenses Caöfè, because amongst the Romans they were made at Velabrum, and that with sioak, whereupon Martial made this Dijtoban;

Non quemcumque socum, nec sumum caæsæ omnem,
Sed Velabrensem qui bilis, ipsa sapit.

Aristotle and Julius Pollux do commend the Sicilian Cheefe, which was made of Sheep and Goats milkie together, and by Athenæus it is called, Capæs Tremilicis, and by Simonides Strumilus. In Hereta of Hebrietia there are excellent Cheeses made of Goats milk and Cow milk mixed together. The milk also of a Goat mixed to a Womans milk is best for the nourishment of man, because it is not too fat; yet Galen faith, if it be eaten without Hony, Waters, and Salt, it curdleth in the belly of a man like a Cheefe and inflameth him; and being so used it purgeth the belly; from thence came the fiction of the Poets, that Jupiter was nourished by a Goat, and that afterward in his War against the Titans or Giants, he flew that Goat by the counsel of Themis, and wore her skin for an armor, and so having obtained victory, placed the Goat among the Stars, whereupon she was called Aix ourania, a heavenly Goat, and so Germanicus Cæsar made this Verse upon him, and Jupiter himself was called Aigiochus.
The History of Four-footed Beasts.

Of the flesh of a Goat.

The flesh of male Goats is not wholesome for man's body, but the flesh of a female in the Spring and Fall of the leaf, by reason of the good nourishment may be eaten without danger. They are worse then Bull-beef, because they are sharper in concoction and hotter, wherefore if they digest not well, they increase melancholy. The liver of a Goat being eaten, doth bring the falling sickness; yet being falten a good space, and then sod with Vine-branches, or other such broad leaves, to keep them sunder, and some Wine poured into the Water when they almost sod, they become very which and delicate meat; and therefore the Athenians praised the Laconians, that in their feast they call *Cotpis*, they gave a Goat; and held it for a divine meat.

Alfo Glaucebeus an Academick of Corinth, relates of a certain Thespian Champion, which excelled in strength all the Champions of his time, and that he did eat continually Goats flesh, for it is very strong, and remaineth a longfeason in the body, and doth much good being digested, notwithstanding the strong and rank smell thereof, otherwise it is dangerous, as is already said, therefore *Fiesa* having commended the *Kyd*, when he cometh to speak of the *Goat* he writeth thus:

*Cum male olis secut, fit jam super improbus, obfit,*
*Et cadat ante fucus victima Baccho tuo.*

But *Pliny* affirmeth, that if a male Goat eat Barley bread, or Parchmes washed, the same day that he is killed, then there is no poyson in his flesh: the stones of a Buck goat, retfift concoction, and beget evil humors in the body: wherefore such a banquet is called in Greek (Trogoi Hulbertas) for Goats after their copulation, have an evil flesh, not fat, but dry, and the remedy to make their flesh sweeter, is to geld the male when he is young and tender, for his temperature is amended by a cold and moist conformation.

The Inhabitants of Portugal eat Goats flesh, and account it delicate meat; especially such as dwell in the Mountains. In Germany they make of it a kind of meat which is called *Klothüfft*, and is prepared in this manner: they take a Goats heart newly taken out of the body, and flit it into small pieces, and break fix Eggs upon it, and the crumbs of white bread, seasoned with Spices and Saffron, and fo put into a bag, and sod or roasted; afterward they are served upon the table, and fpreaded over with Kitchin Sugar.

The guts being falten are called (Hille) which the French flufe like puddings, and call them (Sauceptif) from whence cometh our English Sawfludge, of this fewet and fat of Goats are the best candles made, because it is hard and not over liquid. The bloud of a Goat hath an unpeakeable property, for it stroueth rufli iron better then a file, it also fortheeth an Adamant stone, and that which no fire is able to melt, nor iron to break, being of such an invincible nature, that it contemneth all violent things, yet is it difsolved by the warm bloud of a Goat. The Load-stone draweth iron, and the same being rubbed with garlick, dyeth and lofeth that property, but being dipped again in Goats-bloud, reviveth and recovereth the former nature.

*Ojbanos* prescribeth for a remedy of love, the urine of a Goat to be mingled with Spikenard, and so drunk by him which is overcome with that passion, affuring him thereby that they shall fall in as great loathing as ever before they were in loving. With the hoofs of a Goat they drive away Serpents, and also with the hairs by burning and perfuming them in the place where the Serpents lodge.

With the horns of Goats they make bowes; for in Delos there was dedicated the horn of a Goat, which was two cubs long and a span; and hereat ought no man to wonder, for that noble Bow of *Pandarus*, which *Homer* commendeth, was made of a horn of a female Goat.

*Apriancus* declareth, that in ancient time they made fruitful their Vine-yards by this means: they took three horns of a female Goat, and buryed them in the earth with their points or tops downward, to the root of the Vine-rocks, leaving the hollow tops, standing a little out of the ground, and so when the rain defended, it filled the horns, and foked to the root of the Vine, perfwading themseles thereby that they received no small advantage in their Grapes. The gall of a female Goat put into a vessel, and set in the earth, is said by *Albertus* to have a natural power to draw Goats unto it, as though they received great commodity thereby. Likewise, if you would have white hairs to grow in any part of a Horfe; shave off the hair and anoint the place with a gall of a Goat, so shall you have your defire. The *Sabean*, by reason of continual use of Myrhe and Frankincense, grow to a loathing of that favour: for remedy of which annoyance, they perfume their houses by burning *Rorax* in Goats-skins. And thus much for the several parts of a Goat.

There were in ancient times three kindes of Heard-men which received dignity one above another; the first were called (Bucellii) Neat-heard, because they keep the greater Cattel; the second were (Opiliones) Shepheardes, of their attendance upon Sheep: the third, laft, and lowest kind, were termed *Arpal*, and *Capratis*, that is, Goat-heard, or Keepers of Goats, and such were the *Loctrefians*, who were called *Odace*, because of their filthy smell, for they had the most part of their conversation among other Beasts.

A Goat-heard or Keeper of thefe Cattel must be sharp, stern, hard, laborious, patient, bold and cheerful, and such a one as can easilie run over the Rocks through the Wilderness, and among the bushes without fear or grief, so that he must not follow his flock like other heards, but go before them: yet must alfo be light and nimble, to follow the wandering Goats, that run away from their fellows, and so bring them back again, for Goats are nimble, moveable, and incontinent, and therefore
Of the Goat.

therefore apt to depart away, except they be restrained by the herd and his Dog. Neither have Goats a Captain or Bell-bearer like unto Sheep, whom they follow, but every one is directed after his own will, and herein appeareth the pride of this Beast, that he scorneth to come behind either Cartel, or Sheep, but always goeth before; and also in their own herds among themselves, the Buck goeth before the female for the reverence of his beard, (as Albiones faith) the labour of the Goat-herd must be to see his Cartel well fed abroad in the day time, and well foulded at night; the first rule therefore in this husbandry is to divide the flocks, and not to put any great number of them together, for herein they differ from Sheep, who love to live together in multitudes, as it were affecting society by which they thrive better, and mourn not so much as when they are alone: but Goats love singularity, and may well be called Schifmatics among Cartel, and therefore they thrive best laying together in small numbers, otherwise in great flocks they are soon infected with the pestilence, and therefore in France, they care not to have Magna Greges, sed places: not great flocks, but many.

The number of their flock ought not to exceed fifty, whereupon Varro writeth this story of Guionius a Roman Knight, who had a field under the Suburbs containing a thousand Acres of pasture ground, who seeing a poor Goat-herd bring his Goats every day to the City, and received for their milk a penny a piece, he being led with covetousness, proposed to himself this gain, that if he flored his field with a thousand Milch-female-goats, he also should receive for their milk a thousand pence a day; whereupon he added action to his intent, and filled his field with a thousand Goats, but the event fell out otherwise then he expected: for in short time the multitude infected one another, and so he lost both milk and flesh: whereby it is apparent, that it is not safe to feed great flocks of thefe Cartel together.

In India in the Region Céntis, the Inhabitants give their Milch-goats dryed fishes to eat, but their ordinary food is leaves, tender branches, and boughs of trees, and also bushes or Brambles; whereupon Virgil writeth in this manner:

_Palmarum ver'à falsas & jammas Lyceis,
Herbertique tubos & amantes arbus dumos._

They love to feed on the Mountains better then in the Valleys and green Fields; always striving to lick up the Ivie or green Plants, or to climb upon trees, cropping off with their teeth all manner wide herbs, and if they be restrained and enclosed in fields then they do the like to the plants that they finde there; wherefore there was an ancient law among the Romans, when a man let out his ground to farm, he should always condition and except with the Farmer that he should not breed any Goat in his ground, for their teeth are enemies to all tender plants: their teeth are also excitable to a tree, and Piny and Varro affirm, that the Goat by licking the Olive-tree maketh it barren; for which cause in ancient time, a Goat was sacrificed to Minerva to whom the Olive was saccéd.

There is no creature that feedeth upon finch diversify of meat as Goats, for which cause they are elegantly brought in by Esopo the old Poet, bragging of their belly dear wherein they number up above five and twenty several things, different in name, nature, and taste; and for this cause Eulathibus defended by strong argument against Difarius, that men and cartel which feed upon divers things, have less health then those Beasts which eat one kind of fruit alone. They love Tamarisk, Aldern, Elm-tree, Affararback, and a tree called Aletarum, which never beareth fruit but only leaves: also three-leaved-grafs, Ivie, the herb Luta, which groweth no where but in Arabia, whereby it cometh to pass, that many times the hair of Goats is found in the gumb called Ladaum, for the peoples greedy defire of the gumb, caueth them to wipe the juice from the Goats beard.

For the increas of milk in them, give them Cinquefoyl five days together before they drink, or else bind Dittany to their bellies, or (as Lacuna translatheth the words out of Alcmeon) you may lay milk to their bellies, belike by rubbing it thereupon. The wilde Goats of Crete, eat Ditany among against the strokes of Darts: and Seraption avoucheth by the experience of Galen, that Goats by licking the leaves of Tamarisk, lose their gall; and likewise that he saw them licking Serpents which had newly lost their skins, and the event thereof was, that their age never turned or changed into whiteflies and other external figures thereof.

Alfo it is delivered by good observation, that if they eat or drink out of vessels of Tamarisk, they shall never have any Spleen: if any one of them eat Sea-holly, the residue of the flock stand still and will not go forward, till the meat be out of his mouth. The Cremaurianus say that Chimaera was killed by Bellerophon the son of Cléomen, in the Mountain Lyceus, and the reason hereof is, that the Poets signified Chimaera to be composed of a Lyon, a Dragon, and a Goat, and in that Mountain all those three were kept and fed: for in the top were Lyons, in the middle were Goats, and also at the foot thereof Serpents. If they suffer heat or cold they are much endangered, for such is their nature that they avoid all extremity, and the females with young are most of all molested with cold; if they have conceived in the Winter, then many Abortions or calling their young followeth.

In like fort it happeneth if they eat Walnuts (and not to their full) unripe, therefore either they must be suffered to eat of them to satiety, or else they are not to be permitted to them.
The History of Four-footed Beasts.

If at any time the eat Scammony, Hellebore, Lefferon, or Mercury, they are much troubled in their stomach, and lose their milk, especially the white Hellebore. The Publicans in the Province of Crete, have all the government of the pastures, and therefore they permit not Benzwine to grow in their Country, finding thereby great gain; and if at any time their Sheep or Goats meet with any branch thereof, they eat it greedily, but the Sheep immediately fall to sleep, and the Goats to Needing. "Epeolobros and Sabine are poiyon to Goats. The Herb called in Greek, Rhodo dendron, and may be Englished Rose-tree, is poiyon to Goats, and yet the fame helpeth a man against the venome of Serpents.

The prickly or spindle tree (called also Euphorbus) which growth in the Mount Oceusius called Or dyne) about the bigness of a Pine-apple-tree, having soft leaves like the fame, and it budoth in September, and the flower is like a white Violet flower, this killeth Goats, except they be purged with black Hellebore immediately after they have eaten thereof. The Egyptians when they will describe a man devouring Sheep or Goats, they picture the herb Carilago or Canyza, because it also kill eth them. Also as Osoriffipus affirmeth they avoid Cumin, for it maketh them mad, or bringeth upon them Lethargies, and such like infirmities.

He avoideth also the spettle of man, for it is hurtful to him, and to the Sea-fifth Scolopendra and yet he eateth many venous herbs and growtheth fat thereby; and this also may be added, that Goats grow fat when they are with young, but by drinking of Honey they are weakened, and in danger of death. Concerning their drink, it is necessary for a skilful Goat-herd to observe the nature of the beast, and the belt time and place of their watering, according to the saying of Virgil:

---

Jubes frondentia Capris
Arbata sufficere, & floribus praeda recentes.

In the Summer they are to be watered twice a day, and at other times once only in the afternoon; but it is reported of the Goats of Cephalonia, that they drink not every day like other Goats, but only once or twice in fix months, and therefore they turn themselves to the winde or cold air of the Sea, and by yawning, suck into their mouths or bellies that which serveeth them in stead of water. When the Sun declineth, they ly and look not upon one another but on the contrary, and they which lodge in the fields take up their rell amongst their acquaintance. But if they be fed to fold or houfe, they remember it, and repair theire of their owne accord, which thing causeth the Poet to write in this manner:

Arque ipsa memores reducunt in tela, susque
Ducent, & gravido superant vicum, invenere

Concerning their stables or houfes to lodge in, for their defence against the cold, the diligent herd-man must observe, that nothing must be laid under the Goat to ly upon, and it is best to make his stable upon stones, or some other hard floor, and the same must be kept and turned dry every day from the annoyance of their dung, for that hurtest their heads. It is good to set the window of their stable to the Sun, and from the winde, according to the counsel of Virgil:

Et stabula a ventis hyberno opponere soli,
Ad medium conuerfa diem, cum frigidus sim
Jam cadit extremoque irrotat Aquarum anno.

Although Goats be stronger than Sheep, yet they are never so found, for in buying and selling of them, he was never accounted a wise man, that either hoped to buy, or promised to fell without fault. It was sufficient in open Market places, when and where Goats were to be sold, to promise, Hodie capras rete effe & bibere poffe & eam licite habere, that is, that the day of their sale they were well, and could drink, and they were his own, and it was lawful for him to have them.

But farther no man was urged, for (Archeclus faith) they are ever Furtivating, because their breath is hotter, and their copulation more fiery, and therefore their herdmens must not be unprovided of good and sufficient medicine to help them, and not only against their natural diseases, but also their continual horn-wounds which they give one another by their often fightings, and also when they aspire to climb upon steep and craggy pointed rocks or trees, they often fall and are wounded, in such cases they have no such Phylistian as their Keeper, whose bag and box must be as an Apothecaries shop to yeild continual remedies to all their grievances.

The belt means to preserve them in health, next to a good diet and warm lodging, is, to plant

Florentius.

Affen near to their stabling houes. And their continual Ague spoken of before is profitable to their body, for when it departeth and leaveth them, presently they perih and dy. Sheep and Goats have a natural forelight of the Pelhine or Marrain, of Earth-quantes, and of wholesome temperate weather, and of abundance and store of fruits; but neither of both shall be ever infetted by the Pelhine, if you give them the powder of a Storks Ventricle or maw one spoonfull thereof in water every day.

Quemilus.

And whereas all other kinde of Caftel when they are sick, confume and pule away by little and little, only Goats perih suddenly, insomuch as all that are sick are unrecoverable, and the other
The flock must be instantly let bleed and separated before the infection overspread all; and the reason of their sudden death, is because of their abundance of food, which ministrith speedy flux for the fire of their diseases to burn. At such times they must not feed all the day long, but only thrice or four times a day be led forth to grafts, and brought in again to their mangers.

If any other sicknefs annoy them, they are to be secured with Reed, and the roots of white Thorn beat together with iron Pellets, and mingled with rain Water; and so given to the Cattel to be drunk: but if this medicine help not, then either fell them away, or else kill them, and salt them till you mean to eat them. Goats are not troubled with Lice or Nits, but only with Tickes.

There is a certain Wine called Melampodion, the report is, that one Melampus a Shepherd had it revealed unto him, to cure the madness of Goats: it is made of black Hellebore, and Goats milk. Goats are also mollified and subject to the falling sicknefs, and this is known by their voyce and cold moist brains; and therefore the Roman Priests were commanded to abstain from touching such Goats.

They are also troubled with the Gout; the Female-goat caffeth the pain of her eyes by prick- ing them upon a Bull-ruth, and the Male-goat by prick- ing them upon a Thorn, and so pitifous matter followeth the prick, whereby the sight is recovered without any harm done to the Apple; and from hence it is supposed, that the Physicians learned their Parakentesis pricking of fore eyes of the Needle.

The Females never wink in their sleep, being herein like the Roe-bucks. There are certain Birds (called Capri-mulgi) because of their sucking of Goats, and when these or any of them have sucked a Goat, they presently fall into a blinde. If at any time the be troubled with the Dropefly, an issue must be made under her shoulder, and when the humour is avoided, stop up the hole with liquid pitch. They drink the feed of Sefelis to make them have an eafe delivery of their young, and for that caufe Columella prescribed a pinte of sod Corn and Wine to be infused into their throats in that extremity; or some other medicines being like unto Sheep, we will reserve their description to that History.

These Goats have in ancient times been used for Sacrifices, not only by the Sovereign command of the Almighty God, but also by the practice of Heathen people; for their perfect sacriifce which consisted of a Ram, a Goat, a Hog, and a Bull, was called Hecatombe and Trytis.

The reason why Swine and Goats were sacrificed among the Heathen, was, because the Swine dig up the earth with their noyes, and root out the Corn; they were sacrificed to Ceres; and the Goats spoil the Vines by biting, for which caufe they sacrificed him to Bacchus; that to the drunken God might be pacified with the blood of that Beast, whose hallowed grapes he had devoured; whereupon the Poet writeth thus:

**Sui dederat ponsas : exemplo territus hortum**
**Palmite debueras abstinentia, Capre.**
**Quem squalens aliquis dentes in voto prementem,**
**Talia non tacent dixit dolore dequit :**
**Rube caper vitem, tamen hinc sum flabis ad aras,**
**In tua quadflargi cornua possis, quir.**

When they sacrificed a Goat in Graeea, they tried him by giving him Peafe or cold water to drink, which if he refused, they also refused him for sacrifce, but if he tasted it, they took and offered him.

**Martial** having seen, or rather heard of a Countryman, when the Beast was flain, the Priest commanded the poor Countryman to cut off the fones, _Teter ut immacule carnis abiret ador_, to let the unwholefome vapour of the unclean flefh out of the body. Afterward the Priest being busy about the Sacrifice, and flooping down to the carcas of the Beast, his cords appeared behind him betwixt his legs, the which when the Countryman saw, he suddenly cut them off with his sharp knife, thinking that the ancient ceremony of fasting required this to be done: whereupon Martial wrote this Epigram,

**Sic modo qui Tuscus fuerat, num Gallus aruifex,**
**Dum jugulus biroim, faucis es ispe caper.**

The _Mundifians_ worshipped Goats both males and females, because as they imagine they were like to their God Pan. The _Egyptians_ also deified the male Goat for his genital members, as other Nations did Priapus. The _Gentiles_ had also a brazen Goat, whereupon _Venus_ rode in brafs, which picture they called (Panæmon) and _Venus_ (Epitropia; ) I think that last could not be better described, for venereous persons will suffer their whore to do any disgrace unto them, for their carnal pleasure. And thus much for these male and female Goats, now follow the stories of the wild Goats and the Kids in order.
Here is no man that shall see this Beast, but will easily yield unto my opinion, that it is a Goat, and not a Deer, the hair, beard, and whole proportion of body most evidently demonstrating so much, neither is there any difficulty herein, except for the horns which turn forward at the point, and not backward, this thing yet swarveth not so much from a Goat as from a Deer, and therefore can be no good reason to alter my opinion. There are of this kinde, as Doctor C. affirmeth, in the Northern part of England, and that figure which is engraved at Rome in a Marble pillar, being a remembrance of some Triumph which Pliny seteth forth, differeth in no part from this Beasts description and proportion: Yet I take it that it may be brought into England from some other Nation, and so be seen in some Noble mans house, but that it shoulde be bred there, I cannot finde any monument of authority, but I rather conjecture the same to be bred in Spain. Of these kindes there are three Epigrams in Maritials, whereby is declared their mutual fights killing one another: their fear of Dogs, and their fleth desired both of men and beasts.

The first Epigram describing their wilful fight, one killing another, and so saving a labour to the Hunter, for they kill themselves to his hand, is thus:

Frontibus adversiis molles concurrerere damas
Vidimus; & seti forte jacere part.
Spectauere Canis praelam, suspauit; superbus
Venator, curo n сравнisse suo.
Unde leves animae tanto calliere furare?
Sic pugnant Tauri, sic coeberere viri.

The second Epigram is a Dialogue speaking to the Emperor, who took care to encrease his game, seeing not only men were enemies to them, but they also to one another, whereupon he wrighteth this diflusion:

Aspicis imbelles tentent quum fortes dama
Prehita; tam timidis quaem sit ira feris.
In mortem partis concurrerere frontibus audent,
Vis Caesar damis parare? mise Canes.

The third Epigram is a complaint of their weak and unarmed state, having neither teeth like Bores, nor horns like Harts to defend themselves, but lie open to the violence of all their enemies:

Dente timetur Aper, defendat corum servorum,
Imbelles dama quid mihi praedam susus?

These are of a whitish yellow colour on the back, and are nourished sometime for the pleasure, and sometime for the profit of their pottage, for they will suffer hunting like a Deer, and also he named for milk like a Goat. And hereof I finde no other especial mention among Authors, beside that which is already rehearced.
Of the WILDE GOAT, and the Figure of the Helvetian, Alpian, WILDE or ROCK-GOAT.

Wilde-goats are transfigured into many similitudes, and also dispersed into many Countries beyond the Seas and in the Alps, the picture of the Alpian Wilde-Goat is here set down. They are also to be found in Italy, in the Mountains of Fisorda and Tetrica, in so much as the same Goats which are nourished there, are said to be derived of the same Goats, these are called Cythian Goats, because they are bred in the Mountains of Deis called Cythara. There are of these which are found in the tops of the Libyan Mountains as great as Oxen, whose shoulders, and legs abound with loose flagggy hair, their thins small, their faces are round, their eyes are hollow and hard to be seen.

Their horns crooking backward to their shoulders, not like other Goats, for they stand far distant one from another; and among all other Goats they are indiscernible with a pent singular dexterity of leaping, for they leap from one top to another, standing a great way alander, and although many times they fall down upon the hard rocks, which are interspersed between the Mountains, yet receive they no harm: for such is the hardnefs of their members, to resist that violence, and of their horns to break their falls, that they neither are offended thereby in head nor legs.

Such are the Goats of Seradum as Cato writeth, which leapeth from Rock to Rock, above three-score foot: of this kinde are those Goats before spoken of in the History of the same Goat, which are thought to breathe out of their ears, and not out of their nostrils; they are very swift and strong horned: the love betwixt the Dams and the Kids in this kinde is most admirable: for the Dam doth most carefully educate and nourish her young; the young ones again, do most thankfully recompence their mothers carefulness, much like unto reasonable men, which keep and nourish their own Parents in their old decrepit age, (which the love of God and nature doth enjoy them) for satisfaction of their own education; so do these young wilde Goats, toward their own mothers: for in their age they gather their meat and bring it to them, and likewise they run to the rivers or watering places, and with their mouths suck up waters, which they bring to quench the thirst of their Parents: and when as their bodies are rough and ugly to look upon the young ones lick them over with their tongues, to making them smooth and neat.

And, if at any time the Dam be taken by the Hunters, the young one doth not fortake her till he be also inflamed: and you would think by the behaviour of the imprisoned Dam towards her young Kids and likewife of the Kid towards his Dam, that they mutually contend one to give it self for the other: for the Dam foreseeing her young one to hover about her in the hands of her enemies, and continually to follow; with lighs and tears feemeth to wish and persuade them to depart, and to save themselves by flight, as if they could say in the language of men, "Fugite filii inflos vextatis, nem me miferam capit materum ripine privata: that is to say, Run away my sons, save your selves from these harmful and greedy Hunters, lest if you be taken with me, I be for ever deprived of the name of a mother. The young ones again on the other side wandering about their Mother, bleat forth many a mourful song, leaping to the Hunters, and looking in their faces, with pitiful aspect, as if they said unto him, We adjure you (oh Hunters) by the Maker of us all, that you deliver our Mother from your thraldom, and instead of her take us unhappy children, bend your hard hearts, fear the laws of God which forbideth innocents to be punished, and consider what reverence you owe to the old age of a mother; therefore again (we pray you) let our lives satisfy you for our Dam's liberty. But poor creatures, when they see that nothing can
move they unexorable minde of the Hunters, they resolve to dye with her whom the cannot deliver, and therupon of their own accord, give themselves into the hands of the Hunters, and so are led away with their mother.

Concerning the Lybian Goats before spoken of, which live in the tops of Mountains, they are taken by nets, or snares, or else killed by Darts and Arrows, or some other art of hunting. But if at any time they descend down into the plain fields, they are no less troubled, then if they were in the waves of some great water. And therefore any man of a slow pace may there take them, without any great difficulty.

The greatest benefit that ariseth from them is their skin and their horns; with their skins they are clothed in Winter time against Tempelts, Frosts, and Snow, and it is a common weed for Shepherds and Carpenters. The horns serve them in stead of Buckets, to draw water out of the running streams, wherewithall they quench their thirst, for they may drink out of them, as out of cups; they are so great, that no man is able to drink them off at one draught, and when cunning artificers have the handling of them, they make them to receive three times as much more.

The self same things are written of the Wilde Goats of Egypt, who are said never to be hurt by Scorpions. There is a great City in Egypt (called Cuprau) who were wont to be much addicted to the worship of Isis, and in that place there are great abundance of Scorpions, which with their stings and poisons, do oftentimes give mortal and deadly wounds to the people, whilst they mourn about the Chapel (for they worship that Goddess) with funeral lamentation: against the sting- ing of these Scorpions, the Egyptians have invented a thousand devises, whereof this was the principal: At the time of their assembly, they turn in wilde female Goats naked among the Scorpions lying on the ground, by whose presence they are delivered and escape free from the wounds of the Serpents, whereupon the Capiter do religiously consecrate these female Goats to divinity, thinking that their Idol Isis did wholly love them, and therefore they sacrificed the males, but never the females.

It is reported by Plutarch, that wilde Goats do above other meet love meal and figs, wherefore in Armenia there are certain black fishes which are poisons; with the powder or meal of these fishes they cover these figs, and cast them abroad where the Goats do haunt, and asoon as the Beasts have taffed them, they presently dy. Now to the Wilde Goat before pictured, called in Latin, Capricornus, and Caupronus; and in Greek, a Cacos, and Aegistro, and of Homer Ixanu; of the Germans, Gom- mel, or Gemini; the Boemians which speak Italian, call it Camalco; the Pomerians, Carpemontir; the Po- bernian, Dzyklop; the Bob. miants, Kopynitsk Kolli; is that to say, a Carinthian Goat, because that part of the Alps called Carinthia is near bordering upon Bohemian.

Bellusins writeth, that the French call him Chambrin, and in their ancient tongue Tard, this is not very great of body; but hath crooked horns which bend backward to his back, wherupon he flayeth himself when he faileth from the slippery Rocks or Mountains.

These horns they are not fit to fight they are so small and weak, and therefore nature hath bestowed them upon them for the cause aforesaid. Of all other Goats this is the feaft, it hath red eyes, but a quick eye-light, his horns are black, being nine or ten fingers long, and compassed about with divers circles, but at the top none at all, which is sharp and crooked like a hook. They arise at the root Paradinale, that is by equal distance one from another, being hollow the breadth of ones thumb, the residue fold like the Harts.

The Males in this kind differ not from the Females, neither in horn, colour, or proportion of body: they are in bigness like the common Goat, but somewhat higher. Their colour is betwixt brown and red. In the Summer time they are red, and in the Winter time they are brown. There hath been seen of them which were white and black, in distinct colour one from another: and the reason hereof is, because they change colour many times in the year. There are some of them altogether white, but these are seldom found; they inhabit for the most part the Rocks or Mountains, but not the tops like the Ieeks, neither do they leap so far as the foraid Goats. They come down sometim to the roots of the Alps, and there they lick land from the Rocks, like as the Villagetame-goats to procure them an appetite.

The Helvetians call these places in their natural tongue Faltizen, that is Salaris: about these places do the Hunters hide themselves, and secretly with guns, bows, or other such instruments, they suddenly flock and kill them. When they are hunted they creep upon the steepest Rocks, and most inaccessible for Dogs; by that means providing their own safety: but if the Hunters persist after them, and climb upon the Rocks with hands and feet, they leap from thence, from stone to stone, making their way to the tops of the Mountains, so long as they are able to go or climb, and then they hang by the horns of their head, as if they were ready to fall, which caused Martial to write thus:

Pendentum famito Capronam de rupi video
Catauran iiperi, decisit illa Canis.

Where the Poet attributeth that to the Roe which belongeth to the Wilde Goat, and there they hang many times till they perish, because they cannot loose themselves again, or else they are shot with Guns, or fall down headlong, or else are driven off by the Hunters. From the day of Saint James they use themselves to the coldest parts of the Mountains, that by degrees they may be accustomed to the cold. I have known some
Of the Goat.

of their made came, so that they have descended down to the flocks of tame Goats, whom they do not avoid like the Iex.

From thefe wide Goats hath that fame herb (called Doronicum) and of the Graecian, Doronicum, given a name among the German, Germeleb Wort; that is, Wilde-goats-herb, being excellent to cure the Colick, and therefore highly eftemed among the Arahians, Graecians, and Moftamaniats. It is hot and dry in the second degree; and the Country people in Helvetia do give it against dizziness in the head, because thefe wide Goats oftentimes feed upon the same, and yet are never troubled with that infirmity, although they run round about the Mountains.

There are Hunters which drink the bloud of this Goat coming hot out of his body, immediately after the wound given, against that ficknefs. The fat and milk of a wide Goat mingled together, have cured one long fick of the Putick. The wide Goats of Greet, being wounded with poiyoned darts, run presently and eat of the herb Dittani, by the verue and juyce whereof, they not only avoid the arrow which ficketh in their skin, but also death, and cure the poiyon.

Of the KID.

Having formerly discoursed of several kindes of Goats, now it followeth that we shold also interest of the Kid, which is the iflue of a Goat; and fiirth of the several names thereof. It is called in Hebrew, Eged; which because it Signifieth also a Lamb, they put unto it Haijim, and the plural Masculine is Gediain, and the femine Geduth. Gen. 35, where the Chaldean transla- tion hath Cadex; the Persians, Butakale, or else Cadali basan; for the Feifians render Cadali for Sketer; in Hebrew, Bahan, for Jifim. The Sepuqgnts render Erifon; and vulgarly at this day, the Graecians call him Erifon; but the truth is, that Erifon are Kids of three or four months old, and after that time until their procreation, they are called Chimeras; the Latins call him "Nelido abedendo," from eating (as Isidens faith) for then their flefs is tender and fat, and the taft thereof pleasant. The Italians call it Cavette, or Capette, and Caracello; the Egyptians which speak Italian, Ucel; the Spaniards, Cabrito; the French, Chereus; the Germans, Gife; or Kiflai; the Po- lonians, Costel.

It was a question whether nature would finish her parts upon a young one out of the dam's belly, wherefore a triall was made upon a Kid which never faw the dam, for upon a fcafon a defection was made upon a Female-goat great with young, and out of her belly was a young one taken alive, fo as it could never fee the mother; the fame Kid was put into a houfe where there were many bowls full of Wine, Oyl, Milk, and Hony, and other liquid things; there also lay besides him divers kindes of fruits, both of the Vine, of Corn, and of Plants; at laft this Kid was seen to arife and fland upon his feet, and as if some bod have told him that his legs were made to walk upon, he flook off all that mouthines which he brought with him out of his mothers belly, afterward he scratched his fide with his foot, and then went and smelted at all the former veffels, and at laft coming to the milk bowl, he flapped and licked thereof, which when the beholders law, they all cryed out that Hippocrates rule was moft true, Animantium natura effe indicata, that is to fay, the natures of creatures are not formed by art, but of their own inclination.

There is nothing more wanton then a Kid, whereupon Ovid made this verfe:

Spelendis vitro, tenero lascivior bado.

They often jump and leap among themselves, and then they promise fair weather, but if they keep continually with the flocks, and depart not from their mothers, or continually fwick or lick up their meat, they fore-flew a fiorum, and therefore they must be gathered to their folds, according to the Poets faying;

Sic fine fine modoque
Pabula delibet cum tuis vesper adire
Compellat caulis, monstrabunt adsive nimbor.

If Geefe fwallow the hairs of Kids or Goats, they dy thereof. Kids are not to be seperated from their Dams, or weaned till they be three months old, at which time they may be joyned to the flocks: they are nourifhed when they are young after the fame manner as they be at a year old, ex- cept that they must be more narrowly looked unto, left their laficuliousness overthrow their age: and besides their Milk, you must give unto them Three-leaved-grafs, Ivye, and the tops of Lenthil tender leaves, or small twigs of trees: and whereas commonly they are brought forth in twins, it is bef, to choose out the strongest headed Kid for the flock, and to fell the other away to the Butchers. Out of the rennet of the Calves or Kids is the Coagulation.

There was a certain law (as appeareth by Baifin) in the Books of the civill Lawyers, that chooe should be made of the skins of Kids, as appeare by ancient Marble monuments at Rome, which thing Martial approveth in his verfe to Petrus; fiewing how time altereth all things, and that the skins of Kids which were wont to cover bald heads, are now put upon bare legs; the verfe are chefe that follow,
The History of Four-footed Beasts.

Hadina tibi pelle contengi
Nuda tempora verticenique calce,
Feitiva tibi, Phoebes, dixit ille
Qud dixit opus sese colatus.

Aherus. Out of the hide of a Kid is made good glee, and in the time of Cicero they fluffed beds with Kids hair: their flesh hath been much esteemed for delicate meat; and for that cause dressed and trimmed sundry ways; the best Kids for meat have been said to come from Melas, or Umbratiæ, or Viburtianum, which never tailed herbs, but have more milk in them then bloud, according to the saying of Juvenal.

De Viburtino veneti pinguisfimus agro
Habitus & tæo grise mollor, infestus berbe,
Nec dum aæus virgus humilis mordere falieth.

Anothus. For this cause they may safely be eaten all the year long while they suck, both of men of temperate and hot constitution, for they are less hurtful then the Rams and do easily digest, and nourish temperately, for they engender thin and moist bloud, and also help all hot and temperate bodies, and they are at the best when as they are neither two old, that is above fix months, nor too young, that is under two months.

The red or handly coloured are the best, yet is their flesh hurtful to the Colick. Simeon Sethi affirmed, that if a man eat a Kids liver before he drink in the morning, he shall not be over drunk that day. Celcius also pretendeth it in the sicknes of the Holy-fire. They are wholesome, solid, roasted, or baked, but the ribs are bell fods. Plautus teacheth one way whereby it was dressed in his time for a delicate dish; they took some field Herbs and fat broth, two whites of an Egge well beaten together, with two heads of Garlic, a little Saffron, and a little Pepper, with the Kids flesh, put all together into a dish, rosted before at the fire upon a spit (with Parley, Rosemary, and Laurel leaves) and so serv'd out with that sauce, and set on the table but if they did not eat it before it was cold, it weakened the eye-sight, and rais'd up venereal flux.

The blood also of a Kid was made into a bludding, and given to be eaten of them which have the Bloudy-fiss. They have also devis'd to dress a Kid hot, and to fill his belly with Spices and other good things: likewise it is sod in Milk with Laurel, with divers other fashions, which every Cook is able to practice without the knowledge of learning.

And thus I might conclude the discourse of Kids with a remembrance of their constellation in the Waggoner, upon the Bulls horn, which the Poets observe for signs and tokens fore-saying rain and cloudy weather, according to Virgil verse:

Quantus ab occasu venientis pluvialis Hadir.

These Stars rise in the Evening about the Nones of October, and in December, they wont to sacrifice a Kid with Wine to Faunus. There is a Bird called Captitius, which is a great devourer of Kids and Lambs, and the same him is hunted by a Dragon, for when the hath fill'd her self with these Beasts, being weary and idle, the Dragon doth espy her upon her and overtake her. Also when they fish for the Worm seven cubits long in the River Isar, they bait their hook with a Lamb or Kid, as is reported by Athenæus; and the Ancients were wont by inspection into the entrails of Kids, to declare or fear or into things to come, as Gyralius amongst other their superfluous vanities re-heardeth.

The manifold medicinal properties of Goats come now in the end of this story to be declared and first of all it is to be noted, that these properties are several, both in the male, female, and Kid; and therefore they are not to be confounded, but as the diligence of learned Authors hath inventing and left them severally recorded, so they require at our hands which are the heirs of such beneficial helps, the same care and needful curtefie.

There are some which do continually nourish Goats in stables near their dwelling houses, with an opinion that they help to continue them in health; for the Ancients ordained that a man which had been bitten or stroke by Serpents, and could not easily be cured thereof, should be lodged in a Goats stable. The hairs of a Goat-buck burned and perfumed in the presence, or under a man whose genital is decay'd, it cureth him.

The powder of a Wine bottle made of a Goats skin with a little Rose, doth not only stain the bloud of a green wound, but also cure the same. The powder of the Horn with Nitre and Tamariack seed, Butter, and Oyle, after the head is shaven, by anointing it therewith, strengtheneth the hair from falling off, when it growths again; and cureth the Alpiga, and a horn burnt to powder and mingled with meal, cureth the chippings in the head, and the fots: for taking away the smell of the arm-pits, they take the horn of an old Goat, and either scrape or burn the same, then add they to it a like quantity of Myrrhe, the Goats tail, and first scrape or shave off the hair, and afterward rub them therewith every day; and they are decay'd by that perfuration.
The blood fried in a pan, and afterwards drunk with Wine, is a preservative against intoxications, and cureth the Bloudy-flix; and the blood in a Sear-cloth is applied against the Goat, and cleanseth away all Leprories, and if the blood come forth of the nose without heat, then rub the nose with this blood of a Goat. It being fitted to meet cureth all the pains of the inward parts: being rubbed upon coals fayeth the looseness of the belly, and the same applied to the belly mixed with fine flour, and Rozen, eateth the pain in the small guts; the same mixed with the marrow of a Goat, which hath been fed with Lentils, cureth the Drop little; and being drunk alone, breaketh the stones in the reins; and with Parsley drunk in Wine, also dissolveth the stone in the bladder, and preventeth all such calculating gravel in time to come.

There is a Medicine called by the Apothecaries Divina manus, Gods hand, against the Stone, and they make it in this manner. When Grapes begin to wax ripe, they take a new ear then pot, and pour into it water, and feethe the same till all the cream or earthy substance thereof be ejected: and the same pot cleanseth, then take out of the flock a Male-goat of four year old, or thereabouts; and receive his blood as it runneth forth of his slaughtered body into that pot, so as you let go the first and last dream thereof to the ground, and lave the residue: then let it thicken in the pot, and so being therein congealed, break it into many pieces with a reed, and then covering it with some binnens cloth, let it abroad in the day time where it may gather dew, and then the next day set it abroad in the Sun again to exhalte the same dew, (if in the mean time there fell no rain) then let it dry, and afterward make thereof a powder, and preserve it in a box, and when the evil pincheth, use a spoonful of it with Wine of Cret; and Pulsagium commendeth the manifold benefit thereof, for he had often tried it, and with a medicine made of an African Sparrow mixed with this, he procured one to make water, and to void a great stone which had not vented his urine in many days, and lived in the mean time in horrible pains, and the same vertue is attributed herein, to be anointed near the bladder; and one be bathed in the warm air, and oftentimes both the Bath and the Oyntment be reiterated. Marcellus teacheth how one may make trial of the vertue of this blood, for if he take a Male-goat, and put him up clofe seven days, feeding him in the mean time continually with Bays, and afterward cause a young Boy to kill him, and receive his blood in a bladder, and put in the said bladder sandy stones, like unto those that are engendered in the bladder of a man, within a short time he shall see those stones dissolved, and scarce to be found in the bladder of blood, by which he confidently affirmeth, that nothing in the World is of like power to remove the Stone; but within he willleth some superflitious observations; as namely, that he be killed by a chaste person; and on a Thursday, or Sunday, or such like; but the conclusion is, that the said Blood must be dried to powder in an Oven, and afterward prescribeth that three ounces thereof, one ounce of Thyme, one ounce of Pennyroyal, three ounces of burned Pulpus, one ounce of white Pepper; one ounce of Apium, and one ounce of Lovage-feed to be given to the party in sweet Wine fasting, and having no meat in his stomack undigested, and having digested the medicine, he must eat prefently.

And therefore if it be true, as all antiquity and experience approveth, that the Goats blood breaketh and dissolveth the Adamant stone, then much more (faith Jacabus Silvius) may it work upon the stone in a mans bladder. The flesh of Goats decoct in water, take away all bunches and kernels in the body. The fat of this beast is more moist then a Females or a Kids, and therefore it is most strong in operation, to scatter, dissolve, and resolve more then a Sheep. It cureth all Fissures in the lips mixed with Goose-grease, Rozen, Pitch, and the marrow of a Hart. Also if one be troubled with swellings in his Temples or in his Legs, let him use of this fewt half a pound, and a pound of Capons-grease mixed therewith, and spreading it upon a cloth like a Sear-cloth, let him apply it to the fore, and it shall help mightily. Also when the neck of an Ox swelleth, it hath been proved for a golden remedy, to take and anoint it with Goats-grease, liquid Pitch, the Marrow of a Bugle or Ox, and old Oyl, and may as well be called Tetephermum, as that of Galen made of Wax, Rozen, Pitch, and Goats-feewer. Also if the bloud be fallen into an Oxens legs, it must be let forth, or else it will breed the maundy; and therefore first of all the place must be cut with a knife, and then rubbed with clouts wet in Salt and Oyl, and half of all anointed with old Sewer and Goats-grease.

Two ounces of this Goats-grease, and a pint of green Oyl mixed together, and melted in a pot, and infused into one that hath the Bloudy-flix, cureth him speedily: when the hot dung or flume of a Goat is mixed with Saffron, and applied to the gouty members Hydropick, it worketh upon them a strange cure: and some adhere unto the flanks of Ivy beaten, Mustard-feed, and the flower of a wide Cucumber.

The Liver of this Beast laid upon a man that hath been bitten by a mad Dog, caufeth him never to be afraid of water: the same being faded, yeeldeth a certain liquor, and fore eyes being anointed with that liquor, within twelve times recover; and drunk in sharp Wine, and laid to the Navel, fayeth the Flux; also fod in Wine, no feum or froth being taken off from it, but permitted to joyne with it, helpeth the Bloudy-flix.

The entraits of a Goat eaten are profitable against the Falling-sicknes. The gall killeth the Leprofies, all swellings and botches in such bodies, and being mingled with Cheefe, Quicksilver, and powder of Sponge, and made as thick as Honey, taketh away the spots and burls in the face. It also rooteth out and consumeth dead flesh in a wound, and also mingled with Bran and the Urine of a Bull,
Bull, cureth the scurrie in the head. Actus also teacheth women how to conceive with chide, if the dip a purple cloth in Goats blood, and apply it to her Navell seven dayes, and afterward it with a man in the prime and encrease of the Moon. The Gall of a wilde Goat is commended privately for the help of them that are purblind, and for all whitenes and Ulcers in the eyes: and when the hairs which trouble the eyes be pulled up, if the place be anointed with the Gall of Goats, the hair will never grow any more.

In the Milt being sod, helpeth the Flux, and the Spleen taken out of the beasts belly, and applied to the Spleen of a Man, doth within short time cease it of all pain, if afterward it be hanged up in any fume or smoke to be dried. Albertus and Raffi say, that if a Man eat two Goats bones, and presently lie with his wife, the shall bring forth a male child, but if he eat but one, then shall the child have but one bone. The fume decocted with Hony, and laid to Ulcers and swellings, dissolveth or draweth them, and mingled with Vinegar, is most profitably used to take away black spots in the face.

And if he which is sick of the falling evil do eat thereof fifteen pills, or little bals, it shall procure unto him much cafe. If it be mingled with Mouse-dung, toasted at the fire and sprinkled with Hony, and so anointed upon bald places, where you would have the hair to grow again, and mingled with Vinegar wherein a Sea-onion hath been steeped, and bound to the forehead or temples, afflicteth the pain of the bran-pan.

The Pastoral Carthagiensis, to the intent that the humour flowing out at their Childrens noses, may never hurt them, burna vein in the crown of the head with Wool, when they are four year old, and thereby may conceive that they are kept and confirmed in perpetuall good health: and if when they burnt their children, they fell into a Cramp, they eased them presently by calting upon them the urine of Goats. When a Man is thick of hearing, mingle together the Gall of an Ox, and the Urine of a Goat, and infused into the ears, although there be in them a very matterfull.

Galen. prefcribeth this portion to evacuate that Water which lyeth betwixt the skin by Urine, if one drink Hylopes water and the Urine of a Goat: Likewise it helpeth the Droppie, and the durt of an Elephants tooth drunk in this Goats Urine, it dissolveth the stone in the reins and bladder, without all fearful peril and danger.

The medecines arising out of the female Goats are these. We finde that the female Goat, and the land rood being foddled together, are cures of singular worth for the discharges of all living four-footed beasts. The (Magi, or) wisemen say, that the right eye of a green living Lizard, being taken out, and his head forthwith struck off, and put in a Goats skin is of a great force against quartern Aques. The ashes of a Goats hide befarmed over with Oil, taketh away the spots in the face. The same ashes made of Goats hide, recovereth the blisters and galls of the feet. The flaving of the Goats skin being rubbed with Pumice Stone, and mixed with Vinegar, is an excellent approved good remedy for the Smalpox.

If a Woman bleed overmuch at the nofe, let her breaths be bound with a thong made of a Goats skin. The fame being foddled with the hair on it, the juice being foked up, flayeth the belly. It is not good for those that have the falling ficknes to flay pe or be in a Goats skin, if at any time the passion moveth them to; yet yet it is hurtful for their head, by reason of the rank smell, and not for any other particular cause.

Goats hairs being burnt, do appease all ifues of bloud, which being mixed with Vinegar, they are good to flanch the bleeding at nofe, and you may blow in their nostrils Goats hairs burnt and whole, and also Myrhe mixed with Goats hairs fo burnt. The fame also burnt and mingled with Pitch and Vinegar, helpeth the bleeding at nofe, and being put in the nofe they flie up lethargies.

The favour of the Goats horn, or of the hair doth the like, Goats dung in sweet water, doth expell the stone in the body, fo doth the ashes of Goats hair in like manner, which being burnt and bruifed, and given in a medicine, they do mightily help and recover the Strangury. It is also reported that Goats horn and the hair being burnt, will drive away Serpents: and their ashes foked or anointed, is very good against strokes or flingings of Serpents.

To flay the Flux in the belly, take the hairs that grow behind on the Goats sitting place, and burn them, which being tempered with beaten Barley and Oil, must be perfumed under a mens feet.

Goats flesh being rofted by the fire where dead men are burnt, is good for those that have the Falling-ficknes. The fame is a good remedy against the falling ficknes. It is good for such to abstain from Hogs flesh, Beef, or Goats flesh. They that drink Goats bloud wax pale prettily on it, which is excellent to get out spots of any thing: is also good against those that are intoxicate with poison, and therefore must be drunk with wine, and being sod with marrow, it is good against the same disease: fo is the male Goats bloud. The root of Cinkefoyle drunk in wine, helpeth ill humors. Goats bloud also, either of the male or female, affwageth the inwards and the flowings or lasses of the belly; it is good for those that have the Droppie, being tempered with Hony, and also foddled with marrow.

Some use it against the Bloudy flux and pain of the belly, being also foddled with marrow it is good against the same disease. If you mix Goats bloud with Chiefe freight in brood, and a little Robin put into it, whereof make a plaiater, and lay it to the belly or other parts, and it recovers any pain thereaboutes.
The fat of a male Goat is more fæter, and therefore good for those that have the Bloodly flux. The substance of a Goat is fat, yet is not the fat of a Goat fo moift as a Swines, but for bitings, and those that are grieved in their belly Goats fat is better then Swines, not because it hath more operation in it to expell the grief, but by reason it is thick, whereas the Swines greese will run about like oil; neither is the fat of Kids fo warm and dry as female Goats, neither the male Goats so fat as the gelled Goats, in Latin called Hircus; also female Goats fat is more binding then the Tallow of Oxen, but the males fat is good against Scorpions made in a perfume. It is also good for those that are poisoned with French green flies, called Cantibarideris. Being tempered with Wax, it taketh away the flinging of Serpents; it helpeth any biting or wound. If a Womanes breaft griefe her after her delivery of childe, let her feethe husked Barley and Scallions, and the fat of a male Goat, whereof, let her drink a little. Against the ache of the eyes, take Goats fat and Sheeps together, with a little warm water.

Almost every grief of the body if it be no wound, will be more easily recovered by plaisters, but if the grief be as it were grounded, (or an old grief) let it be burned, and upon the place so scorched, put Butter or the fat of a male Goat; it will also recover and heal kibes and Chilblains, It helpeth The Kings evil; so doth the fat of the female Goats help the fame disease. The males fat mixed with Ashes, taketh away the roughness of the nails; it also healeth the nails of the Leprofe without any pain, it expelleth the Cantibarideris being applied with the juice of the Grape that groweth on a wilde Vine. This Goats fat is profitable to help any about the straightness of their mouths and teeth, being tempered with wax, it layeth Sores and Blisteres, and with Pitch and Brimstone it healeth them, and being applied with Hony and the juice of a Brambel, it cureth the swelling ariseth in the hands or finger, especially in curing of Pellons.

The fat of a Bull well falted, or sift be in an aitch or grief, dipt in oil without Salt, and fo after the fame manner is the male Goat fat us’d, which being tempered with Rofes, taketh away the whoales or blisters that rise in the night: being alfo dropped into the ears of one that is deaf, it recovereth him.

It helpeth the Fallinge sickness, putting thereto as much of the gall of Buls, jutf of the fame weight, and feethe it together, and then lay it in the skin of the gall that it touch not the ground, and drink it out of the water. It is also good against the flinging of Scorpions, being applied with Butter and the meal of Zea, warmed and wathed with red Wine.

The broath that is confequente of Goats fat foddon, is excellent for tho’se that are troubled with the Puffick, to fup now and then a fea; also it helpeth the Cough being tempered with new sweet wine, that an ounce may be put in a goblet, and fo mixed with a branch of Rue. It being alfo foddon with husked Barley, eafeeth tho’se that have frettin in the guts.

The fame alfo foddon with Barley flowre and Wine made of Pomgranates and Cheeffe, let it be given to tho’se that are troubled with the Bloodly flux, and let them take it with the juice of husked Barly.

Rafin alfo faith, that the fat of a fierce Lion is of such fingular account, that if a Gylfer be made of it, with the water of Barly fod, either with the water of toited meal, and boyled Swach, and fo disfolved with Wax, it is a moft preuious remedy for the swelling of the inwards. But Goats fat doth much help the griefs of the inward parts that nothing cometh forth but cold water. The fat of the Buck Goats many use (being fod with bread and afhes) againft the Bloodly flux; and alfo the She Goats fat being taken out of her back alone being a little cold, and then fupped up: Other allow the fat to be foddon with Barly flower, Cinnamon, Annife, and Vinegar mixed together. The fame fat taken fo out of the back mixed with Barly, Bran, and Cinnamon, Annife, and Vinegar, of each of them alike, and feethe thereof, and being strained give it the patient that is diseafe with the Bloodly flux, and it shall most speedily help him.

The fame alfo mixed with Pellitory and Cyprian Wax, may be laid to the Gowt. Alfo foddon with Goats dung and Saffron, and layed on the Gowt it affwageth the grief.

The marrow of the female Goats, in the fourth place next after the marrow of the Harts, the Calf and the Bull is commended of Dioscorides, but the laft of all is the Sheeps fat. The Harts is moft renowned of all, next the Calves, then the Buck Goats, and laft of all the female Goats. To help the grief of the eye, take the marrow of Goats and anoint your eyes, and it will cure them. Goats bloud fod with marrow may be taken again, against all toxical poison.

Pliny faith, that their dung being anointed with Hony, is good for the watering or droping of the eyes, and their marrow against aches. The bloud of Goats, their marrow, and their Liver, is very good to ease the belly. Goats bloud foddon with the marrow, helpeth the Bloodly flux, and tho’se that have the Droppe; and I think that the Buckis is more effectual and of greater operation, fo it be eaten with Maffick. Alfo the Goats marrow is good for the eyes of Horfes.

The right horn of a Goats is of some held to be of more effect then the other, which I rather hold to be superflitious; whatsoever other reafon or secret quality the Horn may afford for the bitings of Serpents, take Goats horn and burn the hairs of them, and the afhes of them foked in water, and Goats milk with the horn, and wilde Marjoram, and three cups of Wine put together, and being drunk against the flinging of an adder expellet the poison.

The afhes of Goats horn being all anointed with Oil, tempered with Mirtle, layeth the sweating of the body. Harts horn and Goats being burned, and (if it be requisite) is good to wash the teeth

withal, and it will make them look white, and the gums soft. It is also good against the bloody flux and watering of the eyes in regard they are moist ulul; yet they neither affwage the griefes nor consume them, which are of a cold and dry nature.

Harts horn being burnt as also a Goats horn, takeh away bitings. Goats dung or the horn being burnt to ashes, and dipped in Vinegar, flippeth the blood. The corrupt blood that cometh out of a Buck Goat, is more effectual and of a better operation; and the ashes of a Goats horn or dung foked in Wine or Vinegar, and anoint the Nostrils, layeth bleeding at the Nofe.

Goats horn being burned at the end, and the pieces or scorchings that are from thereof, must be shaken into a new vesse long till the horn be quite consumed, then beat and bruise them with Vinegar made of Sea-onions, and anoint the evil called Saint Anthonies fire; and it is of a miraculous operation.

It will make one sleep that is troubled with the weakness of his head and watching, if it be laid under their pillow. It being mixed with Bean and Oil of Mirtie, it keepeth the hairs rank that are falling off the head. The favour of the horn burnt destroyeth the falling fikkles, so doth the femell of the intrials of a Goat or the Liver eaten; likewise it raiseth up a Lethingwerk man. They use also the horns of Harts and Goats to make white the teeth, and to soften the gums. The same horn or shaven into mixt hony, represeth the flux of the belly. In the pain of the belly perfume the flavings of the fame, mingled with Oil and burned catly; the fame perfume is good to be laid upon the Ulcers of Horfes.

The hoes of Goats are prescribed by Palladins to be burned for the driving away of Serpents, and the dust of them put into Vinegar cursethe Aphasis. The dust of their hoes is good to rub the teeth withal, also to drive away the swellings in the saibste called St. Anthonies fire, burn the foot of the Goat with the horn, and reserve the dust thereof in a box, and when you will use it, wet the place first with Wine, and afterwards caft on the powder.

The juice of a Goats head sod with hair, is commendeth for surthanes in the belly, and the ancient Magicians gave the brain of the Goats to little infants against the Falling fickles, but perssed through a gold Ring, the same cureth Carbunckles in the belly being taken with Hony.

If the body or head be rubbed with that water or meat which falleth out of the mouth of a Goat, mingled with Hony and Salt, they kill all kinde of Lice, and the fame thing giveth remedy to the pain of the belly, or if it be taken overmuch it purgeth. The broth of the entrails to be gargarized in the mouth, cureth the exaceration of the tongue and arteries.

The Liver of the female Goat sod and eaten, is given against the Falling evil, and taketh from them Convulsion, and with the liquor thereof, after it is sod, it is good to anoint the purblind eyes; alio it is good to hold the eyes open over it while it feetheth, and to receive into them the fume, and the reafon hereof is, because Goats see as perfectly in the night as in the day time, and therefore Celius faith, that this medicine is most agreeable to them that cannot see at all in the night, as it happeneth to Women whose monethly courses are stopped, and then it is good for them to anoint their eyes with the Blood of a Goat, and eat the Liver sod or rofted. The powder of the Liver burnt purged and drunk in Wine cureth the Colick.

If a woman in travel or with childe be fwoollen up, let her take a Goats liver rowled in warm ashes, and let her eat it in four days, and drink old wine thereunto, fo shall she be delivered. The Gall is contrary to all poisoned Witch-craft made upon the rulbick Wesfle1 and if the Kings evil be daily touched therewith at the beginning, it will keep it from over spreadding, and with beaten Alum it dispereth Scabs. The old Magicians were wont to lay, that when a Man rubbed his eyes when he lay down, and put under his neck pillow, he thould sleep soundly; it driveth away scabbes in the head if it be mingled with Fullers chalkule, fo as the hairs may be dry a little; and the fame with Hony helpeth the eyes, according to the saying of Serenus;

The Phystians in application hereof to the cure of eyes take many ways, and mixe it with other drugs, as when they give it against whitenes in the eyes with Hellebore, against wounds and Pin and Webs with Wine; and against the broken tunicles with a womans mik, and therefore Rafis and Albertus do jullly call the Gall of a Goat an Eye-salve, and also being infilled into the ears when they are full of pain, it cureth them, first mingling it with a scruple of Hony in an earthen sheard, and interfuing into the ear, and flutting it in with a little wool.

Alfo all the pains in the ears are cured by the itakes or joyce of Leeks, Gall of Goats, and sweet water; and if there be any Rupture in the ear, then use therewith a womans mik, or warm Oil of Rofes: likewise against the Cankers in the gums, and the Squinacy, it is profitable to use it with Hony. For all tumors or swellings in the neck, take equal quantities of this Gall, of Goole-greafe, and the yolk of an Egg, and thefe being all mingled together, let the offended place be rubbed therewith.

The fame with the joyce of Cyclamine and a little Alum loofeneth the belly, and Wood being well dipped therein and bound to the Navel of the belly, expellethe the Worms; it cureth the faults in the feet by anointment; it also hath another virtue in it expraysed by the Poet in this Verse;
The melt fod cureth the Blandy-flux, and the bladder burnt and given in poftet-drink is good for them that cannot contain urine in their sleep, and the fecunds of a female Goat being drunk in Wine of women after their delivery, ejecteth and caufeth their feconds also. The milk is many ways available, for Democritus the Phyfitian, in the recovery of Confidia the daughter of Serritus, which had been Confult, ufed the milk of Goats a long feafon which he fed with Lentils: Sea-crabs mixed with this milk, expelleth poyfon; and the first milk of a Goat which is milked from her after the weaning of the Kid, drunk by him that hath a quartane Age, caufeth the fits thereof. And some of the ancient Phyficians gave as much dung of Swallows as will ly upon three groats, mixed with this milk against a quartane Age, and when young Lambs were fick, the fhepheards cured them by infuflng into their chaps the milk of Goats; the powder of Btony drunk out of Goats milk flayeth bleeding.

The holy fire is a difeafe of Sheep almost incurable, because if any remedy do but touch them, they fall mad: but they only in this malady admit for the recreation or remedy Goats milk. The root of the greater Siler decocted in Goats milk, cureth those cold ulcers in the flfth or belly, when the place looketh black or liveth fenne: and Apellus taught his followers and patients to drink it againft the Icht, or any biting, and if at any time there be any strain in any member of the body, to that the Article fecmeth to decline and lose his former strength and humor, it is recoverd again by binding unto it Lyne-feed in Goats milk. Fџuratus advieth to wash the face therewith, that the beauty of it may be more fpandant. Take feven Sea-crabs, and being beaten to powder, mingle them with one pint of Goats milk, and a cup of Oyl, and fo strain them diligently, and mixe them into a Horfes mouth which is fick of the Head-ach, and it shall cure him.

The milk alfo by the countел of ibis, with the juycce of Cabages, Salt, and Hony, is given against the thornes of breath; and if the right eye of a Chomeion be pulled out of her alive, and put into Goats milk, and applied to the eyes, it cureth the whiternes of the eyes.

The fat of a Bull mixed with this milk, and infuflng into the ears, cureth their matterie evils, and caufeth them to hear more affuredly and firmly. The gums of children anointed therewith, caufeth their teeth to come forth with lefs pain, and fafeloth the loofe teeth by often rubbing: the corners in the throat, and the Arteries are delivered from exacerbations by purgaring this milk, either warmed at the fire, or else as it cometh forth of the udder.

The feed of Crettes decocted in this milk, and drunk, caufeth the pains in the stomac'h, and alfo purgeth being mixed with Salt and Hony. Marcellus precribeth this excellent purgation, which shall never make the party fick, that is a pint of Goats milk, two ounces of Salt Ammoniack, and one ounce of the bell Mecis, beat them all together, and give them to the patient fasting, and fo let him walk a good while, till the medicine be wrought in his body; and if a woman be with childe, and oppressed with Head-ach, or have an Age, the may falely take this milk fod with Hony.

The Phyficians make a fpecial drink of this milk, which they call Selkion: it is fod in a new earthen pot, and hath put into it the branches of a fig-tree, and fo many cups of sweet water, as there were pints of milk, and when it boyles, keep it from fething over, but putting into it a silver veflil with cold water, and being taken from the fire divide it into many veflils till it be cold, fo the whay will part from the milk: and some take the whay and fcheid it again till the third part be only left, and afterward let it abroad in the Sun to cool, and this may be falely drunk five days together (every day a pint) at five feveral times, againft the Falling evill, Melancholy, Palflies in Leprories, Gows or pains in the Articles, and the ficknes of the Liver, which is like to a Pleuretie. Or let him drink the Goats milk, the third part thereof mingled with Hony (as Hippocrates precribeth) or with the feed of Matridum, (as Serenus counfelleteth) in this verfe:

\[ \text{Stomacho moderat or} \]

\[ \text{Semina Matthi folfa cum little capella.} \]

A draught of Goats milk fodd with Mallows, and a little Salt put to it, renufteth the gripings of the belly, and if you put a little Rennet unto it, it will be more profitable. Goats milk tempered with Rennet, before it be altogether strained, while it is warm, it must be given to thofe that have the Blandy-flux to drink, and it will help them prefently: put alfo to a good portion of sweet Wine mingled with Goats milk, and a little Rennet of a Kid (as much as a Nut-kernel is) which being tempered with the hand, let it be given to the patient, labouring with the Blandy-flux, before it be strained, for the space of three days. Let this drink be given one that is falling about the time he rifeth, and being boyled, put fufficient-Barley flour to it, and being in like manner like pap or potage, you must give it to the patient to drink for the fame difeafe.

Goats milk being fodd half away, may be given to thofe that have the Blandy-flux. If they that be troubled with fretting of the guts, and the Flinx, are weaken'd by reafon of their often going to the foul.

The broath of a fat Hen fodd with Butter or Goats milk, or Sheeps, warmed by it felf, or elfe fodd with Butter, is very good to be given unto them. Take three ounces of Amyllum, being a kinde
Marcellus. of meat; three months old, into as much Goats milk as you shall think fit, and so give it the patient by fapfofitory means for the Bloudy-flix. Oxen, Sheeps, or Goats milk, layeth the exacularions and flowings of the belly, so it be fed on the coals, after the use of glyters, if a man secrete inwards do bind with filth, but if not, after the homets be led to the roots and flock of the yard, freth Goats milk must be applie of the mesure Hemian, and no least, but it must not be done all together, but apart. The next day let the milk be the only half be diminished, still taking away that which is uppermost (I mean the skin or froth that gathereth in setting) and so use it.

For the risings and flowings of the belly and the Fix, it is very good to get Cows milk or Goats, as is before mentioned of the Cow. Panick being fed in Goats milk, helpeth the belly, being taken twice a day, and so it is good for the fretting of the guts. Old bread tempered with Goats milk, being given those that have the Flux in their belly twice a day, in manner of loping, it is a present help.

The juice of planted pease, soaked with Goats milk, helpeth the slack of the belly. The milk is good with Goats milk, after one hath failed two days, let him drink Goats milk, that are fed with Ivy, without any other kinde of meat, for three days together.

They that are troubled with the pain in the milke, the belt remedy is this: let milk Goats be kept falling three days, and in the third day let him eat Ivy only, and let them be milked before they drink; and let the failing patient griev'd about his milke, take three Sextaries warm of that milk, so soon as he is milked, and so let him drink it the space of three days, during which time he shall not eat nor drink any other meat, and it shall help him marvellously. He that hath the Computation of the Spleen, let him drink the whay of Goats that are fed with Ivy. Goats milk also half sodden, so it be of them that feed on Ivy only, it may be given to children that are troubled with the pain in the milke. A drink made of Goats milk and rennet put to it (as Cheese is accustomed to be made) and given to those that have the Dropes, they shall be holpen. Also Goats milk kiliceth the Worms.

Those that are troubled with the grief of the reins, let them take three cups of Cretian fiod in Wine, and so much of Goats milk, and three and thirty grains of Cowcumber seed, all well bruised together, which he may drink at one draught. Antholius saith, that a porreger full of Goats milk, with as much Amyan, which is as much as three porrengers of Sheeps milk, and three ounces of Oyl, all which well tempered together, must be given through a horn to a Horse that piffeth blood, and it will remedy the same; and Polygynius saith, that Goats milk and Amyan, with three Eggs and the juice of Pellitory, is good for the same disease in Horses. The meal of Betony soaked out of Goats milk, layeth the blood dropping out of the paps. Phyfition to drink certain medicines made of Goats milk that increase Fenus.

The men of Thesalia drink another root of a certain herb (called Orecim) being fofter and nothing inferior with Goats milk, to fill up men to carnal copulation, and they drink the harder kinde of root to temperate to play it. The root Raps orn (as some call it) being given to women with childe, it maketh them that they cannot conceive, being of watery condition: against which Goats milk soaked with Honey, is an excellent remedy.

If the hinder parts that are somewhats fliferly stand further out then the rest, and open, anoint them with Goats milk warmed. If any mans Sheep be sick, let him take Goats milk mingled with Wine, and so let him give it them to drink. If Lambs be troubled with Agues or sicknes, let Goats milk be given them through a horn.

Cheese made of Goats milk is an excellent help for those that have drunk Mifelden. For other bitings of Beasts, (besides that of a mad Dog) Goats Cheese well dried with wyde Marjoram must be drunk. The same is also excellent against the stinging of Serpents; for all other bitings and stingings of Iffer Beasts, it is also a very good remedy. Being dried out of Vinegar and Honey, taketh away Ulcers and Blisters.

This tame Cheese when it is new, so it be well press'd, and no what y left in it, and mixed with Honey, is most excellent against the quartain Ague. Goats cheese also reprefeth all dolors and punctions; and being soft and new, and made with Honey, and covered with a woollen or linnen cloth, taketh away the puffing up of the flesh. It being dried by scallions, you may anoint Saint Aeculapius.

Antonio fire with it. Being dried out of Honey and Vinegar, (when men do bath) without Oyl it may be anointed on black wheels. That which is freth and well riwared, being laid on the eyes, it quickly affageth the pain. It is also exceeding good for the pricking of the eyes, the grief of the head and feet, it is also good for the dropping of the eyes, with a little warm water applied unto it, and if it be a swelling of the eyes, then out of Honey, either of which griefs is to be keep warm with what.

For the grief of a mans Yard, sweete Goats Cheese and Honey, of a like quantity in a Poultec made in a new earthen pot, and so laid thereunto twice a day, but not wath the place with old Wine that is to be cured. It is good for Carbuncles; and if a woman be sick of her womb, and troubled with a Fever, let her take half a Chemix of Pettipurege, and so much Nettle-feed, and half a Chemix of Goats Cheefe scraped, being tempered with old Wine, and afterward being sodden, let her sup it up, and if she have the Flux, let her drink the black wilde Grape, and the rinde of a Pomegranate, and a Nut-kernel, and the rennet of a Bull, thefe being washed in black Wine, Goats Cheefe, and Wheat-flower, put them together.
The urine or dung of such Females as live in the Mountains drunk in Wine, cureth the Falling evil; and in Galen time they gave the crindles of Goats in Wine against the Jaundice, and with the same they anoint them that have the Flux, and made into a Poultice, is very helpful against the Colick; but Marcus prepareth it on this manner: first it must be steeped in water and strained, with sixty grains of Pepper, and three prorringers of Sweet water, and so divide it into three equal potions to be drunk, in three several days: but the body of the patient must be first washed or anointed with Aegus, fo as all perditions by sweat may be avoided.

Aetius against the hardness of the Spleen, prepareth a plainer made of Goats dung, Barley meal, and the dung alone against all tumors or swellings of the milt. Against water lying betwixt the skin, and the skin and the flesh this is prepared many ways, and first against the Dropfie, they feeth it in the urine of a Boy which hath tailed of poiffon, or in the Goats urine, till it be as thick that it will fick and cleave, and it will purge all by the belly, and also the thavings of hides which Coriers make, fow in Vinegar with Goats dung is accounted in England a singular medicine to repurge all hydrope swelling in the legs and belly.

The urine of Male-goats drunk in sweet water expelleth the Stone out of the Bladder. Against the pain in the hips, the Aetius prescribeth in this manner, which they call aduotion (betwixt the thumb and the hand) there is a hollow place wherein they put Wool dipped in Oyl; afterward they set on fire little piles of Goats dung in the fame Wool, and there let it burn till the flame and vapour thereof be fensibly felt in the hip-bone: some use to apply this to the fat, but in our time it is all out of use, and feeng yet the pains of the hip do rather fall into the thighs, flins and legs, then irreed up into the Armes and shoulders, Aetius and Carnarvius fay, that this aduotion for the hips was used in the ancient time divers ways, and some on this manner, holding the burning dung in a part of tongs unto the leg of that side where the pain lyeth, untill the aduotion be felt in the hip, and this cure used Diocorides.

Quintillus used another way, which was this: he first of all heat the Goats dung, and therewithall burned the soft and fethy part of the great toe, neer unto the nail, untill it pierced to the sick place; after which, they lay beaten leaves of Leeks with Salt to the place, but in the hard bodies of Country men inured to labour, they apply the Dung of Goats with Barley meal and Vinegar.

The same with Saffron and Goats fweat, applied to the Gout, hath effect; or else Mustard seed, flacks of Ivy, Betony, or the flower of Wilde-cucumber, the fame drunk with Spikenard, or other Spices, firret up a Womans flowers, and caufeth efficac deliverance, but being beaten into Meal and Vinegar, and laid to a Womans belly, with Wool and Frankincense, layeth all Fluxes and Issues: alfo little bals of the fame with hairs, and the fat of a Sea-calf, wrought al together, and perfumed under a woman, hath the fame effect, or else the liver of a Sea-calf, and the thavings of Cedar-wood.

Pliny affirme that, the Mid-wifes of his time lade the greatft Flux of the belly by drinking the urine of a Goat, and afterwards anointing it with the dung of a Horse that hath bruised his hoof; Goats boid with Vinegar cureth the fame, and an Aple-tree have worms in it, the dung of a Goat and the urine of a man laid to the root drive them away.

The urine of Goats blood drunk with Vinegar, refifteth the Stinging of Serpents. and also being laid to bunches and swallowings in the feth, in what part forey they be, it diuiffeth and expelleth them. Against the fitches of the neck, which they call, Ophidiatrrs, take urine of a Goat, and the heads of Scallions bruised to juice, and imbue them into the ears; and the fame mingled with the Oyl of Rifes and a little Nitre, cureth the pain in the ears by infuffion, or by the fmoke perfumed in a Goat's horn twenty days together.

Against natural deafness take the horn of a Goat newly flain, and fill it with urine, and hang it up nine days in the smoke, and afterwards ufe it. The urine of a Goat made warm, and infliffed into the ears, and the fame anointed with fat, is good for the veins of the throat. For the Dropfie drink one spoonful mingled with Cardam, and warm it at the fire: alfo mingled with Wine or Water, it expelleth the Stone in the Bladder, according to the faying of Serenus:

Ne cu nefien unmine capere probatur humor,
Obvit hic morbum fabeaflaque fame remittit.

The fame Phyfitian prescribeth Goats crindles to be drunk in Wine against the Jaundice, and to try the fluxes of women, the fame dung tyed in a cloth about unquiet children, especially women-kind, maketh them more full; being mingled with Wine, cureth the bitings of Vipers, and the dung taken out of the Goats belly and anointed upon the fore, cureth it with all speed: the fame vertue it hath to heal men wounded by Scorpions, being decocted in Vinegar, it cureth also the biting of a mad Dog, mixed with Honey and Wine.

Being laid upon a Wound it keepeth it from swelling, it hath the fame vertue mingled with Barley meal, but healeth the Kings evil. It is used alfo to raper fores and ruptures, being applied to the fuppurations, it keepeth down the swallowings of womens breasts, being first dryed, and then steeped in new Wine, and so laid to the fore, for it digetheft inflammation.

When the eye-lids be thick, hard, red and bald, take Goats dung and Mouse dung, of either a like quantity burned, and twice so much of the powder of the Grecian canes, with Honey Atech; and anoint
The History of Four-footed Beasts.

Dams, also doth: laying it round about the wound, it cureth burnings and draweth out heat, with Oyl of Roses and Vinegar (as Galen writeth.)

It is also commended for broken joints, because it suftereth them not to swell or start out, being once fet, therefore must it be used with Honey and Wine, and it hath the same operation for broken ribs, for it openeth, draweth and healeth: also it being decocted with Vinegar, it healeth the pains in the nerves, although they be ready to rot, and eafeoth the pain in the joints: the fime of a fat Goat cureth the Gout, and the contraction or shrinking of the nerves, being dressed with Vinegar, and made as thick as Honey, it helpeth the trembling members. It is very dry, and therefore (Araldew faith) it cureth the Fistula, making a plaifer thereof with the meal of Beans, Wine and Leigh, which hath been seen wonderfully to dry up the Fiftula. With Oxyem and Vinegar it cureth the Aeftium, but it muft be burned.

Take seven bals of Goats dung, work them in Vinegar, then anoint your fore-head therewith, and it eafeoth the pain in the head, or else mingle it with Oyl of Roses, and spread it upon a cloth laying it to your temples, change it morning and evening, and you shall finde great ease thereby.

If the eyes be swollen at any time, binde this dung unto them: being mingled with liquid pitch and Honey, healeth them which are sick of the Quinffe; being gargarized in the mouth, he which is sick of an old Cough, let him take the dryed trundle and put them into the bell Wine, and drink it off, to thall he presently avoid his feem and filthy humor, and be healed.

The Remedies out of a Wilde Goat.

The fame vertue which are in the Goats before spoken of, do also belong to the Wilde Goats, the blood take away bunces in the fleeth; and being mingled with Sea-palm, eafeoth the hair to fall off. An Ointment made of the fat of Goats, is profitable to them which have webs in their eyes; and the fat of Mountain Goats, helpeth infected Lighes: His liver broiled upon coals and taken alone, helpeth the Flix, but most certainly when it is dried and drunk in Wine: the gawis is good for many things; especially it is a Treacle against poiyon, suffusions, whitenes and bijnedd of the eyes, by anointing it curereth the purblinde and the webs in the eye; and generally it hath the fame properties in every part as the tame Goats before spoken of.

The like may be said of the Kids or young Goats and first of all A Kid being fit stonder alive, and his warm fleeth laid to a poiyoned wound, doth most affuredly heal the same. Others take the warm fleeth of Kids and perfume them with hair, by the favour whereof they drive away Serpents: the skin newly pulled off, and put upon the body beaten with fripes, take away their pain: others again use it against the Crampisand not without reason, for the tender skins of Limbs & Goats, being sprinkled or dipped in warm Oyl; giveth very much strength and patience to endure the Convulsion.

Fraxagor prescribeth the fleeth against the Falling evil; and by gargarizing the brood when it was fode, cureth the Quinffe and forenefs of the throat. Demetrias faith, that the brain being drawn through a gold ring, and given to a Hawk which hath the Faling sicknes, it will work admirably upon her. The blood being dried and decocted with marrow, is good against all intoxicates passions, and being mingled with sharp Vinegar before it be congealed, it helpeth the spitting of blood: the same being eaten, cureth all kindes of Flixes, being taken three days together. Galen rehearseth in the Antidote of Urbane, among other things, the blood of Kids to draw the dead young ones out of the Dams belly.

With the fat there is an Ointment made with Rose water, to heal the fiffures of the lips and nose, which is much desired of Women, not only for the before rehearsete vertue, but also becaue by anoiting they keep by it their face from Sun-burning. The French and Italian call it (Tomato) becaue it smelleth like Apples, they put alo into it Musk and Rose water, a pound of Kids fewer, and warm it in a Bath untill all be white, and so wath it with the fode Rose water, and afterward refe the in a glafs: The Ointment which is called (Ulycemium album) is like unto it: the afhes of the thighs of a Kid, healeth burtinefs, and lacheth blood: the rennet is also commendable against Hemlock, or Toad-fool, and against all the pooyounful strokes of Sea-beats: being drunk in Wine, it layeth bleeding, and refreheth excrations of blood: being taken with Vinegar it helpeth the fix: being drunk falling, it hath some operation to stay womens flowers. The lights of a Kid fod and eaten falling, preserve from drunkennefs that day; and the powder of it burned, eafeoth the itching of the eyes, and peel eye-lids, if it be applid like Sinbium: likewife the bladder of a female Kid drunk in powder, helpeth the inconfoency of urine: the milk laid upon the spleen of an infant, affwages the pain and tumors thereof; the liver is not fit for temperate men, but for weak cholerick men.

The Inhabitants of the Mount Atlas do gather Eusforbium, and corrupt it with Kids milk, but it is discerned by fire; for the good Eusforbium being burned, yeeldeth an unacceptable favour, and so we conclude this story, with the two Emblems of Alcohol. One againeth them that take much pain, and make good beginnings, but evil ends, like a Goat which giveth a good meath of milk, and over-turneth it with her foot.
The other Emblem is upon a Goat, the which by her Keeper was constrained to give a young Wolf fuck, who afterward notwithstanding that good turn, devoureth his Nurse; and it may be applied unto them which nourish their own harms, and save a thief from the gallows.

**Cepra lupum men sponite me nunc unde latte.**
**Quod male pastoris provida cura jubet:**
**Creverit ut semel, mea mea postwhere paxsit:**
**Improbitas nullo spectitur obsequiis.**

There is a pretty comparison of a Harlots love to a fisherman, which putteeth upon him a Goat skin with the horns, to deceive the Sargus-fish, for that fish loveth a Goat above all other creatures, and therefore the fisher-man beguilith her with a false appearance, as the flattering love of Harlots doe simple minds by fained protestations.

**Of the GVLO.N.**

His Beast was not known by the Ancients, but hath been since discover'd in the Northern parts of the World, and because of the great voracity thereof, it is called (Gulo) that is, a devourer in imitation of the German, who call such devouring creatures Viljuff, and the Swedians, Greff; in Lithuania and Muscovia, it is called Raffomelk. It Mathias is thought to be engendered by a Hiena and a Lionis, for in quality it resembleth a Hiena, and it is the fame which is called (Crucuta:) it is a devourer and an unprofitable creature, having sharper teeth then other creatures. Some think it is derived of a Wolf and a Dog, for it is about the bigness of a Dog; it hath the face of a Cat, the body and tail of a Fox; being black of colour: his feet and nails be molt sharp, his skin rully, the hair very sharp, and it feedeth upon dead carcasses.

When it hath found a dead carcass he eateth thereof so violently, that his belly standeth out like a bell; then he seeketh for some narrow passage betwixt two trees, and there draweth through his body, by pressing whereof, he driveth out the meat which he had eaten: and being so emptied returneth and devoureth as much as he did before, and goeth again and emptieth himself as in former manner; and so continueth eating and emptying till all be eaten. It may be that God hath ordained such a creature in those Countries, to express the abominable gluttony of the men of that Country, that they may know their true deformed nature, and lively ugly figure, represented in this Monster-eating-beast: for it is the fashion of the Noble men in those parts, to sit from noon till midnight, eating and drinking, and never rise from the table, but to disgorge their Romachs, or eafe their bellies: and then return with refreshed appetites to ingurgitate and consume more of Gods creatures: wherein they grow to such a height of beastliness, that they love both feme and reafon, and know no difference between head and tail. Such they are in Muscovia, in Lithuania, and most famous of all in Tartaria.

These things are reported by Olaus Magnus, and Mathias Michan; But I would to God that this fame (more then beastly intemperate gluttony) had been circumscrib'd and confined within the limits of those unhchristian or heretical-apollatical-countries, and had not spread it self and infected our more civil and Christian parts of the World; so should not Nobility, Society, Amity, good fellowship, neighbourhood, and honesty, be ever placed upon drunken or glutinous companions: or any man be commended for bibbing and lurking in Wine and Beer like a Swine: When in the mean season no spark of grace, or Christianitie, appeareth in them: which notwithstanding they
they take upon them, being herein worse then Beasts, who still reserve the notes of their nature, and preserve their lives; but these lose the marks of humanity, reason, memory and sense, with the conditions of their families, applying themselves to confume both patrimony and peace in this voracity, and forget the Badges of Christians, offering sacrifice to nothing but their bellies. The Church forfake them, the spirit accuseth them, the civil world abhorreth them, the Lord condemneth them, the Devil expelleth them, and the fire of Hell it self is prepared for them; and all such devourers of Gods good creature.

To help their digestion, for although the Hiena and Gulon, and some other monsters are subject to this glutanny, yet are there many creatures more in the world, who although they be Beasts and lack reason, yet can they not by any famine, stripes, or provocations be drawn to exceed their natural appetities, or meate in eating or drinking. There are of these Beasts two kinds, distinguished by colour, one black, and the other like a Wolf, they seldom kill a Man, or any live Beasts, but feed upon carrion and dead carcasses, as is before said; yet sometimes when they are hungry, they prey upon Beasts, as Horses, and such like, and then they frigely ascend up into a tree, and when they see a Beast under the same, they leap down upon him and destroy him. A Bear is afraid to meet them, and unable to match them by reason of their sharp teeth.

This Beast is tamed, and nourished in the Courts of Princes, for no other cause then for an example of incredible voracity. When he hath filled his belly, if he can finde no trees growing to near together, as by fiding betwixt them, he may expel his excrements; then taketh he an Alder-tree, and with his fore-feet rendeth the same asunder, and seteth through the midst of it, for the sake aforefaid. When they are wilde, men kill them with bows and guns, for no other cause then for their skins which are precious and profitable; for they are white spotted, changeably intertiled like divers flowers; for which cause the greatest Princes, and richest Nobles use them in garments in the Winter time, such are the Kings of Poland, Sweedeland, Coaftland, and the Princes of Germany; neither is there any skin which will notten take a colour, or more confidently retain it. The outward appearance of the said skin is like to a damask garment, and besides this outward part, there is no other memorable thing worthy observation in this ravenous Beast, and therefore in Germany, it is called a four-footed Vulture.

**Of the GORGON or Orange Lybian Beast.**

Among the mani old and divers sorts of Beasts which are bred in Africk, it is thought that the Gorgon is brought forth in that Country. It is a fearful and terrible beast to behold, it hath high and thick eye lds, eyes not very great, but much like an Oxe or Bugils, but all fiery-bloody, which neither look directly forward, nor yet upwards, but continually down to the earth, and therefore are called in Greek, Catoblepunts. From the crown of their head down to their nose they have a long hanging mane, which make them to look fearfully. It eateth deadly and poyfonful herbs, and at any time hee lese a Bull or other creature whereof he is afraid, he presently caufeth his mane to fland upright, and being fo lifted up, opening his lips, and gaping wide, sendeth forth of his throat a certain sharp and horrid breath, which infecteth and poysoneth the air above his head, so that all living creatures which draw in the breath of that air are grievously afflicted thereby, losing both voyce and sight, they fall into lethal and deadly Convulsions. It is bred in Heperia and Lybia.

The Poets have a fiction, that the Gorgone were the daughters of Medusa and Pouxopis, and are called Sirengs, and by Hesiodus Sibens, and Euryale, inhabiting the Gorgodian Islands in the Atlantic Ocean, over against the gardens of Heperia. Medusa is said to have the hairs of her head to be living Serpents, against whom Perseus fought, and cut of her head; for which cause he was placed in Heaven, on the North side of the Zodiac above the Wagggon, and on the left hand, holding the Gorgous head. The truth is that that there were certain Amazons women in Africk, divers from the Scythians, against whom Perseus made war; and the Captain of those Women was call Medusa, whom Perseus overthrew, and cut off her head, and from thence came the Poets fiction, describing it with Snakes growing out of it as is aforefaid. These Gorgons are bred in that Country, and have such hair about their heads, as not only exceedeth all other Beasts, but also poysoneth when the b(ndeth upright. Pliny called this Catoblepunts, because it continually looketh downward, and faith that all the parts of it are but small, excepting the head, which is very heavy, and exceedeth the proportion of his body, which is never lifted up, but all living creatures dy that see his eyes.

By which there ariseth a question, whether the poyson which he sendeth forth, proceed from his breath, or from his eyes. Whereupon it is more probable, that like the Cockatrice he killeth by seeing, then by the breath of his mouth, which is not competable to any other Beasts in the world. Besides when the Souldiers of Marius followed Jugurtha, they saw one of these Gorgons, and supposing it was some Sheep, bended the head continually to the earth, and moving slowly, they set upon him with their swords, whereas the Beast disclaiming, suddenly discovered his eyes, setting his hair upright, at the fight whereof the Souldiers fell down dead.

Marius hearing thereof sent other Souldiers to kill the Beast, but they likewise dyed as the former. At left the Habitants of the Country, told the Captain the poyson of this Beast nature, and that if he were not killed upon a sudden, with the only sight of his eyes, he sent death into his hunters.
hunters: then did the Captain lay an ambush of Soldiers for him, who slew him suddenly with their spears, and brought him to the Emperor; whereupon Marcellus sent his skin to Rome, which was hung up in the Temple of Hercules, wherein the people were feasted after the triumphs; by which it is apparent, that they kill with their eyes, and not with their breath.

So that the fable of Serosius, which reporteth that in the furthest place of Atlas, these Gorgons are bred, and that they have but one eye a piece, is not to be believed, except he mean, as else-where he confefseth, that there were certain maids which were sitters, call Gorgons; and were so beautiful, that all young men were amazed to behold them. Whereupon it was said, that they were turned into ftones: meaning that their love bereft them of their wit and fene. They were called the daughters of Cetus, and three of them were made Nymphs, which were called Porphre, Enyo, and the third Dimos: so called as Geraldus faith, because they were old women, so soon as they were born, whereunto was affigned one eye and one tooth. But to omit these fables, it is certain that sharp poifoned fights are called Gorgon Blepen, and therefore we will follow the authority of Pliny and Athenaeus. It is a Beafl all fet over with scales like a Dragon, having no hair except on his head, great teeth like Swine, having wings to fly, and hands to handle, in nature betwixt a Bull and a Calf.

There be Islands called Gorgones, wherein these Monfters—Gorgons were bred, and unto the days of Pyrrhus, the people of that Country retained some part of their prodigious nature. It is reported by Xenophon, that Hanno, King of Carthage ranged with his Army in that Region, and found there certain women of incredible swiftnetfs and peculiaritv of foot. Whereof he took two only of all that appeared in fight, which had fuch rough and sharp bodies, as never before were seen. Wherefore when they were dead, he hung up their skins in the Temple of Juno, for a monument of their iftrange natures, which remained there unto the deftruction of Carthage. By the confideration of this Beafl there appeareth one manifest argument of the Creators divine wifdom and Providence, who hath turned the eyes of this Beafl downward to the earth, as it were thereby burying his poifon from the hurb of man; and shadowing them with rough, long, and flrong hair, that their poifoned beams should not reflect upwards, until the Beafl were provoked by fear or danger, the heavines of his head being like a clog to refrain the liberty of his poifonful nature, but what other parts, vertues, or vices are contained in the compas of this Monfter; God only knoweth, who peradventure hath permitted it to live upon the face of the earth, for no other caufe but to be a punishment and scourge unto mankind; and an evident example of his own wrathful power to everlafting destruction. And thus much may serve for a description of this Beafl, until by Gods Providence, more can be known thereof.

Of the HARE.

A Hare is a four-footed Beafl of the earth, which the Hebrews call Aranbet, in the feminine gen-der, which word gave an occafion to an opinion that all Hares were females, or at the leaft that the males bring forth young as well as females: whereof we shall fee more in the fequell of this fatory. And the Jews fay, that it signifieth nothing elfe in Hebrew but a Hare, for which word Deur. 14. the Chaldee tranflate Aratoba; the Arabians, Erreb; the Persians, Kargos. Avicenna cal-lefth it Aranberti; Sabinus, Aranbertis, Aranbertus, and Arasben; the Saracents, Arneph; the Gracians, Lagos, Lago, Lagos, because of his immoderate luft. It is called Foon for his fear, and in Latine, Lupus, of Leopes, signifying fwiiftnefs of feet, and that it is not heard when goeth; howsoever some men derive it from Lepor, the Greek word, others derive Lagos from La, betokening elevation, and Oos, signifying an ear, because the pricketh up one of her ears when the runneth. The Italiens cal-lefth it Luveta; the French, Liureau, and Lourebat, Leurebat; the Spaniards, Liebre; the German, Hals, or Hatt; the Ilyrians, Zogicz.
There are four sorts of Hares, some live in the Mountains, some in the Fields, some in the Marshes, and some everywhere without any certain place of abode: They of the Mountains are most swift, they of the fields less nimble, they of the marshes most slow, and the wandering Hares are most dangerous to follow: for they are so cunning in the ways, and mutes of the field, running up the hills and rocks, because by custom they know the nearest way, and forbearing down hills, sometime making heads upon the plain ground, to the confusion of the Dogs, and the dismayning of the Hunter.

Pellæus faith, that there be certain Hares called Elymenus (almost as big as Foxes) being blackish, of long bodies, and large white spots upon the top of their tails; these are called of their country (like the Elymen Dogs). There be also Hares called Mofchias, so called because of their sweet smell, or else that they leave in their foot-steps such a strong savour, whereunto when the Dogs fennel, they are said to be almost mad. At Pisâ the Hares be very great, because there they have more grateful meat then in other places.

In the neither Panemnes they are much fatter and better tafted than they be in Italy, the Italian Hare hath its fore-legs low, a part of his back-pale yellowish, the belly white, the ears long: In Gallia beyond the Alps, they are also white, and therefore some have thought that in the Winter time they eat snow: and this is certain, that when the snow melteth, their colour is much altered. There hath been white haired Conies, whole skin was black, and hair of their ears black. They are bred in Libya, in Sephonia, and in Italy, in the top of the Mountains, and so brought into other Countries. Some again have been white in the Winter, and return to their former colour in Summer. There are great store of white Conies in Flânia, and Lezovina, but they are leffer esteemed and sold cheaper. (Schoenberger's faith) the back of a Hare is commonly ruffer, or like Olive colour interlined with some black spots: the common Hare of the Alps never changes colour, and it is greater than the ordinary Hare. There are white Hares also in England; and in Muatovia, there are a multitude of Hares of all colours, but no where so many as in the Demer Islands, because there are no Foxes there to kill the young ones, or Eagles, which frequent the highest Mountains in the Continent, and the people that inhabit there regard not hunting.

In Athens (Mauriæs faith) there were no Hares, but Alcuin affirmeth the contrary. Hares brought into Italy, d'ye presently, and if they range a little about the Country, yet return them to the haven where they came to land, and depart not from the shore till they be dead. Hagesander Delphicus writeth, that in the reign of Antigonus, there was such a number of Hares in Atlantia, (and afterward in Lebros) that the Inhabitants were constrained to go to the Oracle, and demand counsel how to refit the Hares, from whom they received answer, that they must nourish Dogs and kill them: and whereas they so abounded in Lebros, which at the peoples own request and care, multiplied to their great harm; afterward a sign of the Hare was placed in Heaven, to remember them, that nothing so much hurteth man-kinde, as their own desires: as in ancient time there was not a Hare in those Countries.

In the next place we are to describe all the parts and members of Hares, for it is admirable to behold how every limb and part of this Beall is composed for celerity: and first of all the head is round, nimble, short, and of convenient longitude, prone to turn every way; the ears long and lofty like an Asse, for Nature hath so provided, that every fearful and unarm'd creature should have long and large ears, that by hearing it may prevent its enemies, and save it self by flight. The lips continually move sleeping and waking, and from the flit which they have in the middle of their nose, cometh the term of Hare-lips, which are so divided in men; for if a Woman with child fee one of them suddenly, it is dangerous, if the childe prove not Hare-lipt. They have alfo teeth on both fides.

Whatsoever Beall be born in your flock, having that mark upon them, which is commonly called Hares-tooth, never suffer them to suck their dam, but call them away as unprofitable and baf- fard cattell; the neck of a Hare is long, small, round, foft, and flexible, the fotheadlone ftrait and broad, for her more easie turning; her legs before soft and round, flanding a little aunder, very flexible, broader behind then before, and the hinder leggs longer then the fformer; a beart not narrow, but fitted to take breath in courfe; a nimble back, and fleftie belly, tender loins, hollow fides, fat buttocks filled up, comely, ficroag, and nervy loins, the fore-feet very flexible; only it wanteth a commodious tail for courfe. The eyes are brown, it is a subtile Beall, but not bold; it seldom looketh forward, because it goeth by jumps. The eye-lids coming from the brows, are too short to cover their eyes, and therefore this fene is very weak in them; and befoide their over-much sleep, their fear of Dogs and fwitneffe, caufeth them to fee the lefs; when they watch, they flut their eyes; and when they sleep they open them.

Wherefore the Egyptians when they will fignifie and open a manifest matter, they picture a Hare sleeping. They watch for the moft part all the night: when the eye-lid of a man is pulled back, so as it will not cover the ball of the eye; the Graecians call it Lagophthalma, that is, Hares-eyes, for so doth Callus define it, it cometh sometimtes, when in the cure it is cut away too much, or else when the hinder lid falleth down, and flandeth not up to meet the other, but concerning the colour of their eyes, it is not very possible to difcover it, as well for the caufes aforesaid, as also because it is seldom taken but dead; yet this is certain, that with what colour it beginneth, in that is continueth to the laft, according to Virgils verfe:
The liver is so parted at once, that a man would think there were two livers in one body, and Pliny is bold to affirm, that in Britium, Thrine, Propontis, Scygmum, Boltra, and other places they are all such. Archebodius upon this occasion affirmeth, that a Hare beareth young both male and female, so that the Grammarians know not what of what sex to make it. Albertus and Demostrus are absolute in this point.

Bionius confesseth he cannot tell, the common sort of people suppose, they are one year male, and another female. Eliasius also affirmeth so much, and by relation of his friend, he ventureth the matter, and faith moreover, that a male Hare was once found almost dead, whose belly being opened, there were three young ones alive taken out of her belly, and that one of them looked up alive, after it had lain a while in the Sun, and it put out the tongue as though it desired meat, whereupon milk was brought to it, and so it was nourished.

But all this is easily answer'd, if a man follow the cotinuel of Archebodius, and look upon the secrets of nature, he shall finde a most plain dilinitio; but the hunters object that there be some which are only females, and no more: but no male that is not also a female, and so they make him an Hermaphrodite. Nepher also affirmeth so much, for he saw a Hare which had stones and a yard, and yet was great with young, and also another which wanted stones, and the males genital, and also had young in her belly. Bandellus faith, that they are not stones, but certain little bladders filled with matter, which men finde in female Hares with young, such as are upon the belly of a Beaver, where-in also the vulgar fort are deceived, taking those buncles for stones, as they do these bladders. And the use of these parts both in Beavers and Hares is this; that against rain both one and other seth thereout a certain humor, and anoint their bodies all over therewith, and so are defended in time of rain. The belly of a Swow, a Bitch, and a Hare, have many cels in them, because they bring forth many at a time, when a Hare lyeth down, the bendeth her hinder legs under her loins, as all rough-footed Beasts do.

They are deceived, which deliver by authority of holy Scriptures, that Hares love to lodge them upon Rocks, but we have manifestel else-where, that those places are to be understood of Conies. They have fore-knowledge both of winde and weather, Summer and Winter by their noxes, for in the Winter they make their forms in the Sun-fline, because they cannot abide frost and cold, and in the Summer they reit toward the North, remaining in some higher ground, where they receive colder air.

We havefewed already that their flight is dim, but yet herein it is true that Platarch faith, they have Visum induficium, an indefatigable sense of seeing, so that the continuance in a mean degree, countervaileth in them the want of excellency. Their hearing is most pregnant; for the Egyptian when they signifie hearing, picture a Hare; and for this cause we have fewed already that their ears are long like horns, their voyce is a whining voyce, and therefore Authors call it Vagittum, as they do a young childe, according to the verfe of Ovid:

Intus ut infantia vagiit ore Puér.

They reit in the daytime, and walk abroad to feed in the night, never feeding near home, either because they are delighted with forien food, or else because they would exercise their legs in going, or else by secret instinct of nature, to conceal their forms and lodging places unknown; their heart and blood is cold, which Albertus aliggneth for a caufe of their right-feeding: they eat also Grapes, and when they are overcome with heat, they eat of an herb called Lactea Lepere, and of the Roman, and Histrarian, Celerbati, of the Veterinari, Lebucium; of the French, Lefroite; that is, Hares-letece, Hares-houfe, Hares palace; and there is no diufafe in this Beast the cure whereof of the doth not seek for in this herb. Hares are said to chew the cud in holy Scripture, they never drink, but content themselves with the dew, and for that caufe they often fall rotten: It is reported by Philippus Belat, that when a Hare drunk Wine, the infinitely dyed; they render their urine backward, and their milk is as thick as a Swines, and of all creatures they have milk in udders before they deliver their young.

They are very exceedingly given to sleep, because they never wink perfectly: some Authors derive their name Lagos in Greek, from Laiin to see, and thereupon the Greeks have a common proverb Lagos Cathedon, a sleeping Hare for a dissembling and counterfeiting person, because the Hare feeth when the sleepeth; for this is an admirable and rare work of Nature, that all the residue of her bodily parts take their reit, but the eye flandeeth continually senti- neling. Hares admit copulation backward, and herein are they like to Conies, because they breed every moneth for the molt part, and that many; at that time the female provoking the male to carnal copulation, and while they have young ones in their belly they admit copulation, whereby it cometh to pafs, that they do not litter all at a time, but many dayes sunfer, bringing forth one perfect, and another bald without hair, but all Blinde like other cloven-footed-beasts. It is reported that two Hares brought into the Ille Carpathus, filled that Island with such abundance, that in short time they destroyed all the fruits; whereupon came the Whether malé bear young like females.
The History of Four-footed Beasts.

The proverb Carpathius Legem, to signify them which plow and sow their own miferies.

It falleth out by divine Providence, that Hares and other fearfull Beasts which are good for meat, shall multiply to greater numbers in short space, because they are naked and unarmed, lying open to the violence of men and beasts, but the cruel and malignant creatures, which live only upon the devouring of their inferiors, as the Lyons, Wolves, Foxes, and Bears, conceive but very seldom, because there is lefts life for them in the world, and God in his creatures keepeth down the cruel and ravenous, but advancesthe simple, weak, and despised: when the female hath littered her young ones, she first hicketh them with her tongue, and afterward seeketh out the male for copulation.

Hares do seldom wax tame, and yet they are amongst them, which are neither Placide nor Fere tame nor wilde, but middle betwixt both, and Cardane giveth this reason of their untameable nature, because they are persuaded that all men are their enemies. Scaliger writeth; that he saw a tame Hare in the Cattle of Mount-Pegal, who with her hinder legs would come and strike the Dogs of her own accord, as it were defying their force, and provoking them to follow her. Therefore for their meat they may be tamed and accustomed to the hand of man, but they remain incapable of all discipline, and ignorant of their teachers voice, so as they can never be brought to be obedient to the call and command of their teacher, neither will goe nor come at his pleasure.

It is a simple creature, having no defence but to run away, yet it is subsile, as may appear by changing of her form, and by scraping out her foot-steps when she leapeth into her form, that so she may deceive her Hunters, also she keepeth not her young ones together in one litter, but layeth them a furlong one from another, that so she may not lose them all together, if peradventure men or beasts light upon them. Neither is the careful to feed her self alone, but also to be defended against her enemies, the Eagle, the Hawk, the Fox, and the Weep, for the fear of all these naturally, neither can there be any peace made betwixt her and them, but the rather trufthem the scathing brambles, the solitary woods, the ditches and corners of rocks or hedges, the bodies of hollow trees, and such like places, then a dissembling peace with her adversaries.

The wilde Hare when she taketh a Hare, she feteth one of her talons in the earth, and with the other holding her prey, striveth and wresting with the Beast until she have pulled out his eyes, and then killet him. The Foxes also compass the poor Hare by cunning, for in the night time when he falleth into her foot-steps, he restrains his breath, and holdeth in his favour, going forward by little and little, until he finde the form of the Hare, and then thinking to surprize her, on a sudden leapeth to her at catch; but the watchful Hare doth not take leap after a careless manner, delighting rather in subtilty than security, when the perceiveth the approaching of such a guest, (for the windeth him with her nostrils) and thinketh it better to go from home, than make a fealt to her foe.

Wherefore the leapeth out of her form and runneth away with all speed she can. The Fox also followeth, but a far off, and the hearing her adversary no more, betaketh her self to reit again, under some bramble, or other bush, supposing that the ground the hath gotten shall never be recovered of her again: but the Proverb is old and true. Fair and softly goest far, to the Fox which feldom getteth meat, but winneth it with his wit and his heels, followed as fast as he can; for a flow pace over-taketh the Hare at reit, which when the perceiveth, forth the goeth again, forfaking her quiet sleep, for the safe-guard of her life, and having gone so much ground as she did before, the betaketh her to reit the second time, hoping that now she hath quit her self from her foe; but the Foxes belly hath no ears, and therefore hunger is to him like a thousand whips, or a whole kennel of Hounds, forcing him forward after his game.

The Hare for her better safe-guard getteth up into some small tree, being sleepy and weary through the Foxes pursuit; the Fox cometh to the tree and shaketh it by the roots, and will not suffer the Hare to take any reit, for he hopeth that time and travel will bring her to his diift; the leaps away again, and leteth no graps grow under his feet, hoping that her heels shall deliver her from the Foxes teeth. After follows the Fox, and at length as the greater purfe over-weighteth the smaller, and the great Horfe of War over-weigheth the little hunting Naph, doth do the Junly limbs of the Fox, out-laf the weak legs of the Hare, and when the can go no more, needs must her weaknes betray her to her foe, and so was her flight and want of reit like a sicknef before her death, and the Foxes preluence like the voyce of a palling bell.

And on the contrary, all the labour of the Fox, like a gentle and kinde exercize for the preparing of his stomack to such a fealt. The fift and leaf of kinde of Wolves are also enemies to Hares, and the Weale do craftily sport and play with the Hare until he have wearied him, and then hangeth fift upon her throat, and will not los her hold, runn the Hare never so fall, till at last through want of breath, and loss of blood, she falleth into the hands of her cruel play-fellow, who turneth sport into good earnell, and taketh nothing from her but her blood, leaving her carcasse to be devoured by the hands of others, and in this manner is the filly Hare hunted by beafts: Now let us hear how she is hunted of men.

It is before exprefled, that every limb of a Hare is composed for celerity, and therefore the never traveleth but jumpeh, her ears lead her the way in her chase, for with one of them she kiketh to the voyce of the Dogs, and the other the ftrecheth forth like a fail to haffen her courfe, always stretching her hinder-feet beyond her former, and yet not hindering them at all; but sometimes when her ardent desire maketh her ftrain to fly from the Dogs, the falleth into the nets, for fith
is the state of the miserable, that while they run from one peril, they fall into another; according to the saying of holy Scripture, 1sa. 2:4. *He that goeth out of the snare, shall fall into the ditch.* And this is to be noted, that if the Hare had the wit to run forthright, and never to turn, she could not be so easily over-taken; but because of her love to the place of her breed, there she is taken and losteth her life where she had her beginning: for the preferreth that place above all other for safety. Again some of the elder Hares, assooned as they hear the Dogs, fly to the tops of the high Mountains, and from hence more easily run up the hill, then down.

Wherefore the Hunter must studiously avoid that disadvantage, and keep her down in the valleys. In paths and high ways the runneth more speedily, wherefore they must be kept from that also. The Hares of the Mountains do oftentimes exercise themselves in the plain, and through precipice grow acquainted with the neerer ways to their own lodging; so that if at any time the husbandmen set upon them in the fields, they daily with them till they seem to be almost taken, and then on a sudden take the neerer way to the Mountains, not suspected by the Hunters, and so take sanctuary in the unaccustomed places, whither Dogs nor Horfes dare ascend. For the Hares which we keep in the buffies are not able to endure labour; and not very swift (by reason of the pain in their feet) growing fat through idleness and discontinuance of running, they must be hunted on this spot: first of all they go through young woods and hedges, such as grow not very thick, for the thicker hedges they leap over, but when they come to many thick places that they must leap over, they quickly fall down and are tired.

The Dogs first of all go from them carelessly, because they cannot see them through the trees, but suffer them to run in the Woods following a far off by the scent, until at last they get the sight of her, and through their better exercise and skill, easily overtake her: but the campedial or field-hare being leaner of body, and oftener chased, is taken with more difficulty, by reason of her singular agility, she therefore when she begins her course, leapeth up from the ground as if she flew; afterward pafteth through brambles and thick buffies with all expedition; and if at any time she come into deep grass or corn the eaily delivereth her self and flieth through it. And as it is said of the Lyons, that with their tails they flie up their strength and courage; so are the ears of this Beasts like Angels wings, Ships sails, and rowing Oars, to help her in her flight; for when the runneth the bendeth them backward, and weft them in head of sharp spurs to prick forward her dulness, and in her course the taketh not one way, but maketh heads like labyrinths to circumvert and trouble the Dogs, that fo the may go whither the will, always holding up one ear, and bending it at her pleasure to be the moderator of her chase. Neither is the fo unprovident or prodigal of her strength, to spend it in one course, but observeth the force of her protector, who if he be slow and sluggish, she is not profuse of her celerity, but only walketh gently before the Dogs, and yet fafely from their clutches, refering her greatest strength to her greatest necessity; for the knoweth that he can out-run the Dogs when she pleasteth, and therefore it is a vain conceit to trouble her self more then she is urged. But if there be a Dog following her more swiftly then the reft, then the setheth forward with all the force she can and when she hath left both Hunters and Dogs a great way behind her, the setheth to some little hill or riding of the earth, there the rafeth her self upon her hinder legs, like a Watch-man in his Tower, observing how far or near the enemy approacheth, and perceiving that she is delivered from perfit of all danger, seemeth to deride the imbecility of their forces.

The younger Hares by reason of their weak members, tread heavier upon the earth then the elder, and therefore leave the greater favour behindem them: and in ancient time, if the Hunters had taken a young Levern, they let her go again in the honour of Diana. At a year old they run very swift, and their favour is stronger in the Woods then in the plain fields.

The Hare is followed by the fooe and so defecry'd, eispecialy in soft grounds or high-ways, but if they go to the Rocks, to the Mountains, or to the hollow places, they are more uncertain, if they ly down upon the earth (as they love to do) in red fallow grounds they are easily desecry'd.

When they are startled in the plain fields they run far, but in the Woods they make short courses: If they hear the Dogs they raise themselves on their legs and run from them; but if fearful imagination oppresseth them, as they oftentimes are very sad and melancholy, supposing to hear the noise of Dogs where there are none such flitting, then do they run to and fro, fearing and trembling, as if they were fallen mad.

Their footstepes in the Winter time are more apparent then in the Summer, because as the nights be longer, so they travel farther: neither do they smell in the Winter mornings so soon as it is day, until the frost and ice be thawed, but eispecialy their footstepes are uncertain in the full Moon, for then they leap and play together, flattering and putting out the favour; nor in the Spring time also when they do indiger, they confound one another footstepes by multitude.

They which will go forth to hunt or take pleasure in that paltine must rife early, felt they be deprived of the smell of her footstepes, so shall not the Dogs be able any way to finde the Hare, nor the Hunters their game and paltine; for the nature of the footstep remains not long, but suddenly in a manner vaniseth away every hour. Again, they must set the Hills and Rocks, the Rivers, and also the Brooks with nets and gins; whereby as it were dropping up the flitting holes, paths, and ways, wherein the Hare goeth, and the part trutheth, whether they be broad or narrow: The best time for the effecting and bringing hereof is after the Sun-rising, and not in twlight of
The History of Four-footed Beasts.

break of the day, left the nets be let near the Hares form, and the be scared away, but if they be let a far off, there is no danger of her departure after the Sun is up, because then the giveth her fell to sleep: the nets must be set on this manner, let the rodes be pitched upright, tailing their faire to the tops, raising the net in the middle, and hang a long rope at one side, that when the Hare is in the net she may not go out again. When the Hare is raiied, he which followeth her to the nets, must drive her in with a great cry, and being in the net, he must gently restrain the Dogs, and make signification to the hunter that she is taken, or else if it fail, let him shew the contrary.

The keeper of the nets must keep silence, left by hearing of his voice she be averted, and the hunter must take the Dogs and go to the forme, there to flart the Hare; and the fashion was in ancient time among the Pagan,first of all to call upon Apollo and Diana, (their imagined Gods of hunting) to speed their sport, and to whom they promised part of their game. But when the Dog is sent forth, and after much winding and calling about, falleth into the footstep of the Hare, then let him loose another, and seeing them run in one course, uncouple all the Hounds, let him follow after, speaking to his Dogs by name, saying now A, then B, Habacuc, and such like words of Art, not preñling them too eagerly at the beginning, but gently encouraging them to the pursuit.

The Dogs take this for a sign of joy, and being glad to gratifie their Masters run along with a gal- lant cry, turning over the doubtful footsteps; now one way, then another, like the cuts of Inden- tures, through rough and plain, crooked and straight, direct, and compass, wagging of their tails, and glistering with their eyes, until they finde the Hares form; then they make signification thereof to the hunter with their tails, voices, and pieces; now running together, now standing still divided aunder, they set upon the beast, who suddenly riseth and turns the cry of the Hounds after her flight, then must the Hunters cry out, Jf Dogs, there boyes, there, Jb, A, Jb, Jc, and the flor- tefl word is fitted to applaud the Dogs.

Let the Hunter also run after, so as he never meet the Hare and trouble the hounds, the poor Hare getts her out of sight, and runs to the place where she was first startled, but if the fall into the nets by the way, the keeper of the nets must give token to the Hunters by his hollowing voice, after the usual manner of woodmen; O oha, O ohe, that the game is at an end, and then call the Dogs by name. If the Hare run far, and fland long on foot, and it the Dogs paffe over the Hares footstep and difcry them not, then must the Hunter recall them with a peculiar hunting term, and lead them to the place, or calling himself about as near as he can, rebuking the Dogs that rage at uncertainties, and exhorting them that be diligent; who when they have found the footings again, run on as before, with all alacrity. In the mean reacon let the Hunter fland till the Dogs do infallibly demonstrate unto him that they have found the game again, then let the Hunter proceed as before, exhorting his Dogs to the sport, and if it last all day, the Hunter must regard that he refrain and keep the Dogs to the weareied Hare, left if they flart a fresh one, their labour be lost. If it be in Summer about noon, let him reft his Dogs for strengthening of their feet till the heat be over; if it be snowie weather, and the winde is Northerly, the footstepes remain long and are not eafiely melted, but if the South winde blow, the footsteps are very quickly shortned: and neither when the snow falleth left, or the winde bloweth strong, must the Dogs be led forth to hunting, for the snow beryth the Dogs nofe, and the froft killeth the heat of the Hares foot; then let the Hunter take his nets and some other companion with him, and go to the Woods or Mountains, tracing out the footsteps of the beast in the snow unto the form, which is in some steep or shadowed place, where the winde blows over the snow, for in such places doth the Hare seek her lodging; having found it, let him not take too near, left he raife her from her feat, but cast round about, and if he find no footings from that place, he may take it for granted that the Hare is found.

Having so done, let him leave her, and seek another before the snow be melt, and the footings dañhed, having respect to the time of the day, that so he may inclofe and take them before the evening: then let him draw his nets round about them, compassing the whole plat wherein the refleth, and then raife her from her fiofl: if she awoide the net, he must follow her by the foot unto her next lodging place, which will not be far off, if he follow her clofe, for the snow doth weary her and clot upon her hinder feet, so as the Hunter may take her with his hand, or kill her with his fiaffe.

Bloweth another way of taking Hares: The Hunters spread and divide themselves by the untillled and rough wayes, leading a Gray-hound in a flip, beating the duffes, hedges, and thorns, and many times fending before them a quick smelling Hound, which raife the Hare out of her mufe, and then let go the Gray-hound with hunting terms, and cries, exhorting him to follow the game; and many times the Dogs tear the Hare into many pieces, but the Hunters must pull them bleeding from the mouth of their Dogs.

Others again lie in wait behind bushes and trees to take the Hare on a sudden, and some in the Vineyards, for when they are fat and rety, they are eaily overtaken, especially in the cold of Win- ter. Gyr (as appeareth in Xenophon) was taught to make duches for the trapping of Hares in their course, and the Eagles and Hawkes watch the Hare when she is raiied and hunted by the Hounds, and sit upon her on the right side, whereby they kill and take her, so that it is true which was said at the beginning, that Hares are hunted by Men and Beasts.

Having
Having thus discoursed of Hunting and taking of Hares, now it followeth also in a word or two
to discouer of Parks or inclofed Warrens, wherein Hares, Conies, Deer, Bores, and other such beasts
may always be ready, as it were out of a store houfe or Seminary, to serve the pleasure and use of
their Masters: Graphio luth, that the first Roman that ever inclofed wild beasts, was Faustus Hespi-
num, and Caius faith, that \\u201cHares had been inclofed for the manner was (faith Columella) that-
Richmen poffeed of whole Towns and Lordships, neer some Village, inclofed a piece of land by
pau, madwall, or butt, flushing the fame with divers wild beasts, and such a one there was in the
Lordship that Ptolemy bought of Marcus Pile in Tarsuionum: and Quintus Harenensis saw at Lanreut a
wood inclofed, containing fifty Acres, wherein were nourished all forts of wild beasts, within the compa-
fs of a wall.

Quintus Albea commanded his Forrester to call the beasts together before him, and his guedes fit-
ting at Supper, and imminently he founded his pipe, at the voice whereof there assembled together a
great company of all forts, to the admiration of the beholders. Quintus Fulvia had a Park in Tar-
quium, wherein they were not only the beafts before spoken of, but also wild Sheep, and this
contained forty Acres of ground, besides he had two other. Varro gave a Parke in France,
containing the compafs of three thousand paces, wherein he preferred not only Deer, Hares, and
Conies, but also Doe-mule, Bees, and other Beasts: the manner whereof ought to be thus; first that
the walls or pales be high, or close joyned, so as neither Badgers, nor Cats may creep through, or
Wolves, or Foxes, may leap over: Wherein ought also to be bushes, and broad trees for to cover
the beafts against heat and cold, and other secret places to content their natures, and to defend them
from Eagles and other ravening Fowls: In which, three or four couple of Hares do quickly multi-
ply into a great Warren. It is also good to low Goards, Mifleine, Corn, Barly, Pears, and such like,
wherein Hares delight and will thereby quickly wax fat. For their fatting, the Hunters use another
devife, they put Wax into their ears, and so make them deaf, then turn them into the place where
they should feed, where being freed from the fear of sounds (because they want hearing) they grow
fat before other of their kind.

Concerning the use of their skins, in some Countries they make sleeves and breeches of them,
especially for.workflowing for all outward cold diseases, Heliodorus lay upon a bed filled with new or
wool of Hares, for that there is nothing more fof, for which cause the Cretians made Pounge thereof,
to cleanse the eyes of men. The Goldsmiths use the feet or legs of Hares in stead of brushes or
brooms, to take of the dust from their plate. The flesh of Hares hath ever been accounted a delicate
meat (among all other four-footed beafts) as the Thrufh among the fowls of the air, according to the faying of Martial:

Inter euer Turdus, quius me judicis cortis,
Inter quadrupedes, gloria prima loque.

In ancient time (as Caius faith) the Britains were forbidden to eat Hares, like as the Jews by the
law of Moses, Lev. 11. Deut. 14. Plutarch enquirieth the reaon why the Jews worship Swine, and
Hares, because they did not eat their flefth: whereas unto anfwer was made, that they abftained from
Hares, becaufe their colour, ears and eyes, were like Ases; wherein the ignorance of Gods law ap-
peared, for they abftained from Hares at Gods commandment, because they were not cloven-footed,
for the Egyptians accounted all fufit creatures to be partakers of Divinity.

Their flefth ingenereth thick blood, therefore it is to be prefcribed for a dry diet, for it bindeth
the belly, procureth urine, and helpeth the pain in the bowels: but yet it is not good for an
ordinary diet, it is hot and dry in the second degree, and therefore it nourilheth but little being fo
hard, as Galen witnefeth.

The blood is farre more hot then the flefth, it is thin, and therefore watery like the blood of all fear-
fully beafts; the hinder parts from the loins are most delicate meat, called in Latin, Turdus, for it was
wont to be dressed with fat, and Coriander leafe, yet the forepart is the fweeter, for the manner of the
drifting whereof I leave every man's humour. It was once believed that the eating of the
hinder loins of a Hare would make one fair, or procure blee, whereupon Martial received a Hare
from Gellius a friend of his with this meaffege;

Fomus fepum Marce diebus oris.

And he retorted the jeft in this manner upon Gellius:

Simum non fallis, fi verum (luc mea) dieis,
Edisti numquam, Gellius, in lefserm.

Lampridius writeth that a certain Poet played upon Alexander Severus the Emperor for
eating Hares flefth, which made him fai, whereas in truth he was very black; In this
manner:

Pulcherum quod vides esse nostrum regem,
Quem Syrum fuum detulis propagat.

Venatus
The Emperour seeing those Veres, for Emperours have long ears and hands, made answer unto them as followeth;

Pulchrum quod putas effusum regem
Vulgari (mifrande) de fabella,
Si verum putas eff, non irafcar
Tantum in comedar veniam lepuscular
Ut si animi malis requifis
Pulcher, ne inviden livore mentis.

If any man finde fault with the Emperors Veres, Erosmus hath already answered the objection, that Kings and Emperours are not subject to laws of verifying; besides his answer was in Greek, and this but translated.

The eating of Hares procureth sleep, and thus much for the flesh and parts. The Epithets of a Hare expressing their natures are, Eared, trusting their feet, fearful, careful, fruitful, flying, raging, unhorned, little, crafty, tender, sharp-smelling, swift, whining, and wandering, besides many other Greek names. When Xerxes gathered his Army to go against Greece, a Mare brought forth a Hare, which forestewed that great Army should work no strange effect. And another Mare of three years old brought forth an Hare which spake as soon as it was littered, biting her mother with her teeth, and killing her, and while they looked upon her, sucking her dam's blood, feathers grew out of her back in fashion of wings, which being done, the monfer lifting up the voice spake in this manner; 'Fundite jam labymnas & insivia miseris mortuis, ego hinc abeo: that is to say, O ye wretched mortal men weep and figh, I go away: at which words the flewe away and was never seen more.

There were present at the fight herof seven publick notaries, which called witnesse and made instruments thereupon, (as Antonius Batius writeth in his Epistle to Petrus Tolem of Lyons in the year 1537. in December:) whereunto the said Tolem made this answer, The days fhall come (faith he) except the mercy of God prevent them, that children fhall think they do obedience to their Parents if they put them to death.

They shall grieve because they were born, and fay they are adulterate, as the Hare that was born of the Mare. Likewise it is reported by Lysander, that when the Carminians refused the conduct of the Lacedemonians, and the Lacedemonians befieging the City, fell to be very much afraid, and unwilling to feel the walls; whiles they flood in this amaze, suddenly a Hare leaped out of the town ditch; which thing when Lysander faw, he exhorted his Souldiers, faying, Be not afraid (O ye Spartans) of this fuggifh and unexercifed people, for you fee they flir not out of the City, but fuffer Hares to lodge under their walls; whereupon came the proverb (Dumre lepures sub manibus) Hares fliep under their walls, to ftignifie a flothful, fecure, fuggifh, idle, and untruthie people.

The Eagles of Norway lay their young ones in Hares skins, which themselves pull off. There is also a bird in Sythia, about the bignes of a Buffard, which bringeth forth two at a time, and keept them in a Hares skin which he hangeth upon a bough. Hares were dedicated to love, because (Xenophous faith) there is no man that feeth a Hare but he remembereth what he hath loved.

They fay the City Boco of Laconia was builded by a signe of good fortune taken from a Hare, for when the Inhabitants were driven out of their Country they went to the Oracle to defire a place to dwell in, from whom they received answer, that Diana should shew them a dwelling place: they going out of their Country a Hare met with them, which they confefted to follow, and there to build where the Hare fhould lodge, and they followed her to a Myrtle tree, where the Hare hid her self, in which place they builded their City, and ever afterwards retained with veneration a Myrtle tree. And thus I will conclude this moral discoure of Hares, with that Epigram of Martial made upon occasion of a Hare that in sport paffed through the mouth and teeth of a tame Lion, faying that she was ambitious in offering her life to the Lions teeth in this wise:

Non facit ad sevus cervix nifi prima leones,
Quid fugis hos dentes, ambitio lepus?
Scilicet a magnis ad te defendere tauris,
Et quam cernunt frangere colla velint.
Deferanda tibi est ingentis gloria fatis
Non potes hoc tenum praeda sub bofhi morti.

The medicines of Hares.
Pliny.
it cureth the stone: and Sextus faith, he made trial of it by putting a spoonful of the powder into water wherein was a rand hote, and the same hote did instantly melt and disolve: so likewise a young Hare cut out of the May belly and burnt to powder, hath the same operation. A wafcoat made of Hares skins daylight the bodies of young and old: also the same dipped in Oil laid to the fore places of a Horfes legs where the skin is off by over reaching, it often cureth the fore: the blood taken warm out of the body amended Sun burning, freeclies, pimples, and many other faults in skin and face; which Geoffs prescribes to be done, first by wafting the place many hours together, in the morning with the blood, and afterwards anointing it with oil: the fame virtue is in the fat of Swans mingled with oil, according to the saying of Serenus:

Cyncest adipos bilart mifcefa Lypsin
Omnine malum priferre maculofo ex ore fugabit,
Sanguine vel leposia mobut detoxifuit annunt.

It also cureth and take away the thick skin of the eye, it adorneth the skin, produceth hair in bald places, and eafeth the Gout.

O no cutim, produco pilos, et fede podagra
Sanguine fij fuerint membri furnintia mos.

It being fryed, helpeth the Bloody flux, Ulcers in the bowels, and old lache, and take away the poison of an arrow; it being anointed upon a hot outward Ulcer, it ripeneth it. After a bath, it cureth a great Leprosie by wafting. The Rennet of a Hare by theteth loofefeth the fleth is profitable for Ulcers in the bowels, it breaketh the stone being beaten, and being decocted like a Fox, eafeth the Gout and the shrinking up of the finewes. The fat with the flowers of beans beaten together, dreweth thorns out of the fleth: If a nail flieck in the sole of the foot, beat together the fat of a Hare and a raw Sea-crab, then lay it to the place, and right against it upon the same foot lay also two or three Bean flowers, and it lie a day and a night, and fo it shall be cure’d: and the fame dreweth a poisoned Arrow out of a Horfe. Andeys reporteth to Geoffs, that he hath often heard that the fewet of a Hare layed to the crown of a Womans head, expelth her fecundis, and a dead child out of the womb. The powder made of this wool or Hair flangeth bleeding, if the hairs be pulled off from a live Hare, and flopped into the nofe.

The powder of the wool of a Hare burned, mingled with the Oil of Myrtles, the gall of a Bull, and Allum wafted at the fire, and anoint it upon the head, fallenth the hair from falling off: also the same powder decocted with hony, helpeth the pain in the bowels, although they be broken: being taken in a round ball the quantity of a Bean together; but these medicines must be used every day.

Arnaldus prescribes the hair to be cut shor, and so to be taken into the body against burffenes: A perfame made of the dung and hairs of a Hare, and the fat of a Sea-calfe, draweth forth Womans flowers. The seed of a wilde Cucumber, and an Oyster shell burned, and put into Wine, mingled with the hair of a Hare, and wool of a Sheep, with the flower of Roes, eureth inflammations of Womans secretis after their child-birth. Also Hippocrates prescribes the shell of a Cuttle-fish to be beaten into Wine and layed in Sheeps wool and Hares hair, helpeth the falling down of the womb of a Womans child. Ifa mans feet be scorched with cold, the powder of a Harer wool is a remedy for it. The head of a Hare burned and mingled with fat of Bears and Vinegar, eafeth the hair to come where it is fallen off, and Galen faith that some have used the whole body of a Hare so burned and mingled for the foresaid cure, being layed in manner of a plaiter.

By eating of a Hares head, the trembling of the Nerves and the loffe of motion and fene in the members receiveth singular remedy. Thefe things alfo preverve teeth from aking: the powder of a Hares head burned with fat mingled together, rubbed upon the teeth, or if you will put thereunto the whifeit Fennel, and the dried beans of a Cuttle fish.

The Indians burn together the Hares head and Mice for this purpofe. When ones mouth fmeeteth frong, this powder with Spickard affwage the fneel. The brain is good againft poison. The heart of a Hare hath in it a theriacal virtue, all. The brain is proved to have power in it for comforting and repairing the memory. The fame fed and eaten helpeth tremblings which happen in the afeecions of ficknes, such as is in the cold flaking fit of an Aquae: It is to be noted, that all trembling hath its original caufe from the infirmity or weaknes of the Nerves, as is apparent in old age, although the immediate caufes may be fome cold constitution, as abundance of cold humors, drinking of cold drink, and fuch like; all which tremblings are cured by eating the brain of a Hare roasted, (faith Diffaroides and Egineta.) It alfo helpeth children to breed teeth eafily, if the gums be rubbed therewith, for it hath the fame power againft inflammation, that hony and butter hath: being drunk in Wine and the flowers thereof rofel and eaten, it is good for him that hath any pain in his bladder, and if the Urine exceed ordinary, for flaying therewith, take the brain hereof to be drunk in wine.

The tooth of a Hare layed to that part where the teeth ake, eafeth them. Take the Maw with the dung in it, and waft it in old wine fo as the dung may mingle therewith, and then give it to one fick of the Bloody flux, and it fhall cure him. The Rennet hath the fame virtue that is in a Calves

Serenus

Refis.
or Cows, and whereas Nisianther praises it in the first place, for the virtue it hath in it against poison, Niccan an ancient Phyftitian gives it the second place, for it is full of sharp digesting power, and therefore hath a drying quality. It diffolves the congealed and coagulated milk in the belly, and also clotted blood within in the stomach more effectually then the Rennet of any other beast, being al- way the better for the age.

Being mingled with Vinegar, it is drunk against poison; and also if a Man or Beast be anointed with it, no Serpent, Scorpion, Spider, or Wilde Moule, whose teeth are venomous will venture to sting the body fo anointed; or else inwardly take thereof three spoonfuls with Wine against the said bit- tings, or of any Sea-fish or Hemlock after the wound received; and with Vinegar it is sovereign ag- anist all poison of Chelminthum, or the blood of Buls.

The fame being drunk in Vinegar, or applied outwardly to womens breasts, diffiperseth the co- agulated milk in them; also being mingled with Snails, or any other flifh, which feed upon green herbs or leaves, it draweth forth Thorns, Darts, Arrows, or Reeds out of the belly: or mingled with gum of Frankincense, Oil, bird lime, and Bees-glewe, of each an equal quantity with Vinegar, it blancheth blood, and all ifues of blood flowing out of the belly: and it also ripeneth an old fore, according to the saying of Sennus;

Si indica leporis apicerfa, coagula vinum.

Being layed to the Kings evil in Lint with Vinegar, it diffiperseth and cureth it: also it healeth Cankers, it cureth a Quartain Ague; also mixed with Wine and drank with Vinegar, against the Falling evil and the stone in the bladder: if it be mixed with Sagapumum and Wine Amya, and infused into the ears, giveth help, as also the pain of the teeth. It diffolves blood in the lights, and easeth the pain of blood congealed in your stomach: when one spiteth blood, if he drink Samia and Myrtle with the Rennet of a Hare, it shall give him very prentif eafe.

The latter learned Phyftitians take a drink made of Vinegar and Water, and give it warm to eject and expell blood out of the Lights; and if any drop thereof cleave in the bowels, then do they three or four times together iterate this potion, and after apply and minifter all binding astringent med- icines and emplasters, and for the Bloudy flux it is good to be used: It is held alfo profitable by Disforides and other the ancients, that if the pap or brett of a Woman be anointed therewith, it lay- eth the fucking Infants loofenes in the belly, or else given to the childe with Wine, or (if it have an Ague) with Water.

There is, faith Arifidote, in the Rennet a fiery quality, but not in the highest degree, for as fire diffolves and disintereth, so doth this in milk diffinguish the airy part from the watery, and the watery from the earthy: Wherefore when one talleth an old Rennet, he shall think he talleth an old purifiied Chese, but as leaven is to bread, which hardneth, joyneth, and feafoneth the fame, fo is Rennet to Chese: and therefore both of them have the fame qualities of diffolving and binding: Galen affirmeth that he cured one of Gowty tumours and swellings, by applying thereunto old and strong purifiied Chese beaten in a morter, and mixed with the salted fat or leg of a Swine. If a Man drinks of the Bloudy flux drink therein a receipt, two scruples for two days togethere, it will procure him remedy.

For pacifying the Colic, drink the Rennet of a Hare: the fame mingled with Goose grease, lay- eth the incontinence of Urine, it also retaineth womens flowers. If it be drunk with Vinegar it helpeith the seconds and being applied with Saffron and the joyce of Leeks, driveth a dead childe out of the womb. If it be drunk three or four days together after child-birth, it cauleth barrennes. There are (faith Pliny) a kind of Wormes which being bound to Women before the Sun rising in a Harts skin, caufe them that they cannot conceive: this power is called Apocon.

Mefarius faith, that if a Woman drink this Rennet to her meat before the conceive with childe, she should be delivered of a Male child: and such is the foolish opinion of them which affirn at this day, that if men eat parfly or white buds of black ivi, it maketh them unable to carnall co- pulation.

The Rennet of a Hare easeth and diffiperseth all tumors and swellings in Womens breasts: the Lights of a Hare powderd with salt, with Frankincence, and white wine, helpeith him that is vexed with the Falling ficknes, if he receive it thirty days together. Sextius acribeth the fame remedy to the Hart, and Pliny commendeth the Lights to heal the pain in the eyes. Being drunk in powder, it cereth the seceres. If the heels be troubled with Kibes, they are healed with the fat of Bears: but if they be wrung with a cold, they are healed with the duft of a Hares hair, or the powder of the Lights: Likewise when the foot is hurt with straw shoes, it hath the fame operation. The ancient Magi took the skin of an Ox in powder, with the Urine of Boyes, and sprinkled it on the toes of their feet, binding the heart of a Hare to the hands of him that hath a Quartain Ague: and some cure it by hanging the heart of a young Hare or Leveret to the neck or arme, in the beginning of the fit of him that is so visiteth. The heart of a Hare dried mixed with Frankincence or Manna in white wine drunk thirty days together, cureth the Falling sicke.

For the pain in the belly take the fame medicine, and drunk with water mingled with Samia, cereth the fluxes of womens: also if a man that hath the flux eat the Liver of a Hare dipped in sharp Vinegar it helpeith him if he be Liver sick: or if one have the Falling sicke, eat the quan- tity of an ounce thereof, and it helpeith him. The Gall of a Hare, the Heart, Lungs, Lights and Liver
Of the Hedge-bog.

of a Weasel, mixed together, three drams, one dram of Cafflowen, four drams of Myrrha, a dram of Vinegar and Honey beat together, cureth him that hath a swimming or dizziness in his Brain. The gall newly taken forth mingled with a like portion of honey, and warm in the skin of an onion, and put into the ear, giveth remedy to him that can hear nothing.

If the that is sick in the milt, that is, if it be over hard, swallow down the milk of a Hare not touching it with his teech, or seeing it with his eyes, it cureth him. The belly of a Hare with the entrails toiled and burned in a frying-pan mixed with Oil, and anointed upon the head, relieve where the hair. The reins of a Hare inveterately and drunk in Wine, expel the stone, and being fed, cot and the white loins, Albertus other stones, the stones of a Hare roasted and drunk in Wine, lyeth the incontinency of Urine. In the pain of the reins, and of the hip bones, they have the same operation. The secrets and stones of Hares are given to Men and Women to make them aper to copulation and conception, but this opinion hath no other ground beside the fecundity of the beast that beareth them. Which they carry about with them the ankle bone of a Hare, shall never be pained in the belly (as Pliny faith) So likewitse Sexv: and Marcellus.

Take the ankle bone out of a live Hare, and hairs from her belly, therewithal make a thread and bind the said bone to him that hath the Colick, and it shall ease him. The said bone also beaten to powder is reckoned among the chief remedies against the stone. When Women have hard travel, put it into Creteick-wine with the liquor of Penyroyal, and it procureth speedy delivery, being bound to the benummed joynts of a man leg bringerth great ease: so also do the feet being bruited and drunk in warm Wine, relieve the arteries and shortness of breath; and some belive that by the foot of a Hare cut off alive, the Gout is eas'd.

The time of a Hare cureth forcorked members, and whereas it was no small honour to Virgins in ancient time, to have their breasts continually standing out; every one was preferced to drink in Wine or such other things, nine grains of Hares dung: the same drunk in Wine in the evening lyeth Coughing in the night; in a potion of warm wine it is given to them that have the Blody flux, likewise if a man be fick of the Colick, and drink three pies thereof in sweet Wine, it procureth him much ease: being decocted with honey and eaten every day, the quantity of a Bean in desperate cafes, mendeth Ruptures in the bowels.

Afcipades in his medicine whereby he procured fruitfulness to Noble Women, he gave them four drams of Myrrha, two drams of Flower-delice, two of Hares dung, confused with Collyrial water, & so put up into their bellies after caesing of the flowers, before they lay with their Husbands. Alinew and Raphae prescrib this medicine to help a woman that wanteth milk in her breasts, Crystall, white Mustard-seed, and Hares dung put into broth made with Fennel.

Of the HEDGE-HOG.

Of the kinds of Hedge-hogs.

As much as there be two forts of Hedge-hogs, one of the Sea, and another of the Land, our purpose in this place is only to discourse of the Land Hedge-hog, the Hebrews call him Kipol which in the 14. of Is. and Zepha. 2. is so translated by the Sepiemonis; though that some of the Hebrews would have it to signifie, a ravening bird, but seeing that I find the word Kipol in moth Hebrew dictionaries to signifie Claudere and Contrahere, and that is most proper to shew up and draw together, I do rather believe that the proper meaning thereof is a Hedge-hog, because this beast so draweth it self together, when it is in danger, as we shall hear more at large afterwards, according to the old Verie.

Pristumque fumusfis corporis eorum.

The Arabians call him Cozufd, or Cozufed; the Grecians, Caucida; the Sepiamento, Mugale. Silvaticus calleth it Agityum, Avice, Adulius, and Alberba signifieth a great Mountain Hedge-hog: the Grecians, Cher, and Aecaneincensi, or Echimos, by reason of the prickles upon his back. The Latins, Ebimus, Eritrus, Ricinus, Heris, and Ebimnsa, the Italians, Riccio, and Ricce, the Spaniards, Eriza, the Portingals, Uìris, or Oriz, Cacile, because of hiding themselves; the French, Herisse; the Germans, Fial, as in lower Germany; in Holland, Een Tieren Verehen; in English a Hedge-hog, or an Urchin; by which name we call a Man that holdeth his neck in his boosome: the Italian, Gius, Malux: and the Illrians, Ancuinet, Zabo, and Ozejebux. So then for the entrance of our discourse, we take it for granted, that Herinas and Echinos signifie one thing, except one of them signifie that kind which is like to a Hog, and the other that kind which is like to a Dog, for they differ in place, or in habitacion: some of them keep in the Mountains, and in the Woods or hollow trees, and other about Barnes and Housfe; in the Summer time they keep near Vineyards and Buffie places, and gather fruit, laying it up against Winter.

It is about the bignes of a Cony, but more like to a Hog, being belet and compassed all over with sharp thorny hairs, as well on the face as on the feet: and those thorny prickles are covered with a kind of soft moss, but when she is angred or gathereth her food, she striketh them up by an admirable instinct of nature, as sharp as pins or needles: there are hair at the beginning, but afterwards grow

The paws.

Hermolax
The History of Four-footed Beasts.

grow to be prickles, which is the least to be marvilled at, because there be Mice in Egypt (as Pliny saith) which have hair like Hedge-hogs. It hath none of these prickles on the belly, and therefore, when the skin is off, it is in all parts like a Hog.

His stones are inward and cleave to his loins like as a birds, he hath two holes under his tail, to eject his excrements, which no creature living hath besides him. His meat is Apples, Wormes, or Grapes; When he findeth apples or grapes on the earth, he rolleth himself upon them, until he have filled all his prickles, and then carryeth them home to his den, never bearing above one in his mouth.

And if it fortune that one of them fall off by the way, he likewise shaketh off all the residue, and walloweth upon them a while, until they be all fetted upon his back again, so forth he goeth, making a noife like a cart wheel. And if he have any young ones in his nest, they pull off his load wherewithal he is loaded, eating thereof what they please, and laying up the residue for the time to come.

When they are nourished at home in houses and brought up tame, they drink both milk and Wine: But there is an Herb (called Potomagion) whereof if they taint, they die presently.

When they are in carnall copulation they stand upright, and are not joyned like other beasts, for they imbrace one another, standing belly to belly: but the prickly thornes upon their backs will not suffer them to have copulation like Dogs or Swine, and for this cause they are a very little while in copulation, because they cannot stand long together upon their hinder legs. When the female is to bring forth her young ones, and feeleth the natural pain of her delivery, the pricketh her own belly, to delay and put off her misery, to her further pain, whereupon came the proverb (as Erasmi saith) Echinius partum differs, the Hedge-hog putteth off the littering of her young; which is also applied against them which put off and defer those necessary works, which God and nature hath provided them
them to undergo; as when a poor man defere the payment of his debt, until the value and sum grow to be far more great then the principal.

The inward disposition of this beast, appeareth to be very crafty and full of subtility, by this, because (Lycophran faith) that Nautilus had a cunning crooked wit, and was called by him a Hedge-hog. When they hide themselves in their den, they have a natural understanding of the turning of the wind, the South and North, and that they are nourished tame in houles, immediately before that change remove from one wall to another; the wilde ones have two holes in their cave, the one North, the other South, observing to flop the mouth against the winde, as the skilful mariner to steer and turn the rudder or sails, for which occasion Aristotle, that some have held opinion, that they do naturally foreknow the change of weather.

There is mortal hatred betwixt the Serpent and the Hedge, the Serpent seeketh out the Hedge-hogs den, and falleth upon her to kill her, the Hedge-hog draweth it self up together round like a foot-ball, so that nothing appeareth on her but her thorny prickles; whereas the Serpent biteth in vain, for the more the laboureth to annoy the Hedge-hog, the more she is wounded and harmeth herself, yet notwithstanding the height of her minde, and hate of her heart, doth not suffer her to let go her hold, till one or both parties be destroyed.

The Hedge-hog roareth upon the Serpent, piercing his skin and flesh, (yes many times tearing the flesh from the bones) whereby he escapeth alive and killeth his adversary, carrying the flesh upon his spars, like an honorable banner won from his adversary in the field. The Wolf also is afraid of, and fleereth from the Hedge-hog; and there is also a story of hatred between the Hare and the Hedge-hog, for it is said, that a Hare was seen to pluck off the prickles from the Hedge-hog, and leave her bald, pieled and naked, without any defence. The Fox is also an enemy to the poor Hedge-hog, and lyeth in wait to kill it, for the proverb is true, Multa non vitat Vulpes, Echinus vero non magnum; that is to say, the Fox knoweth many devices to help himself; but the Hedge-hog knoweth but one great one, for by rowling up her self (as before said) the opposeth the thorns of her back, against the Foxes teeth; which alone were sufficient to secure her from a greater adversary; but the wily Fox perceiveth that he can no where stappen his teeth without danger of himself, pisseth upon the Hedge-hogs face and poisoneth her; wherupon the poor beast is forced to lay open himself; and to take breath against the Foxes thinking excrement: which thing the Fox epying, looth no opportunity, but presently teareth the Hedge-hog in pieces; thus the poor beast avoiding the poison, falleth into the mouth of her enemy.

The manner of Hedge-hogs is, that whensoever they are hunted by Men, they draw up their legs and put down their head to the mosch part of their belly, so as nothing of them can be taken but their prickles; and perceiving that shiff will not serue the turn, but their cape growing desperate, they render out of their own bodis certain urine hurtful to their skin and back, envying that any good thereby should ever come to mankinde; and therefore seeing they naturally know the manifold ues of their own hides, here is the cunning of her hunting, to caufe her first of all to render her urine, and afterward to take her, for the urine maketh the thorns of her back to fall off every day, and therefore they take this course for their last refuge. But in these cafes the Hunters must pourre upon the Hedge-hog warm water, for feeling warme the presently unfolds her self, and lyeth open; which the Hunter must observe, and inflantly take her by one of her hinder legs, so hanging her up till she be killed with famine; otherwife there commeth no benefit by her taking.

With the same skin flead off, brushes are made for garments, so that they complain ill which affirm, that there is no good or profitable condition coming to mankinde by this beast. Again this is to be referred and used for dreefling of flax (as Mulgarin faith) and also it is set upon a Javelin at the dore to drive away Dogs. In ancient time they did not eat the fleith of Hedge-hogs, but now a dyes men eat thereof, (of which they are of the wifmest kind.) When the skin is of their bodies, they seald it a little in Wine or Vinegar, afterward lard it and put it upon a spit, and there let it be roastted, and afterwards eaten, but if the head be not cut off at one blow, the fleith is not good.

The Epithets belonging to this beast are not many; it is called red, sharp, marine, voluble, and rough, whereupon Erasmus said,

Ex litter in Leven nunquam mutabilis Echinum.

And thus much for the natural and moral parts of this beast. Now followeth the medici-
nall. Ten sprigs of Laurel, seven grains of Pepper, and of Opnepam as big as a Peafe, the skin of the ribs of a Hedge-hog, dried and beaten caste into three cups of Water and warmed, so being drunk of one that hath the Colick, and let rest, he shall be in perfecft health; but with this exception, that for a man it must be the membrane of a male Hedge-hog, and for a woman a female.

The frame membrane or the body of all Hedge-hogs burnt to ashes, hath power in it of cleaning, diggetling, and detracting, and therefore it is used by Physicians for taking down of proud swelling wounds, and also for the cleansing of Ulcers and Boyles, but specially the powder of the skin hath that virtue; also it being roasted with the head, and afterwards beat into powder and anointed on the head with hyon, cures the Alpecion.
The History of Four-footed Beasts.

The same powder reforteth hair upon a wound if it be mingled with Pech, and if you add thereunto Bears grease, it will restore unto a bald man his head of hair again, if the place be rubbed until it be ready to bleed. The same powder cureth the Fiftula, and some mingle red Snails with this dust, applying it in a plaster to Ruptures and Swellings in the cotes, and being mingled with oil by anneintment, it taketh away the burles in the face, and being drunk in wine is a remedy against the pains of the reins or the water betwixt the skin and the flesh.

A suppuration made of a Hedge-hogs skin, under them that have their Urine stopped, by Gods help (faith my Author) the stopping shall be removed, if it proceed not from the stone, nor from an impostume. The flesh salted, dried, and beat to powder, and so drunk with sweeter Vinegar, helpeth the pain in the reins, the beginning of Dropes, Convulsions, and Leprofies, and all those affections which the Grecians call Καθάρσες. The Mountain Hedge-hog is better then the domestical, having prickles like Needles points, but legs like to the other: the meat is of better taste, and doth more help to the stomach, softening the belly, and provoking the Urine more effectually, and all this which is attributed to Hedge-hogs is much more powerful in the Porcupine.

The Hedge-hog salted and eaten is good against the Leprofies, the Cramp, and all sickness in the Nerves and Pifsick and pain in the belly, rising of windines and difficulty of digestion: the powder appointed on Women with childe, alwayes keepeth them from abortion. The flesh being faile given to a mad Man, cureth him; and being eaten keepeth one from the Strangury; also being drunk in wine, expelleth the stone in the bladder, and is good against the Quotidien Fever, and the bitings of Serpents. The fat of a Hedge-hog layeth the flux of the bowels: If the fat with warm water and hony be gargarized, it amendeth a broken and hoarse voice; the left eye being feryed with O1, yeeldeth a liquor which caufeth sleep, if it be infused into the ears with a quilf. The gall with the brain of a Bat and the milk of a Dog, cureth the reins; likewise, the said gall doth not suffer uncomely hairs to grow again upon the eye-browes, where once they have been pulled up. It maketh also a good eye falve.

Warts of all forts are likewise taken away by the fame; the milft fod and eaten with meft, it healeth all pains in the milft, and the reins dryed are good against a Leprofie or Pifsick coming by Ulcers: or the difficulty of Urine, the Blandy flux and the Cough. The dung of a Hedge-hog fresh, and Sandraqua with Vinegar and liquid pitch, being layed to the head, layeth the falling away of the hair.

When a man is bitten with a mad Dog, or pricked with prickles of a Hedge-hog, his own Urine laid thereunto with a fponge or woof, is the belt cure: or if the thornes fluck in the wound of his foot, let him hold it in the warm Urine of a Man, and it shall easily flake them forth: and Albertus and Rapsus affirm, that if the right eye of a Hedge-hog be fryed with the oil of Abetone or Linseed, and put in a vefsel of red braine, and afterward anoint his eyes therewith, as with an eye-falve, he mall see as well in the dark as in the light. And thus I will conclude this discourse with one story, that a Hedge-hog of the earth was dedicated to the good God among the foolish Pagans, and the water Hedge-hog to the evil, and that once in the City of Phrygia called Asenium, when a great famine troubled the inhabitants, and no sacrifice could remove it; one Euphorbus sacrifed a Hedge-hog, whereupon the famine removed, and he was made Priest, and the City was called Triegas upon the occasion of that sacrifice.

Of the HORE.

When I confider the wonderful work of God in the creation of this Beafs, ending it with a singular body and a noble spirit, the principal whereof is a loving and dutifull inclination to the service of Man; wherein he never faileth in Peace nor War, being every way more neer unto him for labour and travel: and therefore more dear (the food of man only excepted) we must needs account it the most noble and necessary creature of all four-footed Beafs, before whom no one for multitude and generality of good qualities is to be preferred, compared or equalled, whole commendations shall appear in the whole discourse following.

It is called in Hebrew Sus, and a Mare Susofh, the which word some derive from Sin, signifying Joy; the Syriens call it Rekofh and Soufsh; the Arabians, Rancia; and the Caldeans, Ramahum, Sufahat; the Arabians, Bagel; the Persians, Abasa; the Grecians, Hippas, and at this day Algo; the Latins, Equeus, and Caballus; the Italian and Spaniards, Cavalle; the French, Cheval; the Germans, Keffe; the Bohemians, Knis; the Italiens, Kofiba; the Polonians, Konis.

It is also profitable to confider the reafon of fome of these names, both in the Latin and Greek tongue; and first of all Equus feemeth to be derived, ab equitatem,from equality; because they were firft used in Charets and draughts, and were joined together being of equal strength, legs and stature; Caballus feemeth to be derived from the Greek word Caballus, which was a common name for ordinary Hackney-horses, and Horfes of carriage, whereupon Seneca commendeth Marcus Gato, that in his triumph of Cenforthip, \textit{Uno Caballo continent et ne totu quidem, partem enim laricin ab utraque latere dependentes occupabant}; that is to fay, that he was contented with one Horfe for his own faddle, and yet not totally one neither, for the packes that hang on either side of him, poftfeft the greatest
The History of Four-footed Beasts.

greatest part, and the true derivation of this word, seemeth to accord with Case, which signifyeth a manger, and An, abundance, because riding Horset are more plentifully fed, and these Horset were also used for plowing, according to the saying of Horset:

Opat ephippia bos piper, opat arare Caballus.

The Grecians call it Hippes, which seemeth to be deriv'd from flanding upon his feet, and this beast only seemeth to be one of the number of them, which are called Armente.

And besides all Histories are filled with appellative names of Horset, such as these are, Altajor, Action, Nigus, and Ortenw, the Horset of Pluto. Actha a Mare of Agamenon remembered by Homer. Action, Stario, Emas, Pheleg, Pyrovi, the Horset of the Sun: Lampos, Podargus, Xampus, Arxom, the Horset of Erymus; by whose aid Hercules is said to overcome Cygnus, the Son of Mars: Balis, Xambur, and Padaus, the Horset of Achilles, Bori), for whom Adrianus made a grave (as Dion writeth) Bromius, Carus, Calsdon, Campbaut, Cnatus, Cnixbe, and Herpius, two names of Britain Horset cited by Martial and Gillius. Cyllar, the swift Horset of Castor, Dimos, and Phoebus, the Horset of Mars. Earthlo, Cnancus, and Sibonon, the Horset of Neptune, Parthenia, and Euripba, Mares belonging to the Contours of Hippolomia, slain by Ornaronus. Harpe, another Mare. Planium, and Corax, the Horset of Elabesia. Epidaminus, who wan the prizes in the sixty sixth Olympiad, and caufed a flatte to be made in Olympiad, and his said Horset and Chariot called Pantarces, and beside these, other Cnacca and Samaus.

Also Pedarces, Rhobus, Smithon, Tagus, Theron, Thoet, Voleris, which was a Horset of Prasonium, and it is reported, that Venus the Emperor fo much affected this Horset, that he not only caufed him to be brought into his own Palace, and to have his meat alway given in his presence, but made of him a picture with a manger, wherein were Grapes and Corn, from whence came the firft Golden Horset or prizes of Chivalry;

Primus equum volucrum Maffili munera regis
Hand fpernenda tuit:

Unto these may be added the affected names of Poets in love of their favorites, as Rhobanus, Vegi-antius, Baratius, the Horset of Remolius, Rubicanius of Argalais, Hippopyrus of Ruferius, Frontinus and Pratulius of Statrapan, and Rondellius of Olivarius.

The Epithets that belong to Horset, are either general or particular, the general may be rehear- sed in this place, such as these are following; brasse-footed, continual, horn-footed, founding-footed, homing, bride-bearer, neighing, maned, duly, four-footed, fretting saddle-bearing, wate-ry, or sweating, whole-footed; and many such others both among the Greeks and Latio's, which howsoever they may contain divers Allelogenes in them, and therefore may seem to be figuratively fed down, yet I thought good being of other opinion to reckon them in the beginning, that to the Reader may consider, that I would be unwilling to omit any thing in this story, which might any way tend to the dignity of the subject we intent of, or the expressing of his nature. Wherefore we will first of all begin with the description of the natural parts of a good Horset.

The hair of a Horset fallet off every year, the neather eye lid or brow hath no hair growing upon it, and therefore Nicom that famous painter of Greece, when he had most curiously limtbeth forth a Horset perfection, and faid in no part of nature or art, but only in placing hairs under his eye, for that only fault he received a disgraceful blame.

The hair of the manes ought to be long, that part which groweth betwixt the ears, upon the Temples, hanging down betwixt the eyes, the Grecians term Frisonium, the Latiis, Caprona, and in English it may be called a fore-top, which is granted to Horset not only for ornament sake, but also for necessity to defend their eyes. The Horset are naturally proud of these locks and manes, as may appear by those Mares which are kept for procreation of Mules, by copulation with Asses, which at the first disposed to indanger with those shaveling and short haired Stalions. Wherefore their keepers shave off their manes, and their fore-tops, afterwards leading them to the waters, wherein while the Mares behold their own deformity, they grow so ashamed, defected, and discoura-ged, that ever after they admit with quietness the Asses to cover them. Therefore it is never good to cut the mane or theetter-locks, except necessity require, for the mane and fore-top is an ornament to the neck and head, and the fetter-locks to the legs and feet: and he that keepeth Horset must as well regard to have them comely for outward grace, as strong and able for necessary labour. Many use to cut the necks of their riding Horset, even as they do of their drawing Horset, which thing al- though it may seem to be done for greater encrease, and farther growth of hair, yet is it unea-ily for an honest rider: some again cut it to fland compas like a bow, and many use the Ammian fashion, cutting the Mane by rows, leaving some longer then other, as it were the batelements of a Church: but the best fashion of all is the Persian cut, whereby the one half of the thicknes is cut away on the left side, and the other on the right side smoothly turned over and combed, ac- cording to the saying of Virgil:

Denfa juba & dextro-juvata rectumbit in armo.
Of the Horse.

But if the Horse be double maned, and so the hair fall half on the one side, and half on the other, then cut all the middle hairs away, and leave both the sides whole: for such was the intention of the Pārtibus. In a Colt or young foal, the hinder part is higher then the forepart, but as he grows in years, so likewise the forepart grows higher then the hinder.

This beast hath two bones in his head, and other two descending from his forehead to the Nostrils, two inferior Gumbes, or cheek-bones, forty teeth, that is to say, four and twenty grinders, four canines, and twelve biting teeth; there are seven cross ribs in his neck, and seven from his reins to his hole, his tail hath twelve commihiures, and two Rugale in his fo-shoulders, from his shoul-lers to his legs other two, from his legs to his knees two more, in his knees there are two supporters, and from the thin to the Articles two more, there are sixteen small bones in the bottom of his hoof, and but one in his breit, in the inward parts there are six and twenty ribs, from the hinder parts to the top of his reins, the two grinding bones; and from them to the hinder part of the head there are two more, and two little ribs from the upper part of the thigh to the Gumba, and from thence to the hairs of the patterns, there are two, and the little ones to the hooves sixteen; so all the bones in number are accounted a hundred and feventy.

Now it followeth to declare the measure and number of the members; there are twelve fleps or degrees in the roof of his mouth, his tongue is half a foot long, the upper lip hath twelve inches; the under lip five, every one of the cheeks ten: from the fore-lock to the Nostrils he hath one foot in length, his two ears contain six inches, and his eyes four inches a piece. From his fore-lock to the Mercurius, there are contained eight inches, the back-bone containeth three and thirty croffe ribs. From the convolution of the reins to the top of the tail, are twelve commihiures, the length of his Segala containeth also twelve inches, from his shoul-lers to his legs fix, from his legs to his knees a foot in length, from the Articles to the hoofs four inches, in his whole length fix feet. And this is the stature of a courageous and middle Horfe, for I know there are both bigger and leffer.

The quality and the measure of the nerves or fiewes is this, from the middle nostrils through the head, neck and back-bone, is a double file or threed to the top of thefelf, which containeth twelve foot in length. The two broad fiewes in the neck do contain four-foot, from the shoul-ders to the knees, there are two fiewes, from the knee to the bottom of the foot there are four fiewes, in the fore-legs there are ten fiewes, in the hinder-legs there are other ten fiewes, from the reins to the foines there are four fiewes, so the whole number amounteth to thirty four. Consequently the number of the veins is to be declared. In the palate or roof of the mouth, there are two veins, under the eyes other two, in the breit other two, and in the legs other two, four under the patterns, two in the angles, four in the crown of the patterns, four out of the thighs, two out of the loins, two out of the Gambes, one out of the rail, and two in the womb or Matrix; so the whole number is nine and twenty.

There are certain veins above the eyes which are divided in Horfes, wherein they are let blood, by making to them small incisions, the blood also is taken out of the veins, in the palate or roof of the mouth. There was an ancient cutifome of letting Horfes blood upon Saint Stevens day, by reason of many holy days one succeeding another, but that cutifom is now grown out of life. Also some take blood out of the Matrix veins; but that is not to be admitted in Geldings, because with their ftones they lose a great part of their heat, excepting extrem necessity, but out of the palat blood may be let every moneth, and Stallions when they are kept from Mares if the vein of their mouths be opened, fall into blindness, although it is no good part of husbandry to let them bleed that year, wherein they admit copulation, for the vacuum of blood and feed, is a double charge to nature.

But the Organical vein of the neck, is the belt letting of blood, both in ftoned and gelded Horfes. The later Leaches make incifion in the great vein called Fontanelle, and in Inn Thymus or Jugula. The eyes of a Horfe are great or glaffie, and it is reported by Augufius, that his eyes were much more bright then other mens, refembling Horfes: these eyes fee perfectly in the night, yet their colour varieth as it doth in Men, according to the caprine and glaffie humour. And sometimes it falleth out, that one, and the fame Horfe hath two eyes of diflinguent colours. When the eyes of a Horfe hang outward, he is called Exoptalmos. Such fair eyes are belt, for Exoptalbe the Horfe of Alexander fhad fuch eyes, but when the eyes hang inward, they are called Calopp-Thalmos, and the Fortibus count them the belt Horfes, whose eyes are of divers colours, and are therefore called Heteroptalmos, because the breed of that Horfe was faid to take the beginning from the Pefthbius, and the reafon why the people loved not thefe Horfes was, because they were fearful, and apt to run away in wars.

The ears of a Horfe, are tokens and notes of his stomach, as a tail is to a Lion, his teethes are changed, yet they grow clofe together like a mans. It is a hard thing for a Horfe to have a good mouth, except his flallion teeth be pulled out, for when he is cheated or heated, he cannot be held back by his rider, but di McNeth the bridle therefore after they be three year and a half old, those teeth ought to be pulled forth. In old age, a Horfe's teeth grow whiter, but in other creatures blacker.

A Mare hath two udders betwixt her thighes, yet bringeth forth but one at a time: many of the Mares have no paps at all, but only which they are like their Dams. In the heart of a Horfe there
there is a little bone, like as in an Oxe, and a Mule; he hath no gall like Mules and Asses, and other whole-footed-beasts, howsoever (some say) it lyeth in his belly; and others, that it cleaveth to his liver, or to the gut-colon. The small guts of a Horfe lie near that gut, that fo one side of his belly may be free and full of passage; and from hence it cometh, that the belt Horfes, when they run or travel hard, have a nofte or rumbling in their belly. The Hip-bone of a Horfe is called by some the haunch, as the Arabian say; the tail (because therewith he driveth away flies) is called Muf-

orium, it ought to be long, and full of hairs. The legs are called Cunbe of Campo; signifying treading; the hooves of a Horfe ought neither to be high nor very low, neither ought the Horfe to reit upon his ankles, and thofe Horfes which have fraught bones in the Articles of their hinder-
knees, feel hard on the ground, and weary the Rider: but where the bones are short in the fame places, as they are in Dogs, there the Horfe also breaketh, and woundeth one leg with another; and therefore fuch Horfes are called Cympapuc. They have also quick ftehi in their hoofs, and their hoofs are fometimes called horns, upon which for their better travel, men have devised to fatten iron plates or fhoes. This hoof ought to be hard and hollow, that the Beast may not be offended, when he goeth upon ftones; they ought not to be white, nor broad, but almoft kept moift, that fo they may travel the better, having strong feet, hard and fround hoofs, for which caufe the Grecians call them Euf pades.

Forasmuch as it is requisite for every man to provide him Horfes of the belt race, and their kindes are divers in moft places of the world, fo the couriers of Horfes do many times beguile the simpler fort of buyers, by deceitful and deceitful afirmation of the wrong Countreys of the belt Horfes, which thing bringeth a confusion: for there are as many kindes of Horfes as Nations. I will therefore declare severally the Countreys breeding the Horfes, for the Region and air maketh in them much alteraction, that so the Reader may in a short view fee a mufle of Horfes made of all Nations. The Wildernes of Acrania, and Etolias is as fit for feeding Horfes as Thell-

faly. The Horfes of the Greeks, Armenians, and Trojans are fit forwar, of the Grecifb I will speak more afterward.

Alexandria was wont to take great delight in Horfes, and combates of Horfes: Apollonius writeth Lib. 5. Ethioptia (as it is reported) breedeth Horfes havinf wings and horns. Varro commendeth the Apol.n Horfes, and Polletarum writeth, that they and the Horfes of Reafo are moft fit for war: he meaneth above all the Horfes of Italy. There have been very fruitful pastures in Arcadia for cat-

tal, especially for breeding Horfes and Asses that are Stallions, for the procreation of Mules, and the breed of the Aroadan Horfes excelleth. The fame man preferreth the Horfes of Thellalia and the Grecifb Horfes, for they are found of their feet and head, but not of comely Butrocks, they have their back bone whole, great and short.

The latter two I might have referred to the whole body of the Horfe. The Horfes of Armenia are very neceffary and convenient for war, for they and the Capodoeans do breed of the Parthian Horfes, havinf their heads are somewhat bigger. Of the Hawkey or common Horfes, I will fay more afterward, where I touch the difference of Horfes, and of their pace. The Barbarian Horfes are the fame as the Lybian Horfes. Vegetius commendeth the Horfes of Torina and Burgunda, after them of Pontus. Britain breedeth little Horfes and Ambifers. Of Horfes that are celebrate of the Cyprian Mountain: See in the Spanifh. The Horfes of Capodoea and Armenia have the breed of the Parthians; but their heads are bigger, and are of a moft famous Nobility, for that Countrey before any other land, is moft commodious for the nourifhing of Horfes, according to the verfes of Nemosian:

Capadoconum notas referat genera pradegopp toprop

Armenia, & palmas super grex omnis avorum.

The Capodoeans do pay to the Persian every year, besife silver, a thoufand and five hundred Hor-

fes, &c. The Mules have the double of thefe, and they put-name the Capodoean Horfes famous and

swift; for thefe faith, that whiles thefe are young, they are accounted weak by reafon of their young

teeth, and their body feeding on milk; but the older they grow, they become the swifter they are, being

very courageous, and apt for war and hunting, for they are not afraid of weapons, neither to encoun-

ter with wild Beasts. Maceao is a City of Capodoea, fituate under the Mountain Argeus, now called

Cafereos,as Encafeh remembers in his Chronicles, and from that City cometh the Maceao Horfe, for

the Capodoean Horfe. And not only the Countrey, but the City it felf sometime was called Cap-

podoea from this City or walled Town, I suppose the Horfes of Maceao were so called, which Opill-

anus calleth Maceao, of thefe alfo and more, I will fet down thefe verfes of Nemosian:

Sit thi preterea foapis, Maceos tellus

Quam mittit, modo fignetilium fanguine firmus,

Quenque coloratus Maceae deferta per arida

Paviti, & effidus docuit tolerare labores.

Nepignt quod turpe caput, deformis & abitus

Est illis, quodque incensos, quod liber auroque,

Quadque jubis prons cerevis disberber aptus.

Nem flefs facitis, laetaveque colla fecundus

Petet in obquium lente moderamine virgus.

Verbera sunt precepta fuge, sunt verbera frenti.

Quin & promitt ipatia per aqua campi,

Curibus acquirunt commoti fanguine viris,

Paulatinum avidos comites pall terga relinquunt.

Hand fores effus Norei per carula veniens,

Cum fo Thracius Borea super occituli antro, &c.

Horum tarda venit longi fiducia cursum:

His etiam emerito viget eft juvenilis in aev.

Nam quamque suis virtus bene floruit annis,

Non prius efi animo quam corpore paffauima.

}
Of the Horse.

And peradventure nem nisius understand certain Horses of Libya, by the name of the Messian Horses, when as he joins them with the Mauritian Horses, and calls them painted Mauritian Horses, which agree not with Cappadocians; writing also, that they are ruled with a stroke of an air held of a bridle, which thing we have read in Authors writing of the Abyrusian Horses, in the Country of Libya, and whereof we will speak when we discourse of the Lyburn Horses. But the Cappadocians Horses are swift and jolly in their old age; as it is related by Oppianus. Again, if Mauritian Horses be the same that the Cappadocians are; what is the reason why Oppianus doth name them apt, unleas peradventure every Mauritian Horse is a Cappadocius, and not otherwise? The Horses of Chalambria, are so named of a place in Libya; the Chaonian Horses are the same with the Abyrusian Horses. The Cappadocians and Mauritianas do belove great labour in breeding of Horses; for the Cappadocians dwell in a plain, as I have read in a certain Greek Author. Strabo lib. 14. writeth, that the Cappadocians in times past did abound with sea-torses, and have much excelled in Horse-men; that wherefore in any Nation, there was war waged, they hired and required the aid of the Cappadocius Horse-men, and so it was made a common Proverb: Cappadocius edulidus, ferasus. The Horses of Crete are commended by Oppianus, and elsewhere. From their loins upward they are as big as the Cyrenian Horses, with well set thighs, excellent for the fouundness of their feet, and holding their breath a long time in riding, and therefore fit for single races or in Chariots.

The Epean Horses are commended of Oppianus, and the Epeans are a people of Achaia, and the Straed: Achaian Horses are commended of the same. The Lapidaneus kind of Horses is more excellent, and he preferreth the Thesalian Horses before those of Epidaurus, but the Epeian Horses are biring and stubborn: Abirus faith that the Epeian Horses, and the American and Delobonian, although they are stubborn and will not abide the bridle, and besides are base and contemptible, yet they are bold in war and combats, and therefore the Epiusian Horses and the Sicilian despitc not, if their qualities and comely parts be apparent in them, although sometime he hath run away from the enemy, as the Poet saith:

Quamuis sepe fugax ille sertis hores,
     Le patia Epius refusat.—

Ephus and Chonia, is also a part of Epius Alpeidarian, although sometimes it be taken for the whole Country of Ephus. The Horses of Chaonia are commended, as Gratius remembret, writing of the Sicilian Horses, in these verses to this effect, that no man hath preserved to strive with the Chaonians, and the Achaian hand doth not express their delights:

Quam Chonias contendere contra
     Asift, vin mentia quas signa Achaia palina.

There are people of Arabia called Eremiti, which some call Ishbaypogatos, and Tragedinent, Vegus. Oppianus, in the third place commendeth the Erysian Horses for swiftnes, and long continuance of course, after the Boeotian, Barypendians. The French Horse is the same that the Meniquinus, and S. Hierom writeth, that worldly men are delighted with the French Geldings; but Zacariah Als loored from his bands, rejoyneth good men. Lucius Apuleius hath commended the French Beasts, for if the young foale be derived of a generous kinde, it is an argument it will prove a Noble Beall.

The Grecianas Horses are a kinde of base Horses, not fit for war; whether this name proceed of a strange Contry, I have no certain knowledge thereof. There is a certain River in Sicilia called Gelas, of which Country the Horses are of great value and much fet by. And also the Gelas are a people of Sycitia, who in their flight light upon Horses, of which Lucerni writeth to this effect:

Mastigates qui fugit equs, furtifque Gelas: And Virgil,
     Bivale qui more stren, acerque Gelusme,
     Cum fugit in Rhodopin, aut in deferta Getarum,
     Et suo concreption cum janguline potat equino.

Signifying thus much, that the Mastigates & valiant Gelas fly away upon Horses like the Bifalens, when they fly into Rhoedges, or into the Wildernes of the Gelas, and drink milk mixed with Horse-blood for hunger and famine: But these fearful Horses are not meet for war. Germania hath greater Horses and hard trotters, whose pace is very hard and troublesome. The Getian Horses run most swiftly. The Horses of the Greeks have good sound broad feet, and of a great body, a comely fine head, their fore-part somewhat high of stature, straight and well compacted, and of a well fashioned body, but the joyning of their butts are not so agreeable and answerable to the rest: they are most swift and courageous, yet notwithstanding in all Greece the Thesilian Horses are most esteemed; Nemesisus writeth also of the Yorkshire Horses: Greece therefore yeeldeth choice Horses, and well bred. In Helvetia the Horses are fitted, and very great in war, and especially the Algerian Horses, which will last and continue a long time.

In Spain also the Horses are of a great stature of body, well proportioned and straight, having a fine head; the joynts of their bodies very well divided, set apart, and ready or flexible, simple and short butts, but not very strong and comely. They are strong and able to sustaine the undergoing

Of the Horse.
or compaßing of journeys; neither are they slender bodied or subject to leanness; but they are nothing nimble for course, as shall appear by the words of the Authors following, neither are they spurred when they are ridden: from their growing even to their middle age, they are pliant, and easy to be handled, afterward they wax wilde and biting. The Cappadocian Horse is renowned, the like, or the next triumph or victory have the Spaniſh Horses in running the ring. Neither doth Stella yield Horses inferior for the ring then thofe: and Africa is accustomed to bring forth the moft ſwift Horses by copulation with the Spaniſh blood to the use of the saddle.

<tr>
<td>Ruelius</td>
<td>The Spaniſh Horses are deſcribed of great Princes and Peers, and the Magnates, because their opinion is, that they are ſwift and nimble; and out of Spain they are reſpected for lightneſs and elegance. The judgement of the Ancients for the general breed of Horses, was this; that the greatest Horses are bred from the third Climate, to the end of the fixt; and moft of all in Spain: yet we have ſeen stronger and bigger Horses bred in the ſeventh Climate, and those more able to endure labour than thofe that are under the third or fourth climate.</td>
</tr>
<tr>
<td>Camerarius</td>
<td>The Španiſh Horses of the Celēberiens ſomewhat a dully colour: and they change if they be transported in to the farther ſpain; and the Parthian Horses are like them in regard they excel in nimblenes and dexterity of running, whereof Martial writeth thus, Videbīt altam Liciānem Bibilīm, quīt arma noblīm: which Bibili is a City of Celtiberia. Of the Collectani and Gettanni, we will ſpeak also in the Španiſh Horses that are bred in the Calpiain Mountain, afterward, when we entreat of the diſtremes of Horses according to their degree.</td>
</tr>
<tr>
<td>Oppianus</td>
<td>The Huns bring up their Horses hardly, able to endure cold and hunger, and they have great and crooked heads, ſlanting eyes, ſtrait nostrils, broad chaps, and ſtrong and rough necks, and long manes down to their legs; great ribs, ſtraight backs, bumpy ſtands, ſtrong ſhanks or legs, small feet, full and wide hoofs, their ſhanks hollow, and their whole body full of holes. There is no nafnes in their hunch or buttocks, they have no ſtrings in their ſinews or arteries, and they exceed in length more then in height, having great bellies hanging down, big-boned, and leannes (which is a deформity in other Horses) in thefe it ſheweth their ſtatelines: their courage is moderate and wary, and there are ſome of ſwift Horses of thefe Huminian Horses elsewhere he calleth them Huminian Horses, and the fame in times past Huns: but they are called now a days Ungarian Horses.</td>
</tr>
<tr>
<td>Vegetius</td>
<td>The Companies or Armies of Huns, wandering up and down with moſt ſwift Horses, filled all things with slaughter and torment. They are ſitting and kicking Horses, as moſt Pannonians are, (for they call Pannonia at this day Hungaria) of which there is a Proverb of Malignity sprung up, Non nisi irritati spicibus aut offensae muta facient: that is to ſay; They wax not ſtern, or rage not, but either by opinion, or fear of offence, affuring that the Pannonians are very fit for War. There is not any that can hold and conſtrain or draw the bridles in, or loffe them forth, that rideth an Indian Horse when he pranſeth and runneth violently, but ſuch a one that hath been trained up from his childhood in the skill of Horses: theſe men have accuſtommed to hold them with the bridles, and alſo to break their ſtatelines by ſnaffles or bits, and thofe that are well skilled in handling Horses, do compell them from their unrulines, as reſtrain them within a ſmall circuit. Yet notwithstanding to make this circle and ſeſt it, it requireth the help of hands, and it is a great skill belonging to Horſemen.</td>
</tr>
<tr>
<td>Albinus</td>
<td>They which are moſt skilful of this Art, and cunning doers of it, know very well how to bring their course into a circle, whose compaſs is not to be regarded chiefly when it can bear but two Souldiers fighting together at one time. There are among the Indian Eſſilans (for there are also other Affrick of that name) Horses bored no bigger then Rams, and they ſay that in India there are Horses with one horn, of which horn drinking cups may be made, having this virtue in them, that if you put poynets in them, and a man drink thereof, it ſhall not hurt him, because the horn doth drive away or expell the evil or poynſon. Whereof you ſhall see more at large in the History of Monſers: and Albinus himself elsewhere, and Pilaes following him, write the ſame thunget of a cup made of the horn of an Indian Asf, having one horn.</td>
</tr>
<tr>
<td>Oppianus</td>
<td>The Itrien Horses are of goodable feet, very ſtraight, whole back and hollow, but ſwiſte of course. The Moſt Horses (faith Oppianus) are moſt excellence, as well to hold out long courses, as well to endure hard labours: the Lybian next unto these are of a moſt durable celerity: they are ſhaped alike, except that the Lybian Horses are big, and of a longer body, having thicker ribs and sides, and their brest is larger before on their creft; they can easilly abide the heat of the Sun and daily thurſt.</td>
</tr>

| Africu | Africa hath been accustomed to put the moſt ſwiſte Horses of the Spaniſh brood to the use of the saddle: (aſſiſting Lybian) in lib 23. that it was a cuſtom to the Numidas, being in battel, to lead two Horses together, and in manner of vauters oftentimes, in the moſt ſhard conflict could leap from the weary Horſe to a ftreeth, (fo great was the demerſtory of the rider, and the docility of the beaſt.) From Tunis of Africa, Maffeia, and Numida, there are also brought very ſingular Horses, palling
passing for running, which the common people call **Barbary** Horfes. The **Maffylia** (a people of **Lybia**) have very good Horfes, which they govern with a rod whithout a bridle, from whence **Virgil** in his fourth of his **Aenides**, calleth them untamed and wilde **Numides**: and **Silius** faith also, the **Numides** a Nation having no skill of the bridle, do leaup up and down, here, and there, and every where:

*Hic passum exulant Numida gens infa frenti,*
*Quix inter geminam per ludum mobilis aures*.

Also the rode rules the **Maffylia** Horfe: the fame **Nemesianus** writeth of those which he calleth **Magylians** (as I have before spoken of the **Capo-velian** Horfes) The **Dacodian** Horfes although they are of a marveufl provinci, yet they are inferior to the **Lybian** Horfes in running. The **Lybian** Mares are taken with a pipe, and by thofe alluements they are made tame and leave off all wilde qualities, and whitherfoever the pipe hall allure them, thither they follow, and the Shepheard when he flands, they leave off marching forward; and if he finge more pleafantly, they are fo delighted with it, that they cannot holde tears. The Shepheardes of thofe flocks, make their Shepheardes pipe of the tree (called **Rhododaphne**) the found whereof delighteth thofe that go before the herd. **Gratus** alfo writeth to this effect:

*Virgit eos exsultat Numida, &c.*

*Alius & paucior operum genit us ille: vigebit*.

*Centum eflis sparsis: atque etiam annis, Nec magni culus sterilis quodunque remifit.*

*Utra quidem sequentur sui prodere rite.*

Although the place be not perfect, yet that that is spoken concerning the **Numidian** and **Lybian** Horfes, is manifestly as well by the words of **Oppianus** before recited, as alfo by that which **Aelianus** setteth down: for (faith he) I have heard thofe things touching the **Lybian** Horfes of the men of that Nation, that of all other Horfes they are the swifteft, and that they have no fene of their labours, being lank by reafon of their flendernefs and thinnenes of their fhape, and are wholly of themselves fit to endure thofe matters negligence, for their matters give them no meat or fodder, neither doth any man rub or drefs them with the curry-come after they have labourd or travell’d: neither do they lay any litter or straw for them to ly on, nor pare their hoofs, but fo soon as they have ended their journeie, leaping off their backs, they turn them to fearch their food, and in like manner the men of **Lybia** worn with leannes, and all befmeared with filth, do ride on Horfes of this fort.

The Horfes and Oten of **Africa**, which dwell between **Getulid** and us, are as ours, that is, having longer lips, (the Interpreters translate it hoofs,) Their Kings take delight in troops of Horfes, fo that there are numbered to him every yeare four hundred thoufand Cotes.

The **Cotabamian** **Lybian** are before spoken of, and the **Nafvianus** we will speak of hereafter. **Barbary** breedeth very few Horfes: but the **Arabians** which inhabit in the Desert, and the people of **Lybia** do breed very many, and they do not fo much accutum them to journeys and warfare, as to hunting, and feeding them with Camel’s milk only twice a day and night, whereby they keep them fine, but very lean, and in the time of grafs they turn them out to feed in the field, but they ride not on them.

The Horfes of **Maffylia** are equal with the **Lybian**. The people of **Magnetis** have been renowned in feeding and bringing up Horfes, and they are very skilful in combat on Horfe-back (as **Lucan** faith.) The **Magnetianus** are famous for Horfes, and the Nation of **Neces** for Ours: **Magnetis** is a country of **Macedonie**, bordering upon **Thofaly**, to the City and Country of **Aflia** yeeth toward **Macedus**. **Oppianus** commendeth the **Magnetian** Horfes. The **Moares** fight often on Horfe-back with Spears, but their Horfes are naked, and their bridles made of ruthes.

The **Maffylia** following the **Lybian** (for the moft part) are furnifhed after that manner, and they reembele others, having little Horfes, both fwiwt, obedient, and easily to be ruled with a rod.

The collars of their Horfes are made of wood or hair, whereby the bridles hang. The principal Horfes of **Barbary** are not fwiwt, but in respect they live on fodder, they are more handfome and better in flefh, which they use in eminent danger, when it flandeath them upon to efcape the rage of their enemies. Thus far I have related the words of **Oppianus**, touching the nourifhing of Horfes, among the **Lybian**, where he fweath that they are all alike, both in fhape and other proportion. Touching the **Nomesian** Horfes, they are all one with the **Maurian** and **Magylians** (as **Strabo** witneffeth) calling them nimble and fwiwt kindes amongst the **Moares**.

The **Sidicins** are fwiwer then the **Moares**, and the **Moares** are of a more valiant courage then the **Sidicins**, or some fuch like other thing, who are furnifhed with yellow colour, and may to the eye moft shining and fpentand, and which is more; they only defire the roaring of a Lyon, for which when they come to other wilde Beasts by way of hunting, he commendeth them to be excellent: then he faith that the yellow is the beft colour.
The History of Four-footed Beasts.

In the Country of Mauritania are great flocks of Lyons, and of the Naxamans we have spoke before sufficiently. The Medean Horses are of exceeding greatnefs, and the men of that Country are so bewitched with the rich attire and shape of their bodies, and also their Horses being so loofe with superfluity or ranknefs, that the Horses take delight in their Makers, both in greatnefs and in fairnefs of body, and luch colly furniture upon their backs, that they seem to perceive their own nature and comelines. The Medes every year by way of cultume pay three thousand Horses. Herodotus also calleth the Nifean Horses the Medes, whereof more fhall be spoke afterwards. The Menapians amongst our Country-men, the only men which I fuppofe were once called' French of Ceafar, and the Romans, (as Warriors) for the most part are in elimination. I also finde that the Romans inhabited that Country which is now called Robertland, and that Pindar Dicosmus remembereth them, lib. 6.

Touching the affairs of Longobardie, there are that fay they departed into Machelburgia. There are the right off spring of the Germans (fith Althamnuot) they are counted as Germans, both in language and vertue. Gratius writeth of the Marchamian, laying the Marchamian (scarfe) yield their rough neck to the fword. Virgil also declareth Mycesia to be a Country of most notable Horses: and Gratius commendeth a Horfe fit for hunting highly in these veres:

Consul Perni qualis perfuntur amae
Thesalia, aut patria quem comperere Myces.
Glaucum, nempe ingenio, nempe ardua fundet in aura.
Crusa, quae Eneas poftor lubruit arenas?
No tamen locuti agnt opus, jactantur illi.
Virtus, quam filius duurnique lefferee Martem.

The Nifean Horses were once great in elimination (as Cameratus writeth) Also the Naxamians are people of Lybia, living as spoylers of the ships in the Syrias. Of all thefe Horses before faid, the Nifean Horfe is the goodlieft, and fitteft to carry the body of a King, they are of a palling good shape, an eafie pace and very sublimife to the bridle; having a little head, and a long and thick mane, with yellow or brown hairs hanging down on both fides: Armenia is very fit for feeding Horses, wherein is a certain medow called Hippobahus, by which they make their journey which pas from Persia and Babylon into the Caffian Border, in which place they feed five hundred Mares which belong unto their King.

The Nifean Horses (written with Julia and simple Sigma, as Eulathibus writeth) are the most excellent and belt; some faid that they have their generation from Germany, others out of Armenia, but they have a certain kinde of shape like the Parthians.

In India moit of their living creatures are far greater then in other places (except Horses) for the Nifean Horses, do exceed the Indian Horses, (as Herodotus writeth) in his feventh Book, describing the Perfan Horfe. Behinde the fpears (faith he) came ten Horses in moft fumptuous furniture, which were Nifean, fo called, becaufe there is a great field named Nifsus in the Country of Medes, which yeeldeth Horses of a great ftature. After these followed Jupiter's Chariot drawn with eight Horses, after which Xerxes was caried in a Chariot drawn by Nifean Horses, and by how much the greater the Lybian Elephant is then the Nifean Horfe, fo much the greater are the Nifean Horses then the Indian (as the fame man faith) in his firft Book: but the King was about to offer a white Horfe, that is of the Nifean Horses, and to give a better mark as some expounded.

There are that fay that Nifsus is a plain of Perifs, where the moft famous and notable Horfes are bred. Some interpreters think the yellow Nifean Horses, because all the Horses of Nifsus are of this colour. Between Sufamus and Bedria, there is a place where the Greek call [Nisus] in which the moft fingular fine Horses are bred. There are alfo that fuppofe they are had from the red Sea, and all thofe to be of a yellow colour. Herodotus writing of Nifsus, maketh it a part of Media, Orfeus alfo writeth, that there is a place in the red Sea called Nisus. Stephanus alfo maketh mention of [Nifsus Persica] with the Medes, of which people the Horses are fo called. Callius Redigius reprowed a certain man which translated the Iphonip Horfes for the Nifean Horses. Plutarch faith that Pyrrhus had an apperition of a Nifean Horfe armed and furnished with a Rider, that Alexander the Great was Captain thereof.

The Medes have Colts of a moft noble kinde of Horfes, which (as antient Writers do teach us, and as we ourfelves have seen) men when they begin the battle with a fierce encounter are wont to prance valiantly, which are called Nifean Horses.

Touching the Paphlogorians, about the education of their Horses, fee more among the Venetians: The Parthian Horses are of a large body, courageous of a gentle kind, and moft found of their feet. Concerning thofe Horses which have but one eye, commended among the Parthians, and of thofe which are diftinguifh'd by diversify of colours, from thofe that come forth firft, I have spoke already out of Abisius. The Armenian and Parthian Horses are of a flifer pace then the Sicilian, and the Berti twiffer then the Parthians, whereof Gratius writeth to this effect:

Scollet & Parthis inter jua milia rura
Manifi honof : venit Caudini fata Tabarni,
Garganumque trunca, aut Lignarum depefer Alpet,
Ante opus excufus cader ungubus. & tamen illi

Est animus
Of the Horse.

That is to say, among the Partbians there hath remained honour for their foit Countries; but let him come to the Rocks of Cudnum, Tabernas, and too rough Garanus, or upon the Lusitiae Alpes, then he will quickly shake off his hoofs, and make a shew of great valiantnes. The Horses of the Cumbertians are somewhat white; and if they may be brought into Spain they change their colour.

But the Partbians are alike, for they excel others in minblenes and dexterity of running: How the Partbians do make their pace easie in the trotters and hard footing Horses, after the manner of Geldings, shall be declared afterwards, for Perfa preferreth their Horses above the cencure of their patrimonyes as well to carry, (having an easie pace) and being of most excellent dignity: As for their pace it is short, and to be doth delight and lift up the Rider, being not instructed by art, but effecteth it by nature.

Amongst thee ambling Nops (called of the Latines among the common sort of Taurarii) their pace is indifferent, and whereas they are not alike, they are supposeth to have something common from both; as it hath been proved: whereof Vegetius writeth in this manner.

In a short journey they have the more comelines and grace in going, but when they travel far, they are impatient, stubborn, and unless they be tamed, will be stubborn against the Rider; and that which is a more greater marvel, when they are chafed, they are of a delightful comelines, their neck turneth in manner of a Bow, that it seemeth to ly on their breyst. The Pharsalian Mares evermore bring Foals very like their Syre, and therefore very well so named, Equus probe. We read of the Phoebus Horses which receive their name (from the mark or brand of a bird so named) else because of their excellent beauty and comelines.

The Rojetan Horses, Varro do nameth of Rojet, which Volteus ans writeth to be most fit for War; and this Rojet, otherwife Rojet, Febus faith, that it is a Country in the coasts of the Restani, so called, because the fields are laid to be moitt with that dew. The Horses of Rojet, if they happen to throw down their Rider, they forthwith stand still, that they may get up again. Vegetius having commended the Perfan Horfes faith, that the Armenians and Sapharens do follow next. This Saphaire verity is an Iland in the Arabian coast, and the people of Saphaire lybe beside Pontus. The Horses of Epista, Salmarica, and Dalmatia, although they will not abide to be bridled, yet they doth that they are warlike by their legs.

The Sardanian Horses are nimble and fair, but leffer then others. The Sarmatian kind of Horses is fast and well fashioned in this kind, very fit for running, unmixt, having a well set body, a strong head, and a comely neck. Some Horses they call Actogenes, from a certain mark which they have in their shoulders and colour, which the Sarmatians do take unto themselves as very good, with which they do contend about their cruelty, wherefore they impoy them in warlike out-rides, but those that bear the Eagles mark in their buttocks and tail, they are disallowed of them; and they report that they mark them so, because they will not use them, by reason left they should quickly be destroyed or run into some trouble.

The Sarmatians when they entend any long journeys the day before they keep them fasting, giving them a little drink, and so they will ride them a hundred and fifty miles continually going. These Horses are very fit for War, and many of them are found gelded in their tender age, and they say they never lose their teeth. It is a cullome of Scythia and Sarmatia to geld their Horses to make them more gentle: they are swift, little, and fierce, but very stubborn and untamed; neither doth Gore, (situate near Sicilia) breed Horses inferior to the Spanihs, as Vegetius writeth. The Epistaen and Sicilian Horses are not to be despised, if they were well bred and educated, they want not comelines and good qualities.

The Sicilian Horses are most swift. Libycaem is a promontory of Sicilia lying towards Lybia, which a certain verle make their most plain; but as I understand it is the Three-clitt-topt-mountain Etna, which caufeth forth fire, and covereth the carcase of Enceladus the Giant, lying there under (where of Oppianus writeth) and some others alto. But (faith he) the Armenians and Partbians, have swifter couriers by far, then the Sicilians. Now, let us hear Gratian himself, dissoucing of the Sicilian Horses, as well as of the Libycaem.

Sic. & Styronian felatis tutela Bifalae,
Post orbem Etnae stamnam se pererre arces.
Quid ludus Sicilis: quid tuum si turpis colla,
Autenum desce curvatur sinus? per illas
Camalus Gratia Agregat, Etique fragosum
Ne brochun liquere fere. O quemque in armis
Ille meus, cujus doecies pestaria fugi,
Sufficit, quem Othamius contendor contra
Austis, vicis merits qui facit Achaia palmas.

But as for Gratian, I suspect the place to be unperfect; for Agragus is a Mountain of Sicilia, having a Town situate in the top of it, bearing the same name, where their Aretelors were wont to nourish and bring up the belt Horses. There is also in Sicilia a Mountain called Nebrodas, which some think to be so called by reason of the plenty of Dear, but they have no Author for it, and
as for the printed Book of Gratius, I find it expresseth it not so well as Virgil setteth it down, laying, that Agrimus was a breeder of most courageous and notable Horses: but yet Servius faith, (according to indurs,) that the Agrimites in times past sent their Horses to the juggling or combates of Creata, returning with victory from thence, and we have also read that in Cappadocia whole troops of Horses have been destroyed. The men of Delphi by the answer of Apollo got herds and great floc of Horses from Agrimentis, and those were excellent. Aristeophanes calleth those great Athenian Horses (Cembris) either of the greatness of the Mountain, or else great Cambises are bred in it, or of the Horses of Etna, being notable for swiftness and running. The Horses that are bred in Cre't and Cappadocia are also most excellent.

In Greece there are most notable Horses of Thessaly, which Aburus faith be the best in all Greece. The words of Gratius the Poet speaking of the Thessalian Horses are before recited. The Mares of A'mius were the most excellent, but as Homer reporteth the Thessalans were before them. The Solitude or Wildernes of Arcano is as commodious to feed Horses, as Thessalia. It is certain that Thes-salia excels with Horses, from whence Xerxes is said to have made a comate, that he might try his Horses there where he understood the best breed of Greek Horses to be, and from whence this proverb arose, Doce quia Thessalia. It lett the Thessalian Mare be tryed by battail, a proof of excellent wortth, because in old time the chiefest praine was of the Thessalian Mares: which is very apparent by the Oracle that was delivered to the Aginensis. Suidas relates it (but I know not out of what Author) that Thes-salia hath excellent Horses; Tereius expert shooters; and India light armour: so hath likewise Cre't and Caria.

Eragus writeth, that Thessalia is most fit to feed Horses, who do far excel the Arcadians and Epicdares, as Strabo witnesseth, lib. B. Caesar was said (when he was Dictator) to have made the first fow among the Romans of the Horses, fighting against Buls, and killing them, whereof Lucanus writeth thus:

\[
\text{Thessalian Horses prefer Horses own.}
\]

That is to say, the Thessalian Horse is profitable for fence and deadly conflicts. There is also in Thes-salia a City (named Pelus) from whence I deem the Pellean Horses are so called of Gratius, yet there be other places called Pelis (as Macedonias and Achaia) whereof Gratius writeth thus:

\[
\begin{align*}
\text{Spadices \& Pelles valuerunt Coreuni,} \\
\text{Et tibi devote magnum pecunia Cypria.} \\
\text{Phoceae decus non magno in sacrarum tonfas.}
\end{align*}
\]

Which (Coreuni) are Mountains of Eupias, and Cyrbe is a Town of Phocis, situate at the foot of the hill Famus, where Apollo Cyreus was worshipped. The Tyrhenians being excellent warriors, are commended of Oppianus. Out of the Islands of the Tyrrenian Sea (especially Carisca and Sardinia) there be very short Horses, but they are of good courage, and gentle withall.

The Thracean Horses are foul and ill shapen, being rough all over their bodies, and having very shoulers, which in the Greek is named (Colomyten) such a one as will cut down the rider on the ground from off his back, they are crook-back, or bundled out; or else of divers kindes: and therefore they have an unsure and reeling pace, and their course is very unconfortable; Aburus faith, the Thracean Horses are the best. The Tauricinean Horses are neighbours to Heffis, which Pliny and Volaterran supposeth, are called (Medit-nenan Cimbri.)

There be somme that suppose the Venetians to defend from a people of Paphlagonia (called Venice) which after the destruction of Troy came to these places, and by these they make an argument, conjecuting it to be good, in regard they are wholly employed about breeding Horses, which at this time faileth altogether; but in former days they were very careful to follow their business about the training up of young Mules, whereof Homer writeth. And Dionysus the Tyrant of Sicilia ordained, that the breed of Horses should be fethch from hence to make hislike combates with them, that among the Graecian the excellency of the Venetian breed should remain, and that a great while after that breed of Horses got the praine. Vindobona this day is called of the Saxons a gilded Horse, and brought out of that Country, which sometimes was called Dacia. The Lycofassus and Lycophatians shall be spoken of hereafter.

Of the choice of good Horses.

The members of an eligible Horse, Pallas adviseth to observe four things in choice of a Stallion Horse, the form or outward proportion, the colour, the merit, and the beauty, which all are necessary to be observed in the choice of Colts or elder Horses, that they may be of a generous race, having loft legs, lofty paces, gently treading, such as will lead the way, and be not afraid of any water, bridge, or sudden noises; having a gentle neck, a sharp head, a short belly, a fat back, a dapple colour, nimble ears, thick mane lying on the right side, a double bone descending by his loins, a founding hoof, and legs that cannot stand hill, which Virgil expresseth in these words:

\[
\text{Ne}
Varro shewed that at the first foaling of a Colt, a man may observe by certain signs how he will prove when he is in perfection: for if he be cheerful, bold, and not terrified at any strange sight, if he run before the company, be wanton, and contend with his equals in course, and over-run them; if he leap over a ditch, go over a bridge, or through water, and being provoked appear the meek, these are the most true signs of an eligible Colt.

Also it is to be considered, whether they run quickly, being flirred from their rest, and run away speedily, if their bodies be great, long, full of muscles, and if apace, having a little head, black eyes, open and wide nostrils, sharp pricked ears, a soft and broad neck, not long, a thick mane curled, and falling on the right side, a broad and full breast, large shoulders, and shoulder-bones, round ribs, a little belly: a double back; bone, or at the least not thin, bunchy, and extended; his loins prefixed downwards, broad, and well fett, little and smooth bones, a long tail, with curled hair, high, straight and equal legs, round knees, nor great, nor bending inward; round buttocks, brawny and fleety thighs, hard, high, hollow, and round hoofs, well fet to the crown of their pattern, having veins conspicuous and apparent over all his body. That Colt, which at the time of his foaling hath the most highest legs, is likewise by common reason to prove moist and noble in his age, for of all the joynets in the body the knees and legs grow leaft, and they which have flexible joynts in their infancy, will be more nimble and flexible in their age. And thus much for the parts of a Colt. Now, in the next place we must likewise take consideration of a Horfe untamed, and ready for the saddle. For the outward parts of his body, faith Xenophon, yeeld evident significacion of his minde, before he be backed.

Plate willeth that the state of his body be straight, and articulate, his head bony, his cheeks little, his eyes standing out, and not sunk into his head, flaming like bloud looking cruely if the body be black; but black eyes if the body be white, do argue a gentler and better disposition; short and little ear, the crown of his head greater then the refidue, broad nostrils, whereby he not only looketh more terribly, but breateth more easily; for when one Horfe is angry with another, in their rage they are wont to fretch out their nostrils vehemently.

The head or snout of a Horfe, ought not to stand out like a Swines, but to bend down a little crooked, the head to be so joyned to the neck, as it may bend more commodiously, that is, if the neck be small next to the head, so will the neck stand before the rider, and his eyes appear before his feet: and although he be full of stomach, yet will he never be violent or fitlea necked. It ought also to be considered, whether his cheek bones be sharp, tender, or unequally standing one above another; for their imparity maketh the Horfes necke to be hard and stubborn.

The back-bone above his shoulders higher, commodious to set the saddle upon, and his whole body the better compacted, if the back-bone be double, and smooth; for then shall the Rider sit more easily, and the form of the Horfes appear more delectable. A large breat sheweth his come- lines and strength, making him fit to take longer reaches without doubling of his legs, because in a broad breat the legs stand further atunder; large side or ribs swelling out above the belly, for they shew the ability of the Horfe both to his food and work, a round even belly, and his loins being broad and short, caueth the fore-legs to be lifted up more easily, and the hinder-legs to follow: for the small loins do not only deform, but enfeble and opprest the Horfe, therefore the loins ought to be double, the ribs broad and facry, agreeable to the breast and sides, buttopcks solid and broad, with a long tail reaching down to the heels of his hinder-legs. Thighs full of sinews, the bones of his legs thick like posts of the whole body, but that thickness ought neither to be of veins nor flesh, for then they are quickly inflamed and wounded, when they travel in rough and sharp waves; for if the flesh be cut a little, the commifures part atunder, and caueth the Horfe to halt, and above all other things have a regard to his hoof, for being thick, it is better then being thin, likewise if they be hard, caueth the pattern to stand higher from the ground, for so in their pace the soft and hard parts of the foot do equally

Signs to chuse a good Colt.

Colo."
The History of Four-footed Beasts.

sultan one another, and the hard hoof yeildeth a found like a Cymbal for the goodnes of a Horse appeareth by the fround of his feet.

Now on the contrary fide it is good alfo to fet down the faults and fignes of reprobation in Horses, and firft of all therefore, a great and flefy head; great ears, narrow nofrils, hollow eyes, a long neck, a mane not hairy, a narrow breath, hollow shoulders, narrow fides, and little flefy sharp loins, bare ribs, hard and heavy legs, knees not apt to bend, weak thigfis, not ftroge, crooked legs, thin, full flefy, plain and low hoofs: all these things are to be avoided in the choife of your Horse.

of the choife of Stallions and breeding Mares.

Now in the next place, let us confider the choife of Horfes and Mares appointed for breed and propagation, and we have fhtewd already, that in a Stallion, we are principally to confider the colour, form, merit, and beauty. This Stallion is called in Italian, Rezzano; in French, Elton; in German, Ein Springenfah ; and in Latin, Admissarius, quia ed generandum foabum admittere, because he is fent to begat and engender. The Graecians, Anabates, or Oebuates. Firft of all therefore, to begin with the colour: that Horse is beft which is of one continued colour, alfo oftentimes (as Rufus faith) Horfes of a delineable colour prove as noble as any other.

The chief colours are thofe: bay, white, carnution, golden, ruffe, moue-colour, fleaf-bitten, spotted, pale and black: of all thofe the black or bay is to be preferred. Opponens maketh difinction of Horfes by their colour in this manner, the gray or fleyed fotted is fitteft for the hunting of the Hart, the bright bay for the Bear and Leopards, the black with flaming eyes againft the Lyons. The natural colour of the wilde Horfes are an all colour, with a blackкрае from the head along the back to the tail; but among tame Horfes there are many good ones of black white, brown, red, and fleaf-bitten colour. But yet it is to be remembered, that feldom or never Colts be foufl white, but rather of other colour, degenerating afterward by the increafe of their age, for fuch Horfes are more lively, durable, and healthy, then other of their lind, and therefore Plutarch commendeth a white Horse of Sylla for his fweetnefe of foot and focum: among all colours, firft the black, then the bay, next the white, and left the gray are moft commended.

Comarrus commendeth a certain colour called in Latinus, Varius, and may be enlighfed daple grey, becaufc of the divers in-textures of colours, which alfo many Nations do difallow, yet undoubtedly that colour (fainth) is a figne and argument of a good nature, constituted and builded upon a temperate commixture of colors. Where black, white, and yellow hairs appear, fo that the fight of one of thofe is nothing inferior to the equeftrical party coloured caparifons: Among Horfes which are divers coloured, they which have flafs in their fore-head, and one white foot, were moft commended; fuch were the Thracian Horfes not admitted in copulation, of which Virgil speaketh in this manner;

--- Thracius albi
Porta equor bicolor maculae, pelligra primi
Alba pedis, frontenique offensionis arcaum album.

Black Horfes alfo which have one ruffet or swart fpot in their faces, or elfe a black tongue are highly commended for generation, but the pale coloured Horfes are no ways to be admitted to cover Mares, becaufe their colour is of no account: and likewife it is feldom feen that the Foal proveth better then the Sire. The bay colour hath been received without exception for the bel travellers, for it is fuppofed, that Bandius (amongft the Latine) is derived of Vulnum, quia inter cetera animalia fortius vadat: becaufe among other creatures he goeth most foonly.

It is alfo befievable that in a Stallion Horse, the mane be of the fame colour with the body. Horfe-keepers have devifed to make their Mares conceive strange colours, for when the Mares would go to the Horfe, they paint a Stallion with divers colours, and fo bring him into the fight and presence of the Mare; where they fuffer him to fland a good while, until the perfectly conceive in her imagination the true Idea and full imprifon of thofe pictures, and then they fuffer him to cover her; which being performed, the conceiveth a Foal of thofe colours: In like manner, Pigeons conceive young ones of divers colours.

The Germans to mingle the colour of Horfes hairs (especialy to bring black among white) take the roots of Fearn, and of Sage, and fette them together in lee, and then wafh their Horfes all over therewith. For the making of their Horfe white, they take that fat which arifeth from the decoction of a moul in an earthen pot, and therewithall anoint the places they would have white. Also they flave off the hairs, and put upon the bald place crude Honi, and Badgers grease, which maketh the hairs to arife white: and many other means are used by Horfe-teachers, as afterward fhall be fhewen. In the old age of a Horfe his hair doth naturally change white, above all other beales that we know, and the reafon is, becaufe the brain-pan, is a more thin and flender bone, then the greatnef of his body would require, which appeareth by this, that receiving a blow in that place, his life is more endangered then by hurting any other member, according to the obervation of Homer:

Et
Of the Horse.

Et qua sorte herent ca.iti, lethaleque vulnus
Praeips it est equus.—

And thus much shall suffice for the colour of a Stallion: now followeth the form or outward proportion of the body, which ought to be great and solid, his stature answerable to his strength, his sides large, his buttocks round, his breast broad, his whole body full and rough, with knots of mufcles, his foot dry and solid, having a high hoof at the heel. The parts of his beauty are these, a little and dry head, the skin almost cleaving to the bones, short and pricked ears, great eyes, broad nostrils, a long and large mane and tail, with a solid and fixed roundness of his hoofs, and such an one, as througheth his head deep into the water when he drinketh; his ribs and loins like an Oxe's, a smooth and straight back, his hanches or hips long, broad, and fleshy, his legs large, fleshy and dry, the fines and joyntures thereof great, and not fleshy near the hoofs: that the hinder part of his body be higher then his forepart, like as in a Hart, and this beauty better appeareth in a lean body then in a fat, for fatnefs covereth many faults: the former parts are thus expressed by Dioscorides:

Regibus bionim eft ubi equus merominus, spetios
Impinniant, ne facies, ut fape decorat.
Milis tuta pede eft, emptorem indicat biamtern,
Sed pulchri cliantes, breve quod capitis, urina occoix.

If you will make trial of your Stallion, whether he be fit for procreation, Hipparchus teacheth you this experiment: press the genital member with your two fingers, and with locks of Wool draw out his seed, which being to drawn out, if it cleave and hang together, so is it not to be cut nor easily parted, it is a demonstration of a good Stallion; but if it hang not together like birdline, but easily go aunder like Milk or Whay, such a Horse is not to be admitted to cover your Mares. When Horses be old among other faults, they engender Foals lame in their feet, and therefore they The age of a Horse is to be kept, and not to be admitted to copulation nor War; for his rage is like a weak fire among Stallion, wet flubble, according to thefe verifes:

---

Morbo gravis aut signior annis
Deficat, etque domo, nec turpi ignora senecta.
Frigida in venerem senior, frivolare laborem
Ingratam trahit: si quando ad praelia ventum eft,
Ut quondam in fipulis magnus sine viribus igni,
Lactam furit.---

Therefore it behoveth that a Stallion Horfe be not under three years old when he covereth a Mare, and it is beft for him to begin at five, for so he will endure in generation, not only till he be twenty year old, but also to thirty or forty years, as in Some Countries hath been often proved. They are not to be admitted to cover above fifteen in one year at the most, and a young Horfe not above ten or twelve in one year; the residue may be suffered with observation of their strength and nature.

The King of Babylon beftide his Horses for war had eight hundred Stallions, which were admitted to cover fix thousand Mares, fo that every one had twenty a piece; there is also a place in Syria near Apamea, where in one plot of ground were nourished thirty thousand Mares, and three thousand Stallions (as Calvis faith) to that every Stallion had an hundred Mares to cover (in that place) which number exceedeth the proportion of nature. It is also to be remembered, that Stallions are to be separateth from Mares all the year long, except at the time of procreation, and then alfo he must be largely fed according to these verifes:

---

His animadvertit, instant sub tempus, & omnes
Impendant curas denso diftendere pinguis,
Quem legere ducem, & pecor duexere marium:
Floresque fecant herbo, flavosque miniartant,
Ferraque: ne blandos necuerant superesse laboi:
Invididique partum saperant jejunia nati:
Ipsa animum mecum sustinunt armenta solentes.
Atque ubi concubitius primos jam nata volupias
Solicitatis, frondosque regnants, & festibus arcent.
Saepe etiam curia quaquent, & Salo fatigant:
Cum graviter turris genitum area frugibus: Or cum
Surgentem ad Zephyrum palea jaciantur inanes.
Hoc faciant, nino ne luxo obfufor uffis
Sit genitali arvo, & fulos abiminetes,
Sed rapiat fient Venereum, interiusque recondat.
It is also to be observed, that the males which are designed for procreation be not over much labor
ed, for then he will be the more weak for generation, nor yet suffered to be too idle, for then a cer-
tain flanny humor is increased in them, which likewise disableth them in copulation; and thus much
for the males.

Almost all the same things which have been said of the male, belong to the female, except the belly
of the female ought to be greater; but if there be any white speckles or spots in the eyes of the fe-
male, such as are not contracted by accident, but breed in them by nature, such a one is refused for
breed; for an Horfe born of such a Mare, when he cometh to be old, will likewise be affected with
the same blindness; but if it be a female, by reason of her yearly purgation, the may peradventure
avoid that mischief.

It behooveth therefore that the Mares appointed for race, be well compacted, of a decent quaf-
ity, being fair and beautiful to look upon, the belly and loins being great, in age not under three
nor above ten years old.

Concerning their admission to generation, it is to be remembered, that the Latinus have a proper
term to signify the appetite of the female to the male, which they call, Equire, that is, Horfing, and
they continue in that lust sixty days together; the signs whereof are these. They forfake their
company, running not toward the East and West, but the contrary, to the North and South; nei-
ther permit they any body to come near them, until they either be weared or meet with the male,
and if they meet with a female like themselves, they joyne near to her, and seem to rejoice at her
society, lifting up the tail, changing of the voice, and sending forth of her secrets, a certain thin hu-
mour, somewhat like the feed of a Horfe, which is called Hyppomacis.

They also make water more often then at other times, so that among all the females in the world,
there is none, befide a Woman, that is more greedy of procreation then a Mare, because they want a
menstruous purgation, and yet eat abundance of meat, which Virg/ expresseth, setting down their
unlimitable rage, which carryeth them over Mountains and Rivers, in the time of this fury.

Also at that time, their genital handgirth more then at other times, but if their manes be
shorn off, their lust is extingunished. It is reported also by Columella that in Spain, in the Mountain Tegro
which reaceth into Fortuna upon the Ocean, there be Mares which rage so far in lust, that by their
ardent desire of copulation they conceive by the Southweft winde, without the company of a Horfe,
(even as Hens do lay egges being not tord by a Cock) which are called Hyppomacis, but those Foales
live not till they be above three year old. And it is the property of these Mares (fate Avisen) by
kicking against the winde with their hinder legs, to open their own womb, and to receive in that
decelebrable air, wherewithal they are fatisfied.

Also he faith, that he heard of an old man, which was born in the Isle of Realquha, that the Mares
thereof never ceafe running, from the one end of the Island to the other, when the rage of their lust
is upon them; which thing is elegantly described by a Poet, how they turn themselves to the Weft,
standing upon the rocks, and there draw in the cold aire, which oftentimes maketh them conceive,
wondering that they conceive not rather by the Easte sunrizing or South, then by the Westely
winde bordering upon the North; the Poets words are these:

Continuque avidis ubi subdita flamma modulatis,
Veremagis quia verecolor reddit officibus ilia
Ore omnes verfa in Zephyrum, fiant ripibus altis
Exceptantque levibus auris: & sepe fine ullis
Conjungi ventis grandia (mirable diuin
Saxa per, & foquitos, & depressis convulles
Diffingiunt, non Eure tuis neque Solis ad auras:
In borem Caurumg, aut unde nigerum asfier
Nachtur, & phuto contristat frigore calmam.

Sometimes Horfes and Mares admit copulation at two year old, but those Foales never prove ex-
cellent, but at three year old or thirty moneths, they suffer conjunction safely and with profit, because
they cease to lose their teeth. They continue in their generation, bearing every second year, the
male untill he be thirty year old, and the female as long as the liveth; but the male engendereth
yearly; And it is reported of a Horfe in Opis, that covered a Mare after he was forty year old, being
only holf up and down from the Mare.

A history of a stallion to his own dam.

The Abystus.  

The choife of Mares.  

The copulation of Horfes and Mares.  

Aristotle.  

Albenuus.  

Pliny.  

Pliny, Oppianus, Retamud, and Aristotile do confidently affirm, that when the King of Scythia had all
his generous breed of Horfes destroyed by a pellicence (except one of his bel Mares and a Stallion
which was a Foale of that Mares) being defirous to continue the breed, caufed his Horfe-keeper to put the Son and the Mother together, but the Horfe refused copulation with his

own
 OWN Parent. Afterward the Horse-keeper covered the Mare with artificial skins, and likewise dressed the Horse in such manner, as one could not know the other, whereupon being brought together the second time, the Stallion covered his own Mother; Afterward the Horse-keeper discovered them, the one to the other, whereby they knew the fraud, and grew guilty in themselves of incestuous commixtion: Whereupon they took no other revenge upon themselves, but ran to the top of a high rock, and there successively threw down themselves; one after another, so ending their miserable days, and preventing their Misters hopes; to teach all mankinde that they ought not to seek to thrive by fins against nature: the like is before rehearsed of a male Camel.  

The very like story is reported of a Horse in the coasts of Red, yet this is not held to be general; for beasts (as Aristotle faith) do promiscuously cover one another; the Father, the Daughter, the Son the Mother, the Brother the Sister, and this maketh them to be perfect beasts; and the stories before recited may be true, yet are they extraordinary: otherwise the common rule of Ovid remaineth true, That it is not a filthy thing for beasts to observe no degrees of nature.

---

rout animalia nullo
Cetera decellit, nec babatur turpe juvenae
Ferre patrem tego, fit equo: ma flia conjux.

The best time of the year for the joyning of Horfes and Mares for copulation, is from the vernal aquisolstitial to the summer solstice, because then the Colts which are foasted in due time, have the green herbs and all the warm weather for the succour of their infancy: and if the Mare (after she have been once covered) refuse the male, let her rest ten days, and then bring her to the male again; if she refuse the second time, you may take it for granted, that she is filled already. Wherefore seeing it is known certainly that a Mare goeth twelve moneths with young, it is an easie matter to order the time of her copulation, that her foale may always be delivered in a warm and fafionable time of the year; for which caufe there is an invention for stirring up of the luft both in the male and female: the Hymenaeus thereds, by the sweetness of fongs upon their pipes, stirre up their Horfes and Mares to copulation, but the more affured way is, to follow the direction of Columella and Abystitus, to provoke them by natural means, like as Bulls and Kinne.

And first of all for the male, give him the tail of a Hare burnt, mingled with wine, and anoint therewith his loines and genital member, and so shall the Stallion be more prone to venery; also there is a kind of Smyrium, which they give to them in drink, or the powder of a Horfes loines: likewise if the female refuse, take shrimpes beaten soft with water (as thick as bone) therewith touch the nature of the Mare in her purgation, and afterwards hold it to her nose; or else take Hens dung mixed with Rosen and Turpentine, and anoint the secretes of the Mare, which shall far increase her luft, as it cleareth the lothomines of the then the shrimpes, and increaseth luft. But you must regard, that no lean and ill favoured Mare be anointed, because the Horfe is quickly wearied from his luft, and so delighteth only to be ticked therewith without doing any thing.  

Other again do first of all bring some vulgar Horfe to the Mare, who provoketh and stirreth her luft to, and when he is near the very fact of filling her, they lead her away to a more generous Stallion, to be covered by him: And so if none of these means do prevale with her, they do rub her secretes with a Nettle, and that caueth her to suffer the Horfe to enter.

Demeritus also faith that it is in our power to caufe our Horfes to bring forth males or females; for if we suffer them to couple when the North wind bloweth, or the third day before the full Moon, or bind his left loine, he shall get a male; but if when the South wind bloweth, or three days after the full Moon, or bind the right loine of the Horfe, it will prove a female.  

Alfo at the time of copulation, the Horfe leap off from the Mare on the right side, it is a token it will be a male, but if on the left side, it will be a female. Carnal copulation is most acceptable to Horfes, and leffe grievous unto them then to Neat, for there is no kind (min only excepted) that is so venereous and nimble in generation is as a Horse or Mare.  

The males know their females with whom they live, although they have been but a few days together; and if strange females fall into their company, they expel them away by biting, feeding single and alone with their female by themselves; but if any male or other loine Horfe come within their walke, then presently they make force at him; if their female fir from them, they restrain her by biting: and in this time of their rage, they neither regard the rider, nor their adversary, nor the bridle, nor cruel stripes, nor steep hills, nor rocks, nor caves of the earth, if they winde the amorous favour of their fellows; according to the saying of Virgil in these Verdes;  

Nomen viridi, ut toa temor portentet equorum
Corpora, si tantum notas odor attulit aura f
As noque eum jen freva virum, nec verbera sona,
Nan spoalt, expel; earn, atque obieeta retardation
Flamina, corrupit unde torquentia montes.
The History of Four-footed Beasts.

It hath been also received, that a barren Mare shall conceive if you take a bunch of leeks bruised final and put into a cup of Wine and twelve French flies called Cephalotes in water, put them two dayes together into the genital of a Mare, like a Gryffer, and afterwards put her to a Horse anointing her secrtes with the said ointment two several times, when the Horfe leaps down from her; or else they take Niter, Sparrows dung, Rozen, and Turnbulling, thrilling the fame into the Mares genital, whereby it hath been proved, that fecondity oftentimes followed.

Also some use Silur of the Mountains to procure conception in Mares and Cowes, and the true sign of conception is, when their nature (that is) the fluent humour out of their secretes ceaseeth for a moneth, or two, or three: and Pliny faith, that when a Mare is filled, she changeth her colour, and looketh more red, which is to understand not of her hair, but of her skin, lips and eyes, her hair flaming more full then before. Then let them be separarated from the males, exempting them from moist places, cold and labour, for all these are enemies to her foaling, and caule abortion.

Likewise they must not have too much meat nor too little, but only a temperate diet, and soft lodging, their better ordering is elegantly described in Virgil, by these Veres.

Non illis gravisit, qui questam jugo diceat plusfris,
Non saltu superare sanam fit passa et e locri
Carpe praed jugo:-flaviesque in mare raptes.
Dolius in vacuo pensant: et plena securdum
Flamia, mensus ubi er viridis fumes graminertips,
Splen estque tandem: & facta procubet umbra.

This is most certain, that if a Woman in her flowers, touch a Mare with foal (or sometime do but see her) it caueth to call her foal, if that purgation be the first after her Virginity. In like manner if they smell of the juice of a Candle, or eat Buck-mast or Gentian. The Egyptians when they will describe a Woman suffering abortion, they picture a Mare treading upon a Wolf, for if a Mare kick at a Wolf, or tread where a Wolf hath trod, the calfeth her foale: if an Asse cover a Mare which a Horfe hath formerly filled, there followeth abortion; but if a Horfe cover a Mare which an Asse hath formerly filled, there followeth no abortion, because the Horses feed is hotter then the Asses. If a Mare be sick of abortion or foaling, Sulphur mingled with warm water given her in a horn, is a present remedy.

The Systeni when they perceive their Mares to be quick with foale, they ride upon them, holding opinion that thereby they call forth their foales with leffe pain and difficulty. They carry their young one in their wombs, as hath been already said, twelve moneths, but sometimes they come at eleven moneths and ten dayes, and those are commonly males, for the males are sooner perfected in the womb: then the females, and commonly the females are foaled at twelve moneths and ten days: and those which tarry longer are unprofitable and not worth education. A Mare is most easilly delivered of her young among other beasts, and beareth most commonly but one at a time; yet it hath been seen that twins hath proceeded from her. At the time of her delivery, the lefe purgation of bloud then so great a molde of body can afford, and when the hath foaled, the devoureth her seconds, and also a thing that cleaveth to her foales forehead, being a piece of black flesh called Hippomenes, neither doth the suffer her young one to suck until the have eaten that, for by smelling thereunto, the young and old Horses, or other of that kind would fall mad: and this thing have the imposter of the world, used for a Philtre or amorous cup, to draw women to love them, Virgil speaketh thus of it:

Queritur & nascencia Equi de fronde resulis
Et matris praecepit amor.

And again:

Hinc demum Hippomenes vero quod nomine deuent,
Paverse, lentum disstitat et ingurgit virus
Hippomenes, quod sese muliebremque, noverce,
Misfueruntique herbis & non innovaxi verba.

This poison made into a Candle (Anexilaut) in the burning thereof, there shall be a prentention of many monstrons Horfes-heads. There is very great poison contained in this Hippomenes, for the Arcadian Phorin made a Horf of brasse at Olympia, & put Hippomenes into the same, and if the Horfes at any time see this Braunen Horfe, they were so far irraied with heat, that no halters or bands could hold them, but breakeing all, run and leaped upon the said Braunen Horfe, and as hough it wanted a tail, yet would they fortake any beautiful Mare, and run to cover it; neither when they came unto it, and found it by their heels to be founding and hard, would not they deprize the copulation, but more and more, with noise of mouth, rage and endeavor of body, labour to leap upon the same, although the flippery brasse gave them no admission or stay of abode upon the back of that substance, neither could they be drawn from the said Braunen Image, untill by the great strength and cruel stripes of the riders they were forcibly driven away.

Some
Some think this little piece of flesh to cleave to the forehead, others to the loins, and many to the genitals: but howsoever it is an unspreakable part of God's providence, to make the Mares belly a sepulchre for that potion; for it should remain in the males as in the females, the whole race of Horses would utterly perish and be destroyed through rage of lust, for which cause the keepers and breeders of Horses do diligently observe the time of their Mares foaling, and instantly cut off the same from the Colt, referring it in the hoof of a Mare, to procure the Stallions to carnal copulation, and the Colt from which they cut this piece of flesh, they sacrificed it, for it is manifest that the Mare will never love that foal, from whence the hath not eaten and consumed this piece of flesh.

And this potion is not only powerful in brute beasts, but also in reasonable men, for if at any time by chance or ignorantly they take thereof, they likewise fall to be so mad and precipitate in lust, raging both with gullions and voice, that they cast their lustful eyes upon every kind of Women, attempting wherever they meet them to ravish or ingender with him: and besides because of this oppression of their mind, their body consumeth and fadeth away: for three days after the Colt is foaled he can hardly touch the ground with his head. It is not good to touch them, for they are harmed by often handling, only it is profitable, that it be suffered with the dam in some warm and large stable, so as neither it be vexed with cold, nor in danger to be oppressed by the Mare through want of room. Also their hooves must be looked unto, lest their dung sticking unto them burn them, afterward when it waxeth stronger, turn him out into the field with his dam, left the Mare over-mourn her feif for want of her foal, for such beasts love their young ones exceedingly.

After three days let the Mare be exercised and rid up and down, but with such a pace as the foal may follow her, for that shall amend and encrease her milk. If the Colt have soft hoofs, it will make him run more speedily upon the hard ground, or else lay little flones under their feet, for by such means their hoofs are hardened, and if that prevail not, take Swines grease, and Brimstone never burned, and the flanks of Garlick bruised and mingled all together, and therewithanoint the hoofs.

The Mountains also are good for the breeding of Colts, for two causes, first for that in those places their hoofs are hardened; and secondly by their continual ascending and descending, their bodies are better prepared for enduring of labour. And thus much may suffice for the educating and nursing of foals.

For their weaning observe this rule, first separate them from their dams twenty four hours together, in the next morning let them be admitted to fuckle their belly full, and then removed to be never more suckled; at five moneths old begin to teach them to eat bread or hay, and at a year old give them Barly and Bran, and at two years old, wean them utterly.

Of handling, taming, or breaking of Horses.

They which are appointed to break Horses are called by the Grecians, Equoide, Equuiden, Hipposon, and Hipposoma; the Latins, Equitatus, Aratuulatores, and Cociones, in Italiano fo Razzoni. Allfyrus is of opinion that foals are to be used to hand, and to be begun to be tamed at 18 moneths old, not to be backed but only tyed by the head in a halter to a rack or manger, so that it may not be terrifyed for any extraordinary noise, for which cause they use them to brakes, but the best time is at three years old, as Ceretetensis teacheth in many Chapters, wherefore when they begin to be handled, let him touch the rough parts of his body, as the mane and other places, wherein the Horse taketh delight to be handled: neither let him be over fevered and Tyrannous, and seek to overcome the beast by stripes, but as Ceres faith, by fair means, or by hunger and famine.

Some have used to handle them fucking, and to hang up in their presence bits and bridles, that so by the sight and hearing the glinging thereof in their ears, they might grow more familiar. And when they came to hand to lay upon their backs a little boy flat on his belly; and afterward to make him fit upon him formally, holding him by the head, and this they do at three year old, but commit him to no labour untill he be four year old, yet doth well to and small Horses for ordinary use are tamed at two year old, and the belt time for the effecting hereof, is in the moneth of March.

It is also good in riding of a young Horse to light often, and to get up again, then let him bring him home and use him to the stable, the bottom whereof, is good to be paved with round flones, or else planks of Oak, stirring litter upon it when he lyeth down, that so he may lie fast and stand hard. It is also good to be regarded, that the planks be so laid, as the Urine may continually run off from them, having a little close ditch to receive it, that so the Horses feet may not be hurt thereby, and a good Miller of Horses must oftentimes go into his stable, that so he may observe the usage of this beast. The manger also ought to be kept continually clean for the receiving of his provender, that so no filth or noisome thing be mingled therewith: there ought alfo to be partitions in it, that so every beast may eat his own allowance, for greedy Horses do not generally raven upon one's own meat, but alfo rob their fellows. Others again have such weak stomachs that they are offended with the breath of their fellows, and will not eat except they eat alone.

The
The rack also is to be placed according to their stature, that fo their throat may not be too much extended, by reaching high, nor their eyes or head troubled, because it is placed too low. There ought also to be much light in the flable, left the beast accustomed to darkness, be offended at the Sun light, and wink over much, being not able to inure the beams when he is led abroad; but yet the flable must be warm and not hot; for although he do preserve fatness, yet it bringeth indigestion and hurreth a Horfes nature, therefore in the Winter time the flable must be fo ordered, as the beast may not be offended or fall into diseases by overmuch heat or fuddain cold. In the Summer time let them lodge both night and day in the open air.

This also in flabling of your Horfes must be avoided, namely, the flies of Swine; for the flink, the breath, the grunting of Hogs, is abominable for Horfes, and nature hath framed no sympathy or concord betwixt the noble and courageous spirit of a Horfe, and the beatilly sluggish condition of a Swine. Remove also far away from your Horfes flables all kindes of fowl, which were wont to haunt those places to gather up the remnant grains of their provender, leaving behind them their little feathers, which if the Horfe lick up in his meat, flick in his throat, or else their excrements which procureth the loofeness of his belly.

It muft also be regarded, that the flable must be kept neat, sweet, and clean, fo as in abfence of the Horfe, it may not lie like a place for Swine. The infruments also, and implements thereof, such as are the Horfe cloathes, the Curry-combs, the Mane-combs, Saddles and Bridles, be difposed and hung up in order behind the Horfe, fo as it may neither trouble him eating or lying, nor yet give him occasion to gnaw, eat, and devour them to their own damage or hurt, for fuch is the nature of fome Swine, to pull affunder and deftroy whatsoever they can reach.

They are therefore oftentimes to be exercised and backed, and principally to be kept in a good diet, for want of food defectiont the spirit of the noblest Horfe, and also maketh the mean Horfe to be of no ufe; but on the contrary a good diet doth not only make a mean Horfe to be servicable, but also continue the worth and value of the beft: which thing Poets confidered, when they fain that Arian the Horfe of Neptune and fome others were made by Ceres the Goddes of Corn, which any mean witted man may interpret to signify, that by abundance of provender the nature of Horfes was fo far advanced above ordinary, that like the Sons of the Gods they perform incredible things: whether therefore they eat chaffe, or hay, or graffe, or grain, according to the diversities of Countries, let it be wholefome, clean, frefh, and sweet, without dust, gravel, multines, or evil finell.

In the morning give them Barly or provender, a little at a time in diftinct or feveral portions, twice or thrice one after another, fo as he may chew and eke digeft it thoroughlie, otherwise if he raven it in, as he will do having much at a time, he rendreth it in his dung whole and not digested. About three hours after, he hath eaten his provender, give him a little of hay, and three hours after that, his dinners allowance of grain, as in the morning, and afterwards about two or three a clock hay again, and then fome drink; left of all give him his allowance of provender for supper, with a bottle or two of hay, which ought to be more plentiful then the former fervings: and yet these rules are not to be underflood as though they might not be altered, for the times prefixed may be prevented if occa fion require. Their f mell provender is Oats and Barley, yet Barly in gerdeth the thinner and better blowd, and therefore it is to be preferred, only the meafure of the provender is left to the defcretion of the Horfe-keeper, and there is no meat more wholefome for a Horfe, then Barly and Chaffe, becaufe it will make him full of life, and alfo able to indure labour, yet not over fat.

In England in many places they give their Horfes bread made of Fitches, Beans, and Peafe. When one is to make a journey on horfeback, let him not give his Horfe too much provender the noon before, but fo much the more hay, and bread deeped in wine, and alfo let him ferve him fooner at night then ordinary, that fo the beft may take the more refl. There be which refufe to give Horfes wet provender or deeped bread, becaufe they conceive that it will breed in them loathfome nefs of meat; but the truth is, a reafonable Horfe-keeper preventeth that mischiefe; and besides, the meaf of a Horfe is altogether fo dry, that the beft himfelf is indangered to be fick of that difafe; and therefore it is as fafe to give him moistened food fometimes, as well as to give him bread mingled with falt.

When a Horfe is weary or sweateth, let him not drink nor eat provender, but after he is walked a little while, give him hay, firft of all covering him with a large clothe, and remember, that hay is not to be call before a Horfe, as it is out of the reek, but firft of all it muft be pulled, and shaken betwixt the hands, for the avoiding of dust and other filth. Reftrain the Horfe as much as you may from eating the litter under his feet, for even the beft meat fo defiled is unlewhome. It is alfo good fomentes to fuffer him to pick up his meat on the ground betwixt his forelegs, that will make his neck to grow thinner, leaner and more comeby. Let his neck be fall bound in the flable with a Leathern collar, and bind with a manacle his fore-leg to the hinder-leg on the contrary fide, and fo shall his be preferved in more health, becaufe they cannot move out of their place but with difficulty.

Concerning the drink of Horfes, nothing more is to be added in this place, and namely backfifh and troubled water, such as runneth foily, as in great ponds, is fiftteth for Horfes, because that water, being hot and thick nourifheth better, but the fiftw Water is colder, and therefore more unlewhome, but in hot times (as in Summer) the sweet and clearer water is more conve-
ment, if custom be not against it. And because a Horse (except he drink freely) can never be fat, let his mouth oftentimes be washed within with Salt and Wine, and that will make him eat and drink more liberally: and yet the running water is more wholesome for Horses, because whatsoever is moveably fluent, is left subject to poison then that which standeth still; but if a Horse sweat or be weary, it is not safe to let him drink any thing, except he first rule, for in such cases followeth dilution. And it is better to turn or lead forth your Horse to water, then to bring it unto them. And if at any time necessity cause this to be done, then let the Water be very clear and fresh.

His stable or lodging ought to be ordered, as neither it offend him by cold in Winter, nor yet through heat in Summer, for both these extremities are pernicious: and therefore when the weather is extreme cold, then must the Horses back and belly be covered with a cloth: and when on the contrary it exceedeth in heat, then must his litter be taken away. Also in heat he must be covered with linen to avoid flies, and in cold with woollen to help nature: likewise it is good toward night to pick, cleanse, and open his hoofs, with some artificial instrument, and to thrust into the hollow Cow-dung, or in defect thereof Horse-dung with a little straw, that so he may not shake it out again: but this is not good to be done every day, but rather every second day, and it is good to mingle therewith fewest or grease, or else a new laid Egg with warm ashes. In ancient time they used not to shooe their Horses with iron, until the days of Catulus, who remembred this custom, saying,

Ferream a solem tenaee in voragine muda:

So that it seemeth that this devise was first of all invented for Mules. The Horse-shooes ought to be round like his feet, and not heaviest; let the Horses nimbleness be thereby hindered; and great care must be had in nailing or setting them on, let the tender and fleathie part of the foot be there-by pierced.

Another charge of a Horse-keeper is to keep his Horses lips soft, tender, and gentle, so as he Pollaris may more sensibly feel his bit: and for this cause let him often rub them with his hands and warm water, and if need require with oil also: and in handling of a Horse this must be observed for a general rule, That neither he come to the Horse right before his face, nor behind his tail, because both these are dangerous to the rider: let by his heels or mouth he harm him, but on his side he may safely set upon him or handle his Horse, and when he leadeth him, he must likewise go on his side.

Likewise good and painful dressing of Horses is no small means to retain him in sound and perfect health; and therefore he must often be touched with the Curry-comb, and afterward with a handful of straw, so as the hand may follow the broke to lay the hair smooth: and their fashion was in old time to brush over their Horses with a little linen instrument made like a sword, where by they excusse all dust from the beast: and herein it is wisdom to begin at the head and mane, and so to defend to other parts, and to touch the Horses back gently: he may wash the head and mane because it being fo bony, it is dangerous lest the comb offend and grieve the beast, except it be layed on very tenderly, but it is not good to wash the legs, because daily washing lootheth the hoof by flooding down of the water, and therefore it is sufficient only to broke them down with his hands.

The nearest part also of the belly is not to be kept over clean, for the more it is cleansed with water, the more is the Horse pained therein: when a Horse is drest, it is good to bring him out of the stable, that so in the open air he may be tyed in a longer halter, and seem to be at liberty, whereby he shall be brought to more cleannesses and tasteful gentleness, standing upon some smooth stones, till all the dust and loose hairs both by the Comb and Brush be driven away, and in the mean time the stable be emptied, and this is to be performed before the Horses watering. You must also regard the skin wherein the Horses yard runneth he keep clean, for it if be stopped it hindereth urine, and maketh the Horse sick, and when your Horse is in drest, let him have before him no manner of meat either of hay or provender.

Let them be led to the Water twice a day, and wash therein both legs and belly, except in the Winter time, wherein it is not safe to wet the Beafi fo often: and if there be in them any appearance of sicknes and infirmity, or if you have any purposer to give unto them any kind of medicin, then must you altogether forbear to water them. Some use to wash their Horses legs with warm wine-kegs to refresh their joints and sinews after hard journeys, which custom seemeth very allowable: other use in stead thereof warme dmf-water out of the kitchin, and the backes they wash with cold water and falt.

Underneath their tails,and near their yards, you shall find them in the Summer time to be much annoyed with flies, and therefore it is a needful part of the Horse-keepers watchfulness to look in those places and drive them away, for so his charge will take the better reit.

And evermore there must be nourished a mutual benevolence betwixt the Horse and Horfe-keeper, so as the Beafi may delight in the presence and person of his attendent: and for this cause he may be kept from hunger, wet litter, cold in the Winter, and flies in the Summer: and furthermore a diligent caution must be had, that the Beafi be not provokd through overmuch severity, for if the Horfie by his keepers violence be often driven to his rack and menage to avoid
The furniture of a Horse and his trimming.

The History of Four-footed Beasts.

The furniture of a Horse and his trimming, either he hurceth his shoulders or legs by his own weight or force, or else groweth into a trembling at the presence of a man, and to never yeeldeth any loving obedience; or else falleth into some furious and unreclaimable evil qualities. The Matter therefore ought often to enter into his stable, and take a view of his Horses usage, whereby the Beast will quickly take notice of him, especially if he have but one, for it is a great lolly and piece of his husbandry to train Servants and not to overlee them. Cato was wont to say, Evanscripta prior: that is, as the forehead is before the nape of the neck; meaning thereby that nature hath fitted him highest andormost, which should not hide himself, but take his place upon him and discharge it, for it is not safe or any part of wildom, to see by another mans eyes, or work altogether by Deputies.

Men must also be afraid of lending their Horses, for the Germans have a pretty proverb, that they will not trust their wives at great feats out of their sight, for commonly they learn some evil fashion or other more then they had before; and so much more Horses (after lending) return home again to their Makers with alteration of strength and quality.

of adorning and furnishing Horses.

I Cannot approve them that cut off their Horses tail or foretop; one received beginning from an ignorant perversion of increasing the strength of the Horses back, and the other from an imagined comelines, by trimming it with ribbon or some devised knot, or that it hindered the Horses flight. In the first the Beast is wronged and deprived of his help against the flies, and decency of his hinder parts; and in the second nature accursed, for not adorning the Horses forehead with more gaudy and variable coloured hairs, and providing a bunch of hair to weaken his eyes; but neither of these are tolerable, for a wife man once to imagine, and therefore I will not spend any more time to confute this vain adorning of Horses.

Let the horse-keeper take heed that he harm not the Beast when he puteth on his Bridle, for a little negligence quickly bringeth a great offence, by touching, wringing, and oppressling any tender part in the Horses head or mouth. He must alway put on his Bridle on the left side, and if the Horse of his own accord do not open his mouth to the bit, then must he gently open his mouth with one finger, and fo put it upon him; and if by that means he open not his mouth, then preffe or wring his lip upon his great canine tooth, which thing caueth any Horse to open his mouth.

Alfo it must be regarded that the Horse in leading be not drawn after you, for so will he be made hard headed, unwilling to follow. Again his Cheeks must not be pinched by the Bridle, left the skin grow fenfeles; alfo it must not hang long or loose in his mouth, for fo he will be alway biting his bit, and give lefse obedience to his Rider.

Congenatus writeth that he hath seen some put Salt upon their bits, whereof the Horse licking or tasting, became more willing to take it into his mouth; and for the better performance hereof, it is necessary to observe by often trial, what kind or fashioned bit best becometh and fitteth the Horses mouth, and finding it, keep him thereunto continually: and when it is put on, neither wring his Cheeks, or let him rovel it betwixt his teeth.

The Saddle also must be so fastened to his back, as that it may not turn or rovel upon the same; wherefore he which layeth it thereupon, must come on the left side, and gently without violence or noise, fet it upon the Beast; fo that neither girths, peytir, furrops, trapping, or crupyard, fall betwixt the Back and Saddle, neither covering therewith the Horses wither, nor yet touching his hips or loins.

Firft of all let the peytirrill on the breast be buckled, then the girths in order near the forelegs, not upon the belly, for upon the belly they will be fiding off, and that is againft the rules of riding; for Bene equitum qui bene cingunt; that is to say, they ride well which bind fast; and this ought to be done in an open place, where both the Rider and the Horse may have more liberty: wherewith a generous and great stomached Beast is much delighted: neither must he be tyed or drawn too hard till the Rider be seated. Look alfo often to the girths, that they wring not the fides, or pull off the skin.

Of Riding and sitting on Horseback.

When you are to get up and mount on Horseback, take hold on the lower part of the Bridle near the Bit, with the left hand, with such a distance as may both keep him from fying, nor give him offence, if you take advantage to get into the Saddle, and with the right hand take the reins on the top of the shoulders and the mane, and so hold them, as you give no check to the Horses mouth in mounting; there are other rules for this among Riders, whereother I will not meddle, only it is good to use your Horse to backing both falled and bare, as well from the plain ground, as from blocks, and risings invented for the case of man.

Therefore before you go to Horseback, firft broke your Horfe, and make much of him with gentle words, or other convenient sound which the Horse understandeth, and so will he stand more willingly till you be on his back: for this thing there is in Plutarch an excellent story of Alesander the great, when Eucrathmus was firft of all presented to his Father King Philip, by a Thesalian called Philonix: For when the King was perswaded to go forth into the field to try the qualities of this Beast,
beaft, which was so highly commend'd for rare parts, and valued at such a price, as none but a King might yeild for him, then the Horfe began to snort, and kick, and to admit no man to come unto him within the length of the rains, but kept aloft like a wilde and untamed Horfe; yielding no obedience to voice or other signes of the Riders: whereat the King fell exceeding angry, and bad them lend away the unruly and untamed Horfe: Alexander being present, complained of the ignorance and fearfulness of the Riders, and that they were the caufe why such a generous and gallant beaft was no better manned. At the hearing whereof, King Philip smil'd, and yet so carried himself as though he had not heard the words of his Son, till Alexander repeated his saying the second time; whereunto his Father reply'd, What (far Boy) will you make your self more skillful than thefe old cunning Riders? will you lay on them an imputation of fear and ignorance? Yes, said Alexander. I will adventure to handle this Horfe better then any other: Ye but (said Philip) what punishment the King will doth undergo if thou fail and perform not what thou haft said? What punishment? (said Alexander) why I will give them the price of the Horfe: Whereat the King laughed and fluck up the wagers, and so bad Alexander the rains of the Horfe delivered to him, who prefently turn'd him about against the Sun-rising, that so he might not be terrifi'd with the shadow of the beholders, and so led him up and down softly two or three turns, and at laft wan the Horfe to hand, which he gently stroked and applaud'd: and when he had gotten perfect intelligence and understanding of the Horfe's fomach, he caft off his cloak, and addressed himself to mount on his back, so holding the rains and bearing his hand and whole body as he did not check or pinch the Horfe's mouth: so he inclined him firft of all to lay away his firred and angry minde, and afterward paced him to and fro gently, which the Horfe endured: At laft he put Spurs unto him, and made him run, leap, career, and curve, to the terrour, at the firft, of all the beholders, and afterward to the singulur admiration and praife of himself: which cau'd the company or train to applaud this fact, and forced the old man his Father, to fend forth tears for joy; and when Alexander defended from his Horfe, he cou'd not contain himself, but he muft needs go offifie and embrace such a Son; whereby it is manifiest, that when a Man is to ride on a generous spirited Horfe, he fhall bend him to endure the burthen by gentlenefs and familiarity, fo as the Beait may still know and love his Rider.

Likewise when the Master mounteth, it is requisite that the fervant be on the other side of the Horfe to hold the firrop, for so fhall he get up more surely, and let himself more softly. Some farfes are taught to bend their hands to tak'e up their aged and fick farfes, that so they may be the leafe offended in ascending to their back, and this custom (laith Pallas) did firft of all begin a mong the Persians.

The ancient Germans were fo singularly exercis'd in Horsmanship, that standing upon the ground and holding a Spear or Lance in their hands, they mount'd without other firrop or vantage upon their Horfes backs; and not only when they were ordinary attired in common garments, but then also when they were arm'd, (though Julius Ceafar take from them all glory of Chivalry) yet now adayes the invention of Saddles with firrops, is most easily both for Horfe and Horsmen, being then better the Peleborian invention time.

When the Rider is in his Saddle, and is well ftead, he muft not fit as in a Chair or Chariot, bended together, but rather keep his body upright, only bowing outward his knees, for so fhall he be better able to defend himself, or offend his adversary; for he muft rather seem to fland then to fit on horfeback.

The Rider or Master of Horfes muft bare his Horfe in the heat of Summer, (about Dog-days) and in the cold of Winter, and never at any time to Ride palt the twylight of the evening. The Horfe being empty, is most prone to make water then being full, and therefore muft not be hinder'd in that desire: and alway after his riding, ride him not too faft, until his nerves which were extended to let forth the Urine be contracted, fetled and drawn together again.

In the Winter time a Horfe be to paffe over a foord of water (which will ascend up above his belly) let him itale firft, let he fall into the Straggury, and also be a little eaf'd of his load.

There is no beaft that rejoyneth more in celebritie and swiftnesse then a Horfe, because fo soon as he is turned out of hand, he instantly runneth away speedily, and doth walke softly as at other times: and this is a pleasure to them: except when they are provoked above their defires: and the coufell of Xenophon when you are to Ride falt or for a wager, is this, bend the upper part of the body forward, stretching out the hand which carryeth the rains; now drawing it in, and then letting it at length again; and therefore it is good in fuch cafes to ufe short rains, and if the Horfe in his courfe ftrretch for the rains of his own accord, then is it a sign of an unskillful Rider, or of a weak and tireable Horfe. Add not Spurs but in great necellity, but guide and provoke him with voice and riding rod, for quick and good mettled Horfes are by the Spur made fierce; and gentle natured Beaits made fliughter as Afles, which by often beating leem to neglect and cepiphe stripes.

You muft also fhorten and lengthen your journies and times of Ridings, fo as they may neither be certain to the Beait, nor yet over long; and specially after a long journey, take a fhort ar if you Ride upon the fame Horfe.

First of all let him be ufed to plain and equal ways, and if he be to leap or go up a hill, it was a precept of the old Grecians, that then the Rider muft lay the rains in his neck.
The History of Four-footed Beasts.

If the Horse at any time be either more fierce or sluggish then ordinary, he may be helped by these means. Wildenes and fierceness of Horses, is like to anger and rage in men; and therefore occasions of offence in word and deed must be avoided: therefore as soon as the Rider is upon his back, let him rest a little before he set forward, and then also let the Horse move but his own pace: for as men are offended with sudden violence and imperious gestures, so also are Horses: but if the Horse being spurred to his race, be more forward and hot then ordinary, he must be gently restrained by the bridle; and it is better to qualify their rage in long and spacious direct journeys, than in often windings and turnings.

But if any man be so simple as to think that by length of journey or race, his Horse will be more meek, because he may be tired, he deceiveth himself; for as rage in man inventeth hurtful revenge, and turneth into malice by continuance, so also in Horses it procureth a headlong ruine (if it be not prevented) both to Horse and Rider: and therefore if your Horse be of a generous spirit, never provoke him to ferocity, for as they are wilde and fierce, so are they wicked and harmful.

It is also better to use light and gentle bridles then heavy and sharp, except the Rider can by his art frame the sharp as the gentle bit: and also the Rider must so frame himself in his art of riding, that in the commotion of his Horse, he may not touch any member or part of him, but only his back whereupon he sitteth.

He must also learn his different terms, to incite and stir up his Horse to run forward, which the Greeks call Chlamys, or else to restrain him and keep him in, which they call Pappismus, the one cloeth the lips, and the other toucheth the palt.

If the Horse be fearful of any thing, you must shew the thing to him plainly, that so by custom he may learn not to be skittish, and let him smell thereunto, till he learn not to be afraid; but if men beat them, they do but fear them more; for while they are so ill handled, they suspect that the things whereof they are afraid are the cause of their stripes. In like sort when they go on the one side, or turn back again, it is good to use the Spurs, because they encreas their terrour and perseverance; and therefore as peaceable encouragement and friendly persuasion is the best means to perwade a man in his fear, the like course must be taken with a Horse, that so he may go straight on without doubt or trembling; and learn not to account any thing horrible to his nature.

When a Horse is so tyred and wearied in his journey that a man would judge him unfit for any labour, take off his saddle and burthen, and put him into some stabe or green field, where he may tumble and rowle over and over, and he shall easily recover. In ancient time, if Horses were to be travelled through snow, they made them boots of sackcloth to wear in their journey.

Of the disposition of Horses in general.

Among the flocks or heards of Horses, there is not a Captain or leader going before or governing the residue, as among Oxen, Sheep, and Elephants; because the nature of these is more inflable and moveable it being a swift and high spirited Beast, and therefore hath received a body furnished with such members as are apt to be bewayed by such spirit: for Laertes truly observeth in them a defire of glory, because after victory, the conquerors exult and rejoice, but the conquered or overcome, mourn and hang down their heads; which thing Virgil expresseth in this Verse:

Infultare solo, & gressus glomerare superbos.

But more plainly Ovid, the triumph of the conquering Horse; saying,

His generosus bonus & gloria major equorum;
Nam captivat animis palmam, gaudiente triumphus,
Sex septem flavis circa meruere coronam.
Numa widis victor quanta sublimius altum
Attollit caput, & vulgi se venditet aura,
Cellore cum cepo decoratur terga bove,
Quam tamidus, quantque venit spectabilis ait a
Compulque folum, generoso concita pulso,
Ungula sub ppolis graviter redeuntis optimis.

And Pliny affirmeth that when they are joyned together in Chariots, they understand their encouragements of glory and commendation: and therefore there is not any beast of so high a stomach as a Horse.
Of the natural disposition of Horses.

They love wet places and bathe, for which cause they are called Philolures, they also love musick, as hath been already declared, and the whole host of Army or the Sybarites, taught their Horses to dance at the sound of a Pipe: and Cæsar writeth hereof in this manner, So great (faith he) was the riot and wantonness of the Sybarites, that at their common feals they brought in Horses to dance before men; which thing being known by the Cretians, they offered them War, and agreed upon the sight: whereupon in the day of battle, the Cretians brought with them divers Pipers and Minstrels, who upon a sign given to them, founded their instruments, whereupon the Sybaritian Horses came running and dancing among their adversaries, and so betrayed themselves and their Riders to the enemy.

The like story is reported by Athenaeus, of the people called Cardini, for they also taught their Horses to dance upon their hinder legs, and to work many strange feats with their fore-feet, at the hearing of certain measures played upon Pipes.

The Bifaltians waged War against the Cardians, and they had to their Captain a certain man called Otaris, who when he was a Boy was told to Cardis, and there he served with a Barber: In the time of his service he oftentimes heard, that the Oracle had foretold, how the Cardians should be overcome by the Bifaltians, and therefore he to prevent the worst, ran away from his Master, and came home safe to Bifalis his own Countrey, and was by his Country-men created Captain of all their warlike forces: he understanding what tricks the Cardians taught their Horses in dancing, brought out of Cardis certain Pipes, and taught divers Bifaltians to found and play the measures upon them, which the Cardians taught their Horses: whereupon when as they joined battle with the Cardian Horses (for all the force of the Cardians lay in their Horses) he commanded his Piping Bifaltians to found their musick, which the Horses understood, who presently stood up upon their hinder legs, and would not fight any more, or go any further, so as they were overthrown by their adversaries.

They have also a singular pleasure in publick spectacles, and therefore have been observed to be provoked not only by pipes, but such instrumenall musick, but also by Songs or vocall harmony, by variety of colours, and by burning Torches. Dion also writeth that he saw a Horse taught to know and to do reverence to a King.

And Tacitus affirmeth that he saw a Horse at Paris at the triumphs, Tilt, and Turnament made for the marriage of Nero the twelfth to Maria, a Lady of Britain, which being commanded by his Rider to fallen as the Queen, presently did bend both his knees unto her, and then rofe again running away as fast as a bird could fly.

Homer feemeth also to affirm that there are in Horses divine qualities, understanding things to come, for being tied to their mangers they mourned for the death of Paterculus, and also foreshewed Achillus what should happen unto him: for which cause Pliny faith of them, that they lament their dead Masters with tears, and foreknow battles, Virgil writeth thus of the Horse of Pallas:

Post bellum equus, postis infignibus, Robat
It laebrymanis, guatique humat grandibus ara.

Accursius affirmeth, that Caesar three days before he died, found his ambling Nag weeping in the stable, which was a token of his ensuing death, which thing I should not believe, except Tranquillus in the life of Caesar, had of the same thing, and he addeth moreover, that the Horses which were consecrated to Mars, for palling over Rubicon, being let to run wild abroad without their Masters, because no man might meddle with the Horses of the Gods, were found to weep abundantly, and to abstain from all eat. Whereof there could be no cause given, but the love of their former Masters. It is also reported of Rodatus, a Captain to Charles the great, who after the death of the Emperor was made a Monk, his Horse would never suffer any to come on his back except his Master, who likewise had abstained from riding many years: But it happeneth that certain Pagans brake in upon the said Monastery, whereupon poor Rodatus went unto his Horse, who after many days did not stir, willingly took up his aged Master upon his back, and so carried him until he triumphed over his adversaries; and no marvel, for Dogs and Horses are most loving to men, if they be brought up carefully, and liberally, they recompence the good turns with their benefactors. It is observed in the nature of Horses, that they seldom hurt a man or child, except in their madness, yet are there malicious Horses as well as men. It is reported by Pliny and Tertull, that when a foal hath lost his dam, the refuse of the Mares which give suck, bring it up, and that they are seldom found at variance, except the barren Mares pull away the foals from the natural dams. For there is no creature so loving to their young ones, as are Mares, neither any so dearful of young: for which cause, when they are barren themselves, they labour to steal them away from others.

They which were wont to races, would perform it upon Mares newly delivered of foals they tied up the foals at home, and led the Mares to the beginning of the race, making the end thereof at the foals fable: and so putting the Beall forward, the runneth homewards more speedily for the remembrance of her foal.
The History of Four-footed Beasts.

Of the fear of Horses, and their enemies in nature.

Horses are afraid of Elephants in battle, and likewise of a Camel; for which cause when Cyrus fought against Croesus, he overthrew his Horse by the sight of Camels, for a Horse cannot abide to look upon a Camel. If a Horse tread in the foot-path of a Wolfe, he presently falleth to be astonished: Likewise if two or more drawing a Chariot, come into the place where a Wolf hath trod, they fland fo still as if the Chariot and they were frozen to the earth, faith Eathanus and Pliny. Eathanus also affirmeth the same thing of a Horse treading in a Bears foot-steps, and aligneth the reaon to be in some secret, betwixt the feet of both Beasts.

We have shewed already, that if a Mare strike a Wolf, or tread in the foot-steps thereof, she presently calleth her Foal; and therefore the Egyptians, when they signifie a Woman suffering abortion, paint a Mare kicking a Wolf. The Dextanian Horses being not Gelded, dare fight with Lions, but being gelded, like all other Horses, they are so afraid of Lions, that no Itripes, or Ipuris, is able to bring them in their presence, the Carthagian Horses excepted.

All kind of Swine are enemies to Horses; the Elbridge also is so feared of a Horse, that he the Horse dares not appear in his presence. The like difference also is betwixt a Horse and a Bear. There is a Bird which is called Aenurus, which neyeth like a Horse, flying about, the Horse doth many times drive it away, but because it is somewhat blind, and cannot see perfectly, therefore the Horse doth oftentimes catch it, and devour it, hating his own voice in a creature so unlike himself.

It is reported by Aristotle, that the Buffard loveth a Horse exceedingly, for seeing other Beasts feeding in the Patures, delpeth and abhorreth them, but as soon as ever it seeth a Horse, it flyeth unto him for joy, although the Horse run away from it; and therefore the Egyptians, when they see a weak man driving away a stronger, they picture a Buffard flying to a Horse. Horses are also taught to leap, if a Man take him by the rains, and go over the ditch before him, holding him fast, and pulling him to him. But if he be unwilling, then let another come behind him and strike him with a whip, or with a rod, so will he leap over without delay; and thus when you have used him to leap empty, likewise accustom him loaded. First over smaller, and then over greater heights. But at the beginning let him leap in soft ground, and being well practised in harder; and when he beginneth to leap, let the Rider put Ipuris unto him, for so will he perform his leap with more safety to himself and the Rider; and by custom he may leap and run as well down the hill as up hill; and therefore the Persians, and Neditians use and accustom their Horses to run both down hill, and up hill.

These Epithets following, do serve and express the nature of Horses; full of stomach, generous, magnanimous, strong, ardent, sharp, covetous, fierce, bolde, threatening, terrible, foaming; such were the Horses of Acetanias, Argos, Mycena, Asia, Elba, Epid, Spain, Thesalae, Farulias, of which Country was Bucephalus, the Horse of Alexander. Bulbula, a Province addicted to Mahomet, hath many of these excellent, great and swift Horses, whose hoofs are so hard, that they need no iron shoes, although they travel over rocks and mountains.

The Arabians also have such Horses, and in the Kingdom of Senega, they have no breed of Horses at all, by reason of the heat of their Country, which doth not only burn up all pasture, but also cause Horses to fall into the Strangey; for which cause they do buy Horses very dear, using in stead of Hay, the flakeles of Pease dried and cut asunder, and Millet feed in head of Oats, wherewithal they grow exceeding fat; and the love of that people is so great to Horses, that they give for a Horse furnished nine bond-blaves, or if it please them well, fourteen; but when they have bought their Horses, they fend for Witches, and observe therein this ceremony.

They make a burning fire with s扶les, putting therein certain fuming herbs, afterwards they take the Horse by the bridle, and let him over the smoaking fire, asointing him with a very thin ointment, muttering secretly certain charms, and afterwards hanging other charms about their Neck in a red skin, thus them up close for fifteen days together: then did they bring them forth, affirming that by this means they are made more valiant and courageous in war.

The love and knowledge of Horses to men.

And to this discourse of Horses belongeth their nature, either of loving or killing men. Of the nature of Alexander, Horses before spoked of, called Bucephalus, is sufficiently said, except this may be added, that so long as he was naked and without furniture, he would suffer any man to come on his back; but afterwards being faided and furnished, he could endure none but Alexander his Master: For if any other had offered to come near him, for to ride him, he shrit of all terrified him with his neighing voice, and afterwards trod him under foot if he ran not away. When Alexander was in the Indian Wars, and riding upon this Horse in a certain battle, performed many valiant acts, and through his own improvidence, fell into an ambulf of his foes, from which he had never been delivered alive, but for the puiffancy of his Horse, who seeing his Master betimes with so many enemies, received the Darts into his own body; and so with violence pressed through the midst
Of the Horse.

midst of his enemies, having loft much bloud, and received many wounds, ready to die for pain, not once stayed his courtle till he brought his Matter the King, safe out of the battle, and let him on the ground; which being performed, in the same place he gave up the glowt and dyed, (as it were comforting himself with this service) that by his own death he had saved the life of such a King; for which cause, after Alexander had gotten victory, in the very place where his Horse even, he build a Curie and called it Circumambulation.

It is also reported that when Lucius the Emperor would have had his Horses to tear in the Daughter, because she was a Christian, he himself was by one of them bitten to death. Noctis the Son of Themistocles perished by the biting of a Horse; neither herein only is the nature of Horses terrible, because also they have been taught to tear men in pieces: for it is said that Etrusco and Dionysios did feed their Horses with mans flesh, and therefore Herodotus took the like revenge of Diomede; for he gave him to his Horses to be eaten: so Diomedes were these Horses made.

U quà terríllae prœstámen hajentíllis herbis, Impias humánu vijecore pæceth quaesit.

The like also is reported of Glaucus (the Son of Syphius) who fed Horses with mans flesh at, Pompus a City of Eretria, and afterward when he could make no more provision for them, they devoured their Matter: whereof Virgil writeth thus:

Et mentem Venus ipi dedit, quo tempore Glaucus
Petrítur idús membra abjumphere quadráge.

But this is thought a fiction, to express them which by feeding and keeping of Horses, consume their wealth and substance. And thus much for the natural inclination of Horses.

Of several kinds of Horses.

Here be several kinds of Horses which require a particular treatise by themselves, and first of all the Martial or great warlike Horse, which for profit the Poet coupled with Sheep:

Lulphæa prædus & equum bellica proles.

The parts of this Horse are already described in the Stallion, the residue may be supplied out of Xenophon and Oppianus. He must be of a singular courage and docility, without name, fear, or other such infirmity.

He must be able to run up and down the steepest hills, to leap, and bite, and fight in battle, but with the direction of his Rider: for by these is both the strength of his body and minde disovered; and above all, such a one as will never refuse to labour, though the day bespent: wherefore the Rider must first look to the institution and first instruction of his Horse, for knowledge in martial affairs is not natural in Men or Horses, and therefore except information and practice adorns nature, it cannot be, but either by fear or heady stubbornnes, they will overthrow themselves and their Riders. First of all they must not be Gelidings, because they are fearful, but they must be such as will rejoice and gather stomach at the noise of Mutick, or Trumpets; and at the ringing of Armour: they must not be afraid of other Horses, and refuse to combat, but be able to leap high and far, and run into the battle, fighting, (as is said) with heels and mouth.

The principal things which he must learn are these: first to have a lofty and flexible neck, and also to be free, not needing the spur; for if he be sluggish and need occasion to and fro by the hand of the Rider, or else if he be full of stomach and fullen, so as he will do nothing but by flattery and fair speech, he must trouble the minde of the Rider: but if he run into the battle with the same outward aspect of body, as he doth unto a flock or company of Mares, with loud voice, high neck, willing mind, and great force, so shall he be both terrible to look upon, and valiantly prudent in his combate. Wherefore the Rider must so carry his horse, as the rains may draw in the Horses neck, and not to easily, as in a common travelling Gelidings, but rather sharply to his girths, a little, by which he will be taught as it were by ligines and tokens to fight, stand still, or run away.

The manner of his institution may be this; after the dressing and furnishing of your Horse as aforesaid, and likewise the backing, first of all move, fir or walk your Horse gently, until he be well acquainted with the charge of your hand and whole body, and afterward accustom him to greater and speedier pace or exercise, use him also to run longer races, and also by drawing in your hand to lay or stop suddenly; for there are Horses so instructed, that they can stay themselves in their speediest course upon an instant, without any circumspection, flying off the violence of their course, like an ordinary trottling Nag, by mounting up a little with their forefeet.

And always it is to be remembered that after the mounting on horse-back, you must first of all begin on the left hand, bending your hand that way, and also to the right hand when you would have your Horse to run on that side. And above all other things Horses are delighted with crooked;
Men have perished by rattles in riding.

The honour of Horsemanship.

The Athenian Orders.

Aristophanes.

Calici.

Suidas.

Of Horfe-men, and the orders of Chivalry and Knighthood.

The principal Horfe-men of the world celebrated in stories, for training, ruling, and guiding their Horfes according to the art of War, may for the dignity of Knighthood (wherewith they are honoured) and from whom that Equeftrial order is derived, be recited in this place. It is manifest by Sipontinus, that the Roman Equeftrial order, was in the middle between the Senators and the common people, for on the first there was no difference betwixt Equites and Judices, for both of them had for a badge, cognizance, or note of their honour, power to wear a ring of gold, and in the Consulship of Marcus Cicero the title was turned to Equeftrial, or name of a Knight, or man at Arms, by that means reconciling himself to the Senate, and affirming that he was derived from that order, and from that time came the Equesfer ordo being, as is said before, the people, and recorded after the people, because of the latter creation thereof: yet had they not their beginning at this time, but only now they first came into the orders of the Common-wealth; for they were called Celeres under Romanus, of one Celer who at the command of Romanus flew Remus; and he was made the chief Judge of three hundred. They were afterward called Feaxisemete, either because they swayed the minds of them whom they judged, or else which is more probable because of martalling and instructing their Horfes for war: afterward because they took a great company of horse-men, without all aid of footmen, at the City Trosfylam in Illyria, they were called Trosyllam, and Trofylli, and yet some ignorant persons honoured with the title of Trofylli in remembrance of that victory, were esteemed thereof as unworthy their dignities.

They were forbidden to wear purple like as were the Senators, and their golden Ring was a badge both of Peace and War. The Master of the Horfe among the Romans, called by the Greeks, Hipparchos, and by the Latins, Magnus Equitas, was a degree of honour next to the Dilurator, and Marcus the Dilurator made the first Master of horse-men, who was called Spartus, and set him in place next to himself. Tho Equeftrial men or Knights of State were wont to be at the feast, and it was ordained that no man should be called into that order, except both he, his Father, and Grandfather were free men, and were worth in value twenty thousand pounds: Turon and Tiberius made this law, but afterward it grew remisse and not observed; whereby both Bondmen and Scribes were rewarded with this dignity from the Emperour, for Orations and pleasing speeches: yet were the Decurial Judges chosen out of this rank; for indeed by primary institution, they were the flower and民营企业 of the Roman Gentry. Pliny complained that this dignity which was wont to be a reward for Military men, who had adventured their lives for the honour of their Country, was now belowed corruptly, and for money upon mean bribing perons. It should seem they had every one a Horfe of honour given to him for his note, for if one of them had grown fat and unweddy, not able to manage and govern this Horfe, it was taken from him. And Cato took away the Horfe from Speto Afafticus, because he had intercepted money; and from hence came the terms of their allowance, as Equiure et, that for money which was paid for a Horfe to one Knight, and Pararium et, for a double fee to an Equeftrial man.

Among the Athenians, the highest order was of them which were called Pentacofomedymi, which had plowed so much land as had sowed an 1200 bushels of Corn; and the next degree were their Equites, Knights, or Horfe-men, because for the defence of their City, they were able every one to nourish a Horfe of war. There were of these in ancient time but 600, and afterward they were increased unto 1200, and the sacrifices which were made for their poms and triumphs, were called Hippades: and they had liberty to nourish their long hair which was forbidden to other men, and their tax to the sacrifice was at the least half a talent (which is at the least 500 Crowns) and this sacrifice was made for the health of their Horfes. There were two Masters created over these, to wage and order war, and ten inferior Governors or Wardens to look to the provision and nourishing of Horfes.

Among the Lacedemonians they had four Governments; the Monarchy for the Kings, the Aristocracy for the Old-men, the Oligarchy for their Ephors or Commissioniers, the Democracy for their Young-men, which governed, managed, and instructed Horfes. Nefor that ancient Knight was commended for his skill, and had therefore given him the title of Hippotes.

Among the Catillians there was not a rich man but they took him into this Order, and the Civilians likewise did ever highly account hereof, and made it their highest degree of honour, for even the Romans did sometime govern whole Provinces with no other then these; and Egypt had this in peculiar, that no other Order, no not a Senator might be President or Govern among them. The Addams had this degree in high esteem, like as the Germans their Batavis or States. The Citizens of Capua were and are disguised with a perpetuity of this honour, because in the Latin war, they did not revolt from the Romans; and among all other, the Gadditan were most honoured herewith,
but thus came the Teleiota, and were the admiration. There were several places wherein these games of Horaces and Chariots were wont to be observed and kept, and they were called after these places, Olympia, Pythia, Nemesis, and Il ADHDU and of all these the Olympiads were the chief, whereof all stories are full, for they were celebrated in Olympia every fifth year inclusively, that is, after the end of every fourth year.

There was one Amicitia a Cyprian most skilful in this practice, and according to the vain humors of men, was not a little proud hereof, and for his love to Plato would needs in the Academy him and his Scholars his skill, and therefore joining his Horaces and Chariot together, made many courses with such an even and delineate proportion, that his Horaces and wheels never wandered a hair breadth from the circle or place limited, but alway kept the same road and footsteps, whereat every one marvelled: but Plato reproved the double diligence and vain practice of the man, saying to him in this manner, It cannot be, that a man which hath travelled and laboured so much in an art or skill of no worth or use in the Common-wealth, that ever he can addict his mind to grave, serious and profitable businesse, for while he applyeth all his parts and powers of body and soul to this, he is the lefleable and more unapt to those things which are alone more worthy of admiration.

The ancient custom was, to use other mens Horaces in this comitate, and therefore in the funeral of Tactoclus, Homer bringeth in Minelau, using the Horse of Agamemnon. There were four several places wherein these games of Horaces and Chariots were wont to be observed and kept, and they were called after these places, Olympia, Pythia, Nemesis, and Il ADHDU and of all these the Olympiads were the chief, whereof all stories are full, for they were celebrated in Olympia every fifth year inclusively, that is, after the end of every fourth year.

The writers of Chronicles do agree that the games of Olympia were first instituted by Hercules in the 2752. year of the world, beginning the world from Noahs flood, and they begin to record and number the first Olympiad to be about the 3185. year of the world, about seventeen years before the building of Rome.

There were of these Olympiads 328. and the list of these by computation or account fell about the year of our Lord 534. after the birth of Jesus Christ the blessed Saviour of the world.

The perfection of these games began the twenty five Olympiads, at what time Pausanas the Theban was pronounced victor: for then were swift Horaces brought into the games, and were called Teleiotes, that is, perfect in agility and growth; and these are called by Pindarus, Manampycia; afterward came in Synesius with two Horaces, and in succeffion both Coles, Maries, and Mules: their courses are thus expressed by Virgil:

---

End animos avumque notabiles,  
Et quia cuncte alior vidiss, qua gloriam palme,  
Nome videris cum praelippit cernatne campo  
Curriperes, ruatque seffis carercur cursor.  
Cum pors arceo incernum, excutiantique baurit  
Corde pavor pulsant, illi infamet utero toto,  
Et proni dext lora: volat vi servidus axis.  
Jamque humiles, jamque elati subline videmus  
Aera per vacuam ferri atque affurgere in auras,  
Nec more, nec requiris; at fulote tumulti arcanum  
Talitum: bumeuari spumis, fintaque sequentem:  
Tantus amor laudum, fante est victoria cune.  
Sin ad bella maie studium turmacque feroces,  
Aut Alphaburus praelabi flumina Pise,  
Et Jove in loco currum aghare volantes:  
Primus equi labor est, animos arque arma videre  
Bullamund, lusosque pati, trahend; gementem  
Ferre rotam, & sintulo freno audire sonantes.
And Horace expresseth it in this manner:

Sunt quos curricula yvteram Olympicum
Civilisque juncto metuque servos
Evinita, rarum, paene nobilis
Terram dominus vobis ad deos.

Women were wont to be excluded from these games, until Cornelia, the daughter of Achaeanus King of the Spartans, first of all other women nourished and trained Horaces for those curule and Chariot games, and when she brought her Horaces to Olympus, she obtained the prize; therefore her Horaces were consecrated to Jupiter Olympus; and their figures remained in Braies in his temple.

It is also said that Ecbartacus a Thessalian overcame in the Olympian games with a Mare great with foal: And it is also reported that Miltiades, the son of Cimon Stesagoras (one of the ten Captains of Athens) ran away from Pisistratus the Tyrant, and in the time of his absence, he was twice victor at Olympus by four Mares, the first time he bestowed the glory upon his countryman German Miltiades, his mothers brothers, and the second time he took it to himself, for which cause he was slain by the sons of Pisistratus; his Mares were also buried over against him, with an inscription, that they had won four games in Olympus, so that it appeared, he ran divers times and never missed victory. As Athens they observed these courses with Horaces in honour of Theseus, and called the place of the running, Hippodromus.

The Latines call it Stadium, and Curriculum, and it was appointed in some plain valley, according to the proverb, Equus in planis, in the midst whereof was a building called Circus, wherein the beholders stood to look upon the paltime, and there were also places to contain the Horaces and Chariots, till they were turned out to run, (called Carreter) according to the verses of Silius:

Sic ubi prostrat pie se de carrere praceps
Ante suis it vidit Equus.

And Horace also,

Ut cum carrebus missus raips angula currit,
Infatis equis antiqua saus vincitibus illum
Praetituum tumultus extremos inter eumem.

And hereof came the proverb (A. carerebus ad talum) signifying from beginning of the race to the latter end. Eriuchonius invented a Chariot called Heracles, and was the first that ever ran in Olympus with four Horse in the same; of whom Virgil speaketh thus:

Prima Eriuchonius currit & quatuor equos
Jungere Equo rapidissimo insinisse vidit.

And from hence came the term Quadriga, for a Chariot with four Horaces. There was a Chariot in Athens drawn by one Horse, and the games thereof were called Polemperia. Likewise at Rome in the Confal-feals celebrated for the honour of Neptune, they ran with Horaces both joyed and single.

There were likewise games at Rome, called Equitata, and Equitaria, celebrated every year, the twelfth of the Calends of May, wherein after the Horaces they coursed Foxes tied to pieces of wood set on fire; this is called in Latine allo Turnamentum; and in Italian by Scopa, Hagiopera; and in French Formierem. There is also a play with Horaces for children cal'd Troo, first invented by Aenetus, when he besieged Alba, and by him brought and taught to the Romans, of which which Virgil speaketh, saying:

Incedunt pieuri, pariterque ante ora parentum
Frenatis locum in equis.
Cornea bina ferunt prefixa haetilla ferre:
Pars levis humero pharetras.
Tris equitum numero turmes, tertique sagittar
Dulciter; pieuri bisfenti quemque pecte.
——— Signum clarame paratis
Abytides longe dedit, infinitumque flagella.
Oili disferrre partes, aequo egmina vent
Dulcita solere obrit, sursumque vocati
Converte vias, iniustaque tela turtere.
Inde alio incursus curas, atque arcus transus
Adversit spatiius, alteriusque orbibus sider
Impediment, pugnque cedit simulacrum sub armis
Et tunc vaga fuga vadunt, nunc seclorum vertunt
Infensit; falla partiter nunc pace ferantur.
Hinc maxem curas, atque haec oportunam primus
Aequas, longam munis cum tingeat Albam.
of the greatest Horfe-masters and nourishers of Horses.

It is reported of King Solomon, that he had forty thousand stable of Horses for Chariots, and twelve thousand for war. The Libyans when they went to war, did fight out of their Chariots, and therefore they were said to fight upon two Horses. The Centaurs were the first that ever taught men to fight on Horse-back, and the Roman Turma confifted of two and thirty Horse-men, the Captain whereof was called Bersenio. The people of Nomads called Sargatti, bought eight thousand Horse-men at one time into the field, which neither used armour, nor bridles, nor iron, except only their dangers, and a rope of leather thongs, wherewithall they entered the battall, and joyning with their enemy, they made certain trials, or loops thereupon, which they call upon the necks of Horses and men, and so with multitudes drew them unto them, in which draught they strangled them.

The Indians use the very self same Armour on Horse-back that they do on foot, but yet they lead empty Horses and Chariots to leap up and down upon, and to refresh their fighting Horses; and the number of their Horse-men were at one time fourscore thousand.

When Pharaohs the Artaxerxes, was riding on Horse-back, there was a Dog ran betwixt his Horses legs, wherewithall the Horse being amazed, suddenly leaped upright, and cast off his Rider, who being bruised with the fall, fell into a Consumption: whereupon the Servants sent the commandment of their Master, brought the said Horse into the place where he cast his Rider, and there cut off his legs about the knees. There was also a fashion for Horses to fight in battalls without bridles: For Pharnaces the Romans, when the Romans overthrew the Celtiberians in Spain, caused them to pull off their bridles from their Horses, that so they might run with all violence, without restraint of Riders upon their enemies; whereupon followed victory: for many times it fallet out that the Horse hath more courage then his Rider, wherefore a good Horse-mans must have skill to annoy his enemy, and defend himself; and likewise, to make his Horse to come off and on without fear or dread, according to necessity.

There is a proverb in Greek, (C. Millipon) that is, (Seocon equites) the Horsemens are afunder, whereof the Suidas giveth this reason: when Darius invaded the territory of the Athenians ranging and destroying at their pleasure, no man daring to abide his forces, at his departure, the Indians climbed up into trees, and signified unto the Athenians, that the Horse-men had broken rank and were a sunder. Whereupon Multides set upon the scattered company, and obtained a noble victory.

of fighting in War upon Horses.

The most cruel and fearful kind of fight, is the arming of Horses, which were called in ancient time Cataphracti, and Clibanarii, and Acutafarilii, and Perentatii, fighting first of all with spear, and afterwards with sword and shield, calling sometimes also darts at one another, and bearing bows to shoot arrows, their Horses making room for them, which way ever they went: for with sharp pipes and other crooked-keen-cutting-instruments, fastened to their Armour or Chariot-wheels, in the violence of their course, they wounded, killed, over-turned, or cut aunder whatsoever flesh came in their reach.

The ancient Horsemens of the Romans had no breast-plates, (as Polybius affirmeth) and therefore they were naked in their fore-parts, providing for the danger that was behind them, and defending their breast, by their own celerity: their shields were made of Oxe skins plighted and pasted together, being a little round in compass like the fashion of a mans belly.

There was also great use of swift Horses in War, for the Roman Souldiers carried with them two Horses a piece, being taught and exercised like Indians, when they had need to flee, to leap upon their empty Horse, for their sparing of the other: and they were therefore called Amphippis, being apt to carry their Mailers out of danger, and from hence (Aelianus saith) the Roman took the pattern of their Phalans, (called Aciformium) with which they used to terrifie the Barbarians, setting their Horses in a double front, so as they appeared headed both ways: and this was also the custom of all the Germans, when the number of their Horse-men was not equal, they mingled the Foot-men, with their Light-horses, who being experienced to run suddenly with the Horse-men, leaped into the battall, and surprized the enemies flying away: and the same fashion did the Spaniards also use (Strabo saith) for the terrifying of their enemies, making the Foot-men to fall into the battall among the Horse-men.

Those which did shoot Darts on Horse-back, were called Hipponotes, and therefore Aristoboleus in his discours of Birds, calleth Hawks by that name, for the resemblance between them and Horses, bearing these Riders. The Hawks are so called in swiftness of their course; and because the talons of the Hawk are crooked like bows, Aristoboleus writeth that the Horse-men of Alexander carried fpear in their hands fourteen cubits long, whereunto I cannot confent; for eight cubits is a common size, as much as any Souldier on Horse-back is able to use.
In battail there are wings of Horfe-men, which are so called, becaufe like wings they cover and protect the Army. And there were also Legionary Horfe-men, because they were joyned to the Legions of Souldiers, and the company of Elephants, Foot-men, and Horfe-men which were wont to go before the King, were called Agema. A company of Horfes fet like a Tower in a Quadrangular form in a field, was called Perug. The Armour of Horfes on his front or fore-part, is called Prometopidia, upon the ears Paritia, upon the cheeks Paris, upon the breath Profermindia, upon the sides Parapleurdia, upon the loins Parameridia, and the time of arm- 
ing a Horfe is known of every Souldier.

Of Riding.

The Medes, Persians, and Armenians, were the first that invented the art of riding and shooting, (as Strabo faith) Pauflanius calleth Neptune Hippens for no other caufe, but that it was fuppoltd he was the first invented the art of riding. Polyboris aſcribeth it to Bellerophon. Lyfias the Orator faith, that the Amazons' women were the first of all mortal creatures that first advertis'd to back Horfes. Others aſcribe it to the Centaurs: But to leave the Invention, and come to the Art. Da- mie in the life of Apollinius, fetteth down the sum of the Art of riding, which briefly is this: To fit right upon his Horfe, to rule him valiantly, to turn him with the bridle which way foever he pleifteth, to beat him when he is flubborn, to avoid Ditches, Gulfs, and Whirlpools when he rideth through waters; going up a hill, to lengthen the rains, and to refrain and draw them in going down the hill; now and then to ftrike his hair, and not always to ufe stripes. 

Martial hath an excellent Epigram upon one Prifius a rath-headed-hunter, who neither feared Hedges, Hils, Dales, Ditches, Rocks, Rivers, nor other perils; uing a bridle to his Horfe, but none to his aſfections; and therefore he teller him, that he may sooner break a Hunters neck, then take away a Hares life: for there are deceits in the Rocks, Hils, and plain Fields, to shake the Rider from Horfe-back to the earth. Thus followeth the Epigram;

Percius utaris nones rapiente vere,
Prifos, nec in lepores tam violentus eair.
Sepe fatia fecit praece venator, & acri
Deedit excussus nec rediturus equo.
Insidias & campus habet: nec fissa, nee agger,
Nec sit saxa lectus, fallere plana plana.
Non dearent qui tantâ tibi spectacula praefent;
Insidens sait fed leviter cadunt.
Si te delegat animosa pericula, Thufcis
(Titur et virtus) influemus apiis.
Quid te frena juvant temeraria? Septius illis
Fretus damnum eii equitum rumpe, quam leporem.

The best place for riding, is a barren and plain Country. It is reported of Claudius, that when he had road a great way in the Country upon his enemies, and met no body, he returned back again into his own Camp, and blamed the slownehefs of his enemies, because no one of them was left abroad.

It is reported by Arifftole, that the further a man rideth, the more apt he shall be to weep; and the reafon is, because of all the motions of the body, riding is the wholemoft, both for the stomacch and for the hips: for a man must not fit on Horfe-back, as if he were carried in a Coach; but rather keep his back-bone upright, not only to be moved by his Horfe that beareth him, but also by himself; and there he must fit close to the Horfes hips, extending his legs to the uttermoft, uing not only his eyes to look before him, but alfo lifting up his neck to help his fight: fo for the fole pace of the Horfe doth corroborate the spirit above all other exercises; likewise, the body and stomacch: alfo it purgeth the feuces, and make them sharp: yet sometimes by the violent courfe of a Horfe, the break of a Man, or some other part about the reins receive damage, (as fome have ob- 
 served:) yet is it not fo much to be aſcrib'd to the motion of riding, as to the uneafie pace, or rather to the uneafie feat of the Rider.

The Sythians above all other Nations have the looffeft and broadeft bodies: and the reafon is, be- cause they wrap not their children in swaddling cloaths as other people, and likewise becaufe they have no regard unto their fitting upon Horfe-back; and laftly, for their continual ftoath and eafe: for the men ufe much to ride in Chariots, and Litters, before they get on Horfe-back; but after they are accustomed thereunto, they ride fo much, that their hips and bones fall full of ach, and they are alfo thereby made unfit for generation, becaufe in a journey of an hundred miles, they never light to ease themselves and their Beasts.

These men hereafter named, were excellent Riders and tamers of Horfes. Automedon, fervant of Achilles; Iearus, fervant to Paramius; Mesipus, fervant to to Tharmus; Myrthus, fervant to Oenomus; Cebere, fervant to Darus; Atenarcrus, fervant to Cyrenius; Pius to Mesipus; and Laufus Silus remembrith Cyntas, Durius, Atius, and Burus.
The Instruments of Riding appertaining to a Horse.

A good Rider must consider the hardnecs or softnecs of his Horse's mouth, that so he may temper his bit; for a flincke-necked Horse, is not so much to be guided by rod and Spur, as by bit, and bridle: wherefore it must sometime be hard, and sometimes gentle. The hard bits are called Lupati, because they are unequal, and indented to a Wolves teeth, whereunto the Horse being accustomed, growth more tractable and obedient to a gentle bit. According to the saying of Ovid:

Tempore partis equus lentes animo fucubaet,
Et placido duros arcifit ore lupus.

And Virgil again speaketh to like effect:

Presa fronsque a gabano,
Verbera lenta patris, & duris parere lupatis
After equus, duris contumuli ora lupatis.

And Silius faith:

Quadrupedem stecci non sedens virga lupatis.

There is also another instrument made of Iron or Wood (called Psalmonis) and English, Barntacles; which is to be put upon the Horse's nose, to restrain his tenacious fury from biting and kicking, especially at such time, as he is to be fed or dressed. The Indians were wont to use no bridles, like the Germans and Celts, but only put upon their Horse's mouth a piece of a raw Ox skin, fattened round about, containing in it certain iron pricks flanting to the Horifes lips, putting a long round trench through his mouth, to the edge whereof they falten the rains, wherewithall they guide the beast. The Turkihs Horises, and Spaniards' Jennets have bits, with open circles in the middle, confulting of Leather, or Iron, to restrain the Horse's fury. The rains are called Habena, because they make the Horises, Habiles, that is, tractable, and rulable, to be turned, restrained, or put forward, at our pleasure, according to the saying of Silius:

Ferrato calce, atque effusa largus habena,
Confidens impellat equum.

And Virgil:

Ispe ter adducta circum caput etit habena.

Neither is there any Horfe swift, or slow, noble, or un noble, that can be guided without these, which must be held continually in the hand of the Rider, they must not be unequal, one longer then another, neither thick, neither weak, nor briddle.

There was a certain golden chain (called Ampix) wherewithal the fore-tops of Horises were wont to be bound or tied up, and therefore Homer calleth the Horse of Mars, Clysompe; and from hence that custom of women frontlets, to be adorned with gold and precious Horices. There are also other ornaments of Horises called trappings; and in Latin, Pabula, derived from Phulon in Greek, signifying bright, because they were wont to put a great deal of gold and silver upon them, (as Livius faith) which Horises so trapped, were presents for great Princes: And there is a kind of Abyssus fonne, wherewithal the Indians do adorn their Horise-trappings: and it was apparent in Honor's time, that they used little Belts, or founding pieces of Bras to be fattened to their Horises bridles and trappings; they hanged likewise Jewels and Pearls to the breadth of their Horises, which Virgil expresseth in this manner:

Infratur asio alipede, pellisque tapetis
Aurea pelloribus, demissa monilia pendent.
T. Ilii aure, fulsum mandant sub demibus aurum.

A good Horfe-man must alfo have a paring knife, wherewithal to purge and open his Horises feet: this is called by Rofius, Roffinata, and by others Scutrum. There is a kind of Mangle for the poftern of Horises, (called Numella.) Moreover a good Rider must provide him flirrops, (called Subflaves and Stephe) which although it be but a new devife, yet are they fo necessary for every Rider, as without them they cannot long continue. They must not be made too straight for the foot, because that then they do not only hinder motion in that part, and so make it bemumened and cold, but also give occasion of great hurt to the Rider in case the Horfe fall; except he can so temper himself to put but a very little part of his foot therein.

There are also Spirs requisite to a Rider (called Calcaria) because they are fastened to the heel of a man, wherewithal he pricketh his dull Horfe when he would have him haften the journey, and the Greeks derive it from Mops, signifying a prickint fly, from imimation of which it may seem they took this invention: but this must be remembred, that they are prepared for the dull and slung-
gish Horfe, and not for the free and full of life; for such a Horfe being pricked therewith, runneth forth rather with rage and disdain; then for love of the journey, and many times the torment thereof of maketh him by kicking out his heels to call off his Rider.

Lastly, he must have regard to his Saddle, whereon he must sit; for the Barbarians did use to ride upon bare Horfes backs; but since that time, the wiser sort of Horfe-men have invented a fet for their own security. *Martialis* writeth hereof thus:

Stragula fuscithi venator, fome veredis.
Nam solat a nudo furgere ficut equo.

of Hunting Horfes.

Hunting Horfes because of their swiftnefs, were wont to be called V eredis; according to the saying: *Sum & veredus, cura pennisce*: Although they ufe this kinde alfo for pofts, and performance of speedy journeys. The males are much better then the females, and therefore they feldom ufe Mares in hunting, becaufc they are not fo well able to leap, or endure the Woods, for which caufe Gratius writeth in this manner of them;

Reflat equos finire notis, quis arma Dianae
Admittant: non omne mea genus audet in aren.
Ft sitium ex animo: sunt quos imbellis fallant
Corpora: praevertent quaedam aest incumma virtus.

Optimus in his discourse of hunting Horfes, (as we have said already) adviseth to make choice of them by the colour, unto whom Gratius confenteth, faying:

*Venator meius pugnatur color, optimae nigri.*

They that are of bleeuifh colour, having variable specks of legs (he faith) are fitteth to hunt Harts; they that are of a bright gray, to hunt Bears, and Leopards; *they that are bay, or of a reddifh colour, to hunt the Soars: they that are black, having glazed eyes, are good againft Lyons: and thus much for the hunting Horfes.

Of Courfers, or Swift light-running Horfes.

After the ufe of Wagons, and Chariots, which men had invented for their eafe in travel, and growing to be weary thereof, by reafon of many difcommodities, they came alfo to the ufe of fingle Horfes, which therefore they called Courfers, and now a days a Horfe for Saddle, whereupon men perform their journeys; and the Poets fay, the inventor hereof was Bellerophon the fon of Neptun, to whom his father gave Pegafus the flying Horfe, which therefore they describe with wings, and place for a fcar in Heaven like an Angel, becaufe of his incredible celerity; others attribute it to the invention of Sefibris, otherwife called Seleucobofis, a King of Egypt; some to Oroes, when he waged war againft his brother Typhon. For these Horfes, are no les profitable in war, then in peace; although none ufe them in these days, but common Souldiers; yet in antient time the greatest Nobles rode upon them. The Emperor Probus had one of these Horfes, which was nothing common, nor very high; yet would he endure ordinary journeys, to run a hundred mile a day, whereupon his Master was wont to fly merril; that he was better for a flying, then a lighting Souldier. The Horfes of Spain are of this kinde, which they call Jennets, of Genibaru their knees; becaufe when the Rider is on their backs, he muft hold his knees close to the Saddle and fides, for his better eafe. Like unto thefe are the Barbary Horfes, whom they geld, to keep them from the hardness of the Nerves, which happeneth unto them in their heat and travel. There are a kinde of Horfes called Lycaefcalis, and the reafon of this name is, as some fay; becaufe when they were Foals, they escaped the teeth of Wolves, being fet on by them; and therefore they run the more speedily to their dying day, for the wounds of Wolves make a Horfe light footed; but this is not likely, for fear cannot put that into which is not bred of nature; even as we fay, that Ulfcer by avoiding G ides cup, or Cyclops, was therefore made wife; but rather on the contrary; becaufe he was wife, therefore he did avoid Ceres cup; fo likewise we fay, that thefe Horfes are not lighter of foot, nor fuller of courage, becaufe they were fet upon by Wolves, and delivered by fear; but because nature hath framed them, nimble, valiant, and courageous; therefore they did avoid the Wolf.

*Adelus* alfo faith, that thefe Horfes had a wonderful knowledge, and sagacity, to difcern between Gratians and other Nations; for when a Gratian came unto them, they loved them, flood hill, and took meat at their hands; but if a Barbarian, or stranger came unto them, they disdained them by their nofe, as a Dog doth the foot-steps of a Beall, lifting up their voyce, they ran as fast away from them as they would from any raving Beall. These loved not only their famillars, but above all other things to be neat, fine, and cleanly in Chariots: For if at any time they came through water, drawing of a Chariot, they took a pride in cleaning themselves from all dust and filthines, cleaving to their legs or face. And that which is more strange, they were unwilling in race, to be
Of the Horse.

Hayed or taken out thereof, as appeared by this story, related by Feller. There is faith he in Rome a great gate called Katenuma, which took his name from the death of a young man, an Hebraian, who perished there in a race of Chariots, being conqueror, because his Horse would not fly until they came into the Capitol, and saw the framed earthen Chariots, which were placed in the porch of Jupiter Temple by the Romans, and were appointed to be fashioned in earth by the hand of a cunning Potter, the which being wrought in earth, and put into the furnace, they grew so great that they could not be taken out whole: at the sight of these, the Horse of Katenuma stood still, but first of all, their matter was lain in the course by falling off.

The Horses of Tartaries are so incredibly swift, that they will go twenty German miles in one day. There was a race of Horses at Venice (called Luporse) which were exceeding swift, and the common fame is, that they came upon this occasion. There was a certain merry fellow, which would become surety for every man, for which he was commonly jollet at in the whole City. It fortuned on a day, as he travelled abroad in the Woods, that he met with certain Hunters that had taken a Wolf, they seeing him, asked him merrily, if he would be surety for the Wolf, and make good all his damages that he had done to their flocks, and foals, who instantly confessed he would undertake for the Wolf, it they would let him at liberty; the Hunters took his word, and gave the Wolf his life, where-upon he departed without thanks to the Hunters.

Afterward in remembrance of this good turn, he brought to the house of his surety a great company of Mares without mark or brand, which he received, and branded them with the Image of a Wolf, and they were therefore called Luporse, from whom descended that gallant race of swift Horses among the Venetians: upon these ride the pofts, carrying the letters of Kings and Emperors to the appointed places, and these are said to refuse copulation with any other Horses that are not of their own kind and lineage.

The Perisan Horses are also exceeding swift, which indeed have given name unto all others. The messengers of the great King of Tartarius, have their poits so appointed at every five and twenty miles end, of these running light Horses, that they ride upon them, two or three hundred miles a day: And the Pegusarian couriers of France, by the like change of Horses, run from Lyons to Rome in five or six days.

The Epithets of a swift running courier are these, winged or wing-bearing, Lark-footed, breathing, speedy, light, flitted, covetable or race, flying, sweating, not dew, victorious, rash, violent, and Pegusaeum. Virgil also describeth a swift and fliglful Horfe most excellently in these verses; sending one of them to the King, and victory of running, without respect of Country or food, they are to be praised for enriching his matter, and the other for his dilies to the mill, the verses are these following.

---Nempe volucrum
Sti laudosum equum, facilis et plurima palma
Seros, et exultat raus victoris Circe.
Nobilis hic, quacumque vivit de gremine, suis
Clara fuga ate alios, & primus in squere pulvis,
Se venales pecus Coritiae, pectoris &

One of these swift light Horses is not to be admitted to race or course until he be past three year old, and then may he be safely brought to the ring, and put to the stretching of his legs in a composed or violent pace, as Virgil saith:

Caeperi mos gyrum incipiat gradibusque sonare
Compositis,奋etque altera volumina cum.

Plink affirmeth, that if the teeth of Wolves be tyed to these Horses, it will make them never to give over in race, and when the Sarmedians were to take long journeys, the day before they gave their Horses very little drink, and no meat at all, and so would they ride them an hundred and fifty miles out right.

The Arabians also in many regions use to ride upon Mares, upon whom they perform great journeys, and King Darius did also fight his battails upon Mares which had foals; for if at any time their affairs went to rack, and they in danger, the Mares in remembrance of their foals at home would carry them away more speedily then any other Horse: and thus much for the light or swift Horses.

Of the Gelding.

They have used to lib their Horses, and take away their flones, and such an one is called in Latins, Canonem, or Cantarem, which is drove of Catarem, because they were feared with hot irons, or else from the stronger bought or branches of Vines, so called, because they were pruned. In French, Chotal Ore, Cantier, Chureau, and Suppe doth interpret the Spanis, funette, to be a Gelding. It is said of Cato Centius, that he was carried and rode upon a Gelding; and of thee the Turkis Horses receive the greatest commendations.
Forasmuch as many Horfes by their feed and rites are made very fierce, turbulent, and unruly, by taking away of them, they are made serviceable and quiet, which before yeelded unto man very little profit: and this invention may feem first of all to be taken from them which fed divers together in one herd, being taught the intolerable rage of their ftoned Horfes towards their Colleagues and guides; for abating whereof they took from them their male parts.

Of the manner hereof you may read plentifully in Rufius, and he affirmeth that the Scythians and Sarmatians, who keep all their Horfes in herds, were the first divelers thereof: for these people ufing to rob and forrage, were many times by the neighing of their unruly Horfes discovered; for their property is to neigh not only at Mares, but also at every STRANGER that they fee or wiende, and for males they were fo head-ftrong, that they would divers times carry away the Rider perfcorfe, and against his will, to his own diftroyal, in the rage of their natural lust.

If they be gelded under their dams when they lack, it is reported by some, that from such their teeth never fall away; and before, in the heat of their course their nerves are not hardned, for which cause they are the bell of all to run withall.

They use to geld them in March, in the beginning of the Spring, afterward being well nourished, they are no lefs strong, able and courageous then other unliued; also there is a pretty proverb, Cau therius in Pfeus, a Gelding in a Ditch, which is then to be used; when a man undertaketh a business which he is not able to manage; for a Horfe can do much in a plain, but nothing at all in a Ditch. It is reported that Jubilius Tauraeus, and Cafflius, fought a combat on Horfe-back near the City Ca- pua, and when one had provok'd another a while in the plain fields, Tuerca defendeth into a hollow way, telling his tellow combatant, that except he came down unto him, it would be a fight of Horfes, and not of Horfe-men; whereunto Afellius yeelded, and came down unto the Ditch: at whom his adversary jelel, asking him, if he did not know, that a Gelding could do nothing in a ditch, from whence came the common proverb aforesaid.

There is also another proverb (Cau therius in Pfeus) A Gelding in the gate, to significie a man who after he had undertaken the performance of a great exploit, his heart faileth in the very entrance, for it is reported of one Sulpicius Galba, who riding out of the City, his Horfe tyred in the gate.

There is likewise another adage in Plautus, which is this; Crete lac mulier Camberino rim offrons familias. That is to say, this Woman sleeps flanding like a new dress'd Horfe, and is applied against them which in a kind of foolish jeuire flutt their eyes when they talk or work: and thus much for the Gelding.

Of Careering Horfes for Pomp or Triumph.

The nature of these Horfes is to lift up themselves and ride before, standing upon their hinder legs, which is not possible for any to do without a generous and gallant spirit, and also nimble and strong loins to bear up the hinder legs, for it is not as many suppose, that this power of rising before from the softness of his legs, but rather from his loins and hips betwixt his hinder legs, for when his mouth is a little check'd with the bridle he presently bendeth his hinder patterns and ankles, and so lifteth up his fore-parts, that his belly and yard do appear, and in doing hereof the Rider must not bear his hands hard; but giue him the bridie, that so he may do it willingly and with greater grace of the beholders.

There are some which teach Horfes to lift up themseles by knockinge their patterns with a rod, which the Horfe understandeth as well as he doth his race, when he is stroke on the back by the Rider. And in teaching of a Horfe this feat, it must be obserued, that he never have rest until he have learned it, and that at certain signs and tokens, he be taught of his own accord to perform divers and sundry gestures; but if after long riding and copious labour, he begin to understand his Master's pleasure, and ride twice or thrice together, then you may giue him the rains, nothing doubting but that he understandeth and will be obedient to the pleasure of the Rider. And in this kind he is accounted the belte careering Horfe, which will ride high and offnest together; neither is there any quality so commendable in a Horfe as this, or that to draweth and (as it were) to imprisoneth the eyes of old and young, and other beholders, for which cause Martial Horfes for service of War, are to be instructed herein; and thus much for this Horfe.

Of load or Pack-horses.

Where they keep Horfes in herds and flocks, they have some which are not fit for the faddle, nor for the wars, and therefore are to be employed for the carrying of burthen, or to the Cart; although (as Fefius fayth) Mules were first used for carrying and draught; but forasmuch as all Nations have not Mules, they are therefore inforced to use Horfes, and for this purpose the Geldings are much better then the ftoned Horfes; wherefore the Country-men of molt Nations take Horfes, for this purpose, after they be old, past breeding, or have some other blemish in wiende or limb, whereby they are disabled to travel under a man: for so great is the greedines of our age, that Horfes are not spared so long as they be able to live; according to the common proverb, (Afians equis, Molis ferie mule) Horfes, Mules, and Asfes, keep no Holy-days: where the Law of God concerning the Sabbath is not obserued; for the nourishing of Horfes doth counterbalance the charges.
Of the Horse.

In days of Gordianus there were brought to Rome forty wild horses, and in the map of Gordianus Wood, there were pictured three hundred. They are called in Latin, Equus ferus; and in Greek, Hippelaphus, they abound in Spain, and in the Alps, and in the Deserts of Ethiopia, there are many of them; which have two long venomous teeth standing out of their mouths: they differ also in their hoofs from other Horses, for they are cloven-footed like Harts, and they have a long mane growing all along their back to their tail: And if at any time the Inhabitants take them by gins and other snares, they fall so fallen, that they abtain from meat and drink, disdaining to be kept in any servitude or bondage; the Wild Horses of India have but one horn: In the Alps they are of an ash-colour, with a black lift down their backs. The wild Horses of Syria live in Rocks and herds together; and in every herd they have one Captain or Master over the residue, and if it fortune that any of the younger Horses leap upon a Mare, this Captain horse runneth after him, never giving over till he hath bit off his flones.

There are wild Horses in Syria and Asia which are like to other Horses in all parts, excepting their backs, which are so soft and weak, that they cannot endure to be sat upon, neither are they easily tamed, and the people of the Countrey eat their flesh: In Focasia there is a kind of wild Horse which hath horns like a Hart, and therefore I take it to be the same which is called Hippelaphus, whole picture is here described as it was taken here in England, by that learned Physician Doctor Cey.

The figure of Hippelaphus.
They

The History of Four-footed Beasts.

This beast was brought out of Norway, having a mixt form, betwixt a Hart and a Horfe, having a well compacted body, a long and lean leg, a cloven hoof, a short tail; and in all parts you would judge him to be a Hart, but in his head and ears you would judge him to be a Mule, and in his horns a Roe, the upper lip hanging over the neither almost as much as an Elk; his mane like a Horfes, but thinner and hanging more upright, without other alteration from their shoulder to their tail, they have a like brilling mane growing on the back-bone, as long as their other hair; a bunch under their chaps, upon that a bunch or fluffy hair, the hair about their shoulders is more longer then ordinary, but their necks fo short, that they can neither drink their drink, nor eat their meat upon the ground, except they bend down upon their knees. The males in this kind do only bear horns, and such as do not grow out of the Crowns of their head, but as it were out of the middle on either side, a little above the eyes, and so bend to the fides: They are sharp, and full of bunches like Harts, and where smooth but in the tops of the speers, and where the veins run to carry nutriment to their whole length, which is covered with a hairy skin: they are not so rough at the beginning, or at the first profiles, especially in the fore-part, as they are in the fecond, for that only is full of wrinkes: from the bottom to the middle they grow straight, but from thence they are a little recurved; they have only three speers or proffes, the two lower turn away, but the uppermoft growth upright to heaven; yet sometimes it falleth out (as the Keepers of the said Beaf confirmed) that either by sicknes, or elfe through want of food, the lef horn hath but two branches: In length they are one Roman foot and a half, and one finger and a half in breadth, at the root two Roman palms. The top of one of the horns is diftant from the top of the other three Roman feet and three fingers, and the lower fper of one horn is diftant from the lower of the other, two Roman feet measured from the roots: in fhuffance and colour they are like to Harts horns, they weighed together with the dry broken spongy bone of the fore-head, five pound, and half an ounce, (I mean fifteen ounces to the pound:) they fall off every year in the month of April, like to Harts, and they are not hollow. The breadth of their fore-heads betwixt the horns is two Roman palms and a half, the top of the crown betwixt the horns is hollow on the hinder part, and in that fciel lyth the brain which defcendeth down to the middle region of the eyes.

Their teeth are like Harts, and inwardly in their cheeks they grow like furrows, bigger then in a Horfe; the tooth rising out sharp above the throat, as it should feme that none of his meat should fall thereinto unbruised. This Beaf in young age is of a Mouf or Afe colour; but in his older age it is more yellowish, especially in the extrem part of his body: the hair smooth, but molt of all on his legs, but under his belly, in the inner part of his knee, the top of his neck, breast, shoulders, and back-bone, not fo smooth: In height it was about twenty two handfuls and three fingers, being much fwifter then any Horfe; the female beareth every year, as the Keeper faid in Norway, two, or at a time; but in England it brought forth but one.

The fleth of it is black, and the frides broad like an Oxes: but being dressed like Harts flesh and baked in an Oven, it faled much fweeter. It eateth commonly grafs; but in England seldom after the fashion of Horses, which forbear hay when they may have bread; but leaves, rindes of trees, bread and oats, are moft acceptable unto it. It reacheth naturally thirty hand breadths high, but if any thing be higher which it doth affect; it flandeath upon the hinder-legs, and with the fore-legs there iranbracet or leant to the tree, and with his mouth biteth off his defire.

It drinketh water, and alfo English Ale in great plenty, yet without drunkenness: and there were that gave it Wine, but if it drink plentifully it became drunk. It is a molt pleafant creature being tamed: but being wilde, is very fierce, and an enemy to mankinde, percuting men, not only when he feeth them by the eye, but alfo by the fagacity of his nose following by foot more certainly then any Horfe, for which cafe they which kept them near the high ways, did every year cut off their horns with a faw: It fetteth both upon Horfe and Foot-men; trampling and treading them under foot whom he did over-match, when he fleneth a man before he feeth him, he uttereth a voice like the grunting of a Swine being without his female: it doth moft naturally affect a woman, thrilling out his genital (which is like a Harts) as if it dierenfed sexes. In Norway they call it an Elk, or Leland, but it is plain they are deceived in so calling it, because it hath not the legs of an Elk, which never bend, nor yet the horns, as by conference may appeare. Much less can I believe it to be the Hippodarius, because the female wanteth horns, and the head is like a Mules; but yet it may be that it is a kind of Elk, for the horns are not always alike, or rather the Elk is a kind of Horse-hart, which Arifotle calleth Arceobosus of Arreus a region of Affa, and herein I leave every man to his judgement; referring the Reader unto the former discouries of an Elk, and the Tragelaphus.

Of the Sea-horse.

The Sea-horfe, called in Greek, Hippotamos; and in Latine, Equus Fluviatili: It is a molt ugly and filthy Beaf, so called because in his voyce and mane he resembleth a Horfe, but in his head an Oxe or a Calf; in the residue of his body a Swine, for which caufe some Greeks call him sometimes a Sea-horfe, and sometimes a Sea-oxe, which thing hath moved many learned men in our time to affirm, that a Sea-horfe was never feen; whereunto I would easily subfcribe (faie Bellinius) were it not that the antient figures of a Sea-horfe, altogether resembeld that which is here exprefled; and was lately to be seen at Constantinople, from whom this picture was taken.
taken. It liveth for the most part in Nilus; yet is it of a doubtful life, for it brings forth and breedeth on the land, and by the proportion of the legs, it seemeth rather to be made for going, than for swimming: for in the night time it eateth both hay and fruits, forraging into corn fields, and devouring whatsoever cometh in the way; and therefore I thought it fit to be inserted into this history. As for the Sea-calf, which cometh sometimes to land only to take sleep: I did not judge it to belong to this discourse, because it feedeth only in the waters.

This picture was taken out of the Cæsars in the Vatican at Rome, representing the River Nilus, and eating of a Crocodile: and thus I reserve the farther discourse of this beast unto the History of Fifies, adding only thus much, that it ought to be no wonder, to consider such monsters to come out of the Sea, which re semble Horses in their heads, seeing therein are also creatures like unto Grapes and Swords.

The Orfitan Indians do hunt a Beast with one horn, having the body of a Horse, and the head of a Hart. The Biboisians likewise have a Beaul in the neck like unto a Horse, and the feet and legs like unto an Ox. The Rhinoceros hath a neck like a Horse, and also the other parts of his body, but it is said to breath out air which killeth men. Paufianus writeith, that in the Temple of Cabalas, there is the picture of a Horse, which from his breast backwards is like a Whale. Lampsacinius writeith, that in the Scythian Ocean, there are Islands wherein the people are called Hippocrates, having the bodies of men, but the feet of Horses; and Lamia hereafter to be declared, hath the feet of a Horse, but in other things the members of a Goat: and thus much for the several kinds of Horses, both for them that are properly so called, and also for any other, which like haftards retain any resemblance of nature with this Noble and profitable kinde of Beast.

Of the Diet of Horses, and their length of life.

Having thus discoursed of the kindes of Horses, and their several accidents, and uses both for War, and Peace, pleasure, and necessity; now likewise it followeth, that we should proceed to their diet, and manner of feeding: wherein we are first of all to consider, that the natural constitution of a Horse is hot and temperate. Hot, because of his Leuitie, and Velocity, and length of life; temperate, because he is docile, plesant, and gentle towards his Mutter and Keeper. He therefore that will keep Horses, must provide for them abundance of meat; for all other Cattel may be piached without any great danger, only Horses can endure no penury. Varto faith, that in feeding of Horses, we must consider three things; First of all, what food the Country wherein we live doth yeeld; Secondly, when it must be given: Thirdly, by whom, but specially the place of feeding Horses is to be considered; for although Goats can live in the Mountains, better than in the green fields, yet Horses live better in the green fields, then they can in the Mountains. For which cause when we chuse pastures for Horses, we must see that it be fat, such as groweth in Meddows, in the Winter time it may be Sunny, and in the Summer it may be open and cold, neither for loft under-foot, but that the Horses hooles may feel some hardnels, for Horses, Mules, and Asses, do love well green greas, and fruits, yet principally they grow fat with drinking; when they are in the stables, let them have dry Hay. A Mare when she hath foaled give her Barly, and generally at all times in the Winter seaon bullimiage, or a mixture of all kinds of grain is fit for them in the house, according to these versies of Nemeian:

- Inde uti pubenter coelos duravert asias,
  Latentique uncin herbis ficavert iunem
  Menisius humorem, caunctique armavit arifias,
  Oriet tlos, palefque livres, praebere meminit.
  Pulvere quinellan, puis secentere fruges

- Cura sit, anque toto manibus percorrer equestrum,
  Gazeat ut plana, sonitas letumque relaxat
  Corpus, et auras rapit per virosa succus,
  Id current famului, comitunique animosa juventus.
We have shewed already, that they must have straw, or litter to ly upon, and *Pollux* doth set down the kinds of meats for Horfes, as barley, hay, or *Fenno* wheat, rice, and hay; for hard and dry meat is fitteth for Horfes, because it doth not fill them with winde; but all green meat is the les approved, by reason of inflammation. Three-leaved grafs is alfo good for Horfes, efpccially if they be young, for chaffe, hay, grazes, and oats, are their natural and pleaing food: and although grafs be moift, yet in the young age of a Horfe, he delights in moist meats, for they ftreth out his belly, and encrease his growth, but when he is elder, then ought he to be nourifhed with dryer food; as chaffe, Barley, Oats, and fuch things. For although chaffe, by reason of their dryness, make not a Horfe fat, yet do they preferveth him in perfect strength, for all hard things which are diffolved with difficulty, do retain their force of nutriment longer, but fofter meats do not fo; therefore the dyet dyer or habitue for Horfes, is, to retain the mean between fames and leanefles. For fames minIFtreth many humors to the nourishment of fickness, and leanefles diminifheth natural strength, maketh the body deformed. In fome Countrieys they give their Horfes Vine branches in the Autumn, to move their bellies, and inereace their strength.

_The Herb Medics_, which aboundeth in _Melis_, is very nourifhable to Horfes, but the firft flaks are refufl, faith _Arifalle_, the refidue being watered with finking water, is molt commodious. In _Italy_ they fat their Horfes with _Trifoy_; in _Calabria_ with _Sulla_, or _Arbritica_; and the _Thracians_, near the River _Strymon_, with a green Thistle.

In the Spring time give your younger Horfes _Bullimang_ for many daies together, for that will not only make them fat, but alfo purge their bellies: for this purgation is molt neceffary for Horfes, which is called foiling, and ought to continue ten daies together, without any other meate, giving them the eleventh day a little Barley, and fo forward to the fourteenth; after which day, continue them in that dyet ten daies longer, and then bring them forth to exercife a little, and when as they fweat, anoint them with Oyl; and if the weather be cold, keep a fire in the flable: And you muft remember when the Horfe beginneth to purge, that he be kept from Barley and drink, and give him green meat, or _Bullimang_, whereof that is belt that groweth near the Sea fide.

But if the Horfe go to foy in _April_, after five daies, bring him forth, and wash him all over with water, then wiping his hair from all wet and filth, and loofe hairs, pour upon him Wine and Oyl, preffing it fmoother upon his back, down to his skin; fo let him be wiped all over again, and carried into the flable, to be deted with _Maifine_, or _Bullimang_ as before, except he be troubled with the Glanders, and then he muft not feed on it in the day time, let the breath of the Sun, he fall into the magpie, or into madness.

It is alfo requisite, that while we feed our Horfes with green Corn, they be let bleed in the veins of the breaf, and alfo cut in the roof of their mouths, that fo thole places being emppoyred which were difflued with corruption, the vacuity may be replenifhed with better blood; a Horfe thus dyed, fhall not only live in more health, and free from fickness, but alfo be more strong to undergo his labour.

With the blood that cometh out of him, mingled with Nitre, Vinegar, and Oyl, you fhall anoint him all over, if fo be he be subject to the Glanders, or to the Magpie; and then keep him in the flable five daies together, fuffering no Curri or fumm to come upon him, untill the firft day, feeding him in the mean time with green Corn or _Bullimang_; and then bring him forth again, washing him all over with water, and rubbing him with a hard whifp, untill the humor or moithures be wholly wiped off, and he fed as before fourteen daies together.

If you pleafe not to keep him in the flable, then in the Spring time, turn him out in some medow, or green pature, and there let him feed at his own pleafure; for it hath been often proved, that fuch a dyet hath recovered may fick Horfes.

It is reported of the Horfes, and _Gedii_, and men of _Freeeland_, the _Macedonians_, and _Lydians_, do feed their Horfes with fifies: Likewise the _Peonians_ which inhabit about _Phrazis_ near the Mountain _Orbeus_, do feed their Horfes, and all _Cattel_ which they yock with fifies.

Concerning the drink of Horfes we have spoken elsewhere, and therefore we fhall not need to fay any thing of it here, except that the drinking much, and the Horfe thrulling his head in deep into the troubled water, is an unfaluble fign of his goodnes; and the culm of fome is, for to give their Horfes fames made of water and corn fed together, or _Elf_ Bear, Ale or Wine, by drinking whereof, they encrease their spirits and fomack.

_Aberius_ faith, that fome to make their Horfes fat, take Snails, and beat them in pieces, to putting them into their meats, whereby they grow to a falle fatneffe, which is eafily difolved. By eating of black Hellebor, Oxen, Horfes and _Swine_ are killed: and thus much for the food of Horfes.

Concerning the voice of Horfes, the _Latiis_ call it _Hinnium_, and the _Greeians_, _Phrauma_, and _Phumatisia_; but this is certain, that from their very foaling, the females have a thrall and sharper voice then the males, which is fuller and broader, untill they be two year old, and after copulation their voice encreafeth, fo continuing until they be twenty year old, after which time, it falleth and decreafeth again.

The length of a Horfes life (according to _Arifalle_) is eighteen or twenty years, and if they be well tended and regarded in their youth, it hath been found, that fome have lived unto five and twenty, or thirty year old. The females live longer then the males, because of their generation, for
Of the Horse.

259

for the immoderate lust of Horfes, shortened their days. And it hath been found that a Mare hath lived to forty or fifty years, and a Horse to three and thirty: wherefor I do leave the relation of Pliny and Athenaeus, to be cenured by the Reader, who affirm, that Horfes in their time, lived threecore or seventy years.

Athenaeus also affirmenteth, that a Souddier told him for a certain truth, that he knew a Horse which lived till he was threescore years old, and at that age did service in the field. And Augus.

Niphus also affirmenteth, that the Riders of Ferdinand the first, told him there was a Horse in their Malters stable of seventy year old. The age of a Horse may be known by his teeth, and the Persians, Bactrians, Ephrians, and Sicilian Horfes, live longer than the Spanish or Numidians. In their years, the female never groweth after five, nor the male after fix in height or length, so as the males are sooner perfired in the wound then the females, on the contrary the females do sooner grow to their perfection after their foaling then the Males.

The males have more teeth then the females, and in each fex they which have fewes teeth, live not fo long, and in their old age their teeth grow white. Now their age is discerned by their teeth on this manner, the first four, that is two above and two beneath, be changed after they be thirty year old, and a year after the four next are changed in like manner, again after another year four more are changed, fo that after four year and fix moneths, he loofeth no teeth, except canine, which cometh again in the fift and fixt year; fo that afterwards their age cannot be differenc'd, because in the leaveneth year, they are all filled. Another unaligned note of their age, is the hollownes of their temples, and their eye-lids beginning to wax gray, and their teeth hanging out of their mouths. They have also little blacks in the middle of their teeth. Some try the age of their Horfes, as a wife and learned man wrieth, by considering twelve teeth, fix above, and fix beneath, for the old Horfes have longer and thinner teeth, which are black at the top, and there are certain broaches or wrinkles in their teeth, which being filled, the mark is laid to be out of their mouth.

Some try the age of their Horfes by their cheeks, for they pull up the skin from the bones, and if it will quickly fall back again into his former place, they take it for an assured token of the Horfes youth: but if it stand out and fall slowly down, then on the contrary, they judge the Horse to be old, and thus much for the age and diet of Horfes.

Of the uses of Horse-flefh, Mares-milk, and other parts.

There are certain people in Sycitia, which were called Hippophagi, because they lived upon Horfes-flefh; fuch also were the Sarmatians and the Vandalos: likewise in Sycitia the Leffe, near Thauria Chersonesus, the people do not only eat the flefh of Horfes, but alfo their milk, and make Cheefe thereof.

Athenaeus also affirmenteth, that the manner of the ancient Persians was, upon the featts of their nativities to roafe an Ox, an Afe, a Horfe, and a Camel whole, and so let them before their guests.

In like fort, they eat Horfes-flefh and Camels-flefh at Damascus; and in Spania wilde Horfes, especially that part which groweth under the mane. The Sarmatians made meaft of Millet-fleef, and mingle it with Mares milk, or with blood taken out of the veins of their legs, wherewithal they make puddings, and this is their chief food. So wrieth the Tartauros, who having a Horfe feck, cut off his Ueer or wound, and fo kill him, and eat his flefh. The Gobiers also in the daies of Virgil did drink the blood of Horfes, as appareth in thefe Verfes;

Profit intenfus aftus avertiere, & inter
Ina ferte pedis, falienem fanguine venam:
Bifalae, quum more silent, acerque Gelenus,
Cum fugit in Rhodelae, atque in defere Getarum,
Et leo concretum cum sanguine potat equino.

The Poets do alfo fain, that Pelias the Son of Tirm and Neptune, was educated by a Mare, and Metebul brought up his Daughter Camilla with Mares milk, because she was born wilde, he alfo bred her among the bufhes, according to thofe Verfes;

Hic natam in damis, interque horrenda lustra
Armentalis eque marnnis, & latte ferino
Nutravit, teneris immulgens ubera labris.

The Tartariouns drinke Mares milke, which they dreffe like white wine, and call it Conunia, whereof Paulus Venetus rehearfeith this story: The King of Tartar, faith he, nourfeth above ten thoufand milk-white Horfes and Mares, and every year, upon the eight and twenty day of August, they obferue a folemn feast, wherein the milk of thofe white Mares is dreffed and fet forthe in comely veffels.

Afterward the King taketh a bowl full thereof, and powreth it on the ground round about him, being fo taught by his Magians, to offer Sacrifice to the gods of his Countrey: For they perfwade him,
him that the Gods lick up that milk split on the ground, and afterwards the King drank it up the residue, and besides him no body that day, except it be of the Kings lineage, or of the Countrey of Hottach (for the people of that Countrey have liberty to talk thereof that day) because of a battle which once they obtained for the great Cam.

The property of this milk is to loosen the belly, and because it is thin and hath no fat in it, therefore it easily descended, and doth not curdle in the stomack, and is said, that the Scythians can keep it twelve dayes together, therewithal satisfying their hunger, and quenching their thirst. And thus much shall satifie for the natural discourses of Horfes: hereafter followeth the moral.

The moral discourse of Horfes, concerning Fictions, Pictures, and other devises.

And first of all for the moral dignity of Horfes, there is a celestiall constellation called Hippus, according to thefe Verifes of Arianus thus translated;

Hic Equus ille jambum quartum fulgere miscuit
Sumnum contingit equus aut multoque jungens
Una.

The Lanius call this flat Pegusus, and they say that he is the Son of Neptune and Medusa; who with striking his foot upon a Rock in Helicon a mountain of Boeotia, opened a Fountain, which after his name was called Hippocrene. Others tell the tale in this fort, at what time Bellerophon came to Pegasus the Son of Aius the King of the Argives, Antius the Kings wife fell in love with his guef, and making it known unto him, promised him half her husbands Kingdom if he would lie with her, but he like an honeft man abhorring so foul a fact, utterly refused to accomplish the desire and dishonesty of the luftful Queen; whereupon she being afraid left he should disclose it unto the King, prevented him by her own complaint, informing the King that he would have ravished her: when the King heard this accuation (because he loved Bellerophon well) would not give punishment himself, but sent him to Scheherew the Father of Queen Antias, that he in defence of his Daughters chastity might take revenge upon him, who presently call him to Chimera, which at that time depopulated all the coast of Lydian: but Bellerophon by the help of the Horfe Pegasus did both overcome and avoid the monster, and being weary of his life, perceiving that there was no good nor truth upon the earth, determined to forfake the world and flee to heaven: who coming neer to heaven, calling down his eyes to the earth, trembled to see how far he was distant from it, and fo his heart fainting for fear, fell down backward and perished, but his Horfe kept on his flight to heaven, and was there placed among the Stars by Jupiter. Euripides tellett the tale otherwise, for he feath that Chiron the Centaur had a Daughter nourished in the mountain Pelion which was called These and afterward Hippus, because of her exceeding hunting on horfe-back, she was perfwaded by Alenus (the Son of Hellen, a Nephew of Jupiter) to let him lie with her, whereupon she conceived with childe, and when the time of her deliverance came, she fled from her Father into the woods, for fear the los of her Virginity should be known unto him; but he followed her to see what was the caufe of his Daughters departure, whereupon the defired of the Gods that her father might not see her in travel, her prayer was granted, and the after her delivery, was turned into a Mare, and placed among the Stars.

Others fay that she was a Propheteffe, and because she revealed the counsells of the Gods, was therefore metamorphozed in that shape in the place aforesaid Others fay, that because the gave over to worship Diana, she lost her first preience. But to return to the firit tale of Bellerophon, who after the death of Chimera, growing proud for his valor attempted to flie to heaven, but Jupiter troubled his Horfe with a Fury, and fo he ftooke off his Rider, who perished in the field, Alenus upo the felle, becaufe of his erreur: and Pegasus was placed in heaven.

But to come nearer to the defcription of the Poetical Horfe, Alcibiad Magnus and some others fay, that it is a Beast bred in Egiptus, having the head and feet of a Horfe, but horned, and wings much greater then the wings of an Eagle, which he doth not lift up into the air like a bird, but only fettheth them out when he runneth, whereby his only preience is terrible to all creatures, unto whom he is enemy, but especiallly to Men. But for the truth hereof (although Piny and some others feem to affirm as much) yet will I fet down nothing for truth and certainty, because as the Poets call every swift Horfe Volucres, and Alipes: so the erreur of that figure, hath rather given occaion to the framing of this new Monfer Pegasus, than any other reasonable Allegory.

Likewise I know no caufe why the Poets shoulde fain that Ceres was turned into a Mare, and hid her felf in the herds of Oncins:Neptune falling in love with her, followed her to those fields, and perceiving that he was deceived, turned himself also into a Horfe, and fo had to do with her, whereas Ceres was griefoufly offended, and fell into a great fury, for which caufe she was called Erinys: yet afterwards she washed her felf in the River Ladan, laying aside all her rage and fury, at the fulnes of time she brought forth Aietus.
And the Arcadians also had a certain Den, wherein they had a great remembrance of this ravishment of Ceres, sitting in a Den, wherein they say she hid her self from all creatures, and whereunto they offer divine worship. They picture her in a Colts skin, sitting like a woman in all parts, with a long garment down to her ankles, but the head of a Horse with the pictures of many Dragons, and other such wild beasts, holding in one of her hands a Dolphin, and in the other a Dove.

By all which it is not uneasie for every man to know & conceive their meaning, that plenty of food signified by Ceris, doth not only maintain Men, Fowls, Beasts and Fishes, but also the immoderate use thereof draweth men to inordinate lust and concupiscence, and that the Gods of the Heathen were more rather to be accounted Beasts then Men.

Diana also among the Arcadians was called Errippa, for the finding out of those Mares which Ulisses had left: which Ulisses erected a Flature for Neptune the great Rider, and they say that Hippocystis being torn in pieces by Horaces, the horse of the beloved of Diana, and in the canoe of Eancipatus, by the vertue of certain herbs he was restored unto life again: Whereupon Jupiter being sore vexed and angry with Eancipatus for such an invention, concluding as it were the fury of the Gods, killed him with lightning, and thrust him down into hell, because no wretched man would fear death if such devies might take place: which fact Virgil describeth in the Book Verdes:

At Trivis Hippocystis secretis alma recensit
Sedibus, & nymphis Aegeria nemisque velxati,
Sulis ubi in fidiis Idae ignatilia etun
Exigeret, verfque ubi nominat Vivibus effet.

Unte etiam Trivee templo lucente sacratis
Carnipes adventer equi, good histore carmin
Et juventum mensis posuere effedere maris.

The Poets also do attribute unto the night, black Horses, and unto the day white. Homer faith, that the names of the day Horses are Lampus and Planebon; to the Moon they ascribe two Horses, one black and another white: the reason of these inventions for the day and the night is, to signify their speedy course or revolution by the swiftness of Horaces, and of the darkenes of the night by the black Horses, and the light of the day by the white; and the Moon which for the most part is hid and covered with earth, both increasung and decreasing, they had the same reason to signify her shadowed part like a black Horde, and her bright part by a white one.

The like Fiction they had of Hecate, whom Antonius calleth Teremina, because she is described with the head of a Horse, a Dog, and a wilde Man, the Horse on the right hand, the Dog on the left hand, and the wilde Man in the middle: whereby they declared how vulgar, illiterate, and uncivilized men, do participate in their conditions, the labours and envie of brute beasts.

We may also read in the Annales of Tacitus, that in his time there was a Temple raised to Equeftrial fortune, that is, for the honour of them which managed Horaces to their own profit, and the good of their Countrie, and that Eulius the Prætor in Spain, because he obtained the victory against the Celtiberians, by the valour and diligence of his Horace-men, was the first that builded that Temple. Likewise, there was another Temple in Basilia for the same cause deputed unto Hercules.

The ancient Pagans call the God of Horaces Hippa, as the God of Oxen Babona. It is also apparent, that many Nations use to Sacrifice Horaces, for at Saluminum a Horace was cast alive into the fire and offered to Jupiter. Likewise the Lacedemonians sacrificed a Horace to the winds. At Rome also they sacrificed a Horse to Mars, and thereof came the term of Equus October, which was sacrificed every year in October, in Campus Martius. This Horace was often take out of a Chariot, which was a Conqueror in race, and flood on the right hand; as soon as he was killed, some one carried his tail to a place called Regia, and for his head there was a continual combate betwixt the inhabitants of the streets, Saburres, and Sacravus, which of them should posses it; for the Suburrians would have fastened it to the wall of Regia, and the Sacravians to the Tower Mamilla.

The reason why they Sacrificed a Horce, some have conjectured because the Romans were the off-spring of the Trojans, and they being deceived by a Horace, their pollerty made that Sacrifice for punishment of Horaces: but it is more reasonable, that because they Sacrificed a conquering Horace, they did it only for the honour of Mars (the God of victory) or else because they would signify, that flying away in battle was to be punished by the example of Sacrificing of a swift Horace.

The Carvans did also worship Mars, and because they had no Horaces to use in War, they were forced to use Affes, for which cause they Sacrificed an Ass unto him. There is another fable amongst the Poets, that the Mathimants were commanded by the Oracle to call a Virgin into the Sea to Neptune, which they performed: now there was a young man whose name was Euanlus, which was in love with the said Virgin, and seeing her in the Waters, swam after her to fave her, but both of them were covered with the waters of the Sea; yet after a certain space Euanlus returned back again, and brought news that the Virgin lived among the Pharies of the Sea, and that he after that he had kept Neptunes Horaces, by the help of a great wave escaped away by swimming, for the Poets fain that Neptunes Chariot was drawn by Horaces of the Sea, according to these Veres of Gillius;
They also signify that the Sun is drawn with two swift white Horses, from whence came that
abomination, that the Kings of Judea had erected Horses and Chariots in honour of the
Sun, which were set at the entrance of the Temple of the Lord; which Horses were destroyed by
Josias, as we read in holy Scripture. And the manner of their abomination was, that when they
did worship to the Sun, they rode upon those Horses from the entrance of the Temple to the
chamber of Nebuchadnezzar. The Persians also sacrificed a Horse to Apollo according to their
Verfes of Ovid:

Placat equo Persis, radiis Hyperionis cirillum,
Ne de tur seleti victima tarda dieo.

And for this cause the Magistrates sacrificed a Horse (the swiftest of all Beasts) unto the Sun, the swiftest
of all the Gods. Piledesstratus also recorded, that Palamedes gave charge to the Grecians to Sacrifice
to the Sun riling a white Horse. The Rhodians in honor of the Sun did cast yearly away into the Sea,
the Chariots dedicated to the Sun, in imagination that the Sun was carried about the World in
a Chariot, drawn by six Horses.

The ceremony
of the Persians
going to War

As the Army of the Persians did proceed forward on their journey; the fire (which they did
call Holy and Eternal) was lifted up on silver Altars; presently after this, there followed the
Women; and after those Women came 165 young men, being clothed with as many red
little garments as there are days in the year: Infantly upon the fame, came the holy
Chariots of Jupiter, which was drawn by white Horses; after which, with a repinident magni-
citude the Horse of the Sun was seen to appear (for so it was called) and this was the manner of their
Sacrifices.

The King of Indians also (as is said) when the days began to wax long, he descended down
to the River Indus, and thereunto sacrificed black Horses and Bulls; for the Bulls in ancient time
were consecrated to the Rivers, and Horses also were thrown thereinto alive, as the Trojans did in
to Xanths.

Varrinus.

The Veneti (which worshiped Diodetes with singular honour) did Sacrifice to him a white Horse:
when the Thebans made war on the Macedonians, it is said that Cesareus appeared in a vision to Pho-
pidas, one of the Theban Captains, and told him that now the Macedonians were at Leuctra, and
would take vengeance upon the Thebans, and their Daughters: Whereupon P得到了 to avert that
mischief, caused a young foal to be gallantly attired, and the day before they joined battle, to be
led to a Sepulcher of their Virgins, and there to be killed and sacrificed.

The Thessalians observed this custom at their marriages and nuptial Sacrifices, the man took a
Horse of War armed and furnished, which he led into the Temple; after the Sacrifice ended he de-
livered the reins of the Bridle into the hands of his Wife, who led the same Horse home again; but
for what figuration or cause this was observed, poets which relate the story thereunto, not
but faith he referreth himself to the Thessalians to declare their own reasons of this observation.
And thus much shall suffice concerning the Sacrificing of Horses.

The burial of
Horses.

Another moral-honourю done unto them was their burial; For we have learned already that
Vulcan the Horse of Venus the Emperor was honourably buried, the Mares of Cimon which had
won three games at Olympus, were likewise interred near his own body. The Seythians at the burial
of their Kings used for to strangle one of his harlots, his cupbearer, his Cook, his Horse-keeper, his
Messenger, and also Horses and other Cattle; and after a year they do this the second time; tak-
ing fifty of his dearest servants which were natural Seythians and strangled them: likewise fifty of
his best Horses, out of whose bellies they pull out their bowels and guts, and filling ther bellies up
again with chaffe, they bow them up: then make they half an arch upon two posts standing up-
right, and likewise the other half upon two other posts over the Kings grave; likewise fastening
in the earth divers other sharp posts upon which they put the fifty Horses, so fastening them
with thick pieces of timber all along their neck and back, so that the shoulders of the Horses rest
upon the fore-arch and their bellies on the hinder, their legs standing upward, then bridled they
the Horses, and stretch forth the reins of their bridles unto the posts of the earth, afterwards up-
on every one of the dead Horses they lay a dead man, putting a slate through his back out of his
neck, and the other part of the said slate they fasten in the post, which pierceeth and goeth through
the Horse; and thus having compassed about the grave of their King, with such Horses and Horse-
men, they depart, leaving both the one and the other to the consummation of nature, and after this
manner did they bury all their Kings.

Adrian buried his Hunting Horse, Eumenes his Mares, Panteria and Erithra. Like
wife Mithridates, Evagoras, and Augustus the Emperour. At Aegyptus also there are many
Pyramids erected upon the Sepulchres of Horses. And thus much shall suffice for the burial of
Horses.
We have shewed you already how Men and Women have been transformed into Horfes, according to the fiction of the Poets, as of Saturn, Jupiter, Neptune, Ceres, Hesper, and Ogygites the Daughters of Chiron. In like sort there have been predictions or omenations of things to come, taken from a Wolf, a Fox, a Serpent, and a Horfe, which were called Ansia, Fetal, or Auguri(m). Things without delivery was the Horfe, according to the lake of Jupiter, that they watched for the safety of the Roman Empire, and their Temple which was joyed to the same fountain being fast locked, upon a suddain flew open without the hand of man.

Eneas also in Virgil faith, that he knew war would follow by the appearance of four Horfes, which in a green field set upon a whole Campe, whereupon in Virgil, he speake ths to Archiata.

Quatuor bis, primam omne, Equis in gramine vidi
Toucutres cunphu late, cantores navali.
Hesper Anchesfit, Bellum Oterre bosista portas;
Bello armatur equi, Bellum has armenta minatur.

Lucan also speake to the same purpose that Horfes presage war;

Primum ab aquores percussit enside saxis
Thebasius janipes bellum feralibus omne

Alexander also writeth, that the Germans were wont to bring up white Horfes which were never used to labour, by whose neighing they were forewarned of wars, and of other strange events. It is vulgarly known how Darieu came to the Kingdom of Per fixtures, after it was agreed amongst the seven Princes, that he whole Horfe did first neigh in the morning in a place appointed, should be salted King. Ekehor his ruder in the night time took one of the Mares which he knew his Masters Horfe loved, and led her into the Suburbs, and there tied her, afterward he brought thither Darieu his Horfe, and led him about her two or three times, and at length suffered him to cover her, and so led them both away together. In the next morning the Princes met as soon as day brake, and rode up and down the Suburbs, until at last they came to the place where the Mare of Darieu was tyled the night before, whereunto the Horfe of Darieu ran neighing strongly, and presently it stamped and lightened in a clear day: whereupon the residue of the Princes alighted from their Horfes, and did reverence to King Darieu, who by divine appointment was thus advanced to the Scepter.

Although there be some that say Ekehor by handling of a Mares genital and keeping his hand warm, until they came to the place aforefaid, there stroking the Nostrils of his Masters Horfe, caufed him thus to neigh and win the Kingdom; yet I rather incline to the former opinion which was related by Herodotus in his Thesuba.

There have also been Horfes of strange fashions, for as we have shewed already, that a Mare did bring forth a Hare. so also (Livie faith) an Ox did bring forth a Foal. Nero did shew certain Hermaphrodit Mares, wheresithal his Chariot was drawn, which was a thing worth the fight, that the Monarch of the world should fit upon Monfets.

Julius Caesar had a Horfe which had cloven hoofs like a Mans fingers, and because he was foaled at that time when the Sooth-sayers had pronounced that he should have the government of the world, therefore he nourished him carefully, and never permitted any man to back him himself, which afterwards he dedicated in the Temple of Venus, for he conceived that such a strange beast bred in his own flock, was a prediction unto him of great honour. The Palatine of Vero had a Horfe foaled with five legs, and Henry the Count Palatine had likewise a Horfe with six legs. Thus Cellini, much may suffice for the monfer Horfes.

In the next place it is good to enquire what the Centaures are, who are described by the Poets to have their forepart like Men, and their hinder part like Horfes, the occasion whereof is thus related by Pindarus: that Centaurus the Son of Ilion, committed buggerly with the Mares of Magnesia, under the mountain Pelus, from whence came that monstrous birth in the upper part resembling the Father and in the nearer the mother. Thesue faith he posseffed the Mountains and Delfet places of the land, being given to all manner of Latrocin and Depradation. They were called also Hippocentaurs: And some faie that they were fril of all nourished by the Nymphes in the mountain Pelus, who afterwards being the first that tamed Horfes, were thought to be half Men, and half Horfes, because they were seen backward, and from hence came the tule that they were tamed by Hercules.
The History of Four-footed Beasts.

Hercules, which was one of his greatest labours; but yet that no man may wonder or think it impossible that such monstrous creatures should have existence in nature, these authorities following may perforce sufficiently.

Plutarch in his Banket of Wifemen, affirmeth, there was a Horse-keeper which brought into the house of Persius an Infant or rather a Moniter which he had got upon a Mare, which had the head, neck, hands and voice of a child, and the other parts like a Horse, Diceles pretently judged it to be a Moniter, and signified contentions and strifes in the world. But Teles told Persius he was of another opinion, namely, that it was no Moniter, but a meer natural birth from such a copulation, and therefore advised Persius, that either he should keep no Riders, or else let them have Wives.

Claudius Cæsar also writeth, that in the time of his reign there was such a one born in Thrace, which dyed the same day it was born: and Pindarus that he afterwards saw was feaoned in hony, brought out of Egypt to be shewed to the Emperor. These Centaures, Homer calleth Eres, that is, Eres, wilde persons. The Lapithes and the Centaures are said to be very like the one to the other, and were also once very loving, but they fell afterwards to deadly war, by reason the Centaures in a banket being drunk, offered to ravish the females of the Lapithes, for which cause the Lapithes slew them in their jealousie, whereon fell a mortal war: whereby the Poets signifie how intemperance in Men and Beasts doth not only bring with it other sins, but also caueth much slaughter. And so I conclude the story of Centaures, holding it impossible that such should be generated by unclean and natural copulation, but unpossible that they should live long after birth, and therefore the Centaures of the Poets are nothing else but men sitting on Horseback, mistaken for one entire creature which were divided, and so conclude with the Verse of Horace:

Humana Capitis curvicem pilar Equinam
Jungere si velit.—
Hoc monstrum furo Centaurs forst.

of the statues and figures of Horses.

Pollio.

It was no small dignity that the ancient Cephalenes did stamp their money with the picture of a Horse, for surely from them it came, that coin was first of ail called current, because of the image of a speedy Horse, wherewithal it was imprinted. Teuctor also writeth, that amongst the ancients there was a custom to make the Charfet of a Horse in the forehead of a bondlifve; there was also images of Horfemen and Horses renowned in many Countries for the honour of both, such were the statues of the Amazon (said Hippestes) who by Lips the Orator are said to be the first that ever backed Horses; such was the statue of Cleopatra, Quirinas Martius, Tremulla, Dominianus, and many other both Men and Women: for the Romans had the Equellus statues in great reverence and ceremony, no doubt in imitation of the Grecians, but with this difference, that they pictured none but the swift Horses, but the Roman, Horses and Chariots, and from hence came the custome to have Chariots in triumph.

But this custome to have fix Horses in a Chariot was brought in lat of all by Augustus. Altidusius pictured the Chariots and Wagoner. Picaturae the woman Pith, with a Wagon. Furbates the Son of Lyppus expressed the Equeftral combate at the Oracle of Teufonium with fingular art, also many Chariots of Medea, the Horse and his carriage. There were also earthen Chariots at Rome in the porch of Jupiter Temple, as we have shewed before in the discourse of Chariots.

When Conflantius the great took a view of the City of Rome, and passing from place to place, came at length to Forum Traiani, the most exquisite building of all the world, he stood amazed at the admirable frame of Giants which were linearly deciphered therein, whereof despairing to imitate any part of that work, he chose only to erect the picture of such a Horse and Prince, as in the middle of the same was erected in remembrance of Trajan, so much he intimated to his followers: close by him stood that Princeful Hormida (a Pefian) who made the Emperor this answer, Ante imperator stabulum tale consili juheto si viiaes: Equei quem fabracare dolopis ista late succedat ut ipse quern videmus: O Noble Emperor before you make such a Horse, first of all build such a stable: that your work in all parts may be correspondent to this which you propone unto your self to imitate.

Metellus the Macedonia raised two porches which were compasse about with two Horses, without inscription or dedication, which now are compasse with the porches of Oldania, and the row of Equeftral statues in the front of the said buildings, now the greatest ornament of that place, he also brought out of Macedonia. And it is said that Alexander the great canfled Lyppus (that singular work man) to frame the pictures of all those Knights which in his company were blind at the River Grascalos, and alfo to place his own picture among them.

In the City of Rome there are two mountains called Equilini, in one of them are the baths of Ptolemao, and the great Marble Horfes, with two men half naked, holding their reins, being most singular workmanship, whereof one hath this inscription in Latin letters, Opus Fraxinetis, the work of Fraxinetis; the other Opus Phidias, the work of Phidias: and it is clear, that they were brought thither.
thither by Tyrrhenus King of Armenia, for whose entertainment Nero caused the Theatre of Pompey to be covered all over with gold in the space of one day. The story of the Trojan Horse is vulgarly known, which is also called Equus Duratus, or Durens, wherein the Grecians hid themselves, when they took Troy, according to these Verles:

Nor cam dura teus Trojana Pergamo partu
I stam maeit Equi nolturn Grajgenerium.

The truth whereof standeth thus, The Grecians making them that they had vowed a vow unto Pallas, framed a Horse of so great bigness, that it could not be taken into Troy, except the gates were pulled down; and this they placed hard to the walls of Troy: Simon (the counterfeit runnagat) being then within the walls among the Trojans, persuaded them to pull down their walls and pull in that wooden Horse, affirming that if they could get it, Pallas would stand fo friendly to them that the Grecians should never be able to move war against them: wherefore they pull down their gates; and part of their wall, and by that means do bring the Horse into the City: while the Trojans were thus revelling and making merry with themselves, and not thinking of any harm might ensue upon them, the leaders of the Grecian Army who by deceit all this while kept themselves close hid, (ever since which time the Grecians are termed of all Nations deceitful) on a sudden rase out of their lurking places, and so going forward invaded the City, being delusive of any defence, and by this means subdued it.

Others are of opinion, that the Poets fiction of the Trojan Horse, was no other but this, that there was a mountain near Troy called Equus, and by advantage thereof Troy was taken, whereunto Virgil seemeth to allude, saying;

Infat montis Equo divina Palladis atque Adesicem.

For they say that Pallas and Eurus made the Horse, and therefore I conjecture, that the Trojan Horse was nothing else but an engine of War, like unto that which is called Aries: For Panthias faith, that Eurus was the inventor thereof. And Higinius faith, that the Trojan Horse was Machina oppugnatoria, a devile of war, to overthrow the walls.

Of this Horse there was a brazen image at Athens in Acropolis, with this inscription, Charidemus, Evanxis filius celenatus dicitur. When Alexander looked upon his own picture at Ephesus which Apelles had drawn with all his skill, the King did not commend it according to the worth thereof: It fortuned that a Horse was brought into the room, who pretently neighed at the picture of Alexander Horse, smelling unto it as to a living Horse, whereat Apelles spake thus to the King;

Hoe men Hippo elice fou graphioteros cata polu.

That is to say, The Horse is a better discernere of truth than you.

There was one Parnias which went from Manalis in Arcadia into Sicilia, to serve Gelon the Son of Dimeenes, under whom and his brother Hiero he arose to great estate of wealth, and therefore he gave many gifts to Apollo at Delphi, and made two brazen Horses with their riders at Olympia, setting Dismantled the Grecians upon one, and Simon Eugenius upon the other.

Aemilius Caesarinus (a cruel Tyrant in Sicilia) bellowed great gifts upon such as could invent new kind of torments; there was one Aemilius Paterculus, hoping to receive from him some great reward, made a brazen Horse, and presented it to the Tyrant: to include therein such as he should condemn to death: at the receipt whereof Aemilius which was never full before, first of all put the Author into it that he might take experience how curst a thing it was to minister unto cruelty. Apelles also painted Cytus on Horse-back hathening to war, and his Armour-bearer reaching his helmet unto him, so lively, that other dumb beasts were afraid of his Horse. And excellent was the skill of Neatler, who had so pictured a Horse foaming, that the beholders were wont to take their handkerchiefs to wipe it from his mouth. And thus much for the moral uses of Horfes.

Of the several diseases of Horses and their cures.

Seeing in this discourse I have principally aimed at the pleasure, delight, and profit of Englishmen, I have thought good to discours of the diseases of Horses and their cures in the words of our own Courtyreman, M. Blundevile, and M. Markham, whose works of these matters are to be recorded like the Heads of Homer in many places and several Monuments, to the intent that envy or Barbarism may never be able to bury them in oblivion, or neglect to root them out of the world, without the loss of other memorable labours.
Of causes and kinds thereof.

Blundevile.

The causes of sickness be unnatural affects, or evil dispositions preceding sickness; and provoking the same, which of themselves do not hinder the actions of the body, but by means of sickness coming betwixt. Of causes, some be called internal, and some external. Internal be those that breed within the body of the Beast, as evil juice. External be those that chance outwardly to the body, as heat, cold, or the hissing of a Serpent, and such like. In knowing the cause of every disease, consider the chief skill of the Farriar. For unless he knoweth the cause of the disease, it is impossible for him to cure it well and skillfully. And therefore I with all Farriers to be diligent in seeking to know the causes of all diseases, as well in the parts similar, as instrumental, and to know whether such causes be simple, or compound; for as they be simple or compound, so do they engender simple or compound diseases.

Of sickness, what it is, and how many general kinds there be; also with what order the diseases of Horses are herein declared. And finally, of the four times, belonging to every sickness.

Sickness is an evil affect contrary to nature, hindering of it self, some action of the body. Of sickness there be three general kinds, whereof the first consisteth in the parts similar; the second in the parts instrumental; and the third in both parts together. The first kind is called of the Latinis Intemperies, that is to say, evil temperature, which is either simple or compound. It is simple, when one quality only doth abound or exceed too much, as to be too hot, or too cold; it is compound, as when many qualities do exceed, as when the body is too hot and too dry, or too cold and too moist. The second kind is called Mala constringitio, that is to say, an evil state or composition, which is to be considered, either by the shape, number, quantity, or right of the member, or part evil affected or diseased. The third kind is called Unitas soluto, that is to say, the loosening or division of the unity, which as it may chance diversely, so hath divers names accordingly; for if such solution or division be in a bone, then it is called a fracture; if it be in any fleshie part, then it is called a Wound or Ulcer; in the veins, a Rupture; in the sinews, a Convulsion or Cramp; and in the skin, an Excoration.

Again, of diseases, some be called long, and some sharp and short, called of the Latinis, Morbi acuti, which be perillous and do quickly kill the body. The long, do tarry longer by it. Yet moreover, there is sickness by it self, and sickness by content: Sickness by it self, is that which being in some member hindereth the action thereof by it self. Sickness by content, is derived out of one member into another, through the neighbourhhood and community that is betwixt them: as the pain of the head which cometh from the stomach.

Thus the learned Physitians which write of Mans body, do divide sicknesses. But Abiturim writing of Horse-leach craft, faith of that sickness, or rather malady (for he termeth it using that word as a general name to all manner of diseases that be in a Horse) there be four kinds, that is to say, the moist malady, the dry malady, the malady of the joints, and the malady betwixt the flesh and the skin. The moist malady is that which we call the Glanders. The dry malady is an incurable consumptio, which some perhaps would call, the mourning of the chein, but not rightly, as shall appear unto you hereafter. The malady of the joints comprehendeth all griefs and torments that be in the joints. And the malady betwixt the flesh and the skin, is that which we call the Scab. Unto which four kinds of maladies, Vegetim addeth three others, that is, the Farces, the paine of the Reins or Kidneys, and the cankered Mangines, most commonly called of the old writers the Leprosie; and to maketh seven kinds of maladies, under which all other particular diseases are comprehended.
Of the Horse.

Again, Laurentius Rufin, ut in ather kind of division of sicknes. Of Horses diseaues, faith he, some be natural, and some accidental. The natural be thoae that do come either through the ex-
cesse, or lack of engendering seed, or by error of nature, in misforming the young, or cfe by 
some defect of the dam or fire, in that perhaps they be diseaued within, and have their feed 
corrupted.

The accidental diseaues be thoae that come by chance, as by surfeiting, of cold, heat, and 
such like thing. But forasmuch as none of these writers do follow their own divisions, 
or handle the parts thereof accordingly: to avoid their confusion, and to teach plainly: I 
thought good and profitable therefore to use this my own division and order here fol-
lowing.

First then, of diseaues some be inward, and some be outward. The inward be thoae that breed 
within the Horses body, and are properly called maladies and diseaues, whereof some do occupy all the 
whole body, and some particular parts or members of the body.

Of those that occupy all the body, and not be accident to any private member, I do first 
treat, as of Aues, of the Puffling, and such like, and then of those that be incident to every 
particulur member, beginning at the head, and so proceed orderly throughout all the members; 
even down to the sole of the foot, observing therein no night as I can, the 1lef first order that Galen 
useth in his book, De loco male affectu, declaring what manner of diseaue it is, and how it is called in 
English, and also in Italian, because the Kings lyable is never without Italian Riders, of whom our 
Farriars borrowed divers names, as you shall perceive hereafter. Then the cauas whereof it pro-
cceeds, and the signes how to know it, and finally, the cure and diet belonging to the same; and 
because I find not inward diseaues enow to answer every part of the body, I do not let to interlace them 
with outward diseaues incident to those parts, yen rather, I leave out no outward diseaue belonging to 
any particular member, and to the intent you may the better know to what diseaues or forances 
every part or member of the Horses body is most commonly subjext. And note by the way, that I 
call those outward diseaues that proceed not of any inward cauas, but of some outward cauas, as 
when a Horse is shoudered by means of some outward cauze, or his back galled with the faddle, or 
his fides spurgalled, or his his hoof cloid with a nail, which properly may be called forances or 
griues.

Thirdly, I talk of those diseaues as well outward as inward, that may indifferently chance in any 
part of the body, so as Impofumes, Cankerous Ulcers, Wounds, Fieules, Burns, Bruifings, 
Breaking of bones, and such like.

Fourthly, because most diseaues are healed either by letting of blood, by taking up of veins, by 
purgation, or else by cauteration, that is to say by giving the fire: I talk of those four neceffary 
thingseverally by themselvess and finally I shew you the true order of paring and fiousing all man-
ner of hoofs, according as the diversity of hoofs require: and to the intent you may the better un-
derstand me, you have the perfect shapes of all neceffary fhooes, plainly fet forth in figures before 
your eyes. Thus much touching mine order which I have hitherto observed.

Now it is neceffary to know, that to every diseaue or malady, belongeth four feveral times, that is 
to say, the beginning, the increafing, the flate, and declination, which times are diligently to be 
oberved of the Farriar, because they require divers applying of medicinc: for that medicinc which 
was meet to be ued in the beginning of the diseaue, perhaps is not to be ued in the declination 
thereof: and that which is requisite, and very needful, to be applyed in the flate of chiefit of the 
diseaue, may be very dangerous to be ued in the beginning. And therefore the Farriar ought to be 
a man of judgement, and able to discern one time from another, to the intent he may apply his 
medicines rightly. Hither of caues and sicknes in general. Now it is also meet, that we speak in 
general of signes whereby sicknes is known.

Sicknes according to the learned Phýtitions, is known four manner of wanes. First, by infepa-
Blandevile.
urable or subfultant accidents, as by the shape, number, quality, and fight of the part or 
member diseaued. For if it be otherwise formed, or more or leffe in number or quantity, or 
else otherwise placed then it ought to be, then it is not well. Secondly, sicknes is known by alte-
ration of the quality, as, if it be too hot, or too cold, too moift, or too dry. Thirdly, when the 
action of any member is hurt or letted, as when the eye-fight is not perfect, it is a manifest fign that 
the eye is urill affected or fick. Likewise, when there breedeth no good blood in the body, it is an 
evident token that the Liver is not well. Fourthly, sicknes is known by the excrements that come 
from the Beaf; as by dung or flate; For if his dung be too strong of fent, full of whole Cornes, or of 
Wormes, too hard, or too foft, or urill coloured, it is a token that he is not well in his body; so like-
wise if his flate be too thick, or too thin, too white, or too red, it becometh some furfe, raw diges-
tion, or else some grie in his reins, bladder or flones. But Vesgius faith, that it is best known, whe-
ther a Horfe be fick or not, or toward sicknes, by these signes here following; for if he be more 
flow and heavie in his trotting, or galloping, harder of Spur then he was wont to be, or spredeth 
his litter abroad with his feet, often tumbling in the night feafon, fetching his breath short and vi-
olently, loud ftruifing in the Nofe, and caufing our vapors at his Noftrils, or lyeth down immediately 
A 2

after
after his provender, or maketh long draughts in his drinking, or in the night seaseon is now down, and now on foot, or if in the next morning he be very hot in his patterns, or betwixt his cars, or that his ears hang more then they are wont to do; again, if his eye light be dim, and his eyes hollow in his head, his hairs standing right up, and his flanks hollow and empty, whenever two or three of these signes do concur together, then it is to be thought, faith Virgiinius, that the Horie is not well, and therefore he would have him immediately to be separated from his companions that he whole, and to be placed by himself untill his disease be perfectly known and cured, and especially if it be any contagious disease.

I have seen divers Farriars here in England to use that for the trial of a Horie's sicknes, which I never read in any Author, that is, to feel his bones, whether they be hot or cold, and to smell at his nostrils, and so by the favour thereof to judge what sicknes the Horie hath. Truly I think that no evil way, if they can discern with their fende of smelling, the diversity of favours, the one cometh out of his Nostrils, and then apply the saine to the humours whereof such favours be bred, and so orderly to seek out the original cause of his sicknes. But I fear me, that more Farriars fumble with our judgement, then with such judgement, and no marvell why, ift that few or none be learned, or have been brought up with skillfull Matters. But from henceforth I truull that my travall will cause such Farriars as can read, and have some understanding already, to be more diligent in seeking after knowledge then they have been heretofore, whereby they shall be the better able to serve their Country, and also to profit themselves, with good fame, whereas now for lack of knowledge they incur much slander.

Of the Fever and divers kinds thereof in a Horie.

Blondelvile.

I Think it will seem strange unto some, to hear that a Horie should have an Ague or Fever, but it was not strange unto the men of old time, as to Abfritus, Hierocles, Xenophus, Vegetius, and such like old Souldiers, thereby experimented in Horie's griefs. A Fever, according to the learned Phyfitians, is an unnatural and inmoderate heat, which proceeding first from the heart, spreadeth itself throughout all the arteries and veins of the body, and so leteth the aethons thereof.

Of Fevers there be three general kinds, whereof the first, is that which breedeth in the spirits, being inflamed or heated more then their nature requireth. The second breedeth in the humors, being also distempered by heat. The third in the firm parts of the body, being continually hot. What spirits and humors be, hath been told you before in the keepers Office. Of these three general kinds do spring many other special kinds, as Quotidian, Tertians, Quartans, Fevers Heftick, and very many others, whereunto mans body is subject, whereof none of my Authors do treat, unless Virgiinius, who speakeith somwhat of a Fever Quotidian, of a Fever continual, and also of a Fever accidental. He speakeith alfo of Summer, Autumn, and Winter Fevers, without making any great difference betwixt them, more then that one is worse then another, by reason of the time and seasion of the year. So that in effect all is but one Fever. Wherefore according unto Abfritus opinion, I will briefly shew you first the causes whereof it proceeds, and then the signes how to know it, and finally how to cure the same.

The Fever changeth sometimne by surfeiting of extreme labour or exercise, as of too much travelling, and especially in hot weather, of too swift gallopping and running, and sometimne by extreme heat of the Sun, and also by extreme cold of the aire, and sometimne it breedeth of crudity or raw digestion, which many times happeneth by over greedy eating of sweet green corn, or of such provender as was not thoroughly dried or cleansed; for after such greedy eating, and specially such meat, never followeth perfect digestion. The signes to know a Fever be these. The Horie doth continually hold down his head, and is not able to lift it up, his eyes are even blown fo as he cannot easily open them: yea and many times they be watering, the flesh of his lips and of all his body is lufh and feeble, his bones hang low, his body is hot, and his breath is very hot and strong; he standeth weakly on his legs, and in his going draweth them lastly after him, yea he cannot go but very softly, and that flaggering here and there he will lie down on his side, and is not able to turn himself, or to wallow; he foraketh his meat both hay and provender, and is defirous of nothing but of drink, which, as Abfritus faith, is an affured token of a Fever: he also sleepeeth but little. The cure and diet. Let him bloud in the face and temples, and alfo in the palat of his mouth, and the first day give him no meat, but only warm drink, and that by little and little. Afterward give him continually grasse, or else very sweet hay wet in water, and let him be kept warm, and sometime walk him up and down fair and softly in a temperate air, and then let him reit, and when you see that he begins to amend, give him by little and little at once Barley fare fitted and well sodden, and alfo mundified, that is to say, the husk pulled away, like as when you blanch Almonds.
Of the Horse.

Of divers sorts of Fevers according to Vegetius, and first of that which continueth but one day.

The Fever of one day called by the Greek name Ephemerer, or else by the Latin name Diaria, changeth many times through the rathmes and small direction of the keeper, or some other that letteth not to ride a Horfe uneasurably, either before or after watering, whereby the Horfe afterward in the stables entret into an extreme heat, and fo falleth into his Fever, which thou shalt know partly by his watrhim and bloud-fothten eyes, and partly by his short violent and hot breathing and panting. Moreover, he will forfake his meat, and his legs will wax thife and feeble. The cure Let him have reft all the next day following, and be comforted with warm meat, then let him be walked up and down fair and softly, and by little and little brought again to his former eflate.

Of the Fever continuall.

The Fever continuall, is that which continueth without intermission, and is called in Italian by the Latin name Febris continua, which springeth of some inflammation or extreme heat, bred in the principal members or inward parts, about the heart, which is known in this fort. The Horfe doth not take his accustomed reft, whereby his fleshe doth fall away every day more and more, and sometimes there doth appear hot inflamations in his flanks, and above his withers. The cure; Purge his head by sifting into his Noftris Mans urine, or the Water of an Ox that hath been refled a certain time, to the intent such water may be the stronger, and then give him the drink written in the next Chapter.

Of the Fever taken in the Autumn, that is to say, at the fall of the leaf.

If a Horfe chance to get a Fever at the fall of the leaf, caufe him immediately to be fet bloud in the neck vein, and also in the third furrow of the roof of his mouth, and then give him this drink; Take of Jermander four ounces, of Gum-dragant, and of dryed Roses, of each one ounce, beat them all into fine powder, and put them into a quart of Ale, adding thereunto of Oil-olive four ounces, and of Hony as much, and give it the Horfe lukewarm.

Of the Fever in Summer season.

A Fever taken in Summer feafton is much worfe then in any other time, and especially if it be taken in the Dog days, for then the accidents be more furious. The Signes be thefe, his arteries will beat evidently, and he will fheed his feed when heflate, and his going will be unorderly. The cure; Let him blood in a vein that he hath in his hinder hanch, about four fengers beneath the fundamental, or if you cannot finde that vein, let him blood in the neck vein, toward the withers, and if it be needful you may also give him this drink; Take the juicer of a handful of Parfley mingled with Gum-dragant, with Enfens, and a few Damask roches, beaten all into fine powder, and then put thereunto a fufficient quantity of Ale made fweet with Hony.

Of the Fever in Winter.

Or the Fever in Winter, it shall be good to take the powder of the drugs laft mentioned, and with a quill or reed, to blow it up into his left noftir to make him to necfe. It shall be good alfo to let him bloud in the neck vein, and in the palat of the mouth, and then give him one of thefe drinks here following: Take of Ireos fix ounces, of Round Pepper one ounce, of Bay berries, and of the feed of Smallage, of each one ounce, and let him drink them with sodden Wine. Or else take a pinte of good Milk, and put therein of Oyle four ounces, of Saffron one scrupe, of Myrthe two scruples, of the feed of Smallage a spoonful, and make him drink that: or make him this drink; Take of Aroflohoch, otherwise called round Hartwort, one ounce, of Gentian, of Hyfop, of Wormwood, of Sootherwood, of each one ounce, of dry fat figs fix ounces, of the feed of Smallage three ounces, of Rue a handful, boil them all in a clean Veffel with River Water, untill the third part be confumed, and when you fee it look black and thick, take it from the fire, strain it, and give the Horfe to drink thereof lukewarm.

As touching his diet, let his water be alwayes lukewarm, wherein would be put a little Wheat meal, and remember to give him no meat fo long as his fit continueth. And because in all Agues it is good to quicken the natural heat of the Horfe, by rubbing and fretting his body; it shall not be amifs in some fair day to use this Friction, called of the ancient writers Aetaraphie, which is made in this fort. Take of Damask Roses one pound, of old Oyl a pinte, of strong Vinegar a pinte and a half, of Mints and Rue beaten into powder, of each one ounce and a half, together with one old dry Nut, beat them and mingle them together, then being strained and made lukewarm, rub and chafe all the Horfes body therewith against the hair, untill he beginnew to sweat, then let him up in the warmeft place of the stable, and cover him well.
The History of Four-footed Beasts.

Of the Fever which cometh of raw Digestion, or of Repulsion.

You shall know if the Fever proceedeth of any such cause, by these signs here following. The Horse will blow at the nose, more then he is accustomed to do, seemeth to fetch his winds only at his nose, and his breath will be short, hot and dry. You shall see his flanks walk, and his back to beat. The cure: Cause him to let blood abundantly in the head and palpate of his mouth, and by injecting warm Vinegar in the morning into his nostrils, force him to sneeze: and if he be cold, let his fundament be soaked, or else give him a Glyster to ease the pain in his head. And as touching his diet, give him but little provender or hay, neither let him drink much nor often, but buttwixt times. But in any wise let him be well rubbed and chafed, and that a good while together, and if you use the Friction declared in the last Chapter before in such fort as there is said, it shall do him very much good.

Of the Fever accidental coming of some Viles in the mouth or throat.

The Horse not being well kept and governed, after that he hath been let blood in the upper parts; yet, and also besides that of his own nature is subject unto the dissillation in his thorax or parts thereabout, the painful swelling or Ulcer whereof, causeth the Horse to fall into a grievous Ague. Whereof, besides the former remedies apt to purge humors, it shall be necessary also, to let him blood in the vein of the head, and in the palpate of his mouth, and to be short, in all those places where the disease causeth most grief. And if the Horse be for one pained as he cannot swallow down his meat, it shall be good to give him lukewarm water mingled with Barley meal, or Wheat meal, and beside that, to make him swallow down seven fops topped in Wine one after another, at one time: some use at the second time to dip such fops in sweet Sallet Oil. Thus far.

Of the Pellisent Ague.

It seemeth by Laurentius Ruffius, that Horses be also subject to a Pellisent Fever, which almost incurable, is called of him Infirmus Epidemialis, that is to say, a Contagious and pestiferous disease, whereof there dyed in one year in Rome above a thousand Horses, which as I take it came by some corruption of the air, whereunto Rome in the chief of Summer is much subject, or else corrupt humors in the body engendered by unkind food, by reason perhaps, that the City was then perilled with more Horse-men then there could be conveniently harbored or fed. Laurentian himself rendreth no cause thereof, but only writeth Signes how to know it, which he saith: The Horse holdeth down his head, eateth little or nothing, his eyes watereth, and his flanks do continually beat. The Cure: First give him this Glyster, Take of the pulp of Colonnaunts one ounce, of D'arganum one ounce and a half, of Centaury and Wortwood, of each one handful, of Cepharos half an ounce, boil them in Water, then being strained, diftill thereon of Geroussdamum six ounces, of Salt an ounce and a half, and half a pound of Ol-olive, and minifie it lukewarm with a horn, or pipe made of purpose. Make also this Plaster for his head; Take of Squilla five ounces, of Elder, of Cepharos, of Maltard feed and of Euforium, of each two ounces, diftill the same in the juice of Dafodill, and of Sage, and lay it to the Temples of his head next unto his ears; or else give him any of these three drinks following, Take of the salt Tracle two or three ounces, and diltemper it in good Wine, and give it him with a horn; or else let him drink every morning the space of three days, one pound or two of the juceye of Elder roots; or else give him every morning to eat, a good quantity of Quenum hair, called of the Lattus, Cepharum Venetiis, newly and freshly gathered, but if it be old, then boil it in Water, and give him the decocotion thereof to drink with a horn.

Martin's opinion and experience touching a Horses Fever.

Though Martin have not seen so many several kinds of Fevers to chance to Horses, yet he confesseth that a Horse will have a Fever, and that, you shall know it by these signes: For after the Horse hath been sick two or three days, if you look upon his tongue you shall see it almost raw and scall, with the heat that comes out of his body, and he will shake and tremble, reel and stagger when his fit cometh, which fit will keep him his due hours.—both of coming and also of continuance, unless you prevent it by putting the Horse into a heat, which would be done so soon as you see him begin to tremble, either by riding him, or lying upon his legs, and by chafing him up and down in the stable, until he leave shaking, and then let him be kept warm, and stand on the bit the space of two hours, that done, you may give him some hay, by a little at once; and give him warm water, with a little ground malt twice a day, the space of three or four days, and once a day wasth his tongue with Alomwater, Vinegar & Saxe But if you see that all this prevents not, then purge him with this drink, after that he hath fainted all one night; Take of Aloe one ounce, of Agrick half an ounce, of Licors and Annis seeds, of each a dram beaten to powder, and let him drink it
with a quart of white wine likewarme, and made sweet with a little hony in the morning falling, and let him be chafed a little after it, and be kept warm, and suffered to stand on the bit meatlefe two or three hours after, and he shall recover his health again quickly.

Of sicknes in general, and the Fever.

In general, sicknes is an opposite foe to nature, warring against the agents of the body and mind, seeking to confound those actions which uphold and maintain the bodies strength and lively-ood. Who coveteth to have larger definition of sicknes, let him read Vegetius, Rufius, or excellent Master Blundevile, who in that hath been admirably well-deferving painfull. For mine one part; my intent is to write nothing more then mine own experience, and what I have approved in Horfes diseases most available: and first of the Fever or Ague in a Horfe, though it be a diseafe seldom or not at all noted by our Mechanical Horfe Farriars, who cure many times what they know nor, and kill where they might cure, knew they the caufe: yet I have my self seen of late (both by the demonstrate opinions of others better learned, and by the effects of the diseafe) one or two Horfes which, I dare avouch were mightily tormented with a Fever; though divers Leecles had thereof given divers opinions, one saying it was, the Bots, by reason of his immoderate largen-ment: another affirmed him to be bewitched, by reason of great shaking, haemervs, and swea-ting: but I have found it and approved it to be a Fever, both in effect, nature, and quality; the cure whereof is thus: for the original caufe of a Fever, is hurt, breeding putrefaction in the blood; then when his shaking begineth, take three new laid Eggs, break them in a dish; and beat them together, then mix thereto five or six spoonfuls of excellent good Aqvevitae, and give it him in a horn, then bile him, and in three or four Cour, chase him till his shaking cease, and he begin to sweat: then let him up and cloath him warm, and during the time of his sicknes, give him no water to drink, but before he drink it, boil therein Mallowes, Sorrel, Purlau, of each two or three handfuls.

As for his food, let it be fodder Barly, and now and then a little Rice in the sheaf to cleanse and purge him, chiefly if he be dry inwardly and grow coffive. This I have proved uneffectualls for this diseafe, and also much available for any other inward sicknes proceeding either of raw digestion, too extream riding, or other surfeit. Divers have written diversely of divers Agues, and I could pre-SCRIBE receipts for them, but since I have not been experimented in them all, I mean to omit them, intending not to exceed mine own knowledge in any thing.

Of the Pestillence.

T he Pestillence is a contagious diseafe, proceeding, as Pelagian faith, sometime of overmuch labour, heat, cold, hunger, and sometime of sudden running after long reft, or of the reten-tion or holding of hale or urge, or of drinking cold water whiles the Horfe is hot and sweating; for all these things do breed corrupt humors in the Horfes body, whereof the Pestillence doth chiefly proceed, or else of the corruption of the air, poisoning the breath whereby the Beasts should live, which also happeneth sometime of the corruption of evil vapors and exhalations that spring out of the earth, and after great floods or earthquakes, and sometime by means of some evil diis-tribution or influence of the Planets, corrupting sometime the plants and fruits of the earth, and sometime divers kind of Cattle, and sometime both Men, Women and Children, as we daily see by experience. It seemeth that this evil or mitchief in times past came suddenly, without giving any warming, for none of mine Authors doth declare any signes how to know whether a Horfe hath this diseafe or not, but only affirm, that if one Horfe do die of it, all his fellows that bear him company will follow after, if they be not remedied in time: so that as far as I can learn, the sudden death of one or two first, must be the only mean to know that this diseafe doth reign. And the remedy that they give is this, first separate the whole from the sick; yes, and have them clean out of the air of those that be dead, the bodies whereof, as Vegetius faith, if they be not deep buried, will infect all the rest. And let them bloud as well in the neck, as in the mouth, and then give them this drink, Take of Gentian, of Aritisloch, of Bay berries, of Myrhe, of the scraping of Ivory, of each like quantity, beat them into fine powder, and give as well to the sick as to the whole, whom you would preserve from this contagion, every day a spoonful or two of this powder in a pinte of good Wine, so long as you shall see it needful. This medicine before rehearsed, is called of the ancient writers Diapente, that is to say, a composition of five simples, and is praised to be a soveraigne medicine and prefervative against all inward diseases, and therefore they would have such as travell by the way, to carry of this powder alwayes about them.

There be many other medicines which I leave to write, because if I should rehearse every mans medicine, my book would be infinite: for my part would ufe no other then that before expressed, or else Wine and Treacle only.
The History of Four-footed Beasts.

Of the Diseases in the Head.

Blundevile.

The head is subject to divers diseases according to the divers parts thereof: for in the panicles or little fine skins cleaving to the bones, and covering the brain, do most properly breed head-ach and Migrain. Again, in the substance of the brain, (which in a Horse is as much in quantity as is almost the brain of a mean Hog) do breed the Frenzie, madnefs, flying evil, the Palifie and forgetfulness. Finally, in the ventricles or cells of the brain, and in those conducents through which the spirits animal do give feeling and moving to the body, do breed the Turnick or flaggers, the Falling-evil, the Night-mare, the Apoplexy, the Palifie, and the Convulsion or Cramp, the Catar or Rhume, which in a Horse is called the Glaunders: but first of Head-ach.

Of Head-ach.

The Head-ach either cometh of some inward causes: as of some choleric humor, bred in the panicles of the brain, or else of some outward cause, as of extream heat or cold, of some blow, or of some violent favour. Eumelus faith, that it cometh of raw digestion: but Martin faith most commonly of cold: the signes be thefe: the Horse will hang down his head, and also hang down his ears: his fight will be dim, his eyes swollen and waterish; and he will forsake his meat. The cure. Let him bloud in the palat of his mouth: also purge his head with this perfume; Take of Garlike flarks a handful, all to broken in short pieces, and a good quantity of Frankincence, and being put into a chafing-dish of fresh coals, hold the chafing-dish under the Horfes noftils, as fo the fume may ascend up into his head: and in using him thus once or twice, it will make him to caft at the nofe, and fo purge his head of all fith. Pelaginus faith, that it is good to pour into his noftills Wine, wherein hath been loderd Enfeburn, Centaury, and Frankincence.

Of the Frenzy and Madness of a Horse.

The learned Phyfitians do make divers kindes, as well of Frenzie, as of Madnefs, which are not needful to be recited, fith I could never read in any Author, nor learn of any Farriar, that a Horfe were fubject to the one half of them. Abfiyris, Hierocles, Eumelus, Pelaginus, and Hippocrates, do write simply de fuave & rabie: that is to fay, of the madness of a Horfe. But indeed, Vegetis in his fecond Book of Horfe-leach-craft, feemeth to make four mad passions belonging to a Horfe, intituting his Chapters in this fort, de Appiofus, de Frenzie, de Cardiacia, de Rabisus, the effects thereof, though I fear me it will be to no great purpose, yet to content such as perhaps have read the Author as well as I my felf, I will here briefly rehearfe the fame.

When some naughty bloud (faith he) doth strike the film or pannicle of the brain, in one part only, and maketh the fame grievously toake, then the beft become Aphiufum; that is to fay, as it feemeth by his own words next following, both dull of minde and of fight. This word Aphiufum is a strange word, and not to be found again in any other Author, and because in this passion, the one side of the head is only grieved, the Horfe turneth round, as though he went in a Mill. But when the poyfon of fuch corrupt bloud doth infect the mid brain, then the Horfe becometh Prantick, and will leap and fling, and will run against the walls. And if fuch bloud filleth the veins of the ftomach, or breast, then it infecteth as well the heart as the brain, and caufeth alienation of minde, and the body to fweat, and this difeafe is called Ephiufus Paffiocardiaca, which if Equis Appiosus chance to have, then he becometh Rabisus, that is to fay, flark-mad. For faith he, by overmuch heat of the liver and bloud, the veins, and arteryes of the heart are choked up, for grief and pain whereof the Horfe biteth himfelf, and gaaweth his own fith.

Of two forts of mad Horfes, I believe I have seen my felf here in this Realm. For I faw once a black Sweatland Horfe (as I took him to be) in my Lord of Hundons table at Hundon, coming thicker by chance with my Lord Merley, which Horfe would stand all day long biting of the manger, and eat little meat or none, sufferinge no man to approach unto him, by which his doings, and partly by his colour and complixion, I judged him to be vexed with a melancholy madnefs, called of the Phyfitians Manias, or rather Melancholia, which cometh of a corrupt Melancholy, and filthy bloud or humor, sometime spread throughout all the veins of the body, and sometimes perhaps remaining only in the head, or elfe in the fpleen, or places next adjoyning. The other mad Horfe was a Roan of Maufer Abeles, Maufer of the Jewell house, which with his teeth crufted his Maufers right forefinger in pieces, whilst he offered him a little Hay to eat, whereby he loft in a manner the ufe of his whole hand, to the great grief of all his friends, and alfo of all the Mauers, which were wont to be much delighted with fuch paffing sweet mufick as that his fine quawering hand could sometime make upon divers Instruments, but especially upon the Virginals.

This Horfe I fay, though he could eat his meat, drink his drink, and sleep: yet if he were never fo little offended, he would take on like a spirit, and both bite and strike at any man that came nigh him: yea and would bite himfelf by the shoulders most terribly, pulling away lumps of ftiofe, fo broad as a mans hand: and whensoever he was ridden, he was fain to be mulfed with a mulfell of iron, made of purpole to keep him from biting either of his Rider or of himself, which no doubt proceeded of some kinde of frenzy or madness, whereunto the Horfe was fubjeft; by means that hot bloud
blood (as I take it) abounded over much in him. But now as touching the cures, signes, and cure of Horses madness, you shall hear the opinion of old Writers: for Martin never took such cure in hand. 

Abstinent and the other Authors before mentioned, say, that the madness of a Horse comes either by means of some extreme heat, taken by travelling, or long standing in the hot Sun, or else by eating over many stiches, or by some hot blood referring to the puncies of the brain; or through abundance of choler remaining in the veins; or else by drinking of some very unwholesome water. The signes be these, he will bite the manger and his own body, and run upon every man that comes nigh him, he will continually shake his ears, and stare with his eyes, and some at the mouth: and also, as Leporescath faith, he will forsake his meat and pine himself with hunger.

The care. Cause him to let blood in his legs abundantly, which is done (as I take it) to divert the blood from his head. Notwithstanding it were not amiss, to let him blood in the neck and breit veins. Then give him this drink: take the roots of wide Cowcumber, and boil it in harde Red Wine, and put thereunto a little Nutre, and give it him with a horn Luke warm: or if you can get no Cowcumber, then take Rue and Mints, and boil them in the Wine: it were not amiss also to add thereunto a handful of black Eleborus, for that is a very good herb against madness. 

Eumelius faith, that if you give him mans dung in Wine, to drink three mornings together, it will heal him: also to take of black Eleborus two or three handfuls, and boil it in a sufficient quantity of strong Vinegar, and therewith rub and chafe both his head, and all his body once or twice a day; for the other his head is rubbed, the better, and oftentimes is very profitable to all his body. Some again would have the skin of his body to be pierced in divers places with an hot iron, to let out the evil humors: but if none of all this will prevail, then the last remedy is to geld him of both his foemes, or else of one at the least; for either that will heal him, or else nothing. As touching the diet and usage of a mad Horse, the Authors do not agree; for some would have him kept in a close, dark and quiet house, void from all noisie, which as Abstinent faith, will either make him madder, or else kill him out of hand. His diet would be thin, that is to say, without any provender, and this day that he is let blood, and receiveth his drink, they would have him eat until then, and then to have a warm mash of Barley meals: ye, me thinks it were not amiss to feed him only with warm mathes and hay; and that by a little at once, until he be somewhat recovered.

Another of the Head-ach. 

He Head-ach, as most are opinioned, proceedeth of cold and raw digestion: the cure is: Take a Goose feather anointed with Oyl-de-bay, and thrust it up into the Horse's nostrils, to make him sneeze: then take a wreath of Pease-draw or websay, and putting fire thereunto, hold it under the Horse's nose, so as the smoke may ascend up into his head; then being thus perfumed, take a knife and prick him in the palate of the mouth, so that he may lick up and chew his own blood, which done, have great care in keeping his head warm, and doubt not his recovery.

Of the Sleeping-evil.

This is a disease forcing the Beast continually to sleep, whether he will or not, taking his memory and appetite clean away, and therefore is called of the Physitians Lethargy, it proceedeth of abundance of phlegm moistening the brain overmuch. It is easy to know it, by the continual sleeping of the Horse. The cure of this disease according to Pelagonius, Vegetius, and others, is in this fort: Let him bleed in the neck, and then give him this drink: Take of Camomile and Mother-wort, of each two or three handfuls, and boil them in a sufficient quantity of water, and put thereunto a little Wheat-braint, Salt and Vinegar, and let him drink a pint of that every day, the space of three or four days together. It is good also to perfume and chafe his head, with Thyme and Deputyroyal foddens together in Vinegar, or with Brimstone and feathers burned upon a chafing-dish of coal under his nose, and to provoke him to sneeze, by blowing Pepper and Pyretre beaten to powder, up into his nostrils: yea and to anoint the patate of his mouth, with Honey and Mutter mingled together, and in his drink, which would be always warm water, to put Parsley seed, and Fenel seed, to provoke urine. His legs also would be bathed, and his hooves filled with Wheat-braint, Salt, and Vinegar, foddens together, and laid to so hot as he may endure; and in any case suffer him not to sleep, but keep him waking and stirring, by continual crying into him, or pricking him with some sharp thing, that cannot pass through the skin, or else by beating him with a whip, and this doing he shall recover.

Another of the Sleeping-evil.

This Sleeping-evil in a Horse, differeth nothing from that which the Physitians call the Lethargy in men, for it provoketh the Horse to sleep continually, without danger, robbing his memory, and appetite of their qualities: the knowledge thereof is easily known by his darkness, and the cure in this fort: Let one stand by him, and either with fearful noise or despair, so force keep him waking; then let him bleed under the eyes, and in the neck, and then take a leaf or two of the bell Tobacco, which being dried and beaten to powder, with a quill blow it up into his nostrils, and give him to drink Vinegar, Salt, and Mutter mingled well together, to which if you put a little
Honey, it shall not be amiss; and also when he drinketh any water, put thereto either Fennel-seeds, Aniseseeds or Pepper.

**Of a Horse that is taken.**

**Blundevile.**

A Horse is said to be taken, when he is deprived of his feeling and moving, so as he is able to stir no manner of way, but remaineth in such state and form, as he was taken in; which disease is called of the Phyfitians by the Greek name Catalepsis, and in Latin, Depreceptio, or Congelatio; and of Vegetius, Sideratio; which also called those Beasts that have this disease Funemta sideratitis. The Phyfitians say, that it cometh of abundance of phlegm and choler mixt together, or else of melancholy blood, which is a cold dry humor oppressing the hinder parts of the brain. But Vegetius faith, that it comes of some extreme outward cold, striking suddenly into the empty veins, or some extreme heat or raw digestion; or else of some great hunger, caused by long fasting. It is easie to know by the description before mentioned.

As touching the cure, Vegetius faith, that if it come of cold, then it is good to give him to drink one ounce of Lasterpitium, with Wine and Oyl mixt together, and made luke-warm: if of heat, then to give it him with Water and Honey: if of crudity, then to heat him by fasting: if of hunger, then by feeding him well with Peafe. But Martin faith, that this disease is called of the French men Surprins, and it cometh (as he faith) most chiefly of cold taken after heat, and he writeth a Horse that is thus taken, to be cured in this fort. First to be let bloud on both sides of the breast, and then to be put in a heat either by continual ftringing and mollyenting him; or else if he will sitt by no means, then to bury him all fave the head in a warm dunghill, and there to let him ly till his limbs have some feeling. And after you boe him, it shall be good to give him this drink: Take of Malmifie three pintes, and put thereunto a quartern of Sugar, and some Cinnamon and Cloves, and let him drink it good and warm, and before till he be perfectly whole, let him be kept warm, and often exercized and walked up and down in the stably, and thinly dietted, and drink nothing but warm water, wherein if you put some Fennel and Parsly seed, to provoke him to urine, it shall be the better. And if he cannot dung, let him be raked, and have a Giyter made of the broth of Malows and fresh Butter.

**Another of a Horse that is taken.**

**Markham.**

A Horse which is bereft of his feeling, moving or sifting, is said to be taken, and in sooth fo he is, in that he is arrested by fo wilful an disease; yet some Farryers, not well understanding the ground of the disease, confeft the word taken, to be stricken by some Planet, or evill spirit, which is false; for it procedeth of too great abundance of phlegm and choler, symbolized together: the cure is thus: Let him bloud in his furp veins, and his breath veins, and then by foulding him in abundant number of cloaths, drive him into an extrem heat, during which time of his sweating, let one chafe his legs with Oyl-de-bay; then after he hath sweat the space of two hours, abate his clothes moderately; and throughly after he is dry, anoint him all over with Oyl Petrolium, and in twice or thrice drefling him he will be found.

**Of the Staggers.**

**Blundevile.**

His is a dizziness of the head, called in Latin, Vertigine; and of the Italians, as I remember, Capifìna. It comes of some corrupt blood, or gros and tough humors oppressing the brain, from whence procedeth a vaporous spirit, disolved by a weak heat, which troublith all the head. The figues be thefe; dimnes of sight, the reeling and staggering of the Horse, who for very pain will thrust his head against the wall, and forfake his meat. The cure according to Martin is thus:

Let him bloud in the temple veins, and then with a knife make an hole an inch long over-throw his fore-head, hard underneath his fore-top, and raife the skin with a Corner, thoufing it upward towards the head-stale a good handful, and then put in a tent dipit in Turpentine and Hogs greafe molten together, renewing the tent every day once until it be whole, and do the like upon the rige of the rump; but me thinks it were better to do the like, in the powl of his head, or nape of his neck, for if thoufl the evil humors have both ways the easier and speedier paffage: and as touching his diet, let him have continually warm drink, and maffes; and once a day be walked up and down fair and foltly to exercize his body.

**Of the Staggers.**

**Markham.**

The Staggers is a dzy disease, breeding frenzy in a Horse, which if it be not instantly helped, is mortal: the cure is thus: Let him bloud in the temple veins, and then apply to his temples cloth wet in the juice of Garlike, and Aqua vitae mixt together: if you cruel Garlike, and put it in his ears, it is excellent; or if you hit his fore-head, and loofening the skin from the bone, taint it with Turpentine and Salte-oyl, it will undoubtedly help him.
Of the Horse.

275

Of the Falling-evil.

His is a kind of Convulsion or Cramp, called of the Latines by the Greek name Epilepsia; in Italian, il morbo caduco, depriving the Beast at certain times, and for a certain space of the use of feeling, hearing, and seeing, and of all the other senses. And although it be a disease hath been seldom seen to chance unto Horces of this Countrie, yet it appeareth by Abulfus, and also by Vegetius, and divers others, that Horces be subject thereunto. For Abulfus writing to his friend Tiberus Claudius faith, that unto Horces changeth many times the Falling-ficknes. The signs whereof are these: The Horse will fall down suddenly, partly through the resolution of his members, and partly through dilution of his fiewes, and all his body will quiver and quake, and sometime he will foam at the mouth. Vegetius again writeth in this fort: By a certain course of the Moon Horces and other beasts many times do fall, and dy for a time as well as men. The fignes whereof are these: Being fallen, their bodies will quiver and quake, and their mouths will foam, and when a man would think that they would dy out of hand, they rise suddeuly up and fall to their meat. And by feeling the griffe of their nostrils with your finger, you shall know whether they will fall often or not: for the more cold the griffe be, the oftener, and the les cold it be, the feldomer they will fall. The cure:

Let him bloud abundantly in the neck veins, and within five days after, let him bloud again in the temple veins, and let him hand in a warm and dark flable, and anoint all his body with comfortable Ointments, and his head and ears with Oyl of Bay, and liquid Pitch or Tar, mingled together. And also put some thereof into his ears, and then make a Biggen for him of some folt warm skin, as of a Sheeps skin, or elfe of Canvas ruffed underneath with Wood, and make him this purging drink. Take of Radish roots two ounces, of the root of the herb called in Latine, Panax or Panse, and of Scammony, of each one ounce, beat all these things together, and boil them in a quart of Honey, and at sundry times as you shall see it needful, give him a good spoonefull or two of this in a quart of Ale luke-warm, whereunto would be put three or four spoonnefulls of Oyl. It is good also to blow the powders of Motherwort, or of Pyrethrum, up into his nostrils; and if the disease do continue still for all this, then it shall be needful to pierce the skin of his fore-head in divers places with a horizon, and to let out the humors oppreffing his brain.

Of the Night-mare.

This is a disease oppreffing either Man or Beast in the night feaon when he sleeppeth, so as he cannot draw his breath, and is called of the Latines, Incubus. It cometh of a continual crudity or raw digestion of the stomack, from whence grofs vapours ascending up into the head, do oppreffe the brain, and all the fensitive powers, so as they cannot do their office, in giving perfect feeling and moving to the body. And if this disease chancing often to a man, be not cured in time; it may perhaps grow to a worfe michief, as to the Falling-evil, Middens, or Apoplexy. But I could never learn that Horces were subject to this disease, neither by relation, nor yet by reading, but only in an old English Writer, who sheweth neither caufe nor fignes, how to know when a Horfe hath it, but only teacheth how to cure it with a fond foolish charm; which because it may perhaps make you gentle Reader to laugh, as well as it did me, for recreation fake I will here rehearfe it. Take a firit tone that hath a hole of his own kinde, and hang it over him, and write in a bill:

In nomine patris, &c.
Saint George our Ladier Knight,
He walked day, so did he night,
Until he her found,
He her beat, and be her bound;
Till truly her trouth he him plught,
That she would not come with the night;
There as Saint George our Ladier Knigbt,
Named was three times, Saint George.

And hang this Scripture over him, and let him alone: with such proper charms as this is, the false Fryers in times past were wont to charm the money out of plain folks purses.

Of the Apoplexy.

The Apoplexy, is a disease depriving all the whole body of sense and moving. And if it deprive but part of the body, then it is called of the Latines by the Greek name Parafaia, in our tongue a Pallie. It proceeds of cold, grofs, and tough humors, oppreffing the brain all at once, which may breed partly of crudities and raw digestion, and partly by means of some hurt in the head, taken by a fall, stipe, or otherwife. As touching Apoplexy, few or none writing of Horfe-leetch-craft do make any mention thereof: but of the Pallie Vegetius writeth in this maner: A Horfe (faith he) may have the Pallie as well as a man, which is known by these fignes: He will go grovelling and fidding like a Crab, carrying his neck awry, as if it were broken, and goeth crookedly with his legs, beating his head against the wals, and yet forfaketh not his meat nor drink, and his provender seemeth moit and wet. The cure. Let him bloud in the temple vein, on the contrary fide of the wrying of his neck, and anoint his neck with comfortable Oyment, and splent it with splents of wood to make
The History of Four-footed Beasts.

it stand right, and let him stand in a warm stable, and give him such drinks as are recited in the next chapter following. But if all this profiteh not, then draw his neck with a hot iron on the contrary side: this is to say, on the whole side, from the neather part of the ear down to the shoulders, and draw also a good long strike on his temple, on that side, and on the other temple make him a little slit in this fort *, and from his reins to his mid back, draw little lines, in manner of a ragged flaffe, and that will heal him.

Of the Cramp or Convulsion of the Sinews and Muscles.

A Convulsion or Cramp, is a forcible and painful contraction or drawing together of the sinews and muscles, which do happen sometime through the whole body, and sometime but in one part or member only. And according as the body may be diversly drawn, so do the Physicians, and also mine Authors that write of Horfe-leech-craft, give it divers names. For if the body be drawn forward, then they call it in Greek, Empyrolhiasin; in Latin, Tenfor ad anteriora. And if the body be drawn back, it is called in Greek, Opjiftatons; in Latin, Tenfoad posteriora.

But if the body be flark and ftrait, bowing neither forward, nor backward, then it is called simply in Greek, Tetanoe; in Latin, Diufenio or Rigor: which names also are applied to the like Convulsions of the neck. Notwithstanding, Vegetius writing of this disease, entitleth his chapters de Raborofo, a strange team, and not to be found again in any other Author. A Convulsion, as I said before, may chance as well to one part or member of the body, as to the whole body: as to the eye, to the skin of the fore head, to the roots of the tongue, to the jaws, to the lips, to the arm, hand or leg: that is to say, whensoever the finew or muscle serving to the moving of that part, is evill affected or grieved. Of which Convulsions, though there be many divers caufes: yet Hippocrates brings them all into two: that is to say, into unfines and emptines: for when a Convulsion proceedeth either of some inflammation of superfluous eating or drinking, or for lack of due purgation, or of overmuch rest and lack of exercise, all such caufes are to be referred to repletion or unfines. But if a Convulsion come by means of over-much purging or bleeding, or much watching, extreme labours, long failing; or by wounding or pricking of the linew, then all such caufes are to be referred unto emptines. And if the Convulsion proceed of unfines, it chanceth suddenly, and all at once; but if of emptines, then it cometh by little and little, and leisurely.

Besides thies kinds of Convulsions, there is also changing many times in a mans fingers, legs and toes, another kind of Convulsion, which may be called a windly Convulsion, for that it proceeds of some gros or tough vapore, entred into the branches of the finews, which maketh them to swell like a Lute string in moist weather, which though it be very painful for the time, yet it may be soon driven away, by chafing or rubbing the member grieved with a warm cloth. And this kind of Convulsion or Cramp chanceth also many times to a Horfe hinder-legs standing in the stable.

For I have seen some of my fel, that have had one of their hinder-legs drawn up with the Cramp almost to the belly to fitle and hard, as no man hath been able to fitle it, neither could the Horfe himself let it down to the ground of a long feaon, which I think might be soon remedied: first by continual chafing, fretting, or rubbing his legs with a good wiife, and then by tying up the other hinder-leg, or else the foreleg on the fore fide, whereby he should be forced to let down the pained leg. Thus far I have discussed of the Convulsion of finews, and of the caufes thereof, according to the opinions of the learned Physicians. Now I will briefly feue you the caufes, fignes, and cure thereof, according to the doctrine of mine Authors that write of Horfe-leech-craft.

Abhursis fithe, that this disease doth come, either by driving the Horfe into a sweat when he halt, or for that he hath trodden upon some nail, or by taking cold after journeying and sweating in Winter fason, whereby his lips are clung together, or by long lying and reft after sweating, whereby the finews of his fore-legs be numbed, or by having some tripe of his privy members; or by long travelling in the cold Mountains, where Snow and Ice doth abound. For Themenius writeth, that coming out of Peanies, with the King and his Army, and paffing over the Mountains to go into Italy, there fell such abundance of Snow, as not only many Souldiers dyed, fittin' fhill on their Horfes backs, with their Weapons in their hands, being so flark and fline, and cleaving fo faft to their Saddles, as they could not easily be pulled out of them: but alfo divers Horfes in their going were so numbed as they could not bow their legs: yea and fome were found flark dead, flanding fhill on their feet, and few Horfes or none escap'd at that time free from this Convulsion of fnews, infomuch that Themenius his own Horfe which he loved dearly, was fore vexed therewith. The fignes to know whether a Horfe be troubled with the Convulsion in the finews or not, be these:

His head and neck will be fo fline and flark, as he can bow in no manner of way, his ears will stand right up, and his eyes will be hollow in his head, and the fleshy parts thereof in the great corners, will be turned backward; his lips will be clung falt together, fo as he cannot open his mouth, and his tongue so numbed as he can neither eat nor drink; his back-bone and tail will be fo fline, as he cannot move it one way nor other, and his legs fo fline, as they will not bow, and being laid he is not able to rife, and specially on his hinder-legs, but falie down on his buttocks, like a Dog when he fitteth on the ground; and by means of the Convulsion in his back, his bladder also for neighbour-hood fake, fuffereth, whereby the Horfe cannot fline, but with great pain. The cure.
Of the Horse.

Put him into a sweat, either by burying him alive the head in some warm dunghill; or if he be a Horse of price, carry him into a hot house, where is no smoke, and let him sweat there. Then anoint all his body, head, neck, legs, and all, with Oyl of Cypresses, and Oyl of Bay mingleth together. Or else with one of these Ointments: Take of Hogs grease two pounds, of Turpentine half a pound, of Pepper beaten in powder one dram, of new Wax one pound, of old Oyl two pound; boil all these together, and being made very warm, anoint all his body therewith. Or else with this Ointment: Take of new Wax one pound, of Turpentine four ounces, of Oyl-de-bay as much, of Opopanax two ounces, of Deers sweats and Oyl of Storax, of each three ounces, melt all these together, and anoint all his body therewith.

It is good also to bath his head with the decoction of Fitches, or else of Lupins, and make him this drink: Take twenty grains of long Pepper, finely beaten into powder, of Cedar two ounces, of Nutre one ounce, of *Laserpitium* as much as a Bean, and mingle all these together with a sufficient quantity of white Wine; and give him thereof to drink a quart every morning and evening, for the space of three or four days; or else this drink: Take of Opopanax two ounces, of Storax three ounces; of Gennez three ounces, of Mann Sucarry three ounces, of Myrthe one scruple, of long Pepper two scruples, give him this with old Wine: or make him a drink of *Laserpitium*, Cumin, Amiie leed, Fenigreek, Bay-berries, and old Oyl.

In old time they were wont to let him bleed in the Temples, which *Abstrus* doth not allow saying, that it will cure the sinews of his lips to dry up, so as the Horfe being not able to move them, shall pine for hunger. As touching his diet, give him at the first warm mashes, and such soft meat as he may easily get down, and wet Hay, bringing him to harder food by little and little. And in any cafe, let him be kept very warm, and ridden or walked one day to exercise his legs and limbs. *Thebesius* cured his Horfe, as he faith, by placing him in a warm stable, and by making a clear fire without any smoke round about him; and the Horfe not being able to open his jaws of himself, he cau’d his mouth to be opened, and put therein tops dipt in a confection called *Emivin conditum*, and also anointed all his body with a Medicine or Ointment called *Acipum* (the making whereof hereafter followeth) dissolved in Cypresses Oyl, which made him to fall into a sweat, and being before half dead and more, brought him again to his feeling and moving, so as he did ride and eat his meat.

Of the Cramp or Convulsions of the Sinews or Muscles.

*A Convulusion or Cramp, is a forcible drawing together of the sinews, sometimes universally over the whole body; as I have seen one Horfe in my life time, and sometimes but in one part or member, as I have known and helped divers. These Convulsions have two grounds, namely, either natural, or else accidental; natural, as proceeding of cold windy humors ingenered in the body, and dispers’d into those parts, work then the effects of grievance. Accidental, is by wounding or prickling the sinews, of which immediately ensueth a Convulusion. If it be natural, and the disease generally dispers’d; then the cure is thus: Dig a great deep hole in some old dung-hill, and there bury him all save the head, so as he may sweat there for the space of two hours at the least; then take him out, and anoint his body all over with Nerve oil, Turpentine, and Deers sweats mingled together on the fire and bath his head in the juice of Rue and Camomile.

Then give him to drink old Ale brewed with Cinnamon, Ginger, Fenigreek and long Pepper; of each three ounces. As for his diet, let it be warm mashes, fodder wheat and hay, thorough carded with a pair of Wool-cards: let him be kept very warm and aired abroad once a day at the least.

If this Convulusion be but only in one member, then it is sufficient, if every day with hard ropes of hay or straw you rub and chafe that part exceedingly, and apply there to a little quantity of the Oyl of Pepper. If the Convulusion be accidental, proceeding of some hurt, whereby the sinew is wounded or prick’d; then shall you incommodiously take up the sinew so wounded, searching the wound with great dexterity, and cut it clean in funder; then shall you endeavour to heal up the fame with ungues, plattiers and balms, as shall be hereafter mentioned in the chapters of wounds and ulcers, of what kinde or nature soever.

Of the Cold in the Head.

ACcording as the cold which the Horfe hath taken, is new or old, great or small, and also according as humors do abound in his head, and as such humors be thick or thin, so is the disease more or les dangerous. For if the Horfe calleth little or no matter out of his nose, or hath no very great cough; but only heavy in his head, and perhaps lightly cougheth now and then, it is a sign that he is stopp’d in the head, which we were wont to call the pofe. But if his head be full of humors concealed by some extreme cold taken of long time past; and that he calleth foul filthy matter out at the nose, and cougheth grievously; then it is a sign that he hath either the Glaunders, or the Strangulation, mourning of the chen, or Conquamation of the Lungs. For all such diseases do breed for the most part of the rheume or distillation that cometh from the head. Of the cures thereof we leave to speak, until we come to talk of the diseases in the throat, minding here to shew you how to heal the pofe or cold before mentioned.
The History of Four-footed Beasts.

MARTIN faith, it is good to purge his head, by perfuming him with Frankincense, and also to provoke him to neeze, by thwarting two Goose feathers dip't in Oyl-de-bay, up into his nostrils, and then to trot him up and down half an hour, for these feathers will make him to cough immediately at the nose. LAURENCE Rusius would have him to be perfumed with Wheat, Penny royal, and Sage sodden well together, and put into a bag so hot as may be; which bag would be so close fastened to his head, that all the favour thereof may ascend up into his nostrils, and his head also would be covered, and kept warm: and to provoke him to neeze, he would have you to bind a soft clout anointed with Sope, or else with Butter and Oyl-de-bay unto a stick, and to thrust that up and down into his nostrils, so high as you may conveniently go, and let him be kept warm, and drink no cold water. Yet, it shall be good for three or four days, to boil in his water a little Fenigreek, Wheat meal, and a few Anise-leeds. And every day after that you have purged his head by perfuming him, or by making him to neeze, cause him to be trott'd up and down, either in the warm Sun, or else in the house half an hour, which would be done before you water him, and give him his provender.

Of the Cold in the Head.

MARKHAM.

The pox or cold in a Horse, is the most general disease that happeneth, and is the easiest perceived, both by flopping, rating in the nose, and coughing, the cure thereof is in this sort: If it be but newly taken by some careless regard, and immediately perceived, you shall need no other remedy, but to keep him warm every morning and evening after his water, to ride him forth, and to trot him up and down very fast till his cold break, and then gently to gallop him a little, which moderate exercise with warm keeping will quickly recover him again; but if the cold hath had long residence in him, and still encreaseth, then you shall give him this drink three days together: Take of strong Ale one quart, of the best Treakle fix penny-worth, of long Pepper and grains, of each as much beaten to powder, of the juice of Garleek two spoonfuls, boil all these together, and give it the Horse to drink; so warm as he may suffer it, and then trot him up and down by the space of an hour or more, and keep him warm, giving him to drink no cold water.

Of the diseases of the Eyes.

BLANDEVILLE.

Horses eyes be subject to divers griefs, as to be waterish or blood-shotten, to be dim of sight, to have the Pin and Web, and the Haw, whereof some comes of inward causes, as of humors refracting to the eyes, and some of outward, as of cold heat, or stripe.

Of Weeping or Watering Eyes.

T HIS, as Laurensius Rusius faith, may come sometimetime by confluence of humors, and some- time by some stripe, whose cure I leave to recite, because it doth not differ from Martinus experience here following: Take of Pitch, Rofen and Mslick, a like quantity, melt them together. Then with a little stick, having a clout bound to the end thereof, and dip in them, amongst the temple veins on both sides, a handful above the eyes, as broad as a Telfern, and then clap unto it immediately a few flocks of like colour to the Horse, holding them close to his head with your hand, until they stick fast unto his head, then let him bloud on both sides, (if both sides be infected) a handful under the eyes. Rusius also thinketh it good to wash his eyes once a day with pure pure white wine, and then to blow therein a little of Tartarum, and of Pumice stone, beaten into fine powder.

Of Watering Eyes.

MARKHAM.

Watering eyes come most commonly in some stripe or blow, and the cure is thus: Lay unto his temples a plaster of Turpentine and Pitch molten together, then wash his eyes with white Wine, and afterward blow the powder of burnt Allum into the same.

Of Blood-shotten Eyes, also for a blow or itching, and rubbing in the Eyes.

BLANDEVILLE.

MARTIN never used any other medicine, then this water here following, wherewith he did always heal the forefaid griefs: Take of pure Rose water, of Malmie, of Fenelin water, of each three spoonfuls, of Tutia as much as you can easilly take with your thumb and finger, of Cloves a dozen beaten into fine powder; mingle them together, and being Luke-warm, or cold if you will, wash the inward part of the eye with a feather dip't therein, twice a day until he be whole. Rusius faith, that to blood-shotten eyes it is good to lay the white of an Egge, or to wash them with the juice of Celidony.
Another of Blind-shotten Eyes, or any other sore Eye, coming of rhume or other humor.

Or any sore eye make this water: Take of the water of Eye-bright, of Rose water, and Malmsey, of each three spoonfuls, of Cloves six or seven been to fine powder, of the juice of Houfeleek two spoonfuls; mix all these together, and wash the Horse's eyes therewith once a day, and it will recover him.

Of dimness of sight, and also for the Pin and Web, or any other spot in the Eye.

If the Horse be dim of sight, or hath any Pearl growing in his eye, or thin film covering the ball of his eye, then Buffia would have you take of Puttyce stone, of Tartarum, and of Salt Gumme, of each like weight, and being beaten into very fine powder, to blow a little of that in his eye, continuing to to do every day once or twice, unill he be whole. Martin faith, that he always used to blow a little Sandivoir into the eye once a day, which simple he affirmeth to be of such force, as it will break any Pearl or Web in short space, and make the eye very clear and fair. Buffia amongst a number of other medicines, praised most of all the powder of a black Flint stone.

Of the Pin and Web, and other dimness.

Or to cure the Pin, Web, Pearl Film, or other dimness, use this means following: Take of Sandivoir, the powder of burnt Allum, and the powder of black Flint-stone, of each like quantity: and once a day blow a little thereof into the Horse's eye, and it will wear away such imperfect matter, and make the eye clear.

Of the Hav, called of the Italians, Unghia degl' occhi.

This is a gristle covering sometime more then one half of the eye. It proceedeth of gros and tough humors, descending out of the head; which Hav, as Martin faith, would be cut away in this fort: First, pull both the both eye-lids open with two several chords, stitching with a needle to either of the lids. Then cast hold of the Hav with another needle and thred, and pull it out so far as you may cut it round the breadth of a penny, and leave the black behind. For by cutting away too much of the fat and black of the eye, the Horse many times becomes bear-eyed. And the Hav being clean taken away, squirt a little white Wine or Beer into his eye.

Another of the Hav.

A Hav is a gros gristle growing under the eye of a Horse, and covering more then one half of his sight; which if he be suffereth will in short time perish the eye: the cure is thus: Lay your thumb under his eye, in the very hollow, then with your finger pull down the lid, and with a sharp needle and thred take hold of the Hav, and pulling it out, with a sharp knife, cut away the compass of a penny, or more, that done, wash the eye with a little Beer.

Of Lunatick Eyes.

V Egetius writeth De ocula Lunatice, but he thorowth neither cause nor signes thereof, but only faith that the old men teared it fo, because it makesthe eye sometime to look as though it were covered with white, and sometime clear. 

Martin faith, that the Horse that hath this disease, is blind at certain times of the Moon, inmuch that he feeth almost nothing at all during that time, and then his eyes will look yellowish; yes, and somewhat reddish, which disease according to Martin, is to be cured in this fort: First use the plaster mentioned before in the chapter of Waterish or Weeping eyes, in such order as is there prescribed; and then with a sharp knife make two flits on both sides of his head an inch long, somewhat to wards the nose, a handful beneath the eyes, not touching the vein: and with a corneet hoofen the skin upward the breadth of a great, and thrust therein a round piece of leather, as broad as a two penny piece, with a hole in the middle to keep the hole open, and look to it once a day, that the maker may not be stopped, but continually run the space of ten days, then take the leather out, and heal the wound with a little flux dipte in the salve here following: Take of Turpentine, of Honey, of Wax, of each like quantity, and boil them together, which being a little warmed, will be liquid to leave your purpose, and take not away the plasters from the temples until they fall away of themselves, which being fallen, then with a small hot drawing Iron, make a star in the midst of each temple vein where the plaster did ly. Which star would have a hole in the midst made with the button end of your drawing Iron.
The History of Four-footed Beasts.

Another of Lunatick or Moon-eyes.

Markham.  Of thefe Lunatick eyes, I have known divers: they are blinde at certain times of the Moon, they are very red, fiery, and full of him: they come with over-riding, and extraordinary heat and fury, the cure of them is thus: Lay upon the Temples of his head a plai ster of Pitch, Rotten, and Mallick molten together very exceeding hot: then with a little round Iron made for the purpose, burn three or four holes an inch or more underneath his eyes, and anoint those holes every day with Hogs grease, then put it in his eyes every day with a little Honey, and in short time he will recover his sight.

Of the Canker in the Eye.

Blundeville.  This cometh of a rancck and corrupt bloud defending from the head into the eye. The signes. You shall see red pimples, some small, and some great, both within and without upon the eye-lids, and all the eye will look red, and be full of corrupt matter. The cure according to Martin is thus: First, let him bloud on that side the neck, that the eye is grieved, the quantity of a potle. Then take of Roch Allum, of green Copperas, of each half a pound, of white Copperas one ounce, and boil them in three pintes of running water, until the half be consumed, then take it from the fire, and once a day witch his eye with this water being made luke-warm with a fine lenen cloth, and cleanse the eye therewith fo oft as it may look raw, continuing thus to do every day until it be whole.

Of diseases incident to the Ears, and Poll of the head, and first of an Impoſtum in the Ear.

Impoſtumes breed either by reafon of some blow or bruising, or elfe of evil humors congealed in the ear by some extrem cold: the signes be apparent, by the burning and painful swelling of the ear and part thereabout. The cure according to Martin is in this fort. First, rape the Impoſtume with this plaister. Take of Linseed beaten into powder, of Wheat floure, of each half a pinte, of Honey a pinte, of Hogs greafe, or Barrows greafe one pound. Warm all these things together in an earthen pot, and fir them continually with a flat fliek or flife, until they be thoroughly mingled and incorporated together, and then spread some of this plaister, being warm, upon a piece of lenen cloth, or soft white leather, fo broad as the swelling, and no more, and lay it warm unto it, and let it remain one whole day, and then renew it with fresh Ointment, continuing fo to do until it break; then lance the fore, fo that it may have passage downward, and tent it to the bottom with a tent of flax dipt in this Ointment: Take of Niel Resanum, of Oyl Olive and Turpentine, of each two ounces, and mingle them together, and make him a dipt of Canvas to clofe in the fore, fo as the tent with the Ointment may abide within, renewing the tent once a day until it be whole. But if the Horfe have pain in his ears, without any great swelling or Impoſtumation, then thrust in a little black Wooll dipt in Oyl of Camomile, and that will heal it.

Of the Poll evil.

This is a disease like a Fiftula growing betwixt the ears and the poll or nape of the neck, and proceedeth of evil humors gathered together in that place, or elfe of some blow or bruise, for that is the weakenest and tenderest part of all the head, and therefore soonest offended, which rude Carters do little consider, whilest in their fury they beat their Horfies upon that place of the head with their whip-flacks; and therefore no Horfe is more subject to this disease than the Cart-horse; and this disease cometh most in Winter fea{on. The signes. You shall perceive it by the swelling of the place, which by continuance of time will break it self, rottling more inward then outward, and therefore is more perilous if it be not cured in time; and the sooner it be taken in hand, the better. The cure according to Martin is thus: If it be not broken, rape it with a plaister of Hogs greafe laid unto it fo hot as may be; and make a biggen for the Poll of his head to keep it from cold; which biggen would have two holes open, fo as his ears may stand out; and renew the plaister every day once, until it break, keeping the fore place as warm as may be.

And if you fee that it will not break so soon as you would have it, then there as it is fo{set and most meetel to be opened; take a round hot Iron, as big as your little finger, and sharp at the point, and two inches beneath that soft place, thrust it in a good deepnefs upward, fo as the point of the Iron may come out at the ripeſt place, to the intent that the matter may descend downward, and come at the nearest hole, which would be always kept open; and therefore tent it with a tent of flax dipt in Hogs greafe, and lay a plaister of Hogs greafe alo upon the same, renewing it every day once the space of four days, which is done chiefly to kill the heat of the fire.

Then at the four days end, take of Turpentine half a pound, clean wash'd in nine findy waters, and after that throughly dry'd, by thrithling out the water with a flife on the dishes side, then put thereunto two yolks of Egges, and a little Saffron, and mingle them well together: that
The Vives be certain kernels growing under the Horse's ear, proceeding of some rank or corrupt blood referring to the place, which within are full of little white grains, like white salt kernels. The Italians call them Pisole, which if they be suffered to grow, Laurensius in his faith, that they will grievously pain the Horse in his throat, so as he shall not be able to swallow his meat, nor to breathe. They be easy to know for, they may be felt, and also seen: The cure according unto Martin, is in this fort: First draw them down in the midst with a hot iron, from the root of the ear so far as the tip of the ear will reach, being pulled down: and under the root again draw two strikes on each side a broad arrow head; then in the midst of the first lance them with a lancet, and taking hold of the kernels with a pair of pinfons, pull them so far forward, as you may cut the kernels out without hurting the vein; that done, fill the hole with white Salt. But Hieroles would have them to be cured in this fort: Take a piece of Spunge soaked well in strong Vinegar, and bind that to the fore, renewing it twice a day until it hath rotted the kernels; that done, lance the nearest part where the matter lyeth, and let it out, and then fill it up with Salt finely brayed, and the next day wash all the filth away with warm water, and anoint the place with Honey and Finch-flowers mingled together. But beware you touch none of the kernels with your bare finger, for fear of venoming the place, which is very apt for a Filitula to breed in.

An other of the Vives.

The Vives be certain kernels growing under the Horse's ear, which come of corrupt blood, the cure is diversly spoke and written of; but this is the bell mean which I have tried, that if you finde the kernels to enflame and grieve the Horse, take a handful of Sorrel, and lay it in a Baw-dock leaf, and roll it in the hot embers like as a Warden; then being taken out of the fire, apply it so hot as may be to the fore part, suffering it to ly thereunto the space of a day and a night, and then renew it, till such time that it ripen and break the fore, which it will in short space do. When it is broken, and the vitle matter taken away, you shall heal up the fore place with the yolk of an Egge, half a spoonful of Honey, and as much Wheat-flowes as will serve to make it thick, plaster-wise, which being bound thereunto, will in three or four days heal the same.

Of the Cankerous Ulcer in the Nose.

This disease is a fretting humor, eating and consuming the flesh, and making it all raw within, and not being holpen in time will eat through the gristle of the nose. It cometh of corrupt blood, or else of sharp humors ingendered by means of some extreme cold. The figures be these: He will bleed at the nose, and all the flesh within will be raw and filthy finking favours, and matter will come out at the nose. The cure according to Martin is thus: Take of green Copperas, of Allum, of each one pound, of white Copperas one quartern, and boil these in a pottle of running water, until a pinte be consumed, then take it off, and put thereunto half a pinte of Honey; then cause his head to be holden up with a drinking flaske, and squirt into his nostrils with a squirt of brafs, or rather of Elder, some of this water being luke-warm, three or four times one after another, but betwixt every squirtning, give him liberty to hold down his head, and to blow out the filthy matter, for otherwise perhaps you may choke him. And after this it shall be good also without holding up his head any more, to wash and rub his nostrils with a fine clayt bound to a white ficks end, and wet in the water aforefaid; and serve him thus once a day until he be whole.

Of bleeding at the Nose.

I have seen Horsetf my self; that have bled at the nose, which have had neither fore nor ulcer in their nose, and therefore I cannot choose, but say with the Phyfitians, that it cometh by means that the vein which endeth in that place, is either opened, broken or fettered. It is opened many times by means that blood aboundeth too much, or for that it is too fine, or too subtil and so perceth through the vein. Again, it may be broken by some violent strain, cut or blow. And finally, it may be fretted or gnawn through, by the sharpens of some blood, or else of some other humor contained there-in. As touching the cure, Martin faith, it is good to take a pinte of red Wine, and to put therein a quartern of Bole Armony, beaten into fine powder, and being made luke-warm, to pour the one half thereof the first day into his nostril that bleedeth, causing his head to be holden up, and drinking the liquor may not fall out, and the next day to give him the other half. But if this previalleth not, then
The History of Four-footed Beasts.

Even for my part would cause him to let blood in the breast vein, on the same side that he bled, at several times; then take of Frankincense one ounce, of Aloes half an ounce, and beat them into powder, and mingle them thoroughly with the whites of Eggs, until it be so thick as Honey, and with half Hares' hair, thrust it up into his nostril, filling the hole so full, as it cannot fall out; or else fill his nostrils full of Affes dung, or Hogs dung, for either of them is excellent good to restrain any flux of blood.

Of the bleeding at the Nose, or to staunch Flux of blood in any sort.

Markham.

I have known many Horses in great danger by bleeding, and I have tryed divers remedies for the same, yet have I not found any more certain then this: take a spoonful or two of his blood, and put it in a Sawer, and let it upon a chafing dith of coals, and let it boil till it be all dryed up into powder, then take that powder, and if he bleed at the nose, with a Cane or Quill blow the same up into his nostrils, if his bleeding come of any wound or other accident, then into the wound put the same powder, which is a present remedy. New Horfe-dung, or earth, is a present remedy, applied to the bleeding place; and so are Sage leaves bruised and put into the wound.

Of the diseasen in the Mouth, and slight of the bloody Rits, or Chops in the Palatn of the Month.

Blundeville.

This disease is called of the Italians, Papatina; which as Laurentius Ruffus faith, cometh by eating horse-dung or provender that is full of prickings feeds, which by continual prickings and fretting the furrows of the mouth do cause them to ranke, and to bleed corrupt and thinking matter, which you shall quickly remedy, as Martin faith, by washing first the fore places with Vinegar and Salt, and then by anointing the same with Honey.

Of the Bladders in an Horse's mouth, which our old Farriers were wont to call the Gigs. The Italians call them Fronzelle.

Markham.

Some Horses will have bladders like paps growing in the inside of their lips, next unto their great teeth, which are much painful: the cure whereof is thus: Take a sharp pair of thers, and clip them away close to the gum, and then wash the fore place with running water, Allum and Honey boiled together, till it be whole.

Of the Lamps.

Markham.

The Lamps, called of the Italians, Lampaeus, proceedeth of the abundance of blood, resorting to the first furrow of the mouth. I mean that which is next unto the upper fore-teeth, causing the said furrow to swell so high as the Horses teeth, so as he cannot chew his meat, but is forced to let it fall out of his mouth. The remedy is to cut all the superfluous flesh away, with a crooked hot iron made of purpose, which every Smith can do.

Another of the Lamps.

Markham.

The Lamps is a thick spongy flesh, growing over a Horse upper teeth, hindering the conjuncti- on of his chaps, in such sort that he can hardly eat: the cure is as followeth. Cut all that naughty flesh away with a hot iron, and then rub the fore well with Salt, which the most ignorant Smith can do sufficiently.

Of the Canker in the mouth.

Blundeville.

This disease, as Martin faith, is a rawness of the mouth and tongue, which is full of blisters, so as he cannot eat his meat. Which proceeds of some unnatural heat coming from the stomach. For the cure whereof, take of Allum half a pound, of Honey a quarter of a pinte, of Columbine leaves, of Sage leaves, of each a handful; boil all these together in three pints of water, until a pinte be consumed, and wash the fore places therewith so as it may bleed, continuing so to do every day once until it be whole.
Of the Horse.

Another of the Canker in the mouth.

This disease proceedeth of divers causers, as of unnatural heat of the stomac, of foul feeding, or of the ruff or venom of some bit or snaffle, undiscreeitly lookt unto. The cure is thus: Wash the fore place with warm Vinegar, made thick with the powder of Allum, two or three dayes together, every time until it bleed, which will kill the poison and vigor of the exulcerated matter: then make this water; Take of running water a quart, of Allum four ounces, of Hony four or five spoon-fulls, of Woodbine leaves, of Sage leaves, and of Columbine leaves, of each half a handful, boil all these together till one half be consumed, then take it off, and every day with the water warmed, wash the fore until it be whole.

Of the heat in the mouth and lips.

Sometime the heat that cometh out of the stomac breedeth no Canker, but maketh the mouth hot, and causeth the Horse to forake his meat. The cure whereof, as Martin faith, is in this fort: First, turn up his upper lip, and jagge it lightly with a launcet, fo as it may bleed, and then wash both that and all his mouth and tongue with Vinegar and Salt.

Of the tongue being hurt with the bit or otherwise.

If the tongue be cut or hurt any manner of way, Martin faith, it is good first to wash it with Allum water, and then to take the leaves of black Bramble, and to chop them together small with a little Lar'd, that done, to binde it up in a little clout, making it round like a ball, then having dippt the round end in Hony, rub the tongue therewith: continuing fo to do once a day until it be whole.

Of the Barbles or paps underneath the tongue.

Here be two little paps, called of the Italian, Barbole, growing naturally (as I think) in every Horfes mouth underneath the tongue, in the neather jawes, which if they grow to any length, Russif faith, that they will hinder the Horfes feeding, and therefore he and Martin also would have them to be clipt away with a pair of sheers, and that done, the Horfes mouth to be washed with Vinegar and Salt.

Of the pain in the teeth and gums, of the Wolfs teeth, and Jaw teeth.

A Horse may have pain in his teeth, partly by defcent of humor from his head, down into his teeth and gums, which is to be perceived by the rankness and swelling of the gums, and partly having two extraordinary teeth, called the Wolfs teeth, which be two little teeth growing in the upper jawes, next unto the great grinding teeth, which are so painful to the Horse, as he cannot endure to chaw his meat, but is forced either to let it fall out of his mouth, or else to keep it still half chawed, whereby the Horse prospereth not, but waxeth lean and poor, and he will do the like also when his upper Jaw-teeth be so far grown as they overhang the neather Jaw-teeth, and therewith be so sharp, as in moving his jawes they cut and rave the insides of his cheeks, even as they were rafed with a knife. And first as touching the cure of the pain in the teeth, that cometh by means of some distillation: Vegetum faith, it is good to rub all the outside of his gums with fine chalk and strong Vinegar mingled together, or else after that you have washed the gums with Vinegar, to strew on them of Pomegranate plies. But me thinks that beides this, we were not amisse to hopp the temple veins, with the planter before mentioned, in the Chapter of weeping and waterish eyes. The cure of the Wolfs teeth, and of the Jaw-teeth, according to Martin, is in this fort: First cause the Horse head to be tyed up to some rafter or post, and his mouth to be opened with a cord, fo wide as you may easily see every part thereof; then take a round strong iron toole, half a yard long, and made at the one end in all points like unto the Carpenters gouge, wherewith he maketh his holes to be bored with a wimble or auger, and with your left hand set the edge of your tool at the foot of the Wolfs teeth, on the outside of the jaw, turning the hollow side of the tool downward, holding your hand readily, fo as the tool may not slip from the aforefaid tooch: then having a mallet in your right hand, strike upon the head of the tool one pretie blow, and thersewith you shall loose the tooth, and cause it to bend inward: then slaying the middle of your tool upon the Horfes neather jaw, wrench the tooth outward, with the inside or hollow side of the tool, and thrust it clean out of his head: that done, serve the other Wolfs tooth on the other side in like manner, and fill up the empty places with Salt finely brayed. But if the upper Jaw-teeth do also overhang the neather teeth, and fo cut the inside of his mouth as is aforefaid, then keeping his mouth still open, take your tool and mallet, and pare all those teeth shorter, running along them even from the first unto the laft, turning the hollow side of your tool towards the teeth, fo shall not the tool cut the inside of his cheeks, and the back or round side being turned towards the foresaid cheeks, and that done wash all his mouth with Vinegar and Salt, and let him go.
Why the diseases in the neck, withers, and back, be declared here before the diseases in the throat.

Having hitherto spoken of the diseases incident to a Horse's head, and to all the parts thereof, natural order requireth that we should now descend into the throat, as a part next adjacent to the mouth. But forasmuch as the diseases in the throat have not only affinity with the head, but also with the lungs and other inward parts, which are many times grieved by means of distillation coming from the head, and through the throat: I will speak of the diseases incident to the neck, withers, and back of a Horse, to the intent that when I come to talk of such diseases, as Rheumes and distillations do cause, I may discourse of them orderly without interruption.

Of the Crick in the neck.

Because a Crick is no other thing then a kind of Convulsion, and for that we have spoken sufficiently before of all kindes thereof in the Chapter of Convulsion, I purpose not here therefore to trouble you with many words, but only shew you Ruffinopinion, and also Martin experience therein. The Crick then called of the Italians, Senna, or Lutero according to Ruffin, and according to Martin is, when the Horse cannot turn his neck any manner of way, but hold it still forth right, insomuch as he cannot take his meat from the ground but by times, and that very slowly; Ruffin faith, it cometh by means of some great weight laid on the Horse's shoulders, or else be overmuch drying up of the fines of the neck. The cure whereof, according to Martin, is in this fort. Draw him with a hot iron from the root of the ear on both sides of the neck, through the midle of the same even down to the breast, a draw deep, so as both ends may meet upon the breast, then make a hole in his forehead, hard under the foretop, and thrust in a Coronet upward between the skin and the flesh a handful deep, then put in a Goose feather, doubled in the midle and anointed with Hogs grease to keep the hole open, to the intent the matter may run out the space of ten days. But every day during that time, the hole must be cleansed once, and the feather also cleansed and fresh anointed, and so put in again. And once a day let him stand upon the bit one hour or two, or be ridden two or three miles abroad, by such an one as will bear his head, and make him to bring it in. But if the Crick be such as the Horse cannot hold his neck straight, but clean awry, as I have seen divers my self: then I think it not good that the Horse be drawn with a hot iron on both sides of the neck, but only on the contrary side. As for example, if he bend his head toward the right side, then to draw him as is aforesaid only on the left side, and to use the rest of the cure as is above said, and if need be, you may splent him also with handfome flaves meet for the purpose to make his neck stand right.

Of Wens in the neck.

A Wen is a certain kineyll like a tumor of swelling, the inside whereof is hard like a gristle, and spongy like a skin full of wrets. Of Wens, some be great, and some be small. Again, some be very painful, and some not painful at all. The Physitians say, that they proceed of groffe and vicious humors; but Vegetine faith, that they chance to a Horse by taking cold, or by drinking of waters that be extreme cold. The cure according to Martin is thus. Take of Mallowes, Sage, and red Nettles, of each one handful, boil them in running waters, and put thereunto a little Butter and Honey, and when the Herbs be soft, take them out and all to bruife them, and put thereunto of oil of Bay two ounces, and two ounces of Hogs grease, and warm them together over the fire, mingling them well together; that done, platter it upon a piece of leather fo big as the Wen, and lay it to hot as the Horse may endure it, renewing it every day in such fort, the space of eight days, and if you perceive that it will come to no head, then lance it from the midle of the Wen downward, so deep as the matter in the bottom may be discovered and let out; that done, heal it up with this Salve, Take of Turpentine a quarter, and Walsh nine times in fair new water, then put thereunto the yolk of an Egg and a little English Saffron beaten into powder, and make a tent or rowle of Flax, and dip it in that ointment, and lay it unto the fore, renewing the same every day once until it be whole.

Of swelling in the neck after blood-letting.

This may come of the stem being rufly, and so causing the vein to rankle, or else by means of some cold wind striking suddenly into the hole. The cure according to Martin is thus: First anoint it with oil of Camouile warmed, and then lay upon it a little hay wet in cold water, and bind it about with a cloth, renewing it every day the space of five days, to see whether it will grow to a head, or else vanish away. If it grow to a head, then give it a slit with a lanceet, and open it with a Coronet that the matter may come out. Then heal it up, by tenting it with Flax dipped in Turpentine and Hogs grease melted together, dressing it so once a day untill it be whole.
How to staunch bleed.

If a Horse be let bleed when the sign is in the neck, the vein perhaps will not leave bleeding so soon as a man would have it, which if any such thing chance, then Rub your Faith, it is good to bind thereunto a little new Horse dung tempered with chalk and strong Vinegar, and not to remove it from thence the space of three days, or else to lay thereunto burnt silk, felt, or cloth, for all such things will staunch bleed.

Of the falling of the Crest.

This cometh for the most part of poverty, and specially when a fat Horse falleth away suddenly. The cure according to Martin is thus: Draw his Crest the depthnes a straw, on the contrary side with a hot iron, the edge of which iron, would be half an inch broad, and make your beginning and ending somewhat beyond the fall, so as the first draught may go all the way hard upon the edge of the mane, even underneath the roots of the same, beareing your hand right downward, into the neckward, then answere that with another draught beneath, and so far distant from the first as the fall is broad, compassing as it were all the fall, but still on the contrary side: and betwixt those two draughts right in the midst, draw a third draught, then with a button iron of an inch about, burn at each end a hole, and also in the spaces betwixt the draughts, make divers holes distant three fingers broad one from another: that done, to flake the fire anoint it every day once, for the space of nine days, with a feather dipt in fresh Butter moulten. Then take Malows and Sage, of each one handful, boil them well in running water, and wash the burning away untill it be raw flesh then dry it up with this powder: Take of Honey half a pinte, and so much unfeck't line as will make that Honey thick like paste, then hold it in a fire-pan over the fire untill it be baked so hard as it may be made in powder, and sprinkle that upon the fore places.

Of the falling of the Crest.

The falling of the Crest is occasioned most commonly through poverty; yet sometimes I have seen it chance thorough the ill proportion of the Crest, which being high, thick and heavy, the neck thin and weak underneath, is not able to support or sustain it up, however he be, there is remedy for both: if it proceed of poverty, first try by good keeping to get it up again, but if it will not rise, or that the original of the disease be in the ill fashion of the Crest, then let this be the cure, First with your hand raise up the Crest as you would have it stand, or rather more to that side from which it declineth, then take up the skin between your fingers on that side from which the Crest swarveith, and with a sharp knife cut away the breadth of very near an inch, and the length of four inches; which done, stitch up the skin together again with three or four stitches, and by means of stringing, weights, or other devices, keep the Crest perforce on that side, applying thereunto a plaster of Deers sweete and Turpentine, boiled together, till the fore be healed; and at the self same instant that by this manner of infliction you draw together and straiten the skin on that side, you shall in this sort give liberty to the other side, whereby the Crest may the easier attain to his place, Take a hot iron made in fashion of a knife, the edge being a quarter of an inch broad, and therewith from the upper part of his Crest unto the neather part of the same extending towards his shoulder, draw three lines in this forme || ||, and the same again dayly with fresh Butter, untill such time as it be perfectly whole. By this manner of cure, you may make any lame-ear'd Horse, to be as prick ear'd and comely, as any other Horse whatsoever.

Of the mangles of the Mane.

The mangles proceedeth of ranknes of blood, or of poverty, of lowliness, or else of rubbing where a mangy Horse hath rubbed, or of filthy dust lying in the mane for lack of good drefling. The signes be apparent by the itching and rubbing of the Horse, and the Scabs, fretting both flesh and skin. The cure, according to Martin, is thus: Take of fresh grease one pound, of Quicksilver half an ounce, of Brimstone one ounce, of Rape oil half a pinte, mingle them together, and ther them continually in a pot with a flisce, untill the Quicksilver be so wrought with the retl, as you shall perceive no Quicksilver therein. That done, take a blunt knife, or an old Horse-comb, and scratch all the mangy places therewith untill it be raw and bloody, and then anoint it with this ointment, in the sunshine it may be, to the intent the ointment may link in: or else hold before it in a fire-pan or some broad bar of iron made hot, to make the ointment to melt into the flesh. And if you see that within the space of three days after, with this once anointing, he leave not rubbing, then make in what place he rubbeth, and drefse that place again, and you shall see it heal quickly.
of the falling of the hair of the Mane.

T falleth for the most part, because it is eaten with little Wormes, fretting the roots in sundry which, according to Martin, you shall remedy in this fort: Anoint the mane and Creft with Sop, then make strong lie and wash all the mane and Creft withall, and that will kill the Wormes, within twice or thrice washing.

of griefs in the widders.

O a Horfes widders and back, do chance many griefs and storms, which, as Ruffin faith, do sometime proceed of inward causes, as of the corruption of humors; and sometime of outward causes, as through the galling and pinching of some naughty faddle, or by some heavy burthen laid on the Horfes back, or fuch like. And of such griefs, some be but superficial blisters, swellings, light-gals or bruises, and be easily cured. Some again do pierce to the very bone, and do dangerous, and especially if they be nigh the back bone; let us firft then fiew you the cure of the smaller griefs, and then of the greater.

Another of blisterings, or small swellings in the widders or back and galling.

W hensoever you fee any swelling rife, then Martin would have you to binde a little hot Horfe dung unto it, and that will affwage it. If not, then to prick it round about the swelling, either with a flem, or else with a fharp pointed knife not too deep, but fo as it may pierce the skin, and make the bloud to fiume forth. That done, take of Mallowes or elfe of Smallage, two or three handfulls, and boil them in running water until they be fo hot as pap; then drain the water from it, and bruife the herbs in a treen difh, putting thereunto a little Hogs greafe, or elfe Sallet oil, or Sheeps fefew, or any other frefh greafe, boil them and fur them together, not frying them hard, but fo as it may be fof and fipple, and then with a clowft lay it warm upon the fore, renewing it every day once until the swelling be gone. For this will either drive it away, or elfe bring it into his head, which lightly chanceh not, unleffe there be fome griffle or bone perforf.

Ruffin biddeth you, fo foon as you fee any swelling rife, to have the place with a rafor & lay thereunto this plaiter: Take a little Wheat flower and the white of an Egge beaten together, and fpread it on a little clowft, which being laid unto the swelling two or three days and not removed, will bring it to a head, and when you come to it to take it off, pull it away fo softly as you can poffible, and whereas you fee the corruption gathered together, then in the loweft place thereof, pierce it upward with a fharf iron fomewhat hot, that the corruption may come out, and anoint the fore place every day once with frefh Butter, or Hogs greafe; but if the skin be only chafed off without any swelling, then wafh the place with Water and Salt, or elfe with warm Wine, and fprinkle this powder thereon: Take of unleck's Lime beaten into fine powder, and mingle it with Hony until it be as thick as any paffe, and make rols or bals theof, and bake them in a fire-pan over the fire, untill they be fo hard as they may be brought to powder, for this is a very good powder to dry any galling or fore. The powder of Myrthe or burnt flift, felt, or cloth, or any old poft, is alfo good for fuch purpofes; but whensoever you ufe this powder of Lime and Hony, let the place be wafhed, as is aforefaid.

Of great swellings and inflammations in a Horfes widders.

If the swelling be very great, then the cure according to Martin is thus: Fift draw round about the swelling with a hot iron, and then croffe him with the fame iron in manner of aチェックer, then take a round hot iron having a fharf point, and thrust it into the swelling place on each fide up toward the point of the widders; to the intent the matter may fuisse downward at the hols. That done, tent both the hols with a tent dipt in Hogs greafe to kill the fire, and also anoint all the other burnt places therewith, continuing fo to do untill the swelling be affwaged, renewing it every day once, until the fiery matter be clean fallen away, and then tent him again with wafhed Turpentine mingled with yolks of Eggs and Saffron in fuch manner as hath been aforefaid, renewing the tent every day once untill it be whole.

If you fee that the swelling for all this go not away, then it is a figne of fome impofition within and therefore it fhall be neceffary to lance it, and to let out the corruption; then take of Hony half a pinte, of Verdigrife two ounces beaten to powder, and mingle it together with the Hony, then boil them in a pot untill it look red, then being lukewarm, make either a tent or plaiter, according as the wound fhall require, renewing the fame every day once, untill it be whole. But the fore may be fo vehement, that for lack of looking in time, it will pierce downward betwixt both shoulders toward the intrails, which is very dangerous: yea, and as Ruffin faith, mortal, because the corruption of the fore infecting the lungs and heart (which be the vital parts and chief prefervers of life) the body muft needs decay. And therefore Martin would have you to fill the hole with the Salve laft mentioned, and to thrust in afterward a piece of a}*{spung;
Of the Horse.

287

lponge, as well to keep the hole open, as also to suck out the corruption, renewing it every day once until it be whole.

Of the horns or hard knobs growing under the Saddle side.

This is a dead skin like a piece of leather, called of the Italians, Cutane, that is to say, a horn, Blunderbuss.

for that it is hard under, and come by means of some shrart Saddle, pinching the Horse more on the one side then on the other; or else on both sides equally. The cure whereof, according to Martin, is in this sort; Anoint them with fresh Butter or Hog's grease, until they be mollified and made so soft as you may either cut them, or pull them away, and then wash the wound with mans bile, or with white Wine, and dry it with powder of unliquef't Lime mixt with Hony.

Of Wens or knobs growing about the Saddle skirts.

These great hard knobs growing most commonly betwixt two ribs, apparent to the eye, which by their hardness seem to come of some old bruise, and are called of the Italians, le Cut. The cure whereof, according to Martin, is thus; First mollify them, by anointing them with Hog's grease every day once or twice, the space of eight dayes, and if you perceive that it will come to no head with this, then lance it from the middle downward, that the matter may come out: then tent it with washed Turpentine, yolks of Eggs, and Saffron mingled together as is aforesaid, renewing the tent every day until it be whole.

Of the Navill gall.

The Navill gall, is a bruise on the back behind the Saddle right against the Navil of the Horse, and thereof taketh his name. It cometh either by splitting of the Saddle behind, or for lack of stuffing, or by means of the hinder buckle fretting that place, or else by some great weight laid on his back: you shall perceive it by the pulled up and spongy flesh, looking like rotten Lights or Lungs, and therefore is called of the Italians, Pulmon, or Pulmonials. The cure whereof, according to Martin, is thus; Cut it round about with a sharp knife or razor even to the bone, leaving no rotten flesh behind: that done, take the white of an Egg and Salt beaten together, and lay that phalafenwife to the fore upon a little towe, renewing it once a day the space of two dayes. Then take of Hony a quartern of a pinte, and of Verdigrease an ounce beat into powder, and boile them together in a pot, flirring it sill until it look red, and being lukewarm, make a plaister with cowe and clap it to the wound, waffhing and cleansing well the wound first with a little warm Vinegar or white Wine, continuing it once a day until it begin to heal and skin, then dry it up, by sprinkling thereon this powder following; Take of Hony a quartern, and as much of unliquef't Lime as will thicken the Hony like unto pate, and in a fire pan over the fire, flir it sill until it be hard baked, so as it may be beaten into powder, but before you throw on the powder, wash the wound first with warm Vinegar, continuing so to do until it be perfectly skinned and whole.

Of the foaying of the back.

This is called of the Italians, Malefato, and according to Raffian and Martin's opinions, cometh either by some great strain, or else by heavy burthen: you shall perceive it by the reeling and rolling of the Horfes hinder parts in his going, which will falter many times, and sway sometimes backward, and sometime fiddling, and be ready to fall even to the ground, and the Horse being laid, is scant able to get up. The cure, according to Martin, is thus; Cover his back with a Sheep's skin, coming hot from the Sheeps back, laying the fleshie side next unto his back, and lay a houling cloth upon the same to keep his back as warm as may be, and so let it continue until it begin to smell; then take the old skin away, and lay a new unto it, continuing so to do the space of three weeks. And if he amend not with this, then draw his back with a hot iron out on both sides of the ridge of his back, from the pitch of the Buttocks, unto a handful within the Saddle, and let every line be an inch distant one from another, and then again overthwart checkerwise, but let not such strokes be over deep, and so burned as every one look yellow, then lay on this charge following; Take Pitch one pound, of Rozen half a pound, of Bole Armony half a pound made in powder, and half a pinte of Tar, and boil all these together in a pot, flirring it until every thing be molten and thoroughly mingled together, then being lukewarm, dawb all the burning therewith very thick, and thereupon clap as many flocks of the Horfes colour, as you can make to abide on, and remove it not before it fall away it fell, and if it be in Summer, you may turn him to graffe.
The History of Four-footed Beasts.

Of the weakness in the back.

It doth appear by Laurentius Russius, that there is another kind of weaknesses in the back, called in Italian, le gatte o mortecucura del reuo, that is to say, the fretting or biting of the reins, which as the said Russius faith, proceedeth of abundance of humor resorting to that place, whereby all the hinder parts of the Horsie do lose their feeling and strength, and the Horsie falleth down on the ground; yea, and such humor resorting to the heart, do suffocate the same, and in two or three hours do cause the Horsie to die. The remedy, according to Russius, is in this fort; Let him blide abundantly in the neck, and draw his back with a hot iron, in such fort as is declared in the last Chapter. He faith alio it is good to make him swim thorough a river, and to rowel him on his hanches nigh the huckle bones; and to make the hair to grow again, it is good, as he faith, to anoint the place with Hogs greate, and three leaved graffe stamped together.

Of Hidebound.

Hidebound, is when the skin cleaveth so fast to the Horsies back, that a man cannot pull it from the fifth with his hand, which Russius calleth Corroges; it cometh for the most part of poverty, or else when the Horsie after some great heat hath been suffered to stand long in the rain or wet weather, for that will cause the skin to shrink, and to cling to his ribs. It is known by the leanes of the Horsie, and gantnest of his belly, and by full flocking of the skin unto the ribs when you pull it at with your hand. The cure, according to Maritius, is thus: Let him bloud on both sides the belly in the flank veins betwixt the flank and the girding places: that done, give him this drink: Take a quart of white Wine, or else of good Ale, and put thereunto three ounces of good Saller Oil, or Cumin one ounce, or Annis two ounces, ofLicoras two ounces, beat all into fine powder, and give it him lukewarm with a horn. And when he hath drank, let one flanding at his huckle bone, rub him hard with his hand along the back, and overthwart the ribs, the space of half an hour: that done, let him in a warm stables, and let him stand in litter up to the belly, and cover all his back and ribs with a sack firft, throely soaked in a tub of cold water, and then well and hard wrung, and over that cast another cloth, and gird it fast with a surcingle, fluffing him well about the back with freth straw, continuing thus to do every day once the space of a week, during which time he will give him no cold water, but lukewarm, and put therein a little ground Mault. The wet sack will cause the back to gather heat it self, and the skin to loosen from the fifth, and if you will beftow more cote, you may anoint all his body with Wine and oil mingled together, according to the opinion of the old writers, which no doubt is a very comfortable thing, and must needs supple the skin, and loosen it from the fifth.

Of the disease in the thorae and lungs, and why the griefs of the shoulders and hips be not mentioned before amongst the griefs of the withers and back.

Some perhaps would look here, that for so much as I have declared the diseases of the neck, withers and back, that I should also follow on now with the griefs of the shoulders and hips. But fith that such griefs for the most part doe caufe a Horsie to halfe, and that it requireth some skill to know when a Horsie halteth, whether the fault be in his withers, hip, leg, joint, or foot, I think it is not good to separate those parts of one another, specially fith nature hath joined them together, that is to say, the withers to the forelegs, and the hips to the hinder legs. And therefore according to nature order, I will treat of them in their proper place; that is to say, after that I have shewed all the diseases that be in the inward Horsies body, not only above the midriff, as the diseases of the throat, lungs, breast and heart, but also under the midriff, as those of the liver, lungs, and guts, and of all the rest. And first, as touching the diseases of the throat, the Glandures, and Strangullion, to all Horsies is most common.

Of the Glanders and Strangullion, so called according to the Italian name Strangullion.

Most Farriars do take the Glandures and Strangullion to be all one disease, but it is not so, for the Glandures is that which the Physitians call Tosyle, and the Strangullion is that which they call in Latin, Angina, in Greek, Gynance, and we commonly call it in English the Squinacy, or Quinsie. Tosyle, is interpreted by them to be the inflammations of the kirnels called in Latin, Glandes, the Italian, Glandule, which lie on both sides of the throat, underneath the root of the tongue, nigh unto the swallowing place; of which word Glandes, or Gondule, I think we borrow this name Glandure; for when the Horsie is troubled with this disease, he hath great kirnels underneath his jaws, eafe to be seen or felt, paining him so, as he cannot safely swallow down his meat, which cometh first of cold distillations out of the head: But if such kirnels be not inflamed, they will perhaps go away of themselves, or else by laying a little hot horse-dung and straw unto them, the warmth thereof will dissolve them, and make them to vanish away.
But if they be inflamed, they will not go away but encrease and wax greater and greater, and be more painful every day then other, and cause the Horse to eat continually filthy matter at the Nose. The cure whereof, according to Martin, is this: First rife the kernels with this-plaister: Take of bran two handfuls, or as much as will thicken a quart of Wine or Ale: then put thereunto half a pound of Hogs grease, and boil them together, and lay it hot to the fore with a cloth, renewing it every day until it be ready to break, then lance it, and let out all the matter, and tent it with a tent of Flax dipt in this false; Take of Turpentine of Hogs grease, of each like quantity; and a little wax, and melt them together, and renew the tent every day until it be whole. Laetentius Roffius faith, that this diseaſe is very common to Colts, because in them both abound fluable moiturie, apt to be dissolved with every little heat, and to turn to putrifacions: and therefore if the Horse be not yeong, he would have you first to let him bleed in the neck vein, and then to lay unto the face a ripeing plaister, made of Mallowes, Linfeeds, Rew, Wormwood, ground Ivy, Oyl of Bayes, and Dailthea, and to anoint his throat alfo, and all the fore place with freth Butter: and the fore being ripe, to lance it, or else to rowel it, that the matter may come forth. But if the kernels will not decrease, then pull them away by the roots, and dry up the Ucerous place with an omtent made of unſleck. Limne, Pepper, Brimthone, Nitrum, and Oyl Olive. It shall be alfo good to purge his head by perfuming him every day once, in such fort as hath been before declared. And let the Horse be kept warm about the head, and hand in a warm bed, and let him drink no cold water: but if you see that after you have taken away the kernels, the Horſe doth not for all that leave calling filaſy matter at the Nose, then it is to be feared that he hath some fpice of the Mourning of the Chine, for both difeafes proceed of one caulfe, and therefore I think good to faek of it here presently. But firſt I will let down a drink which I have feen proved upon a Horſe that I thought could never have been recovered of the fame disſeaſe, and yet it did recover him in very short space, fo as he travelled immediately after many miles, without the help of any other medicin.

A drink for the Strangullion or Glanders.

Take of warm milk as it cometh from the Cow a quart, or in ſtead thereof a quart of new Beer Blanched, or Ale warmed, and put thereunto of moutien Butter the quantity of an Egge: and then take one head of Garlick, firſt clean pilled and then stamped small, which you must put into the milk or drink being made lukewarm, and give it the Horſe with a horn, and immediately after the drink be given, catch hold of his tongue with your hand, and having broken two raw Eggges, either upon his fortemeeth, or against the ſtaffe wherewith his head is holden up, call those broken Eggges, thels and all into his throat, making him to ſwallow down the ſame; that done, ride him up and down till he begin to sweat, then let him up covered warm with an old coverlet and ſhay, not suffering him to eat or drink for the ſpace of two or three hours after, and let his drink for the ſpace of two or three dayes be ſomeſwhat warm, whereunto it is good to put a handful or two of Bran or ground Malt, and in giving the said drink, it ſhall not be amifsie to powre some thereof into either Noſtril.

Of the Mourning of the Chine.

This word, Mourning of the Chine, is a corrupt name borrowed of the French tongue, wherein it is called Moſte defoblé, that is to fay, the death of the back. Because many do hold this opinion, that this diseaſe doth confume the marrow of the back; for remedy whereof, they use strange kinds of cure. For some taking it to be a rhuema, go about to ſtop it, by laying affiftive, or binding charges to the ſpace of the ſkin. Some again do twine out the pithe of the back with a long wire throught up into the Horſes head, and do into his neck and back, with what reaſon I know not. Well, I know that few Horſes do recover that have this diseaſe. Some again think that the Lungs of the Horſe be rotten, and that the Horſe doth call them out at his Noſte. But Martin faith, that he hath cut up divers Horſes which have been judged to have dyed of the mourning of the Chine, but he could finde never either Back or Lungs to be perifhed, but only the Liver, and most commonly that side of the Liver which anſwereth the Noſtril whereat he calleth, whereof we will talk in his proper place, when we come to speake of the diseaſes in the Liver. The Italians do call this diseaſe Glimorra, the old Authors do call it the moift malady, whereof Thrommeſius maketh two differences. For in the one the matter which he doth call at the Noſte is white, and doth not ſmell at all: and in the other which he calleth is filthy and finking corruption. They proceed both of cold humors congeated in the head, but more abounding in the one then in the other: by reaſon perhaps that the Horſe was not cured in time: for of cold firſt cometh the Pote, and the Cough, then the Glanders, and laſt of all the Mourning of the Chine. When the Horſe calleth matter at the Noſte that is not finking, he may easily be cured by fuch remedies as have been before declared in the Chapter of the Pote: but if the matter be very ſmelly and finking, then it is very hard to cure. Notwithstanding it shall not grieve me to write unto you here, the experience of Thrommeſius, and of Laetentius Roffius. Thrommeſius cure is thus; Take of Water and Hony, Ge called
The History of Four-footed Beasts.

called of the Phystians *Hydromel*, a quart, and put thereunto three ounces of Oyl, and powre that into his Nostrils every morning the space of three days; and if that do not profit him, then let him drink every day, or once in two days, a quart of old Wine, mingled with some of the medicine, or rather the precious meat, called of the old writers *Tetrapharmacum*, and that will restore him to his former elate. *Laurentius Ruffius* faith, that of all disases there is none more perillous, nor more to be suspect, then the rheume which cometh of cold, for Horfes have large Conduites, and are full of moisture, and therefore if cold once enter, it findeth matter enough to work on, to breed continual distillation as well outwardly at the Nofe, as inwardly, descending down to the vital part in such forts, as it doth not suffoicate the fame.

The signes, according to the said *Ruffius*, be these: the Horie doth caft matter continually at the Nofe, sometime thin, and sometime thick. his Nostrils, Ears, and all his outward parts, will be cold to the feeling, his eyes, head, and all his body heavy, and he will cough, and have small appetite to his meat, and leele to his drink, and sometime he will tremble and shakke. His cure is in this fort; Purge his head, partly by perfuming him, & partly by making him to neeze in such fort as hath been before taught in the Chapter of the Pofe, which wayes of perfuming and purging his head as they be good, so doth *Ruffius* praise these two here following to be most excellent; the first is this: Take of the falks of *Vitis alba*, otherwife called *Brunie*, or wilde Vine, two or three good handfuls, and being bruised put them into a linen bag, and fallen the bag to the Horfes head, so as he may receive the fents up into his Nostrils, without touching the heare with his mouth, and this will cause the humors to run down abundantly. The second medicine; Take of Eurfobium beaten into fine powder, three ounces, of the juice of Betes one pound, of Swines blood halfe a pound, boy all these together until they be throughly mingled together, and liquid like an ointment, and then take it from the fire, and put thereunto one ounce more of Eurfobium, and mingle them again throughly together, and preserve the same in a box, to use at needful times in this fort; Make two full long rolls or tampins of linen, or such like stuff, sharp pointed like Sugar loaves, which tampins are called of the Phystians in *Latin*, *Riphi*, and being anointed with the ointment aforesaid, thrust them up into the Horfes Nostrils, and let them abide thereas in a pretty while, then pull them out, and you shall fee such abundance of matter come forth at his Nofe, as is marvellous to behold. *Ruffius* also praiseth very much this medicine here following.

Take as much of the middle bark of an Elder tree, growing on the water side, as will fill a new earthen pot of a mean size, putting thereunto as much clear water as a pot will hold, and let it boil until one halfe be consumed, and then to be filled up again with fresh water, continuing fo to do three three times one after another, and at the last time that the one halfe is consumed, take it from the fire, and draine it through a linnen cloth. Then take two parts of that decoction, and one part of Hogs greafe, or Butter, and being warmd again together, give the Horfe to drink thereof one horneful, and powre another horneful into his Nostrils. and caife them; and whensoever you give him this medicine, let the Horfe be empty and fasting, and keep him without meat alfo two or three hours after, for this is a very good drink for any ficknes that cometh of cold. Moreover, open the skin of his forehead, and of his temples, and alfo of his tail with a sharp hot iron, that the corrup humors may issue outward. That done, take hot brucics, or elle a pan of freth burning coles, and hold it nigh unto his belly and flanks, to the intent that they may be throughly warmd, and being so warmd, anoint them all over with Oyl-de-bay, or Dialthea, to defend his body from the cold, and let his head be well covered, and all his belly kept warm. Yea, and it were good to bathe his head some time, as *Ruffius* faith, with a bath made of Rew, Wormwood, Sage, Juniper, Bay leaves, and Hyfop. And let his drink be warm water mingled with Wheat meal; yea, and to make it the more comfortable, it were good, as *Ruffius* faith, to put thereunto some Cinnamon, Ginger, Galangale, and such hot pieces. And his meat in Winter season would be no other but loddan Corn, or warm Mathes, made of ground Malt and Wheat bran: in Summer season, if he went to graffe, I think it would do him most good, so that he go in a dry warm ground, for by feeding alwaies downward, he shall purge his head the better, as *Ruffius* faith. Thus much of the Glanders, and mourning of the Chine. Now we will speake somewhat of the Strangulion, according to the opinion of the Authors, though not to the satisfaction perhaps of our English Parriars.

Of the Strangulion or Squainy.

The Strangulion, called of the *Latin*, *Angina*, according to the Phystians, is an inflammotion of the inward parts of the throat, and as I said before, is called of the *Greeks*, *Cynechr*, which is as much to say in English as Strangling, whereof this name Strangulion as I think is derived for this disease doth strangle every Man or Beast, and therefore is termed amongst the perillous and sharp disases, called of the *Latin*, *Morbi acuti*; of which strangling, the Phystians in Mans body make four differences; The first and worst is, when no part within the mouth nor without, appeareth manifeftly to be inflamed, and yet the patient is in great peril of strangling. The second is, when the inward parts of the throat only be inflamed. The third is, when the inward and outward parts of the throat be both inflamed. The fourth is, when the muscles of the neck
Of the Horse.

neck are inflamed, or the inward joints thereof so loosened, as they straie ten thereby both the throat, or wealnd, or wind-pipe; for short breath is incident to all the four kinds before rected, and they proceed all of one cause; that is to say, of some cholerick or bloody fluxion, which comes out of the branches of the throat venes into those parts, and there breedeth some hot inflammation. But now to prove that a Horfe is subject to this disease, you shall hear what Abftrius Hieroles, Vegiutus and others do say. Abftrius writing to his friend a certain Farriar or Horfe-leach, called Afiorius, spekeyth in this manner. When a Horfe hath the strangollion it quickly killeth him; the signes whereof be these: His temples shall be hollow, his tongue will swell and hang out of his mouth, his eyes alfo will be swollen, and the paffage of his throat flopt so as he can neither eat nor drink. All these signes be also confirmed by his rocolis. Moreover, Vegiutus rendereth the caufe of this disease, affirming that it proceedeth of abundance of subtle bloud, which after long travele will inflame the inward or outward muscles of the throat or weand, or such affluence of bloud may come, by use of hot meats after great travele, being fo alterative, as they caufe those parts to swell in such fort, as the Horfe can neither eat nor drink nor draw his breath. The cure, according to Vegiutus, is in this fort: First bathe his mouth and tongue in hot water, and then anoint it with the gulf of a Bull; that done, give him this drink, Take of old Oyl two pound, of old Wine a quart, nine Figs, and nine Leeks heads well flamped and brayed together. And after you have boiled thefe a while before you strain them, put thereunto a little Nitre, Alexandrinum, and give him a quart of this every morning and evening. Abftrius and Hieroles would have you to let him bloud in the palate of his mouth, and alfo to pouwe Wine and Oyl into his Nostrils, and alfo give him to drink this decoction of Figs and Nitre in foddon together, or elfe to anoint his throat within with Nitre, Oil, and Hony, or elfe with Hony and Hogs dung mingled together, which differeth not much from Galen his medicine, to be given unto man. For he faith, that Hony mingled with the powder of Hogs dung that is white, and swallowed down, doth remedy the Squinany presently. Abftrius alfo praieth the ointment made of Bddellium, and when the inflamation beginneth somewhat to decrease, he faith it is good to purge the Horfe, by giving him wilde Cucumber and Nitre to drink. Let his meate be graffe if it may be gotten, or elfe wet hay, and sprinkled with Nitre. Let his drink alfo be lukewarm water, with some Barley meal in it.

Of the Cough.

Of Coughs, some be outward, and some be inward. Thofe be outward which do come of outward causes, as by eating a feether, or by sitting duluy or sharp straw, and fuch like things: which tickling his throat, caufeth him to cough: you fhall perceive it by waggynge and wryng his head in his coughing, and by flamping fometyme with his foot, labouring to get out the thing that grieveth him, and cannot. The cure, according to Martin, is thus: Take a Willow wand, rold throughout with a fine linnen clothe, and then anoint it all over with Hony, and thrust it down his throat, drawing your hand to and fro, to the intent it may either drive down the thing that grieveth him, or elfe bring it up, and do this twice or thrice, anointing every time the flick with fresh Hony.

Of the inward and wet Cough.

Of inward Coughs, some be wet, and some be dry. The wet Cough is that cometh of cold, taken after some great heat given to the Horfe, disloving humour, which being afterward congealed, doth caufe obstruction and toppng in the lungs. And I call it the wet Cough, because the Horfe in his coughing will void moist matter at his mouth after that it is once broken. The signes be these: The Horfe will be heavie, and his eyes will run with water, and he will forfake his meat; and when he cougheth, he thrufleth out his head, and reacheth with great pain at the firit, as though he had a dry Cough, untilt the fleam be broken, and then he will cough more hollow, which is a signe of amendment. And therefore, according to Martin's experience, to the intent the fleam may break the fooner, it fhall be neceffary to keep him warm, by clothing him with a double cloth, and by littering him up to the belly with fresh straw; and then to give him this drink; Take of Barley one peck, and bowly in two or three gallons of fair water, unfill the Barley begin to burft, and bowly therewith of bruifed Licoros, of Antifeeds or Raifins, of each one pound; then flain it, and to that liquor put of Hony a pinte, and a quartern of Sugareandy, and keep it clofe in a pot to serve the Horfe therewith four or five mornings, and call not away the foddon Barley with the refl of the brayings, but make it hot every day to perfume the Horfe withal, being put in a bag and tied to his head, and if the Horfe will eat of it, it fhall do him the more good. And this perfuming in Winter feldon would be used about ten of the clock in the morning, when the Sun is of fome hight, to the intent the Horfe may be walked abroad, if the Sun fhine, to exercise him moderately. And until his Cough wear away, fall not to give him warm water, with a little ground Mulie. And as his Cough breaketh more and more, fo let his water everyday be leffe warmed then other.
The History of Four-footed Beasts.

Of the dry Cough.

His feemeth to come of some grosse and tough humor cleaving hard to the hollow places of the Lungs which stoppeth the winde-pipes, so as the Horfe cannot easilie draw his breath, and if it continue, he will either grow to the Purtlick, or else break his winde altogether. The signs be these: He will cough both often, drily, and also vehemently, without voiding at the nose or mouth. The cure, according to Martin, is in this fort: Take a clofe earthen pot, and put therein three pinte of strong Vinegar, and four Eggs, thels and all unbroken, and four Garlick heads clean pilled and bruised, and let the pot be very clofe covered in some warm dunghill, and there let it stand a whole night; and the next morning with your hand take out the Eggs, which will be so soft as filk, and lay them by untill you have strained the Garlick and Vinegar through a fair cloth, then put to that liquor a quartern of Honie, and half a quartern of Sugar-candy, and two ounces of Licoras, and two ounces of Anife seeds, beaten all into fine powder. And then the Horfe having fasted all the night before, in the morning betwixt seven and eight of the clock, open his mouth with a cord, and whistle therein one of the Eggs, so as he may swallow it down, and then immediately pouer in after a hornefull of the aforefaid drink, being first made lukewarm, and eat in another Egg with another hornful of drink, and so continue to do, untill he hath swallowed up all the Eggs, and drunk up all the drink; and then bridle him, and cover him with warmer clothes then he had before, and bring him into the stable, and there let him stand on the bit, at the bare rack, well littered up to the belly, the space of two hours. Then unbitt him, and if it be in Winter, offer him a handful of Wheaten straw; if in Summer, give him grasse, and let him eat no hay unlesse it be very well dusted and sprinkled with water, and give him not much thereof. And therefore you shall need to give him the more provender, which also must be well cleaned of all filth and duff, and give him no water the space of nine days. And if you perceive that the Cough doth not wear away, then if it be in Winter, purge him with these pilis; Take of Lard two pound laid in water two hours, then take nothing but the clean fat thereof, and flamp it in a morter, and thereto put of Licoras, of Anife seeds, of TENegreek, of each beaten into powder three ounces, of Aloes in powder two ounces, of Agarick one ounce: Knead thefe together like paste, and make thereof fix bals as big as an Egge. Then the Horfe having fallen over night, give him the next morning these pilis one after another, anointed with Honie and Oyl mingled together in a platter; and to the intent he may swallow them down whether he will or not, when you have opened his mouth, catch hold of his tongue, and hold it fast while you whirle in one of the pilis; that done, thrust it into his throat with a rolling-pin, and then let his tongue go untill he hath swallowed it down; then give him in like manner all the rest of the pilis, and let him stand on the bit warm clothed and littered, the space of three hours at the least, and after that give him a little wet hay, and warm water with a little ground mault in it to drink, and let him drink no other but warm water the space of a week. And now and then in a fair sunny day, it shall be good to troste him now and then to breath him.

Of the Frettizd, broken and rotten Lungs.

This proceedeth, as Albesius and THEOMENSIUS faith, either of an extreme Cough, or of vehement running, or leaping, or of over greedy drinking after great thirst, for the Lungs be infected in a very thin film or skin, and therefore easie to be broken, which if it be not cured in time, doth grow to Apototamation, and to corruption, oppressing all the Lungs, which of old Authors is called Ymomia, and Suppuratio. But THEOMENSIUS faith, that broken Lungs, and rotten Lungs, be two divers diseases, and have divers signes, and divers cures. The signes of broken Lungs be these: The Horfe draweth his wind short, and by little at once, he will turn his head toward the place grazed, and groaneth in his breathing, he is afraid to cough, and yet cougheith as though he had eaten small bones. The same THEOMENSIUS healed a friends Horfe of his, whose Lungs were fretizd, or rather broken as he faith, by continual eating of Salt, with this manner of cure here following: Let the Horfe have quiet and reft, and then let him blow in the hanches, where the veins appear most: and give him to drink the space of seven days, Barley, or rather Oates fedden in Goats milk; or if you can get no milk, boil it in water, and put therein some thicke collops of Lard and of Deers feathers, and let him drink that: and let his common drink in Winter seafon be the decoction of Wheat meal; and in the Summer time, the decoction of Barley; and this as he faith will bind his Lungs again together. VEGASKIN utterly disalloweth letting of bloud in any such disease as this is; and all manner of sharp medicines, for fear of provoking the Cough, by means whereof the broken pieces can never heal perfectly. And therefore neither his medicines nor meaz would be harsh, but smooth, gentle and cooling. The best medicine that may be given him at all times is; Take of TENegreek, and of Linseed, of each half a pound, of Gum dragant, of Malice, of Myrrhe, of Sugar, of Fitch flower, of each one ounce. Let all these things be beaten into fine powder, and then infuted one whole night in a sufficent quantity of warm water, and the next day give him a quart of this lake-water, putting thereunto two or three ounces of Oyl of Rofes, continuing so to do many days together, and if the disease be new, this will heal him; yea, and it will easie him very much, although the disease be old, which is thought uncurable. And in Winter seafon fo long as he langeth in the
Of the Horse.

Of putrid and rotten lungs.

The signs to know whether a Horse's lungs be putrid or rotten, according to Theophrastus are these: The Horse will eat and drink greedily then he was wont to do, he shall be oftener vexed with a Cough, and in coughing he will cast little lumps of matter out of his mouth. The cure whereof, according to Theophrastus, is thus: Give him to drink every morning, the space of seven days, the juice of Purslain mingled with Oil of Roses, and add thereunto a little Tragananthum that hath been layed before in steep in Goats milk, or else in Barley or Oaten milk, strained out of the Corn. When the Apotheke is broken, then a very strong vile and evil favour will come out of his Nostrils; for remedy whereof, it shall be good to give him the space of seven days this drink here following: Take of the root called Cclus tus two ounces, and of Catia or else of Cinnamon three ounces into fine powder, and a few Raisins, and give it him to drink with wine. But Vegetius would have him to be cured in this fort, and with lefse cost: I assure you; Take of Frankincense and Arisftoloch, of each two ounces, beaten into fine powder, and give him that with wine; or else take of unburnt Brimstone four ounces, and of Arisftoloch one ounce and a half beaten into powder, and give him that with wine. And he would have you also to draw his breath with a hot iron, to the intent the humors may issue forth outwardly.

Of shortness of breath.

A Horse may have shortness of breath, by halfly running after drinking, or upon a full stomach, or by the defcending of humors unto his throat or lungs, after some extreme heat dissolving the said humors, which so long as there is nothing broken, may in the beginning be easly holpen. The signs be these: The Horse will continually pant, and fetch his breath short, which will come very hot at once, and in his breathing he will quife in the nose, and his flanks will bear thick and some cannot fetch their breath unless they hold their necks right out and straight, which disease is called of the old writers by the Greek name Orthopnea. The cure; Let him bloud in the neck, and give him this drink; Take of Wine and Oil, of each a pinte, of Frankincense half an ounce; and of the juice of Horehound half a pinte. It is good also to powre into his throat Hony, Butter and Hogs greafe mouteen together, and made luke warm. Tibrina faith, it is good to give him whole Eggs, silks and all, steeped and made soft in Vinegar; that is to say, the firft day three, the second day five, and the third day seven; and to powre Wine and Oile into his Nostrils. I for my part would take nothing but Anis seeds, Licoras and Sugar-candy, beaten all into fine powder, give him that to drink, with Wine and Oile mingled together.

Of the Purfick.

This is a shortness of breath, and the Horse that is so diseased is called of the Italians, Cebali pulvisor, or Bils, which I think is derived of the Latin word Vulfus, by changing V. into B. and I think differeth not much from him that hath broken lungs, called of Vegetius and other old writers Vulfus, for such shortness of breath comes either of the same cause, or else much like, as abundance of groffe humors, cleaving hard to the hollow places of the Lungs, and stopping the windpipes. And the winde being kept in, doth refort downward, as Rulfus faith, into the Horses guts, and so caufeth his flanks to beat continually without order; that is to say, more swiftly and higher up to the back, than the flanks of any Horse that is found of winde. And if the diseafe be old, it is seldom or never cured; and though I finde many medicines, prescribed by divers Authors, few or none do content me, unlefs it be that of Vegetius, recited before in the Chapter of broken Lungs. And if that prevalent he, then I think it were not amiss according to Rulfus to purge him with this drink here following; Take of Maiden hair, of Fenugreek, or Licoras, of Peper, of Butter Almonds, of Baratrach, of each two ounces, Of Nettle seed, and of Arisftoloch, of each three ounces, boil them all together in a sufficient quantity of water, and in that decoction dissolve half an ounce of Aparick, and two ounces of Cocloquintida, together with two pound of Hony, and give him of this a pinte or a quarter at divers times; and if it be too thick, make it thinner, by putting thereunto water wherein Licoras hath been sodden: and if need be, you may also draw both his flanks croffe-wise with a hot iron, to relat the beating of them, and also slit his Nostrils, to give him more air. And if it be in Summer, turn him to graffe; if in Winter, let him be kept warm, and give him now and then a little sodden wheaten Rulfus would have it to be given him three dayes together, and also new sweet wine to drink, or else other good wine mingled with Licoras water.

Of the Spleen.

The signs to know whether a Horse's spleen be putrid or rotten, according to Theophrastus are these: The Horse will eat and drink greedily then he was wont to do, he shall be oftener vexed with a Cough, and in coughing he will cast little lumps of matter out of his mouth. The cure whereof, according to Theophrastus, is thus: Give him to drink every morning, the space of seven days, the juice of Purslain mingled with Oil of Roses, and add thereunto a little Tragananthum that hath been layed before in steep in Goats milk, or else in Barley or Oaten milk, strained out of the Corn. When the Apotheke is broken, then a very strong vile and evil favour will come out of his Nostrils; for remedy whereof, it shall be good to give him the space of seven days this drink here following: Take of the root called Cclus tus two ounces, and of Catia or else of Cinnamon three ounces into fine powder, and a few Raisins, and give it him to drink with wine. But Vegetius would have him to be cured in this fort, and with lefse cost: I assure you; Take of Frankincense and Arisftoloch, of each two ounces, beaten into fine powder, and give him that with wine; or else take of unburnt Brimstone four ounces, and of Arisftoloch one ounce and a half beaten into powder, and give him that with wine. And he would have you also to draw his breath with a hot iron, to the intent the humors may issue forth outwardly.
Consumption is no other thing but an exileration of the lungs, proceeding of some frett ing or gnawing humor, descending out of the head into the lungs. And I take it to be that distemper which the old Writers are wont to call the dry Malady; which perhaps some would rather interpret to be the mourning of the chine, with whom I intend not to strive. But thus much I mutt needs say, that every Horse having the mourning of the Chine, or draining of the nose, in the dry Malady it is contrary. For all the Authors that write thereof affirm, that the Horse avoideth nothing at the nose. And the signs to know the dry Malady, according to their doctrine, be these: His flesh doth clean consume away, his belly is gaunt, and the skin thereof doth shrivel, or rather shrunk up, as if you strike on him with your hand it will sound like a Taber, and he will be hollow back, and forfeake his meat, and though he eateth it, (as Abytius faith) yet he doth not digest it, nor prospereth not withal, he would cough and cannot but hickup, as though he had eaten small bones. And this distemper is judged of all the Authors to be incurable. Notwithstanding they say, that it is good to purge his head with such perfumes as have been shewed you before in the Chapter of the Glanders, and also to give him alwayes Coleworts, chopt small with his provender. Some would have him to drink the warm blood of sucking Pigs new flain; and some the juice of Leeks, with Oyl and Wine mingled together. Others praise Wine and Frankincense; some, Oyl and Rue; some would have his body to be purged and fet to grafts.

Of the Consumption of the Flesh, and how to make a lean Horse fat.

Marinus faith, that if a Horse take a great cold after a heat, it will cause his flesh to wilt, and his skin to wax hard and dry, and to cleave fast to his fides, and if he shall have no appetite unto his meat, and the fillets of his back will fall away, and all the flesh of his buttocks, and of his shoulders will be consumed. The cure whereof is thus: Take two Sheep's heads entire, boyl them in three gallons of Ale, or fair running waters, until the flesh be consumed from the bones, that done, strain it through a fine cloth, and then put thereunto of Sugar one pound, of Cinamon two ounces, of Conserve of Roses, of Barberryes, of Cherries, of each two ounces: and mingle them together, and give the Horse every day in the morning a quart thereof lukewarm, until all be spent: and after every time he drinketh, let him be walked up and down in the Stable, or else abroad if the weather be warm, and not windy, and let him neither eat nor drink in two hours after, and let him drink no cold water, but lukewarm, the space of fifteen days, and let him be fed by little and little, with such meat as the Horse hath most appetite unto. But if the Horse be not sound and tender, and fo wax lean without any apparent grief or distemper, then the old Writers would have him to be fed now and then with parched Wheat, and also to drink Wine with his water, and eat continually Wheat-bran mingled with his provender, until he wax strong; and he must be often drest and trimmed, and ly fay, without the which things his meat will do him but little good. And his meat must be fine and clean, and given often and by little at once. Ruflius faith, that if a Horse eating his meat with good appetite, doth not for all that prosper, but is full lean: then it is good to give him Sage, Savin, Bay-berries, Earth-nuts, and Boare's-grasse, to drink with Wine: or to give him the intrails of a Barbel or Tench, with white Wine. He faith also that sodden Beans mingled with Bran and Salt, will make a lean Horse fay in very short space.

Of grief in the Breast.

Blundevile.

Augustius Ruflius writeth of a distemper called in Italian, Gravezza di petto, which hath not been in experience amongst our Farriers, that I can learn. It comes, as Ruflius faith, of the superfluity of blood, or other humors dissolved by some extreme heat, and returning down the breast, paining the Horse, so as he cannot well go. The cure whereof according to Ruflius is thus: Let him bleed on both sides of the breast in the accustomed veins, and rowel him under the breast, and twice a day turn the rowels with your hand, to move the humors that they may issue forth, and let him go forrowed the space of fifteen days.

Of the pain in the Heart called Anticor, that is to say, contrary to the Heart.

His proceedeth of abundance of ranck blood bred with good feeding and over much rest, which blood reftoring to the inward parts doth suffocate the heart, and many times causeth swellings to appear before the brest, which will grow upward to the neck, and then it kil leth the Horse. The signs: The Horse will hang down his head in the manger foraking his meat, and is not able to lift up his head. The cure according to Martin is thus: Let him bleed on both fides abundantly in the plat veins, and then give him this drink: Take a quart of Malm ste, and put thereunto half a quartern of Sugar, and two ounces of Cinamon, and give it him.
him like warm, then keep him warm in the Stable, stuffing him well about the stomach, that the wind offend him no manner of way; and give him warm water with mault always to drink, and give him such meat as he will eat. And if the swelling do appear, then besides letting him blood, strike the swelling in divers places with your stam, that the corruption may go forth: and anoint the place with warm Hogs grease, and that will either make it to wear away, or else to grow to a head, if it be covered and kept warm.

**Of tired Horses.**

But because we are in hand here with the vital parts, and that when the Horses be tired with overmuch labour, their vital spirits wax feeble, I think it best to speak of them even here, not with long discoursing, as Vegetius useth; but briefly to shew you how to refresh the poor Horse, having need thereof, which is done chiefly by giving him raff, warmth and good feeding, as with warm medicines and plenty of provender. And to quicken his spirits, it shall be good to pour a little Oyl and Vinegar into his nostrils, and to give him the drink of Sheep's heads recited before in the Chapter of Consumption of the flesh; yea, and also to bath his legs with this bath: Take of Mallows, of Sage, of each two or three handfuls, and of a Rofe-cake; boil these things together, and being boiled, then put unto it a good quantity of Butter, or of Sallet-oyl. Or else make him this charge: Take of Bole Armony, and of Wheat-flowre, of each half a pound, and a little Razen beaten into powder, and a quart of strong Vinegar, and mingle them together, and cover all his legs therewith; and if it be Summer turn him to graze.

**Of the diseased parts under the Midriff, and first of the Stomach.**

The old Authors make mention of many diseases incident to a Horse's stomach, as loathing of meat, spewing up his drink, surfeiting of provender, the hungry evil, and such like, which few of our Farriers have observed: and therefore I will briefly speak of as many as I think necessary to be known; and first of the loathing of meat.

**Of the loathing of Meat.**

A Horse may loath his meat through the intemperance of his stomach, as for that it is too hot or too cold. If his stomach be too hot, then most commonly it will either inflame his mouth and make it to break out in blisters, yea and perhaps cause some Cancker to breed there: The cure of all which things hath been taught before. But if he forfake his meat only for very heat, which you shall perceive by the hotness of his breath and mouth, then cool his stomach by giving him cold water, mingled with a little Vinegar and Oyl to drink; or else give him this drink: Take of Milk, and of Wine, of each one pint, and put thereunto three ounces of Mel Rosetum, and wash all his mouth with Vinegar and Salt. If his stomach be too cold, then his hair will tare and stand right up, which Abhirus and others were wont to cure, by giving the Horse good Wine and Oyl to drink, and some would feethe in Wine Rew, or Sage; some would add thereunto white Pepper and Myrrhe; some would give him Onyons and Rocket-seed to drink with Wine: Again, there be other some which prescribe the blood of a young Sow with old Wine. Abhirus would have the Horse to eat the green blades of Wheat, if the time of the year will serve for it. Columella states, that if a Horse, or any other Beast, do loath his meat, it is good to give him Wine, and the feed of Gith; or else Wine and Flash Garlick.

**Of casting out his Drink.**

Vegetius states, that the Horse may have such a Palate proceeding of cold in his stomach, as he is not able to keep his drink but many times to cast it out again at his mouth. The remedy whereof is to let him blood in the neck, and to give him Cordial drinks, that is to say, made of hot and comfortable Spices; and also to anoint all his breast, and under his shoulders with hot Oyls, and to purge his head, by blowing up into his nostrils, powders that provoke neezing, such as have been taught you before.

**Of Surfeiting with glut of Provender.**

The glut of provender or other meat not digested, doth cause a Horse to have great pain in his body, so as he is not able to stand on his feet, but lyeth down, and walereth as though he had the Bots. The cure whereof according to Martinus experience, is in this sort: Let him blood in the neck, then trot him up and down for the space of an hour; and if he cannot take, draw it out of his yard, and wash it with a little white Wine lukewarm, and thrust into his yard either a bruised clove of Garlick, or else a little oyl of Camomile, with a wax Candle. If he cannot dung, then rase his fundament, and give him this Glyster: Take of Mallows two or three handfuls, and boil them in a potte of fair running water; and when the Mallows be sodden, then strain it, and put thereunto a quart of Wheath Butter, and half a pinte of Oyl Olive; and having received this Glyster, lead him up and down,
The History of Four-footed Beasts.

down, untill he hath emptied his belly, then let him up, and keep him hungry the space of three or four days, and the Hay that he eateh, let it be sprinkled with water, and let him drink water, where in should be put a little Bran, and when he hath drunk, give him the Bran to eat, and give him little or no provender at all, for the space of eight or ten days.

Of another Kinde of Surfetings with Meat or Drink, called of us, Foundering in the body.

Blundevile.  

His diseaue is called of the old Writers in Greek, Crisibius; in Latin, Hardestio; it cometh as they say, by eating of much provender suddently after labour, whilst the Horfe is hot and panting, whereby his meat not being digested, breedeth evil humor, which by little and little do spread throughout his members, and at length do oppresse all his body, and do clean take away his strengthe, and make him in such a case, as he can neither go, nor bow his joynts, nor being laid, he is not able to rise again; neither can he stale, but with great pain. It may come also, as they say, of drinking too much in travelling by the way when the Horfe is hot, but then it is not so dangerous, as when it cometh of eating too much.

But howsoever it cometh, they say all, that the humors will immediately refort down into the Horfes legs, and feet, and make him to call his hoofs: and therefore I must needs judge it to be no other thing but a plain foundering; which word foundering is borrowed, as I take it, of the French word Fundero, that is to say, molten. For foundering is a melting or dissolution of humors, which the Italians call Infusione. Martin maketh divers kinds of foundering, as the foundering of the body, which the French men call most commonly Morbus; and foundering in the legs and feet; also foundering before and behind, which some Authors do deny, as Magister Neurus, and Laurentius Ruffius, affirming that there are fewer humors behind then before, and that they cannot easily be disolved or molten, being so far distant from the heart, and the other vital parts. Whereunto a man might answer, that the natural heat of the body doth not cause dissolution of humors, but some unnatural and accidental heat, spred throughout all the members, which is dayly proved by good experience.

For we see Horfes foundered not only before or behinde, but also of all four legs at once, which most commonly changeth either by taking cold suddently after a great heat; as by standing full upon some cold pavement, or abroad in the cold winde; or else perhaps the Horfe travelling by the way, and being in a sweat, was suddently to stand in some cold water while he did drink, which was worse then his drinking: for in the mean time the cold entering at his feet, afcended upward, and concealed the humors which the heat before had dissolvd, and thereby when he cometh once to reft, he waxeth thinke and lame of his legs. But leaving to speake of foundering in the legs, as well before as behinde, untill we come to the griefs in the legs and feet; we intend to talk here only of foundering in the body, according to Martin's experience. The signes to know if a Horfe be foundered in the body, be these: His hair will flare, and he will be chill, and shrif for cold, and forfike his meat, hanging down his head, and quiver after cold water; and after two or three days he will begin to cough. The cure, according to Martin is thus: First, scour his belly with the Glyster laft mentioned, and then give him a comfortable drink made in this fort: Take of Malmife a quart, of Sugar half a quarter, of Honey half a quarter, of Cinnamon half an ounce, of Licorcs and Anife seeds, of each two spoonsfuls, beaten into fine powder, which being put into the Malmife, warm them together at the fire, so as the Honey may be molten, and then give it him Luke-warm: that done, walk him up and down in the warm stable the space of half an hour, and then let him stand on the bit two or three hours without meat; but let him be warm covered, and well litted: and give him Hay sprinkled with a little water, and clean pasted provender by a little at once; and let his water be warmed with a little ground Malt therein. And if you fee him somewhat cheered, then let him bleed in the neck, and also perfume him once a day with a little Frankincense; and use to walk him abroad, when the weather is fair and not windy, or else in the house, if the weather be foul; and by thus using him you shall quickly recover him.

Of the Hungry Evill.

This is a very great desire to eat, following some great emptines, or lack of meat, and it is called of the old Authors by the Greek name Beimus, which is as much to say, as a great hunger proceeding, as the Phyfians say, at the first of some extreme outward cold, taken by long travelling in cold barren places, and especially where Snow aboundeth, which outward cold caueth the stomach to be cold, and the inward powers to be feeble. The cure according to Abiopus and Hierocles, is in the beginning to comfort the Horfes stomach, by giving him Bread foft in Wine. And if you be in a place of reft, to give him Wheat-floure and Wine to drink; or to make him Cakes or Bals of Floure and Wine kneaded together, and to feed him with that; or with Wine and Nuts of Pine trees. Hierocles faith, if any such thing chance by the way whereas no floure is to be had, then it shall be best to give him Wine and earth wrought together, either to drink, or else to eat in Bals.
Of the Disease in the Liver.

All the old Authors speak much of the pain in the liver, but none of them do declare whereof it cometh, or by what means, saving that Hippocrates faith, that some Horseths get it by violent running upon some fiery or hard ground. I for my part think that the liver of a Horse is subject to as many diseases as the liver of a man, and therefore may be pains diversly. As sometimes by the intemperateness of the same, as for that it is perhaps too hot, or too cold, too moist, or too dry: sometimes by means of evil humors, as choler, or flemg abounding in the same, according as the liver is either hot or cold: for heat breedeth choler, and cold, flemg, by means of which intemperature proceedeth all the weaknesses of the liver. It may be pains also sometime by obstruction and stopping, and sometime by hard knobs, inflammation, Apotloume, or Ulcer bred therein, sometime by Consumption of the substanc thereof. The signes of heat and hot humors, be these: loathing of meat, great thirst, and looseness of belly, voiding dung of strong fent, and learness of body. The signes of cold, and cold humors be these: appetite to meat without thirst, a belly neither continually loole nor lipitike, but between times, no strong fent of dung, nor learnness of body, by which kind of signes, both first and last mentioned, and such like, the weaknesses and grief of the liver be.

Obstruction or stopping most commonly chargeth by travelling or labouring upon a full stomack, whereby the meat not being perfectly digested, breedeth grofe and tough humors, which humors by vehement of the labour, are also driven violently into the small veins, whereby the liver should receive good nutriment, and so breedeth obstruction and stopping.

The signes whereof in mans body is heaviness and diffusion, or swelling, with some grief in the right side under the short ribs, and especially when he laboureth immediately after meat, which things I believe if they were diligently observed, were easift enough to finde in a Horse, by his heavy going at his setting forth, and often turning his head to the side grieved. Of an old obstruction, and especially if the humors be cholerick, breedeth many times a hard knob on the liver, called of the Phyfitians Sclerites, which in mans body may be felt, if the body be not over fat: and it is more easift for him to ly on the right side than on the left, because that lying on the left side, the weight of the knob would oppress the stomack and vital parts very fore, by which signes methinks a diligent Farrier may learn, whether a Horse hath any such diseafe or not. The inflammation of the liver cometh by means that the blood either through the abundance, thinness, boiling heat, or sharpeness thereof; or else through the violence of some outward caufe, breaketh out of the veins, and floweth into the body of the liver, and there being out of his proper vessels both immediately putrific and is inflamed and therewith corrupteth soo much fleshy substance of the liver as is imbrowed withall; and therefore for the most part, the hollow fide of the liver is consumed: yet, and sometime the full fide.

This hot bloody matter then is properly called an Inflammation, which by natural heat is afterward turned into a plain corruption, and then it is called an Impollumte, which if it break out and run, then it is called an Ulcer, or filthy fore: Thus you fee, of one evil Fountain may spring divers griefs, requiring divers cures. And though none of mine Authors, nor any other Farrier that I know have waded thus far, yet I thought good by writing thus much, to give such Farriers as be wise, discreet and diligent, occasion to seek for more knowledge and understanding then is taught them; and me thinketh that it is a great shame, that the Farriers of this age should not know much more than the Farriers of old time, fith that beides that the old mens knowledge is not hidden from them, they have also their own experience; and time also bringeth every day new things to light. But now to proceed in diffcourling of the liver according to the Phyfitian doctrine as I have begun; I say then of an inflammation in the hollow fide of the liver, the signes be these: loathing of meat, great thirst, looseness of belly, easift lying on the right side, and painful lying on the left. But if the inflammation be on the full side or swelling fide of the liver, then the patient is troubled with difficulty of breathing, with a dry cough and grievous pain, pulling and twitching the winde-pipe, and to ly upon the right side is more painful than the left, and the swelling may be felt with a mans hand. But you must understand by the way, that all these things last mentioned be the signes of some great inflammation, for small inflammations have not such signes, but are to be judged only by grief under the short ribs and fetching of the breath.

The signes of Apotlumation is painful and great heat. The signes of Ulcerations is decrease of the heat with felleannes and fainting. For the filthy matter flowing abroad with evil vapours corrupteth the heart, and many times caufeth death. The signes of the Consumption of the liver, shall be declared in the next Chapter; and as for the curing of all other diseases before mentioned, experience must first teach it ere I can write it. Notwithstanding, I cannot think but that such things as are good to heal the like diseases in Mans body, are also good for a Horse; for his liver is like in substance and shape to a mans liver, differing in nothing but only in greatness. And therefore I would wish you to learn at the Phyfitians hands, who I am sure first, as touching the weaknesses of the liver, proceeding of the intemperateness thereof, will bid you to heal every such intemperateness by his contrary; that is to fay, heat by cold, and dryness by moisture: and for contrary; And therefore it shall be very necessary for you to learn the qualities, natures, and virtues of herbs, drugs, and all other simples, and how to apply them in time. And for to heal the oblation of the liver, they will counsel you perhaps to make the Horfe drinks of such simples as these.
The History of Four-footed Beasts.

be, Agrimony, Fumitory, Camomile, Wormwood, Licorice, Anise seeds, Smallage, Parfley, Spikenard, Gentian, Succory, Endive, Sperage, Lupines, the vertues whereof you shall learn in the Herbs; but amongst all simples, there is none more praifed than the liver of a Woolf beaten into powder, and mingled in any medicine that is made for any diseas in the liver.

The cure of an inflammation conffitteth in letting blood, and in bathing, or fomenting the fore place with fuch herbs and Oyls, as may mollifie and diffolve the furfeit, whereby lome simples that be allritent would be always mingled: yes, and in all other medicines that be applied to the liver, for any manner of diseases. Simples that mollifie and diffolve be thefe: Linseed, Fe- niger, Camomile, Anife seeds, Melliot; and fuch like things. Simples allritent be thefe: Red Rofe leaves, Bramble leaves, Wormwood, Plantain, Myrrhe, Mahick, Strax, and fuch like. Apo- thumes are to be ripped and voided. Ulcers must be cleaned, and fcowred downward, either by the belly, or by urine: and therefore the use of fuch simples as provoke urine in fuch cafe is neceffary. The old Writers of Horse-leech-craft do fay, that when a Horfe is griev'd in his liver, he will for- fake his meat, and his body will wafte, his mouth will be dry, his tongue rough and harfh: yea, and it will smell, and he will refuse to ly on that fide where his grief is. The cure whereof according to Affyrus is in this fort: Let him drink flantmpt Ireres with Wine allayed with water. He praieth alfo an herb much like unto Calamint; called of Fliny, Polymnia; or let him drink Savory with Wine and Oyl. I think that Agrimony or Liver-wort is as good as the best of them. Affyrus would have his body to be chafed with Wine and Oyl mixt together; and to be well lithered that he may ly fift; and his provender that fhould be given him to be steeped firt in warm water: and now and then fome Nitre to be put into his drink.

of theConsumption in the Liver.

I believe that no inward member of a Horfe doth suffer fo much as the lungs and liver, and that not fo much by continual, as by unordinate, and untimely travall, labour, and exercife, whereby either the Horfes lungs, or his liver do most commonly perifh, and is confumed: yea, and fome- time both. Of the Conflammation of the lungs, we have talked sufficiently before: therefore let us fiew you here the caufes whereof the Conflammation of the liver proceedeth. The Phyftians fay, that it may come of any humor, but chiefly and moft commonly of cholerick matter, fted throughout the fubflance of the liver, which purifying by little and little, and lefuely, doth at length corrupt and perifh all the fubflance of the liver, which thing in mans body doth firft proceed, as the Phyftians fay, either by eating corrupt meats, or elfe by continual drinking of sweet Wines.

But me thinks that the Conflammation of a Horfes liver, fhou'd come by fome extreme heat, in- flamming the blood, which afterward being purified, doth corrupt and exacerbate the fubflance of the liver. For after inflammation, as I faid before, cometh Apollamation, and Exulceration, which is very hard to cure, becaufe the fubflance of the liver is spongious like unto the lungs. And whileft the liver is fo corrupted, there can be no good digeflion, for lack whereof the body receiveth no good nutriment, and therefore muft needs alfo languifh and confume. The figures according to Mee- tin be thefe:

The Horfe will forfake his meat, and will fland stretching himfelf in length, and never cover to ly down; and his breath will be fo strong, as no man can abide it, and he will continually caft yellowish matter at the one noftril, or elfe at both, according as one or both fides of the liver is corrupted; and on that fide that he caufeth moft, he will have under his jaw, even about the midft thereof, a knob or kernel as much as a Walnut, which when Martin ffindeth, he comitteth his car- kafe to the Crows, taking him to be paft cure. But if he were let bold in time, and had fuch drinks given him, as are good to comfort and strenthen the liver, he thinketh that the Horfe might be recovered. I never read any medicine for the wafting of the liver, as I remember, but this only diet, which I found in an old English Book: Let him drink for the space of three days no other thing but warm wort; and let him eat no other meat but Oats baked in an Oven, and let him fland meatles the firft night before you give him the wort: But I think it were not amifs to put into the wort that he drinketh every morning fome good confection or powder made of Agrimony, red Rofe leaves, Salumn, Refum, Diarchedan, Albathe, Disfantlon, Licorat, and of the liver of a Wolf, and fuch other simples as do comfort and strenthen the liver; or elfe to give him the fame things with Goats milk Luke-warm.

of the diseases in the Gall.

In my opinion the gall of a Horfe is subject to divers diseafes, as well as the gall of a Man, as to obfttruction, whereof cometh the fulness and emptines of the bladder, and likewife the stone in the gall. But obfttruction may chance two manner of ways: Firft, when the way, whereby the cholrer fhould proceed from the liver unto the bladder of the gall as unto its receptacle, is flopped, and thereby the bladder remaineth empty, whereof may spring divers evil accidents: as vomit- ing, the Lax or Bloodly flx. Secondly, when the way whereby fuch cholrer fhould iffue forth of the bladder of the gall down into the guts is shut up, whereby the bladder is over full and abound- eth with two much cholrer,which causeth heavines, suffocation, belching, heat, thirst, and disposition.
To angrynes: The signes of both kindes of obstruction in the gall is coalevenes and yellowishness of skin infected with the yellow Jaundife. The stone in the gall, which is somewhat blackish, procedeth of the obstruction of the conduits of the bladder, whereby the choler being long kept in, waxeth dry, and turneth at length to hard gravel or stones; whereof because there is neither signes nor any grievous accident known to the Physitians, I leave to talk any farther thereof, and the rather for that none of mine Authors do make any mention of the gall at all. Notwithstanding to give some light to the learned Farriers; and that they may the better understand the inward parts of a Horse; I thought good to write thus much, thinking it no time lost while I may profit them any way.

Of the diseases in the Spleen.

The Spleen, as I have said before in many places, is the receptacle of melancholy, and of the dreggs of blood, and is subject to the like diseases that the Liver is, that is to say; to swelling, obstruction, hard knobs, and inflammation; for the substance of the Spleen is spongy, and therefore apt to wax in all flesh, and to dilate it self; wherefore being full it must needs swell, which will appear in the left side under the short ribs; and such swelling causeth also shortness of breath, and especially when the body doth labour or travel. It is painful also to ly on the right side, because the spleen being too thin to oppose the midriff, and especially when the stomacch is full of meall, and the patient hath worse digestion then appetit, and is troubled with much wind, both upward and downward. Moreover the vapour of the humor doth offend the heart, making it faint, and causeth all the body to be heavy and dull; and if such swelling be suffered to go uncured; then if it be a melancholy humor, and abounding over much, it waxeth every day thicker and thicker, causing obstruction not only in the veins & arteries, which is to be perceived by heaviness and grief on the left side, but also in the Spleen it self; whereas by vertue of the heat it is hardned every day more and more, and so by little and little waxeth to a hard knob, which doth not only occupy all the substance of the Spleen, but also many times all the left side of the womb, and thereby maketh the evil accidents or griefs before recited much more than they were.

Now as touching the inflammation of the Spleen which changeth very seldom; for so much as every inflammation proceedeth of pure blood, which seldom entereth into the Spleen: I shall not need to make many words, but refer you over to the Chapter of the Liver, for in such case they differ not, but proceeding of like cause, have also like signes, and do require like cure. The old Writers say, that Horfes be often grievous with grief in the Spleen, and specially in Summer feaon with greedy eating of sweet green meats, and they call those Horfes Liniath; that is to say, Spleenetic. The signes whereof (lay they) are these, hard swelling on the left side, short breath, often groaning, and greedy appetite to meat. The remedy whereas according to Abjirus is to make a Horfe to sweat one day during a certain time, by riding him, or otherwise travelling him, and to pour into his left noftroll every day the juice of Mirabolas mingled with Wine and Water, amounting in all to the quantity of a pinte. But me thinks it would do him more good, if he drank it as Hieropis would have him to do. Eumelius praifeth this drink: Take of Chamim feed and of Honey, of each fix ounces, and of Lapsa so much as a Bean of Vinegar a pint, and put all these into three quarts of water, and let it stand for all night, and the next morning give the Horfe thereof to drink, being kept over night fasting. The same Abjirus praifeth the decoction of Capers, especially if the bulk of the root thereof may be gotten stuffed in water to a fyrop. Or else make him a drink of Garlic, Nitre, Hore-bound, and Wormwood, stuffed in harth Wine: and he would have the left side to be bathed in warm water, and to be hard rubbed. And if all this will not help; then to give him the fire, which Abjirus doth not allow, saying the Spleen lyeth so, as it cannot easilly be fired, to do him any good. But for so much as the Liver and Spleen are members much occupied in the ingendring and separating of the vitals, many evil accidents and griefs do take their first beginning of them, as the Jaundife, called in a Horfe, the yellows, drieenes of body, and Concupis- ence of the feth, without any apparent caufe why, which the Physitians call Arithia; also evil habit of the body, called of them Coexhes, and the Drapfie. But first we will speake of the Jaun- dife or Yellows.

Of the Yellows.

The Physitians in a mans body do make two kindes of Jaundife: that is to say, the Yellow, pro- ceeding of choler dispersed throughout the whole body, and dying the skin yellow; and the Black, proceeding of melancholy, dispersed likewise throughout the whole body, and making all the skin black. And as the yellow Jaundife cometh for the most part, either by obstruction or Reip- ping of the conduits belonging to the bladder of the gall, which (as I said before) is the receptacle of choler; or by some inflammation of the Liver, whereby the blond is converted into choler, and fo spreadeth throughout the body; even so the Black Jaundife cometh by mean of some obstruction in the Liver-veins, that goeth to the Spleen, not suffering the Spleen to do his office, in receiving the dreggs of the blond from the Liver, wherein they abound too much; or else for that the Spleen is already too full of dreggs, and fo sheddeth them back again into the veins. But as for the black Jaundife; they have not been observed to be in Horfes as in Men, by any of our Farriers in these days
that I can learn. And yet the old [Writers of Horfe-leech-craft, do seem to make two kindes
of Jaundife called of them Cholerja, that is to fay, the dry choler, and alfo the moist choler. The fignes of
the dry choler, as Abjurtus fayth, is great heat in the body, and coftiveness of the belly, whereof it
faid to be dry. Moreover, the Horfe will not covet to ly down, because he is fo pained in his body,
and his mouth will be hot and dry.

It cometh, as he fayth, by obftuction of the conduit, whereby the choler fhould refort into the
bladder of the gall, and by obftuction alfo of the urine vefifals, as fo he cannot flate. The cure ac-
cording to his experience, is to give him a Glyftier made of Oyl, Water and Nitrum, and to give
him no provender, before that you have raked his fundament, and to pour the decocution of Mal-
lows mingled with sweet Wine into his noftrils, and let his meat be grafs, or elfe fweet Hay fprikned
with Nitre and Water; and he muft reft from labour, and be often rubbed. Horfe fayth would
him to drink the decocution of wilde Coleworts fidden in Wine. Again of the moist choler of Jaun-
dife, there are the fignes: The Horfes eyes will look yellow, and his noftrils will open wide; his ears
and his flanks will fweat, and his flate will be yellow and cholerick; and he will goone when he ly-
ed or laid down; which difeafe the faid Abjurtus was wont to heal, as he fayth, by giving the Horfe a drink
made of Thyme and Cumin, of each like quanity flappd together, and mingled with Wine, Honey,
and Water, and alfo by letting him bloud in the patterns. This laft difeafe feemeth to differ nothing
at all from that which our Farriers call the Yellows. The fignes whereof, according to Martin, be
thefe: The Horfe will be faint, and sweat as he flannedeth in the flate, and forfake his meat: and his
eyes, and the inside of his lips and all his mouth within will be yellow. The cure whereof accord-
ing to him is in this fort: Let him bloud in the neck-vein, a good quantity, and then give him this drink: Take of white Wine, of Ale a quart, and put thereunto of Saffron, Turmeric, of
each half an ounce, and the juycce that is wrung out of a handful of Celandine, and being luque-warm,
give it the Horfe to drink, and keep him warm the space of three or four days, giving him warm wa-
ter with a little Bran in it.

Of the Yellows.

Markham.

The Yellows is a general difeafe in Horfes, and differ nothing from the yellow Jaundife in men:
It is mortall, and many Horfes die thereof: the fignes to know it is thus: pull down the lids of
the Horfes eyes, and the white of the eye will be yellow, the infide of his lips will be yellow, and
pumps; the cure followed: Firft, let him bloud in the palat of his mouth, that he may fuck up the
fame, then give him this drink: Take of strong Ale a quart, of the green ordure of Ghee strained,
three or four fpoonfuls, of the juycce of Celandine as much, of Saffron half an ounce; mix thefe to-
gether, and being warm, give it the Horfe to drink.

Blundevile.

A touching the drinckes and Conufmption of the fluth, without any apparent caufe why, called
of the Phyfitians as I faid before Atropia; I know not what to fay more then I have already
before in the Chapter of Conufmption of the fluth, and therefore refert thither. And as for the
ew habit of the body, which is to be euill coloured, heavy, dull, and of no force, flrength, nor live-
lines, cometh not for lack of nutriment, but for lack of good nutriment, for that the bloud is cor-
ruped with flem, choler, or melancholy, proceeding either from the Spleen, or elfe through weak-
nefs of the stomatch or liver, caufing euill digeftion, or it may come by foul feeding: yea, and alfo
for lack of moderate exercife. The Euill habit of the body, is next couuen to the Dropifie, whereof
though our Farriers have had no experience, yet because mine old Authors writing of Horfe-leech-
craft do speake much thereof: I think it good here briefly to fhew you their experience therein,that
is to fay, how to know it, and alfo how to cure it. But fith none of them do fwee the caufe whereof it
proceeds; I think it meete firft therefore to declare unto you the caufes thereof, according to the do-
crine of the learned Phyfitians, which in mans body do make three kindes of Dropiffies, calling
the firft Anaftarea, the second Aiftera, and the third Timpania. Anaftarea, is an univerfal fwalving of the
body through the abundance of the water, lying betwixt the skin and the bones, and different not
from the difeafe laft mentioned, called Catheria, that is to fay, Euill habit of the blood, faying that
the body is more fwinon in this then in Catheria, albeit they proceed both of like caufes as of coldnefs
and weaknes of the liver, or by means that the heart, fpleen, stomatch, and other members ferving to
digiftion, be grieved or diseafe. Aiftera is a swallving in the covering of the belly, called of the Phy-
sitians Abdamen, comprifing both the skin, the fat, eight mufcles, and the film or pancile called
Peritoniun, through the abundance of some wayiff blood entred into the fame, which besides the
cauces before alledged, proceeded moft chiefly by means that some of the vesfels within be broken
or rather cracked, out of the which, though the bloud being somewhat grofs cannotiffe forth, yet
the wayiff blood being fubil, may run out into the belly, like water diftilling through a crack-
ed pot. Timpania, called of us commonly the Timpany, is a swallving of the aforesaid covering of the
belly, through the abundance of winde entred into the fame, which winde is ingendered of cruelty
and euill digiftion, and whileft it abunorth in the stomatch, or other intraits finding no iffue out,
it breaketh in violently through the small conduits among the pannicles of the aforesaid covering,
Of the Horse.

not without great pain to the patient, and so by tolling to and fro, windeeth at length into the space of the covering at self. But fully such winde cannot be altogether void of mischief.

Notwithstanding, the body twelfth not so much with this kind of Dropsey as with the other kind called Afebræ. The signes of the Dropsey is shortness of breath, swelling of the body, evil colour, loathing of meat, and great desire to drink, especially in the Dropsey called Afebræ, in which also the belly will found like a bottle half full of water: but in the Timpany it will found like a Tabber. But now though mine Authors make not so many kindes of Dropseys, yet they say all generally, that a Horse is subject to the Dropsey. The signes according to Abhurius and Hierocles, be these: His belly, legs, and bones, will be fwool; but his back, buttocks, and flanks, will be dried and shrunk up to the very bones.

Moreover the veins of his face and temples, and also the veins under his tongue will be so hidden, as you cannot see them; and if you thrust your finger hard against his body, you shall leave the print thereof behind, for the flesh lacking natural heat will not return again to his place, and when the Horse lyeth down he spreadeth himself abroad, not being able to lie round together on his belly; and the hair of his back by rubbing will fall away. Pelagorius in shewing the signes of the Dropsey, not much differing from the Physitians first rected, feemethe to make two kindes thereof, calling the one the Timpany, which for difference fake may be called in English the Winde Dropsey, and the other the Water Dropsey. Notwithstanding both have one cure, so far as I can perceive, which is in this fort: Let him be warm covered, and walked a good while together in the Sun to provoke sweat, and let all his body be well and often rubbed alonget he hair, and let him feed upon Coleworts, Smallage, and Elming boughs, and on all things, and on all kindes which may loosen the belly, or provoke urine; and let his common meat be grofs if it may be gotten, if not, then Hay sprinkled with Water and Nitram. It is good also to give him a kinde of Pulfe called Cich, steeped a day and a night in water, and then taken out, and laid so as the water may drop away from it. Pelagorius would have him to drink partly flampet with Wine, or the root of the herb called in Latin, Panax, with Wine. But if the swelling of the belly will not decrease for all this, then flit a little hole under his belly a handfule behind the navil, and put into that hole a hollow reed or some other pipe, that the water or winde may go out, not all at once, but by little and little at divers times, and beware that you make not the hole over wide, left the kall of the belly fall down thereunto; and when all the water is clean run out, then heal up the wound as you do all other wounds, and let the Horse drink as little as is possible.

Of the Evil habit of the Stomach.

If your Horse either by inward ficknesse, or by present furrie, grow to a toath of his meat, or by weaknesse of his stomatch call up his meat and drink; this shall be the cure for the same: First, in all the drink he drinks, let him have the powder of hot Spices; as namely, of Ginger, Anise seeds, Licorac, Cinamon, and Pepper; then blow up into his nostrils the powder of Tobacco to occasion him to sneeze, instantly after he hath eaten any meat, for an hour together after. Let one fland by him, and hold at his nose a piece of fowre leaven封建 in Vinegar, then anoint all his breas over with the Oyl of Ginnuper and Pepper mixt together.

Of the diseases of the Guts of a Horse, and first of the Colick.

The guts of a Horse may be diseased with divers griefes, as with the Colick, with Colitvencetis, with the Las, with the Bloody flux and Worms. The Colick is a grievous pain in the great gut, called of the Physitians Ctenis, whereof this disease taketh his name, which gut because it is very large and ample, and full of corners, it is apt to receive divers matters, and so become subject to divers griefes. For sometime it is tormenteded with the abundance of gros humors gotten betwixt the panicle of the said gut, and sometime with winde having no issue out, sometime with inflammatiion, and sometime with sharp fretting humors. But so far as I can learn, a Horse is most commonly troubled with the Colick that cometh of winde, and therefore our Farriers do term it the winde Colick. The signes whereof be these: The Horse will fortake his meat, and lie down and wallow and wander upon the ground, and standing on his feetes he will flamp for very pain with his fore-feet, and strike on his belly with his hinder foot, and look often towards his belly, which also towards his flanks will swell, and seem greater to the eye then it was wont to be. The cure whereof according to Martin, is in this fort: Take a quart of Malmte, of Cloves, Pepper, Cinamon, of each halfe an ounce, of Sugar halfe a quarter, and give it the Horse lukewarm, and anoint his flanks with Oyl of Bay, and then bende him and trot him immediately up and down the space of an hour, until lie dung, and if he will not dung, then rake him; and if need be provoke him to dung, by putting into his fundament an Omony piled and jugged with a knife crose wise, so as the juice thereof may tickle his fundament; and for the space of three or four days let him drink no cold water, and let him be kept warm. Bussius was wont to use this kind of cure: Take a good big reed a span long or more, and being anointed with Oyl, thrust it into the Horse fundament, fastening the outward end thereof unto his tail, so as it cannot flip out, and then having
first anointed and chas’d all the Horse’s belly with some hot Oyl, cause him to be ridden hastily up and down some hilly ground, and that will make him to void the winde out of his belly through the reed: which done, let him be kept warm and fed with good provender, and warm maſhes made of Wheat-meal, and Fennel seed, and let him drink no cold water until he be whole. Abystyn would have you to give him a Glyster made of wild Cowcumber, or elle of Hens dung, Nitrum, and strong Wine.

Of Cofiveineſs, or Belly-bound.

C Oiliveſens is when a Horse is bound in the belly and cannot dung, which may come by glut of provender, or overmuch feeding and reft, whereof we have talked sufficient before, also by winde, gros humors, or cold causing obturſion, and floppıng in the guts. The cure whereof, ac-

©ording to Milton, is in this fort: Take of the decoction of Mallowes a quart, and put thereunto halı a pinte of Oyl, or in fleed thereof, halı a pinte of ſtreth Butter, and one ounce of Benteſide laxa-tive, and pour that into his fundament with a little Horn meæt for the purpoſe, that done, clap his tail to his fundament, holding it ﬁll with your hand, whilst another doth lead him in his hand, and trot him up and down, that the medicine may work the better, and having voided all that in his belly, bring him unto the ﬂable, and there let him fland a while on the bit well covered, and warm littered, and then give him a little Hay, and let his drink be warm’d; it shall not be amifs alfo to give him that night a warm maſh.

Of the Lax.

The Indians call this diſeafe Ragiſta, and the Horse that hath this diſeafe Caſuſo Arrayiga, or Sbrao. It may come through the abundance of choleric humors deſcending from the liver or gall, down to the guts. But Ruffino faith, that it cometh most commonly by drinking overmuch cold water immediately after provender, or by fudden travelling upon a full stomæch, before his meæt be digiſted, or by hally running, or galloping immediately after water. If this diſeafe continue long, it will make the Horse very weak and feeble, fo as he shall not be able to fland on his legs. Notwithstanding, fith nature feeling her self oppreſſed, endevoroureth thus to eafe her self by expelling those humors that grieve her, I would not with you suddeny to fip it, let fome worfe inconvenience grow thereof. But if you fee that the Horse looth his ſtreth, and waxeth more dull and feeble then he was wont to be; then give him this drink often experimen
ted by Milton, and that shall fip him: Take of Bean-flowre, and of Bole Armony, of each a quartra, mingle these things together in a quart of red Wine, and give it him Luke-warm, and let him reft and be kept warm, and let him drink no cold drink but Luke-warm, and put therein a little Bean-flowre, and let him not drink but once a day, and then not over-much, for the space of three or four days.

Of the Bloody flux.

I ffeemeth by the old Writers, that a Horse is alſo ſubject to the Bloody flux. For Abystyn, Hireroes, and Democritus, say all with one voyce, that the guts of a Horse may be fo excretaed, that he will void bloody matter at his fundament, yea and his fundament therewith will fall out, which diſeafe they cal

© Dyſteria, which is as much to fay, as a painful excretaion of the guts, under the which the old men as it ffeemeth by the words of Hiresos, and Abystyn, would comprehend the diſeafe called of the Phyfitians Tenafmus, that is to fay, a deſire to dung often, and to do but little, and that with great pain: And alſo another diſeafe called Proviſionia ani, that is to fay, the falling out of the fundament, which the Phyfitians do account as feveral diſeafees. Notwithstanding, for fo much as Dyſteria, and Tenafmus, do spring both of like caufes: yea, and alfo for that the falling out of the fundament hath some affinity with them, I will follow mine Authors, in joyning them alſo togethe

r in this one chapter.

The Phyfitians make divers kindes of Bloody flux, for sometime the fat of the fatty ſlith which is voided, is sprinkled with a little blood, sometime the matter that voideſeth is mixt with the feræping of the guts, and sometime it is waterſh blood, like water wherein fleſh hath been washd, and sometime blood mixt with melancholy, and sometime pure blood, and by the mixture of the matter you ſhall know in mans body, whether the ulceration be in the inner ſmall guts or no; if it be, the matter and blood will be perfectly mixt together; but if it be in the outward guts, then they be not mingled together, but come out severall, the blood most commonly following the matter. Of this kinde is the diſeafe called before Tenafmus, for that is an ulcer in the right gutterving the fundament; and doth proceed even as the flux doth of some ſharp humors, which being violently driven, and having to paſs through many crooked and narrowways, do cleave to the guts, and with their sharpnes fret them, caufing excretaion and grievous pain. The flux alfo may come of some extreme cold, heat or moistenes, or by mean of receiving some violent purgation, having therein over-much Scammony, or ſuch like violent fpife; or through weakenes of the Liver, or other members serving to digestion. Now as touching the falling out of the fundament, the Phyfitians say, it cometh through the resolution or weakenes of the muscles, serving
to draw up the fundament, which resolution may come partly by over-much training, and partly they may be loozened by over-much moisture, for whose sake children being full of moisture are more subject to this diseaie then men. And for the self same cause I think that Horfes having very moist bowies be subject thereunto. Thus having thewed you the cauеs of the diseases before receiued, I will shew you the cure prescribed by the old Writers. Alchemists would have the fundament on the outside to be cut round about, but to the inward ring thereof be not touched. For that were dangerous, and would have kill the Horfe, for so much as his fundament would never abide within his body; and that done, he would have you to give him to drink the powder of unripe Pomegranate blés, called in Latin, Malacram, together with Wine and Water, which indeed because it is allringent, is not to be miflied: But as for cutting of the fundament, I assure you I cannot judge what he shold mean thereby, unleas it be to widen the fundament, by giving it long lites or cuts on the outside; but well I know that it may cause more pain, and greater inflammation. And therefore me thinks it were better in this cate to follow the Phyftitians precepts, which is first to consider whether the fundament being fallen out be inflamed or not; for if it be not inflamed then it shall be good to anoint it first with Oyl of Rifes somewhat warmed, or else to wash it with warm red Wine. But if it be inflamed, then to bathe it well, first with a fuppen dipt in the decoction of Mallows, Camomile, Linfeed, and Fenigreek, and alfo to anoint it well with Oyl of Camomile and Dill mingled together, to affage the twelving, and then to rub it in again fair and foltly, with a soft linen cloth. That dose, it shall be good to bathe all the place about with red red Wine wherein hath been fdden Acratium, Galles, Acorn cups, parings of Quinces, and fuch like simples as be allringent, and then to throw on some allringent powder made of Bole Armony, Frankeence, Sanguia Dragomion, Myrifs, Acratium, and fuch like: yea, and alfo to give the Horfe this drink, much praising of the old Writers. Take of Saffron one ounce, of Myriffe two ounces, of the herb called in Latin, Abrotonum, named in some of our English Herbs Southenwood, three ounces, of Parfyl one ounce, of garden Rue, otherwise called Herb Grace three ounces, of Pitheum, otherwise called of some people Spittlewort, and of Hylas, of each two ounces, of Galles, which is like Cinnamon, one ounce. Let all these things be beaten in fine powder, and then mingled with Chalk and fimng Cord Vinegar wrought into pale, of which pale make little cakes, and dry them in the fadow, and being dryied, dissolve some of them in a fimcient quantity of Barly mylk, or joyce called of the old Writers, and alfo of the Phyftitians, Cremas, Pifane, and give to the Horfe to drink thereof with a horn, for the medicine, as the Authors write, doth not only heal the Bloudy-flix, and the other two diseases before receiued, but alfo if it be given with a quart of warm water, it will heal all grie and pain in the belly, and alfo of the bladder, that cometh for lack of italinge. And being given with sweet Wine, it will heal the buring of any Serpent or mad Dog.

Of the Worms.

I n a Horfes guts do breed three kindes of Worms, even as there doth in Mans body, though they be not altogether like in shape. The firft long and round, even like to those that children do molt commonly void, and called by the general name Worms. The second little worms having great heads, and small long tails like a needle, and be called bots. The third be thourt and thick like the end of a mans little finger, and therefore be call Trenchones: and though they have divers shapes according to the diversity of the place perhaps where they breed, or else according to the figure of the putrified matter whereby they breed: yet no doubt they proceed all of one caufe, that is to fays, of a raw, gros and fleematick matter apt to putrification, ingendered most commonly by foul feeding: and as they proceed of one self caufe, so also have they like fignes, and like cure. The fignes be thefe: The Horfe will forfike his meat, for the Trenchones and the Bots will covet alwayes to the maw, and pain him fore. He will also lie down and wallow, and standing he will flamp and strike at his belly with his hinder-foot, and look often toward his belly. The cure according to Martius is thus: Take of sweet Milke a quart, of Honey a quartern, and give it him luk-warm, and walk him up and down for the space of an hour, and to let him reit for that day, with as little meat or drink may be, and fuffer him not to lie down. Then the next day give him this drinke: Take of Herb-grace a handful, of Savin as much, and being well smappe, put thereunto a little Brimfbone, and a little Soot of a Chimmy, beaten fine into powde, and put all these things together in a quart of Wort or Ale, and there let them lie steep the space of an hour or two, then strain it well through a fair cloth, and give it the Horfe to drink lukewarm, then bridle him, and walk him up and down the space of an hour: that done, bring him into theitable, and let him liand on the bit two or three hours, & then give him a little Hay. Lawrence Kuffins faith, that it is good to give the Horfe the warm guts of a young Hen with a Salt three days together in the morning, and not to let him drink untill it be noon. Some fay that it is good to ride him, having his bit firft anointed with duing coming hot from the man: some again use to give him a quantity of Brimfbone, and hall as much Rozen beaten into powders, and mingled together with his provender, which he must eat a good while before he drinketh.

I have found by often tryal, that if you give the Horfe with a horn a good pretty dishing of Salt brine, be it flefh brine, or Cheefe brine, it will kill any of the three kindes of Worms, and make the Horfe to avoid them dead in short time after.
The History of Four-footed Beasts.

304

Markham.

Bloudelvill.

Of Worms in general.

Beedes the Bots, there are other Worms, which lie in the great paunch or belly of a Horfe, and they be thinning, of colour like a Snake, six inches in length, great in the midst and sharp at both ends, and as much as a Spindle: they cause great pain in a Horfes belly, as you shall perceive by his continual sucking of himself on the belly with his foot. The cure is thus: Give him two or three mornings together new Milk and Garlic boiled together, or chop Hay in his provender, either of both will serve: it killeth the worms and maketh them to void.

Of the pain in the Kidneys.

Me thinks that the Kidneys of a Horfe should be subject to as many griefs as the Kidneys of a Man, as to Inflammation, Obstruction, Apoftumes and Ulcers, and specially to obstruction that cometh by means of some stone or gravel gathered together in the Kidneys whereby the Horfe cannot mrape but with pain; for I have seen divers Horses my self that have voided much gravel in their little, which without doubt did come from the Kidneys; but my Authors do refer such griefs to the bladder and urine, and write of no disease but only of the inflammation of the Kidneys, which is called of them Neftritis, and so is called of the Physitians. It cometh, as they say, by some great drain over some ditch; or else by bearing some great burden. The signes whereof be these: The Horfe will go rolling behind and staggering, his foles will shrunk up, and his little will be blackish and thick. I think this disease differeth not from that which we called before the swelling of the back when we talked of the griefs in the back and loins, and therefore refteth thither. The cure of this disease, according to the bell of the old Writers, is in this fort: Bathe his back and loins with Wine, Oyl, and Nature warm together, after that you have so bathed him, let him be covered with warm clothes, and stand littered up to the belly with straw, so as he may lie foit; and give him such drinks as may provoke urine as those that be made with Dill, Fennel, Anife, Smallage, Parley, Spikenard, Myrthe, and Caffia. Some say it is good to give him a kind of pulle called Chat with Wine. Some again do praise Ewes milk, or else Oyl and Deers sweet molten together, and given him to drink, or the root of the herb called Asphodelus, Englisht by some Daffadi, sodden in Wine.

Of the diseases belonging to the Bladder and Urine of a Horfe.

Hieraceps faith, that a Horfe is subject to three kind of diseases incident to the Bladder or Urine, the first is called Strangury; the second Dysuria; the third Ichuria. Strangury, other wise called in Latine, Sifedundium, and of our old Farriours, according to the French name Choulepsis, is, when the Horfe is provoked to foile often, and voideth nothing but a few drops, which cometh, as the Physitians say, either through the sharpnes of the urine, or by some exculoration of the bladder, or else by means of some Apoftume in the liver or Kidneys; which Apoftume being broken, the matter reforteth down into the bladder, and with the sharpnes thereof caufeth a continual provocation of pifling.

Dysuria is when a Horfe cannot pis but with great labour and pain, which for difference fako I will call from hence forth the pain-pis. It may come sometime through the weaknes of the bladder and cold intemperate thereof, and sometime through the abundance of flagmatics and grofs humors, fopping the neck of the bladder. Ichuria, is when the Horfe cannot pis at all, and therefore may be called the pis-suppreft, or imprefion of urine, whether you will: me thinks always that the shorter and the more proper the name is, the better and more eafe it is to pronounce.

It may come, as the Physitians say, by weaknes of the bladder, or for that the Water conduit is fopt with grofs humors, or with matter defending from the liver or Kidneys, or with the fone: yea and sometimes by means of some inflammation or hard knob growing at the mouth of the conduit, or for that the fiews of the bladder is numbed, fo as the bladder is without feeling: or it may come by retention, and long holding of the water, most of which caufes Hieraceps alfo reciteth, adding thereunto that it may chance to a Horfe through over-much red and idenees, and alfo by meanes of some extreme cold, and especially in Winter feaon; for which, warmth of the fire is a preuent remedy. But now me Authors do not fhow for every one of tho three kindes of diseases several signes; but only fay, that when a Horfe cannot pis, he will fand as though he would itale, and thref out his yard a little; and alfo for very pain, fanding beatt his tail between his thighs.

Neither do they seem to appoint several cures, but do make a hopochip, mingling them all togethersome of them praffing one thing, and some another: For some fay it is good to mingle the juice of Leeks with sweet smelling Wine and Oyl together, and to pour it into his right noftl, and then to walk him up and down upon it, and that will make him to itale. Some fay it is good to give him Smallage feed, or efe the root of wild Fennel sodden with Wine to drink; or to put fine sharp Onions clean pilled, and somewhat bruised into his fundament, and to chafe him immediately upon it, either by riding him or otherwife, and that shall caufe him to itale prefently. It is good alfo to bathe all his back and loins with warm water.

The
Of the Horse.

The scraping of the inward parts of his own hoofs beaten into powder and mingled with Wine, and poured into his right nostril, will make him to flate, if you chase him upon it, and the rather as Heriot's faith, if you carry him to some Sheeps cot; or other place where Sheep are wont to stand, the smell of whole dung and pifs, without any other medicine, as he faith, will provoke him to flate.

Some will give the Horse white Dog's dung dried and mingled with Salt, Wine, and Ammoniacum to drink, some Hogs dung only with Wine, and sothe the dogs of Horse:pifs with Wine, and many other medicines which I leave to rehearse, for fear of being too tedious, and especially, fifth Martin experience doth follow here at hand; agreeing in all points with Laurensius Kajser, cured, which is in this fort: First, draw out his yard, and wash it well in white Wine, and scour it well, because it will be many times flopped with durt and other baggage together, and hardened like a stone; and then put a little Oyl of Camomile into the conduit, with a wax Candle and a bruised clove of Garlic, and that will provoke him to flate. And if that will not help: Take of Puffley two handfuls, of Coriander one handful, flamethem and strain them with a quart of white Wine, and dilute therein one ounce of Cake-ope, and give it Luke- warm unto the Horse to drink, and keep him as warm as may be; and let him drink no cold water for the space of five or six days; and when you would have him to flate, let it be either upon plenty of straw, or upon some green plots, or elle in a Sheeps cot, the favour whereof will greatly provoke him to flate, as hath been aforesaid.

Of Pissing Blood.

Pelagius faith, that if a Horse be over-much laboured, or over-charged with heavy burdens, or over fat, he will many times pifs blood, and the rather as I think, for that some vein is broken within the Horse body, and then cleer bloud will come forth many times, as the Physitians say, without any pifs at all. But if the bloud be perfectly mingled together with his steale, then it is a signe that it cometh from the Kidneys, having some blone therein, which through vehement labour, doth fret the kidneys and veins thereof, and so cause them to bleed, through which while the urine paffeth, must needs be infected and dyed with the bloud. It may come also by some strife, or from the muscle that incloseth the neck of the bladder. The cure according to Pelagius, Absuris, Heriot's, and the rest, is thus: Let the Horse bloud in the palace of the mouth to convert the bloud the contrary way; then take of Tragagant that hath been steeped in Wine, half an ounce, and of Poppy seed one dram and one scruple, and of Strixas as much, and twelve Pineapple-kernels: Let all these things be beaten and mingled well together, and give the Horse thereof every morning, the space of seven days, the quantity of a Hafl-nut dilempered in a quart of Wine: me thinks that the quantity of a Wal-nut were too little for so much Wine. Some write that it is good to make him a drink with the root of the herb Aploodus, which some call Daf, dail, mingled with Wheat-flowre and Sumach sodden long in water, and so to be given the Horse with some Wine added thereunto; or make him a drink of Colts milk and Oyl, straining thereunto to a little Fromency. And I believe, that it is good to give the Horse three days together, sodden Beans clean pilled, whereunto would be added some Deers Sewer, and a little Wine.

of the Colt Evil.

This name Colt Evil, in my judgement, doth properly signifie that diasefe, which the Physitians call Prapismus, which is a continual standing together, with an unnatural swelling of the yard proceeding of some wind, filling the arteries and hollow finew or pipe of the yard; or elles by the abundance of seed, which do chance oftimes to man, and I think somet ime to fioned Hories. Notwithstanding Martin faith, that the Colt Evil is a swelling of the steale of the yard, and part of the belly thereabout, caufed of corrupt seed, coming out of the yard, and remaining within the steale where it putrefieth. And Gelding's most commonly are subject to this diasefe, not being able for lack of natural heat, to expel their seed any further. For Hories, as Martin faith, are seldom troubled with this diasefe, because of their heat, unless it be when they have been over travelled, or otherwise weakened. The cure, according to him is thus: Wash the steale clean within Luke-warm Vinegar; then draw out his yard and wash that also: that done, ride him into some running strem up to the belly, toffing him therein to and fro to allay the heat of the members, and use him thus two or three days, and he shall be whole.

Another of the Colt Evil.

The Colt Evil is a diasefe that cometh to fioned Hories, through rackness of nature and want of vent, it appeareth in his cod and steale, which will swell exceedingly; the cure is nothing: for if you will but every day, twice or thrice drive him to the mid-side in some Pond or running River, the swelling will fall, and the Horse will do well. If the Horse be of years, and troubled with this grief; if you put him to a Mare, it is not amifs; for standing still in a liable without exerc is, a great occasion of this diasefe.
of the mattering of the Yard.

Tcometh at covering time, when the Horse and Mare both are over-hot, and so perhaps burn themselves. The cure according to Martin is thus: Take a pinte of white Wine, and boil therein a quarton of roch Allum, and quirt thereof into his Yard three or four quartsfulls, one after another, and thrust the quirt so far as the liquor may pierce to the bottom, to scour away the bloody matter, continuing thus to do once a day until he be whole.

of the shedding of Seed.

His disease is called of the Phisitians Conurrea, which may come sometime through abundance and ranckness of feed, and sometime by the weakenss of the stones and feed veffels not able to retain the feed until it be diggled and thickened. Vegetius faith, that this disease will make the Horle very faint and weak, and especially in Summer feaon. For cure whereof, the said Vegetius would have the Horle to be ridden into some cold water, even up to the belly, so as his stones may be coverd in water; and then his fundament being first bathed with warm water and Oy', he would have you to thrust in your hand and arm even to the very bladder, and softly to rub and claw the same, and the parts thereabouts, which be the feed veffels: that done to cover him warm that he take no cold, and every day would you have to give the Horle Hogs dung to drink with red Wine until he be whole. I for my part, if I thought it came of weakens, as aforesaide, I which would judge by the waterishnes of the feed and unflinnes of the Horle, would give him red Wine to drink, and put therein a little Aescum, the juice of Plantain, and a little Mallick, and bath his back with red Wine and Oyl of Roses mingled together.

of the falling of the Yard.

I come, as I take it, through the weakenss of the member, by means of some resolution in the muscles and finevess furning the fame, caused at the first (perhaps) by some great strain or slippe on the back. It may come also by weariness and tiring. For remedy whereof, Absinth was wont to wash the yard with salt water from the Sea, if it may be gotten; and if not, with water and salt, and if that prevailed not, he would all to prick the outmost skin of the yard with a sharp needle, but not deep, and then wash all the prickes with strong Vinegar, and that did make the Horle, as he faith, to draw up his yard again immediately: yes, and this also will remedy the falling out of the fundament. Pelageius would have you to put into the pipe of his yard, Honey and Salt boiled together and made liquid, or else a quick flie, or a grain of Frankincense, or a clove of Garlick clean pinled, and somewhat bruised; and also to pour on his back Oyl, Wine, Nitre made warm and mingled together. But Martin's experience is in this fort: First, wash the yard with warm white Wine, and then anoint it with Oyl of Roses and Honey mingled together, and put it up into the sheath, and make him a Cod-piece of Canvas to keep it still up, and dres it thus every day once until it be whole. And in any case let his back be kept warm, either with a double cloth, or else with a charge made of Bole Armony, Eggs, Wheat-flowre, Sanguis Draconis, Turpentine, and Vinegar; or else lay on a wet sack, which being covered with another dry cloth will keep his back very warm.

of the swelling of the Cod and Stones.

Absinth faith, that the inflammation and swelling of the cod and stones, cometh by means of some wound, or by the flingling of some Serpent, or by lighting one Horle with another. For remedy whereof, he was wont to bathe the cod with water wherein hath been fdden the roots of Wilde Cowcumber and Salt, and then to anoint it with an Ointment made of Carsa Oyl, Goats greese, and the white of an Egge. Some again would have the cod to be bathed in warm Water, Nitrum, and Vinegar together, and allo to be anointed with an Ointment made of Chalk, or of Potters earth, Oxe dung, Gummi, Water and Vinegar, or else to be anointed with the juice of the herb Salamum, called of some Night-flade, or with the juice of Hemlock growing on dunghils: yes, and allo to be let bled in the bloud. But Martin faith, that the swelling of the cods cometh for the most part after some sicknes or sweating with cold, and then it is a sign of amendment. The cure according to his experience is in this fort: First let him bloud on both fides the flank vesse. Then take of Oyl of Roses, of Vinegar of each half a pinte, and half a quarton of Bole Armony beaten to powder. Mingle them together in a cruce, and being huke-warm, anoint the cods therewith two or three feathers bound together, and the next day ride him into the water, so as his cods may be within the water, giving him two or three turns therein, and so return fair and softe to the stable, and when he is dry anoint him again as before, continuing thus to do every day once until they be whole. The said Martin faith also, the cods may be swollen by means of one hurt or evil humors reftoring into the cod, and then he would have you cover the cods with a charge made of Bole Armony and Vinegar wrought together, renewing it every day once until the swelling go away, or that it break of itself, and it it break, then tent it with Mel Roseatum, and make him a breech of Canvas to keep it in, renewing the tent every day once until it be whole.
of incoring and bruising.

T

His term, Incoring, is borrowed of the Italian word Incoraro, which in plain English is as much to say as Burilen: and might be more rightly termed of us uncoddled. For when a Horse is Burilen, his guts falleth down into the cod making it to swell. The Italians, as I take it, did call it Incoraro, because the gut follows the string of the fome, called of them Cordone, or La corda, whereof Incoraro seems to be derived with some reason. According to which reason we should call it rather In-

fringed, then Incorded: for Corda doth signifie a string or cord. Notwithstanding, such that Incoraro is already received in the Cable; I for my part am very well content therewith, minding not to contend against it. But now you have to note, that either Man or Beast may be Burilen diversly, and according to the names of the parts griev'd: the Physicians do give it divers names; for you shall understand, that next unto the thick outward skin of the belly, there is also another inward thin skin covering all the muscles, the Caul, and the guts of the belly, called of the anatomists Peritoneum, which skin cometh from both parts and fides of the back, and is fastened to the Medriff above, and also to the borrom of the belly beneath, to keep in all the contents of the heather belly. And therefore if the skin be broken, or over ftreined or stretched, then either some part of the caul or guts flippeth down, sometyme into the cod, sometyme not so far.

If the guts flipp down into the cod, then it is called of the Physicians by the Greek name Enterocle, that is to say, Gut-burilen. But if the caul fall down into the cod, then it is called of the Physicians Epsheke, that is to say, Caul-burilen. But either of the diseas is most properly incident to the male kind, for the female kind hath no cod. Notwithstanding they may be to burilen; as either gut or caul may fall down into their natures, hanging there like a bag; but if it fall not down so low, but remaineth above nigh unto the privy members or fkins, which place is called of the Latins, Iegua, then of that place the Burilen is called of the Physicians Bubonocle, whereunto I know not what English name to give, unlefe I should call it flank-burilen. Moreover, the cod or flank may be sometimes swollen, by means of some watersh humour gathered together in the same, which is called of the Physicians Hydrocele, that is to say, Water-burilen; and sometimes the cod may be swollen by means of some hard piece of flesh cleaving to the thin skins or panicles of the fomes, and then it is called of the Physicians Sarocle, that is to say, Fleith-burilen.

But forasmuch as none of mine Authors, Martus, nor any other Farriere in these days that I know, have intermeddled with any kind of Buriling, but only with that wherein the gut falleth down into the cod: leaving all the rest apart, I will only take of this; and that according to Martus experience, which I assure you differeth not much from the precepts of the old writers: But firft you shall understand, that the Gut-burilen, and Flank-burilen, doth proceed both of one cause, that is to say, by means that the skin, called before Peritoneum, is either fore straine, or elfe broken, either by some stripe of another Horse, or elfe by some flrain in leaping over a hedge, ditch, or pale, or otherwife; yes, and many times in paffing a career, through the carelefnes of the Rider, stopping the Horse suddenly without giving warning, whereby the Horse is forced to cast his hinder legs abroad, and so straineth or burilen the skin aforefaid, by means whereof the gut falleth down into the cod. The figures be thefe; The Horse will forfake his meat, and fland fторing and leaning alwayes on that side that he is hurt; and on that fide if you fearch with your hand be twixt the fome and the thigh upward to the body, and somewhat above the fome you shall finde the gut it fell big and hard in the feeling, whereas on the other fide you shall finde no fuch thing. The cure, according to Martus, is thus: Bring the Horfe into some houfe or place that hath over head a ftrong back or beam going overthwart, and flrew that place thick with fraw; then put on four patterns with four rings on his feet, and then fluffen the one end of a long rope to one of thofe rings, then thread all the other rings with the loofe end of the rope, and to draw all his four feet together, and call him on the fraw. That done, call the rope over the baull, and hoife the Horfe fo as he may lie flat on his back, with his legs upward without struffling. Then bathe his fomes well with warm Water and Butter molten together, and the fomes being somewhat warm, and well mollified, raife them up from the body with both your hands being clofed by the fingers fift together, and holding the ftones in your hands in fuch manner, work down the gut into the body of the Horfe, by flinking it downward continually with your two thumbs, one labouring immediately after another, until you perceive that fide of the fome to be fo small as the other, and having fo disordered, that is to say, returned the gut into his right place; take a lift of two fingers broad throughe anointed with frefth Butter, and tie the fomes both together with the fame fide as may be, not over hard, but fo as you may put your finge betwixt That done, take the Horfe quietly down, and lead him fowol and softly into the fable, where he must fand warm, and not be flurred for the space of three weeks. But forget not the next day after his dis ordering to unloofen the lift, and to take it away, and as well at that time, as every day once or twice after, to caft a fift or two of cold water up into his cods, and that will caufe him to shrink up his fomes, and thereby refrain the gut from falling down, and at the three weeks end be sure, it were not amiffe to geld the fome on that fide away, fo shall lie never be encor-

ved again on that fide. But let him not euer nor drink much, and let his drink be always warm.
The History of Four-footed Beasts.

of the bitch in the grains of a Horse.

If a Horse be full of humours and then suddenly laboured, the humors will resort into the weakest parts, and there gather together and breed a Bitch, and especially in the hinder parts bet\"twixt the thighs, not far from the cuds. The figures be these; The hinder legs will be all swollen, and especially from the hoofs upward, and if you feel with your hand you shall find a great kind of swelling, and if it be round and hard it will gather to a head. The cure, according to Martin, is thus; First ripe it with a plaiifer; take of Wheat-flowre, of Turpentine, and of Hony, of each a like quantity, flirring it together to make a liffe plaiifer, and with a cloth lay it unto the fore, renewing it every day until it break or wax soft, and then lane it as the matter may run downward; then tent it with Turpentine and Hogs greese molten together, renewing it every day once, until it be whole.

Of the diseases incident to the womb of a Mare, and specially of barrenness.

It semeth by some writers, that the womb of a Mare is subject to certain diseases, though not as many as the womb of a Woman, as to ascent, descent, falling out, Convulsion, Barrenness, abortion; yea, 

Aristotle and others do not let to write, that menstrual blood doth naturally void from the Mare, as from the Woman, though it be so little in quantity, as it cannot be well perceived. But sith none of mine Authors have written thereof to any purpose, nor any Farrier of this time that I know, have had any experience in such matters, I will pass them all over with silence, saving barrennesse, whereas I promised before in his due place, to declare unto you the causes and such kind of cure for the same, as the old writers have taught. A Mare then may be barren through the untemperatenes of the womb or matrix, as well for that it is too hot and fiery, or else too cold and moist, or too dry, or else too short, or too narrow, or having the neck thereof turned awry, or by means of some obstruction or stopping in the matrix; or for that the Mare is too fat, or too lean, and many times Mares go barren, for that they be not well Horfed. Wel, the cure of barrennesse that cometh through the fault of the matrix or womb according to the old writers is thus; Take a good handful of Leeks, ramp them in a morter with half a glasse full of wine, then put thereunto twelve Flies, called of the Apothecaries Cantharides, of divers colours, if they may be gotten, then strain all together with a sufficient quantity of water to ferre the Mare therewith two days together, by pouring the same into her nature with a horn or glyster-pipe made of purpofe, and at the end of three days following offer the Horse unto her that should cover her, and immediately after that she is covered, wath her nature twice together with cold water.

Another receipt for the same purpose.

Take of Nitrums, of Sparrows dung, and Turpentine, of each a like quantity well wrought together and made like a Suppository, and put that into her nature, and it will caufe her to defire the Horse, and also to conceive. *Hippocrates* faith, that it is good also to put a nettle into the Horfes mouth that should cover her.

Of the Itch, Scab, and Mangines in the tail, and falling of the tail.

Blundevile.

In spring time Horses many times are troubled with the Troncheons in their fundament, and then they will rub their tail, and break the hair thereof, and yet in their tail perhaps, shall be neither Itch, Scurfe nor Scab; wherefore if you rake the Horse well with your hand anointed with Sope, and search for those Troncheons and pull them clean out, you shall caufe him to leave rubbing; and if you see that the hair do fall away it self, then is it a sign, that it is either eaten with Worms, or that there is some Scurfe or Scab fretting the hair, and causing such an itch in his tail as the Horfe is always rubbing the same. As touching the wormes, Scurfe or Scab, it shall be good to anoint all the tail with Sope, and then to waft it clean even to the ground with strong liue, and that will kill the Wormes, and make the hair to grow again. And if much of the tail be worn away, it shall be needful to keep the tail continually wet with a flunge dipt in fair water, and that will make the hair to grow very fast. But if the Horse's tail be many, then heal that like as you do the mangines of the mane before rehearsed. Again, if there breed any Canker in the tail (which will consume both flesh and bone, and as *Laurentius Ruffin* faith, make the joints to fall away one by one) it shall be good, as *Martin* faith, to waft all his tail with *Aqua fortis*, or strong water made in this fort; take of green Copperas, of Allum, of each one pound, of white Copperas a quarter. Boyl of all these things together in three quarts of running water in a strong earthen pot, untill one halfe be conformed, and then with a little of this water being made lukewarm, waft his tail with a little clout, or flax bound to the end of a flicke, continuing so to do every day once untill it be whole.
of the Scab.

The Scab is a foul scourfe in divers parts of a Horse's body, and cometh of poverty or ill keeping, or many times by going amongst woods wherein they are infected with water boughs: it is most incident to old Horses, which will die thereof, and chiefly in the Spring time when the new blood appears: the cure whereof I have spoken before.

How to know when a Horse halteth before in what part his grief is.

Being now come to talk of the griefs in the shoulders, legs, hips, houghes, joynts and hoofs; I say the Horfe most commonly to halt: I think it good first to shew you the way how to find in what part of his legs the Horfe is grieved when he halteth either before or behind. And first you have to consider that if a Horfe halteth before, it must be either in his shoulders, in his legs, or in his feet. If it be in his shoulders and new hurt, the Horfe will not lift that leg, but trail it nigh the ground. If it be old hurt, he will call that leg further from him in his going then the other, and if he be turned on the foreside, then he will halt to much the more. If a Horfe halteth in the leg, it is either in the knee, in the shank, or else in the pattern joynte; if it be either in the knee, or pattern joynte, he will not bow that leg in his going like the other, but go very flify upon it. If he halteth in the shank, then it is by means of some splentiment, wind gal, or such apparent grief, apt to be seen or felt. If he halteth in the foot, it is either in the crotone, heel, in the toe, in the quarters, or sole of the foot. If it be in the crotone, the grief will be apparent, the skin being broken or twelome some manner of way. If in the heel, as by over-reach or otherwise, then he will tread moff on the toe. If upon any of the quarters, then going on the edge of a bank or hilly ground, he will halt more then on the plain ground, and by the Horfes coming toward you, and going from you upon such edge or bank, you shall easily perceive whether his grief be in the inward quarter or in the outward quarter; the quarter is to be understood, from the mid hoof to the heel.

If he halteth in the toe, which is not commonly seen, then he will tread more upon the heel. If the grief be in the sole of the foot, then he will halt all after one foot upon any ground, unlesse it be upon the llones. And to be sure in what part of the foot the grief is, it shall be good first to make him go upon the plain ground, and then upon a hard and fliny ground: yea, and also a banke ground. Thus having declared unto you in general, how to know in what part a Horfe is grieved when he halteth before: I think it meet first to shew you orderily all the particular griefs and forances, whereunto the foreparts of a Horfe is subject, together with the caufes, fignes and cure thereof. That done, I will speak of halting behind, and shew you first generally where the grief is, and then particularly declare unto you every grief incident to the hinder parts of a Horfe. And lastly, I will speak of such griefs and forances as are commonly in both parts, that is to say, as well to the fore legs and fore feet, as to the hinder legs and hinder feet.

Of the grief and pinching in the shoulder.

This cometh either by labouring and straining the Horfe too young, or else by some great burthen; you shall perceive it by the narrowness of the breaste, and by confumming flieth of the shoulders, insomuch as the forepart of the shoulder bone will flick out, and be a great deal higher then the flieth. And if it be of long continuance, he will be very hollow in the brisket towards the armholes, and he will go wider beneath at the feet, then above at the knees. The cure: according to Martin, is thus. Give him a flit of an inch long with a sharpe knife or rafor upon both fides an inch under the shoulder bones: then with a Swans quill put into the fliet, blow up fliet the one shoulder, and then the other, as big as can poftible, even up to the withers, and with your hand strike the winde equally into every place of the flieth. And when they be full, then beat all the windy places with a good halfe wand, or with both your hands, clapping upon the places puffed up with wind, so fast as they can walk one after another over all the shoulder; then with a flat flice of iron, loofen the skin within from the flieth: that done, roll the two flats or cuts with two round rols made of the upper lether of an old shooe, with a hole in the middelt that the matter may iffue forth, and let fuch rols be three inches broad, and fo put in as they may lie plain and flat within the cut; then make a charge to lay upon the fame in this flieth; Take of Pitch, and Rofen, of eacch one pound, of Tar half a pinte, boyl these things all together in a pot, and when it is somewhat cooled, take a flitck with a woollen clot bound fliet to the end thereof, and dip it into this charge, and cover and daub all the shoulder therewith. That done, clap thereunto a pound of Fiox of fuch colour as the Horfe is, or as nigh unto the fame as may be, every other day cleanse both the wounds and rols, and put them in again, continuing thus to do the space of fiften dayes. Then take them out, and heal up the wounds with two tents of Flax dipt in Turpentine, and Hogs greafe molten together, renewing the fame every day once, untill the wounds be whole. But let the charge lie till, untill it fall away of it self, and let the Horfe run to graffe untill he hath had a frol or two.
The History of Four-footed Beasts.

Of the wrenching of the Shoulder.

His cometh somet ime by a fall, and somet ime by turning too suddenly in some uneven ground, or by running out of some door, or by some fripe of another Horfe, or by some sudden stop in palling a flyer: you fhall perceive it in his going, by trailing his leg up, or the great rack, fo close unto him that he can perceivable. The cure, according to Martin, is thus: Let him bleed the quantity of three pintcs, on the breath in the palat-paint, receiving the blood in a pot; and thereunto put firft a quart of strong Vinegar, and half a dozen broken Eggs, the while and all, and fo much Wheat-floure as will thicken all that liquor. That done, put thereunto Bole Armony betten into fine powder one pound, Senguin Draconis two ounces, and mangle them all together, to as the floure may not be perceived, and if it be too fine, you may make it more liquid or soft, with a little Vinegar. Then with your hand daub all the shoulder from the main downwards, and betwixt the fore-bowels, all against the hair, and let not the Horfe depart out of that place, until the charge be fully fallent unto the skin.

That done, carry him into the stable, and tie him up to the rack, and suffer him not to lie down all that day, and give him a little meat, dieting him moderately the space of fifteen days: during which time he may not sit up in his place, but only lie down, and every day once refresh the shoulder with this charge, laying still new upon the old, and at the fifteen days end, lead him abroad to fee how he goeth, and if he be somewhat amended, then let him rest without travelling, the space of one month; and that shall bring his shoulder to perfection. But if he be never the better for this that is done, then it shall be needful to rowel him with a leather rowel upon the shoulder-point, and to keep him rowelled the space of fifteen days, renewing the rowel, and cleaning the wound every other day; and then walk him up and down, and foil it, and turn him always on the contrary side to the fore; and when he goeth upright, pull out the rowel and heal the wound with a tent of flux dipt in Turpentine, and Hogs grease molten together. And if all this will not serve, then it shall be needful to draw him checker-wise with a hot iron over all the Shoulder-point; and also make him to draw in a plough every day two hours at the least, to settle his joynts for the space of three weeks or a month; and if any thing will help him, these two last remedies will help him, and make him to go upright again.

Of Splafting in the Shoulder.

This cometh by some dangerous sliding or slipping, whereby the shoulder parteth from the breast, and so leaves an open riot, not in the skin, but in the flesh and film next under the skin, and so he halteeth and is not able to go; you shall perceive it by trailing his leg after him in his going. The cure according to Martin is thus: Firft put a pair of straight patterns on his fore-feet, keeping him still in the stable without disquieting him: Then take of Drisius one pound, of Salter Oyl one pinte, of Oyl-de-bays half a pound, of fresh Butter half a pound; melt all these things together in a Pipkin, and anoint the grievous place therewith, and also round about the inside of the shoulder, and within two or three days after, both that place and all the shoulder besides will swell. Then either prick him with a lancet or seath, in all the swelling places, or else with some other sharpe hot Iron, the head whereof would be an inch long, to the intent that the corrupption may run out, and use to anoint it still with the fame Ointment. But if you see that it will not go away, but swell still, and gather to a head, then lance it where the swelling doth gather most, and is not under the finger, and then tent it with flux dipt in this Ointment: Take of Turpentine and of Hogs grease, of each two ounces, and melt them together, renewing the tent twice a day until it be whole.

Of the Shoulder right.

This is when the shoulder point or pitch of the shoulder is displaced, which grief is called of the Italians, Spallato; and it cometh by reason of some great fall forward, ruth or strain. The signes be thefe: That shoulder-point will twitch out further then his fellow, and the Horfe will halt right down. The cure according to Martin is thus: Firft make him to swim in a deep water up and down a dozen turns, and that shall make the joynt to return into his place. Then make two tough pins of Alken wood as much as your little finger, sharp at the points each one five inches long: that done, fit the skin an inch above the point, and an inch beneath the point of the shoulder, and thrust in one of the pins from above downward, so as both ends may equally flick without the skin. And if the pin of wood will not easfly pass through, you may make it way firft with an Iron pin. That done, make other two holes crofs to the firft holes, so the other pin may crofs the firft pin rignt in the midst with a right crofs, and the firft pin would be somewhat flat in the middle, to the intent that the other being round, may pas the better without stop, and close the fulter together. Then take a piece of a little line somewhat bigger then a whip-cord, and at one end make a loop, which being put over one of the pins ends, winde the reft of the line good and straight about the pins ends, so as it may lie betwixt the pins ends and the skin, and fallen the last end with a pack-needle and pack-thread untile the reft of the cord, so as it may not slip: and to do well, both the pricks and the cord would be firft annointed with a little Hogs grease. Then bring him into the stable, and let him rest the
Of the Horse.

The space of nine days, but let him lie down as little as may be, and put on a pattern on the fore leg, so as it may be bound with a cord unto the foot of the manger, to keep that leg always whilst he standeth in the stable more forward then the other. And at the nine days end take out the prick, and anoint the fore places with a little Distilbea, or with Hogs greafe, and then turn him out to graze.

Of the swelling of the Fore-legs after great labor.

Great labour and heat caufeth humors to refort down into the legs making them swell. The cure whereof according to Martin is thus: Bathe them with buttered beer, or else with this bath here following: Take of Mallows three handfuls, a Rose cake, Sage one handful, boil them together in a fufficient quantity of water, and when the Mallows be foft, put in half a pound of Butter, and half a pinte of Sallet Oyl, and then being somewhat warm, wash the swelling therewith every day once, the space of three or four days: And if the swelling will not go away with this, then take Wine fees, and Cumyn, and boil them together, and put thereunto a little Wheat-flowre, and charge all the swelling therewith, and walk him often: and if it will not serve, then take up the great vein above the knee on the inside, suffering him not to bleed from above, but all from beneath.

Of the Foundering in the Fore-legs.

The caufe of this grief is declared before in the Chapter of foundering in the body, whereas I shewed you, that if a Horfe be foundered in the body, the humors will immediately refort down into his legs, as Martin faith, within the space of 24 hours, and then the Horfe will go crouching all upon the hinder-legs, his fore-legs being fo flibfe, as he is not able to bow them. The cure whereof, according to Martin, is in this fort: Garter each leg immediately one handful above the knee, with a lift good and hard, and then walk him or chafe him, and fo put him in a heat, and being somewhat warmed, let him bleed in both the breast veins, referving the blood to make a charge withall in this manner:

Take of that bloud two quarts, and of Wheat-flowre half a peck, and fix Egges, three and all, of Bole Armony half a pound, of Sanguis Draconis half a quarter, and a quart of strong Vinegar; mingle them all together, and charge all his shoulders, breast, back, loyyn, and fore-legs therewith, and then walk him upon some hard ground, sufferin him not to hand flith, and when the charge is dry, refresh it again. And having walked him three or four hours together, lead him into the stable, and give him a little warm water with ground Mault in it, and then a little Hay and provender, and then walk him again, either in the house, or else abroad, and continue thus the space of four days: and when all the charge isspent, cover him well with a housing cloth, and let him both fland and lie warm, and eat but little meat during the four days. But if you fee that at four days end he mendeth not a whit, then it is a sign that the humor lies in the foles, for the which you must search with your Butler, paring all the foles of the fore-feet, lo that you shall fee the water infue through the sole. That done, with your Butler, let him bleed both at the toes, and let him bleed well. Then stop the vein with a little Hogs greafe, and then tack on the floweres, and Tarpenfie molten together, and laid upon a little Flax; and cram the place where you did let him bleed hard with TOW, to the intent it may be freely flop. Then fill both his feet with Hogs greafe, and harp fried together in a fopping pan, so hot as is possible. And upon the fopping clap a piece of leather, or else two flipes to keep the fopping. And immediately after this, take two Egges, beat them in a dish, and put thereto Bole Armony, and Bean-flowre fo much as will thicken the fame, and mingle them well together, and make thereof two flapers, such as may clofe each fquot round about, somewhat above the cronet, and binde it falt with a lift or roller, that it may not fall away, nor be removed for the space of three days, but let the fole be cleaned, and new flop the every day once, and the cronets to be removed every two days, continuing fo to do untill it be whole. During which time let him refl unwalked, for fear of loofening his hoofs. But if you fee that, he begin to amend, you may walk him fair and softly once a day upon some flot ground, to exercise his legs and feet; and let him not eat much, nor drink cold water. But if this foundering break out above the hoof, which you shall perceive by the loofenes of the coffin, above by the cronets: then when you pare the foles, you must take all the fore-part of the foles clean away, leaving the heels whole, to the intent the humors may have the freee passage downward, and then flop him, and dress him about the cronet as is before said.

Of Foundring.

Of all other forances, foundering is soonest got, and hardlyest cured: yet if it may be perceived in twenty four hours, and taken in hand by this means hereafter prefcribed, it shall be cured in other twenty and four hours: notwithstanding, the fame receit hath cured a Horfe that hath been foundered a year and more, but then it was longer in bringing it to pift. Foundering cometh when a Horfe is heated, being in his greafe and very fat, and takeith thereon a sudden cold, which stricketh down into his legs, and taketh away the life and feeling thereof. The sign to know it is, the
The History of Four-footed Beasts.

Horse cannot go, but will stand crippling with all his four legs together; if you offer to turn him, he will conch his buttocks to the ground, and some Horfes have I seen fit on their buttocks to feed.

The cure is thus: Let him bleed of his two brest veins, of his two flackle veins, and of his two veins above the crovets of his hinder hoves; if the veins will bleed, take from them three pints at least; if they will not bleed, then open his neck vein, and take so much from thence. Save the blood, and let one fland by and flir it as he bleeds, left it grow into jumps; when he hath done bleeding, take as much Wheat flour as will thicken the blood, the whites of twenty Eggs, and three or four yolks; then take a good quantity of Bolearinsack, and a pinte of strong Vinegar, incorporate all these well together, and withal charge his back, neck, head, and ears; then take two long rags of cloth and dip in the same charge, and withal garter him so tight as may be above both his knees of his forelegs; then let his keeper take him out to some flony caufie, or high-way paved with flone, and there one following him with a cudgel, let him trot up and down for the space of an hour, or two, or more: that done, let him up and give him some meat; and for his drink, let him have a warm mann: some three or four hours after this, take off his garters, and set him in some pond of water up to the mid-side, and so let him fland for two hours, then take him out and set him up; the next day pull off his shoes, and pare his feet very thin, and let him blood both of his heels and toes; then get on his shoes again, and ftop them with Hogs greafe and bran boiling hot, and flplint them up, and fo turn him out to run, and he shall be found.

Of the Splent as well in the inside or outside of the knee, as other where in the Legs.

Blandeville.

His forance to any mans feeling, is a very griffe, sometime as big as a Walnut, and sometime no more then a Hafel-nut, which is called of the Italians, Spinella, and it cometh as Laurentius Ruffin faith, by travelling the Horse too young, or by opprieving him with heavie barthuns offending his tender finews; and so caueth him to halt. It is easie to know, because it is apparent to the eye, and if you pinch it with your thumb and finger, the Horse will shrinke up his leg.

The cure whereof, according to Martin, is in this forte: Wash it well in warm water, and flave off the hair, and lightly fcarnie all the fore places with the point of a rafor, fo as the blood may issue forth: Then take of Cantharides half a spoonful, and of Euforbiwm as much, beaten into fine powder, and mingle them together with a spoonful of Oyl-de-bay, and then melt them in a little pan, flirring them well together, fo as they may not boil over, and being fo boiled hot, take two or three feathers, and anoint all the fore place therewith. That done, let not the Horse flir from the place where you do drefle him for one hour after, to the intent he shalke not off the ointment. Then carry him fair and softly into the flable, and tie him as he may not reach with his head beneath the manger, for otherwise he will covent to bite away the smarting and prickinge medicine, which if it should touch his lips, would quickly fetch off the skin. And also let him fland without litter all that day and night. The next day anoint the fore place with fresh butter, continuing fo to do every day once for the space of nine daies, for this shall allay the heat of the medicine, and caueth both that, and the cruf to fall away of it self, and therewith either clean take away the splent, or at leaft remove it out of the knee into the leg, and so much diminish it, as the Horse shall go right up, and halt no more through occasion thereof. Laurentius Ruffin would have the splent to be cured by biring it longt wife and overthwart. I have seen the Splent to be clean taken away thus: first having clipt away the hair growing upon the hard place, you must beat it with a good bigfick of Hafel almost a foote long, in which fick somewhat diftant from the one end thereof would be let fall a sharp prick of a little feet of flick, to plock the fore place therewith, once or twice to make the blood issue ouer, never leaving to beat it first softly, and then harder and harder until it waxeth fof in every place to the feeling, and to throuth out the blood, partly with the flick, leaning on it with both your hands, and partly with your thumbs: that done, wind about the fore place with a piece of double red woollen cloth, holding it fo as it may lie close thereunto; then fear it upon the cloth with the flat fide of your fearing iron, made hot, and not red hot, but fo as it may not burn through the cloth; that done, take away the cloth, and lay upon the fore a piece of Shoemakers wax, made like a little cake, fo broad as is the fore place, and then fear that into his Legs with your fearing iron, until the wax be thoroughly molten, dried, and funkin into the fore: that done, fear another piece of wax in like manner into the fore, until it be dyed up, and then you may trave your Horfe immediately upon it if you will, for he will not halt no more.

Markham.

A Splent is a forance of the leaft moment, unleffe it be on the knee, or elfe a through Splent, bo th which cannot be cured. A Splent is a fpongy hard griffe or bone, growing laft on the inside of the shin-bone of a Horfe, where a little making flark the finews compels a Horfe somewhat to stumble. The cures are divers, and thus they be: If the Splent be young, tender, and but new
Of the Horse.

Of a Malander.

A Malander is a kind of Scab growing in the forme of lines, or stripes, overthwart the bent of the knee, and hath long hairs with stubborn roots, like the briddles of a Bore, which corrupteth and cankereth the flesh, like the roots of a child's scabbed head: and if it be great, it will make the Horse to go siffle at the setting forth, and also to halt. This disease proceedeth sometime of corrupt blood, but most commonly for lack of clean keeping, and good rubbing. The cure, according to Martinis, is thus: First wash it well with warm water, then shave both hair and scab clean away, leaving nothing but the bare flesh, wherein to lay this Plaister: Take a spoonful of Sope, and as much of Lime, mingle them together, that it may be like paste, and spread as much on a clout as will cover the whole, and bind it fast on with a lint, renewing it every day once the space of two or three days, and at the three days end, take away the Plaister and anoint the sore with Oyl of Rofes made Luke-warm, and that shall fetch away the cruft-curse, bred by means of the Plaister, which being taken away, wash the fore place well every day once with his own flate, or else with mans urine, and then immediately throw upon it the powder of burnt Oylterthels, continuing thus to do every day once until it be whole.

Another of the Malander.

A Malander is a peevish forauce, and cometh of ill keeping, it is on the fore-legs, just on the inside, at the bending of the knee, it will make a Horse go stark, and stumble much. The cure is in this sort: Call the Horse, and with some instrument pluck off the dry ftab that will flick thereon, and rub it till it bleed, then take and bind it thereto for three days, in which space you shall see a white asker on the sore, then take that off and anoint it with Oyl of Rofes or Freth Butter until it be throughly cured.

Of an upper Attaint or over-reach upon the back shinew of the shanke, somewhat above the joint.

The Italians call this forauce Attainos, which is a painful swelling of the matter swine, by means that the Horse doth sometimes over reach, and strike that finew with the toe of his hinder-foot, which caufeth him to halt. The signs be apparent by the swelling of the place, and by the Horse halting. The cure, according to Martinis, is thus: Wash the place with warm water, and shave all the hair so far as the swelling goeth, and scrape every part of the fore place lightly with the point of a Rafor, that the blood may influe forth. Then takeoff Cantharides and of Euforbium, of each half an ounce, mingle them together with half a quart of Sope, and with a flice spread some of this Ointment over all the fore, suffering him to reit there as you dreffe him for one halfe hour after, and then you may carry him into the stable, and there let him stand without litter, and tyed as hath been laid before in the Chapter of the Spleen, and the next day dreffe him with the fame Ointment once again, even as you did before. And the third day anoint the place with Freth Butter, continuing so to do the space of nine days, and at the nine days end, make him this bath: Take of Mallowes three handfuls, a Rowe-cake, of Sage a handfull; boyl them together in a sufficient quantity of water. And when the Mallowes be foff, put in halfe a pound of Butter, and halfe a pinte of Salt and Oyle; and then being somewhat warm, wash the fore place therewith every day once, the space of three or four days.
The History of Four-footed Beasts.

Of a Nether taint.

Blundevile.

His is a little bladder full of jelly, much like unto a Wind-gal, not apparent to the eye, but to the feeling, growing in the midst of the pattern, somewhat above the truth. It cometh by a strain, or else by some wrench, or by any other over-reach, and maketh the Horse to halt. The figure be thefe; The necker-joynt toward the fewer-lock will be hot in feeling, and somewhat swollen. The cure, according to Martin, is in this fort; Tie him above the joynt with a lift somewhat hard, and that will cause the bladder to appear to the eye. Then lance it with a sharp pointed knife, and thrust out all the jelly. That done, lay unto it the white of an Egge, and a little Salt beaten together, and laid upon flax or tow, and bind it fast unto the fore, renewing it once a day the space of four or five dayes, during which time let him rest, and then you may boldly labour him.

Of an Attaint.

Markham.

An Attaint is a grief that cometh by an over-reach, as clapping one leg upon another, or by some other Horses treading upon his heels. The cure is; Take a sharp knife and cut out the over-reach, that is, if it be never so deep like a hole, cut it plain and smooth, how broad so ever you make it, then wash it with Beer and Salt, and lay to it Hogs grease, Wax, Turpentine, and Rofen, of each like quantity, boyled and mingled together, and this will in few dayes heal him, be it never so fore.

Of an over-reach upon the heel.

This is a cut, so as the skin hangs down at the heel, made with the toe of the hinder foot, and is apparent to the eye, and it will cause the Horse somewhat to halt. The cure whereof, according to Martin, is thus; Cut away the skin that hangeth down, and bind a little flax dipt in the white of an Egge mingled with a little Bole-armony, renewing it every day once the space of three or four days, and that will heal it.

Of false quarters.

This is a rift sometime in the outside, but most commonly in the inside of the hoof, because the inside is ever the weaker part, which sides are commonly called quarters, and thereof this forance taketh his name, and is called a false quarter; that is to say, a caved or unsound quarter, which name indeed is borrowed of the Italian, calling it in their tongue, Fallo quar- to. It cometh by evil shooing, and partly by evil paring. The figure be thefe; The Horse will for the most part halt, and the rift will bleed, and is apparent to the eye. The cure, according to Martin, is thus; If the Horse halt, then pull off the shooe, and cut so much away on that side of the shooe where the grief is, as the shooe being immediately put on again, the rift may be uncovered. Then open the rift with a Rofenet or drawer, and fill the rift with a roll of Toe dipt in Turpentine, Wax, and Sheeps fewel molten, renewing it every day once until it be whole. And the rift being closed in the top, draw him betwixt the hair and the hoof with a hot Iron overthwart that place, to the intent that the hoof may shoot all whole downward, and when the Horse goeth upright, ride him with no other shooe, until his hoof be thoroughly hardend again.

Of halting behind, and where the grief is.

Blundevile.

If a Horse half behind, the grief must either be in the hip, in the flifie, in the hough, in the ham, in the leg, in the neather joynt, pattern or foot. If the halt in the hip of a new hurt, the Horse will go fidelberg, and not follow so well with that leg as with the other; but if it be old hurt, the fore hip will shrink and be lower then the other. And is best seen, when he goeth up a hill, or upon the edge of some bank, so as the worst leg may go on the higher side, for then he will halt so much more, because it is painful unto him to go so unevenly wrenching his leg. If the grief be in the flifie, then the Horse in his going will cast the flifie joynt outward, and the bone on the inside will be far bigger then the other. If the grief be in the hough, then it is by means of some Spaven, or some other hurt apparent to the eye. And the like may be said of the ham, wherein may be seen the Solander, or such like apparent forance, causing the Horse to halt. If the grief be either in the leg, pattern or foot, then you shall finde it by such signes as have been taught you before. And therefore let us now speake of those forances that are properly incident to the hinder legs.
Of the Horse.

315

Of the String-bait.

The String-bait is a disease that maketh a Horse twitch up his leg suddenly, and so halt much, it is called the Italians, Mal del anche. It cometh most commonly by some great stipe or strain, slipping, flinding or falling. The signes be these: The Horse will halt, and in his going, he will go sideling, and the fore foot will fall lower then the other, and the flesh in process of time will consume clean away. And if it be suffered to run so long, it will never be restored unto his pristine estate. The best way, as Martin saith, is to charge his hip, and back with Pitch and Rofen molten together, and laid on warm, and then some flockes of his own colour to be clapped upon the same, and so let him run to graffe until he go upright. But the fore hip will never rise again fo high as the other. If the Horfie be not hipped, but only hurt in the hip, and that newly, then first take of the Oyl de-bay, of Diathca, of Nerval, of Swines grease, melt them all together, stirring them continually until they be thoroughly mingled together, and anoint the fore place against the hair with this Ointment every day once, the space of a fortnight, and make the Ointment to sink well into the flesh, by holding a hot broad bar over the place anointed, weaving your hand to and fro, until the Ointment be entered into the skin. And if at the fortnights end, you fee that the Horse amendeth no whit for this, then fit a hole downward in his skin, and an inch beneath the hip-bone, making the hole so wide, as you may easily thrust in a rowel with your finger, and then with a little broad lice or iron, loosen the skin from the flesh above the bone, and round about the same, so broad as the rowel may lie flat and plain betwixt the skin and the flesh, which rowel would be made of soft Calves Leather, with a hole in the midit like a ring, having a thred tied unto it, to pull it out when you would cleanse the hole, and if the rowel be pulled about with flux fall tyed on, and anointed with the ointment under written, it will draw so much the more; and thrust in the rowel first double, and then spread it abroad with your finger. That done, tent it with a good long tent of flux or rowel flat in a little Turpentine and Hogs grease molten together and made warm, and cleanse the hole and the rowel every day once, and also renew the tent every day for the space of a fortnight. And before you dresse him, cause him every day to be led up and down a foot pace a quarter of an hour, to make the humors come down, and at the fortnights end pull out the rowel, and heal up the wound with the same salve, making the tent every day jeffer and jeffer until it be whole. And so soon as it is whole, draw with a hot Iron crosse lines, of eight or nine inches long, right over the hip-bone, so as the rowelled place may be in the very midit thereof, and burn him no deeper, but so as the skin may look yellow, and then charge all that place, and over all his buttckes with this charge: Take of Pitch a pound, of Rofen half a pound, of Tar half a pinte; boil them together, and then being good and warm, spread it on with a clot tyed in a riven fick, and then clap on a few flockes of the Horse's colour. And if it be in Summer, let the Horse run to graffe a while, for the more he travell'd at his own will, the better it is for him.

Of sideling, and hurts in the stiffe.

The Horse is said to be sideling, when the sideling bone is removed out of his right place; but if it be not removed nor loofened, and yet the Horse stalleth by means of some grief there, then we say that the Horse is hurt in the stiffe, and not sideling. The stiffe cometh by means of some blow, or some great strain, slipping or sideling. The signes be these: If he be sideling, the one bone will stick out farther than the other, and is apparent to the eye. Martin would have you to cure the stiffe in all points like unto the shoulder-joint, sawing that the pins need not be so long, because the sideling place is not so broad as the shoulder, and standing in the fable, let him have a pattern with a Ring on his fore-leg, and therunto fallen a cord, which cord must go about his neck, and let it be so much strained, as it may bring his fore leg more forward then the other to keep the bone from slanting out. But if the Horse be but hurt in the stiffe with some stipe or strain, then the bone will not flant out, but perhaps the place may be swollen. The cure, according to Martin, is thus: First anoint the place with the Ointment mentioned before, everyday once the space of a fortnight; and if the Horse amend not with this, then rowel him with a hearen rowel, or else with a quilt, and let the nearest hole be somewhat before the fore place, and cleanse the hole every day, by turning the rowel, continuing still to anoint the place with the Ointment aforesaid, and that will make him whole.
The History of Four-footed Beasts.

Of foundering behind.

T

He dry Spaven, called of the Italians, Spavano, or Sparavago; is a great hard knob as big as a Walnut growing in the inside of the hough, hard under the joyn, nigh unto the maller vein, and caueth the Horfe to halt, which forance cometh by kinde, because the Horfes Parents perhaps had the like diseafe at the time of his generation; and sometime by extreme labor and heat dissolving humors which do defend through the maller vein, continually feeding that place with evil nutriment, and caueth that place to swell. Which swelling in continuance of time becometh so hard as a bone, and therefore is called of some the Bone Spaven. It needeth no signes or tokens to know it, because it is very much apparent to the eye, and therefore mull Farris do take it to be incurable.

Notwithstanding, Martin faith, that it may be made lefse with these remedies here following; Wash it with warm water, and shave off the hair so fast as the swelling extendeth, and rarifie the place so far as it may bleed; then take of Cantharides one dozen, of Epsom-bath half a spoonful, break them into powder, and boil them together with a little Oyl-de-bay, and with two or three feathers bound together, put it boiling hot upon the face, and let his tail be tyed up for wiping away the medicine; and then within half an hour after, let him up in the stable, and tie him so as he may not lie down all the night for fear of rubbing off the medicine, and the next day anoint it with fresh butter, continuing thus to do every day once the space of five or six days, and when the hair is grown again, draw the fores place with a hot Iron; then take another hot sharp Iron like a Bodkin, somewhat bowing at the point, and thrust it in at the neather end of the middle line, and so upward betwixt the skin and the flesh to the compass of an inch and a half. And then tent it with a little Turpentine and Hogs grease moulten together and made warm, renewing it every day once the space of nine days. But remember first immediately after his burning to take up the malleter vein, suffereth him to bleed a litlle from above, and tie up the upper end of the vein, and leave the neather end open, to the intent that he may bleed from beneath until it cease it self, and that shall diminisn the Spaven, or else nothing will do it.

Of the Spaven, both bone and blond.

Dubtlesse a Spaven is an evil forance, and caueth a Horfe to halt principally in the beginning of his grief; it appeareth on the hinder-legs within, and against the joyn, and it will be a little fowne; and some Horfes have a thorough Spaven, which appeareth both within and without. Of the Spaven there are two kindes, the one hard, and the other soft; that is, a Bone-Spaven, and a Blond-Spaven: for the Bone-Spaven, I hold it hard to cure, and therefore the leffe necessarry to be dealt withal, except very great ocation urge; and thus it may be holpen.

Call the Horfe, and with a hot Iron fli the fleth that covereth the Spaven, and then lay upon the Spaven, Cantharides and Epsom boiled together in Oyl-de-bay, and anoint his legs round about,
Of the Horse.

about, either with the Oyl of Roses, and with Unguentum album camphiratum. Dress him thus for three days together, then afterward take it away, and for three days more lay unto it only upon flux and unfeck it Lyme, then afterward dresse it with Tar until it be whole.

The Cantharides and Eospernum, will eat and kill the spungy bone, the Lime will bring it clean away, and the Tar will rack out the poison, and heal all up found: but this cure is dangerous, for if the incision be done by an unskilful man, and he either by ignorance, or by the swerving of his hand, burn in twain the great vein that runs croffe the Spaven, then the Horse is spoiled.

Now for the blood Spaven that is easily helpt, for I have known divers which have been but newly beginning, helpt only by taking up the Spaven vein, and letting it bleed well beneath, and then stop the wound with Sage and Salt, but if it be a great blood Spaven, then with a sharp knife, cut it as you burn the bone Spaven, and take the Spaven away, then heal it up with Hogs grease and Turpentine only.

Of the wet Spaven, or through Spaven.

This is a soft swelling growing on both sides of the hough, and seems to go clean through the hough, and therefore may be called a through Spaven. But for the most part the swelling is on the inside, because it is continually fed of the matter vein, and is greater than the swelling on the out side. The Italians call this forance Latrera, or Getroad, which seemeth to come of a more flexible humour, and not so viscous or slimy as the other Spaven doth, and therefore this wazeth not so hard, nor groweth to the nature of a bone as the other doth, and this is more curable then the other. It needs no signes, because it is apparent to the eye, and eafe to know by the description thereof before made. The cure, according to Martin, is thus; First wash, shave, and scarifie the place as before; then take of Cantharides half an ounce, of Eospernum an ounce broken to powder, and Oyl-de-bay one ounce, mingle them well together cold, without boiling them, and dresse the fore therewith two dayes together, and every day after, until the hair be grown again anoint it with fresh Butter. Then fire him both without and within, as before, without tenting him, and immediately take up the matter vein, as before; and then for the space of nine dayes, anoint him every day once with Butter, until the tired place begin to scale, and then wash it with this bath; Take of Mallowes three handfuls, of Sage one handful, and as much of red Netorles, boil them in water until they be soft, and put thereunto a little fresh Butter, and bathe the place every day once for the space of three or four dayes, and until the burning be whole, let the Horse come in no wet.

Of the Seldner.

This is a kind of Scab breeding in the ham, which is the bent of the hough, and is like in all points to the Malander, proceeding of like caufes, and requireth like cure, and therefore refer to the Malander.

Of the hough bony, or hard knob.

This is a round swelling bony, like a Paris ball, growing upon the tip or elbow of the hough, and therefore I thought good to call it the hough-bony. This forance cometh of some stripe or bruife, and as Martin faith, is cured thus; Take a round hot iron somewhat sharpe at the end like a good big bodkin, and let it be somewhat bending at the point; then holing the fore with your left hand, pulling it somewhat from the finews, pierce it with the iron, being first made red-hot, thrusting it beneath in the bottom, and so upward into the belly, to the intent that the same jelly may issue downward out at the hole, and having thrust out all the jelly, tent the hole with a tent of Flix dipt in Turpentine, and Hogs grease molten together, and also anoint the outside with Hogs grease made warm, renewing it every day once until the hole be ready to shut up, making the tent every day leffer and leffer, to the intent it may heal up.

Of the Curb.

This is a long swelling beneath the Elbow of the hough, in the great finew behind, and caufeth the Horse to halt, after that he hath been a while laboured, and thereby somewhat heated. For the more the finew is strained, the greater grief, which again by his rest is eas'd. This cometh by bearing some great weight when the Horse is young; or else by some strain or wrinch, whereby the tender finewes are griev'd, or rather bowed (as Russian faith) whereof it is called in Italian, Curb a Currenda, that is to say of bowing, for anguifh whereof it doth swell, which swelling is apparent to the eye, and maketh the Leg to sliue bigger then the other. The cure, according to Martin, is thus; Take of Wine-lees a pinte, a porriger full of Wheat flour, of Cumin half an ounce, and stir them well together, and being made warm, charge the fore three or four days,
The History of Four-footed Beasts.

dayes, and when the smell is almost gone, then draw it with a hot iron, and cover the burning with Pitch and Roofen molten together, and lay it on good and warm, and clap thereon some flocks of his own colour, or so near as may be gotten, and remove them not, until they fall away of themselves. And for the space of nine dayes let the Horse rest, and come in no wet.

Another of the Curb.

Markham.

A Curb is a farance that maketh a Horse to halt much, and it appears upon his hinder legs, straight behind upon the cumbrel place, and a little beneath the Spaven, and it will be swollen as big as half a Walnut. The cure followeth; Take a small cord and bind his legs hard above it, and beneath it, then beat it, and rub it with a heavy stick till it grow firr, then with a flambe strike it in three or four places, and with your thumbs crush out the flity bruised matter, then looke the cord, and anoint it with Butter until it be whole.

Of the Pains.

Blundevile.

This is a kind of Scab, called in _Italian, Crappe_, which is full of fretting matterish water, and it breedeth in the patterns for lack of clean keeping and good rubbing after the Horse hath been journeyed, by means whereof, the sand and dirt remaineth in the hair, frettest the skin and flesh, and so breedeth a Scab. And therefore those Horses that have long hair, and are rough about the feet, are soonest troubled with this diseaue, if they be not the cleanser kept. The signes be these; His legs will be swollen and hot, and water will issue out of the Scab, which water is hot and fretting, as it will scal off the hair and breed Scabs, so far as it goeth. The cure, according to _Martin_, is thus; First wash well all the patterns with Beer and Butter warmed together, and his legs being somewhat dryed with a cloth: clip away all the hair, having the fewest locks. Then take of Turpentine, of Hogs grease, of Honey, of each like quantity, mingle them together in a pot, and put thereto a little Boile-armony, the yolks of two Eggges, and as much Wheat flour as will thicken the things aforesaid, and make it plaster like, and for that cause it had need to be very well wrought and thirred together. Then with a flie strike some of the plaster upon such a piece of lennen cloth as will serve to go round about the pattern, and bind it fast on with a roller, renewing it once a day until it be whole, and let not the Horse be travelled nor stand wet.

Another of the Pains.

Markham.

Pains is a farance that cometh of hot ill humors of ill keeping; it appeareth in the Fetlocks, and will swell in the Winter time, and will send forth a sharp water: the hair will faire: and the cure is thus; Wash them every day twice or thrice with gunpowder and Vinegar, and they will be whole in one week at the most.

Of Mules or Kibed heels, called of the Italians, Mule.

Blundevile.

This is a kind of Scab breeding behind, somewhat above the neather joyst, growing overthwart the fewter lock, which cometh most commonly for being bred in cold ground, or else for lack of good dresling, after that he hath been laboured in foul mire and dirty ways, which durt lying full in his legs, frettest the skin, and maketh scabby rifs, which are foon bred, but not so foon gotten away. The anguish whereof maketh his legs somewhat to swell, and specially in Winter and Spring time, and then the Horse goeth very fitly, and with great pain. The farance is apparent to the eye, and is cured, according to _Martin_, in this fort: Take a piece of lennen cloth, and with the falve recited in the last Chapter, make such a plaster as may cover all the fore place, and bind it fast on that it may not fall off, renewing it every day once until the fore leave running, and beginneth to wax dry, then wash it every day once with strong water, until it be clean dryed up, but if this farance be but in breeding, and there is no raw flesh, then it shall suffice to anoint it with Sopo two or three dayes, and at the three dayes end, to wash them with a little Beef broth or dith water.

Of Frettishing.

Blundevile.

Frettishing is a farance that cometh of riding a Horse till he sweat, and then to let him up without litter, where he taketh suddenly cold in his feet, and chiefly before; it appears under the heel in the heart of the foot; for it will grow dun, and wax white and crumly like a Pomys, and also in time it will flowe, by the wrinkles on his hoof, and the hoof will grow thick and brickle, he will not be able to tread, on stones or hard ground, nor well to travel but stumble and fall. The cure is thus; Take and pare his feet so thin as may be, then roft two or three Eggges in the Embes very hard, and being extreme hot taken out of fire, crush them in his foot, and then clap a piece of Leather thereon, and fplint it that the Eggges may not fall out, and so let him run and he will be found.
Of the Horse.

of sorances or griefes that be common to all Fore-feet.

Hitherto we have declared unto you the caues, signes and cure of all such griefes as are properly incident, either to the fore-legs, or hinder-legs: now therefore we speake of those griefes that be common to them both, and first of Windgals.

Of Windgals.

The Windgal called of the Latins, Gall, is a bladder full of corrupt jelly, whereof some be great, and some be small, and do grow on each side of the joint, and is so painful, and especially in Summer season, when the weather is hot and the ways hard, as the Horse is not able to travel, but haltereth down right. They come for the most part through extreme labour and heat, whereby the humors being dissolved, do flow and refort into the hollow places about the neather joints, and there be congealed and covered with a thin skin like a bladder. They be apparent to the eye, and therefore need no other signes to know them. The cure whereof according to Martin is thus: Wash them with water, and shave off the hair, sawrie them with the point of a rafor, and dress them with Cantharides in the self fame manner as the splent in the knee was taught before, and anoint them afterward with Butter until the skin be whole. And if this will not heal it, then draw them with a hot Iron like a ragged staffe. That done, flit the middle line which paffeth right down through the windgal with a sharp knife, beginning beneath, and so upward the length of half an inch, to the intent you may thrust the jelly out at that hole; then lay unto it a little Pitch and Rouge molten together, and made luke-warm, and put a few flocks on it, and that will heal him. And you may dry up the Windgal in such manner as here followeth: First chop off the hair so far as the Windgal extendoth, and having fricken it with a ream, thrust out the jelly with your finger. Then take a piece of red wollen cloth and clap it to the place, and with a hot broad fearing Iron sear it, so as the Iron may not burn through the cloth, which is done to dry up the humors.

Then having taken away the cloth, lay unto the place a piece of Shoomakers wax made like a flat cake, about the breadth of a telforn; and with your Iron not made over hot, streek softly upon it to and fro, until the fad wax be thoroughly melted into the fore. Whereupon lay a few flocks, and let him go. Which flocks will afterward fall away of their own accord.

Of Windgals.

Wingals are easie to cure, they be little swellings like blebs or bladders, on either side the joint next unto the fewer-locks, as well before as behinde, and they come through the occasion of great travel, in hard, gravelly, or sandy ways. The cure is: Take Pitch, Rozen, and Mafick, of each like quantity, melt them together, and with a fick lay it round about the Horfes legs, and whilst it is hot lay flocks thereon; the nature of this plaister, is never to come away whilst there is any Windgal on the Horfes legs; but when they are dried up, then it will fall away of it self.

Of Wrinching the neather joint.

His cometh many times by treading awry in some Cart root or otherwise. The signes be these:
The joint will be swollen and sore, and the Horfe will halt. The cure whereof according to Martin is thus: Take of Distilbea half a pound, and as much of Nerval; mingle them together, and anoint the fore place therewith, chafing it well with both your hands, that the Ointment may enter, continuing fo to do every day once, until the Ointment be all spent, and let the Horfe rest. But if this will not prevail, then washe it with warm water and thave away all the hair saving the fewest lock. Scarifie it, and lay to it Cantharides, and heal it as you do each splent in the knee.

Of Enterfening.

Beaue Enterfening is to be holpen by flouing, we purpose not to speak of it, untill we come to talk of the order of paring and flouing all manner of hooves.

Another of Enterfening.

Enterfening is a grief that cometh sometimes by ill flouing, and sometimes naturally, when a Horfe trots so narrow that he hews one leg upon another, it appeareth both before and behinde, between the feet against the fet-locks, and there is no remedy but flouing him with shooes made thin and flat on the outside, and narrow and thick within.
The History of Four-footed Beasts.

Of the Shakel-gall.

F a Horse be galled in the patterns, with shakel, lock pattern, or halter, anoint the fore place with a little Honey and Verdigrase boyled together, until it look red, which is a good Ointment for all gallings on the withers, and immediately throw upon the Ointment, being first laid upon the leg, a little chopt flax or tow, and that will stick fast, continuing so to do every day once untill it be whole.

Of hurts in the Legs, that cometh by casting in the halter or collar.

Blundevile.

IT chanceeth many times, that a Horse having some itch under his ears, is defirous to scratch the fame with his hinder-foot, which whileth he reacheth to and fro, doth falten in the collar or halter, wherewith the more that he striveth the more he galleth his legs; and many times it chanceth for that he is tyed so long, by means whereof being laid, and the halter flack about his feet, rising perhaps or turning he sharleth himself so as he is not able to get up, but hangeth either by the neck or legs, which sometime are galled even to the hard bone.

Ruffius calleth such kind of galling Capistratura, which he was wont to heal with this Ointment here following, praising it to be excellent good for the cratches, or any scab, bruise, or wound: Take of Oyl Olive one ounce, of Turpentine two or three ounces; melt them together over the fire, and then put thereunto a little Wax, and work them well together, and anoint the fore place therewith. Martin faith, it is good to anoint the fore place with the white of an Egg and Saller Oyl beaten together; and when it cometh to a scab, anoint it with Butter being molten, untill it look brown.

Of the Cratches, or Rats tails, called of the Italians, Crepacie.

This is a kind of long scabby rifts growing right up and down in the hinder part, from the fet-lock up to the curb, and cometh for lack of clean keeping, and is easily seen if you take up the Horse's foot, and lift up the hair. The cure according to Martin is thus: Take of Turpentine half a pound, of Honey a pinte, of Hogs grease a quartern, and three yolks of Eggs, and of Bole-armony a quartern, beaten into fine powder, of Bean-flowre half a pinte; mingle all these well together, and make a calfe thereof, and with your finger anoint all the fore places, bedding the hair as you go, to the intent you may the easier finde them, and also to make the calfe enter into the skin, and let the Horse come in no wet, untill he be whole.

Of the Scratches.

Markham.

Scratches will cause a Horse to halt for, and they come only by naughty keeping, and they appear in the patterns under the Fet-locks; as if this skin were cut over-thwart, that a man may lay in a Wheat-braw. The cure is thus: Binde unto them, the hair being cut clean away) black Sope and Lime kneed together, for three days, then lay that by, and anoint the place with Butter; and heal the fore with Bores greafe and Tar mixt well together.

Of the Ring-bone.

This is a hard gristle growing upon thecronet, and sometimeth goeth round about the cronet, and is called in Itallan, Sopraff. Laurentius Ruffius faith, that it may grow in any other place of the leg; but then we call it not a Ring-bone, but a knot or knob. It cometh at the first either by some blow of another Horse, or by stricking his one foot against some flub, or stone, or such like causality. The pain whereof breedeth a vicious and flamy humor, which retorting to the bones, that are of their own nature cold and dry, waxeth hard, cleaveth to some bone, and in process of time becometh a bone. The signes be these: The Horse will halt, and the hard swelling is apparent to the eye, being higher then any place of the cronet. The cure according to Martin is thus: First wash it well with warm water, and shave away all the hair, so as the fore place may be all discovered. Then scratch it lightly with the point of a raper, so as the blood may issue forth. Then if the fore be broad, take of Euferbium one ounce, of Cantharides half an ounce, broken into fine powder, and of Oyl-de-bay one ounce; and if the fore be but little, the one half of this may serve: Boy these things together, stirring them continually, let it run over; and with two or three feathers, lay it boiling hot unto the fore, and let not the Horse fir from that place for half an hour after, then carry him into the stable, both uufing and curing him for the space of nine days, in such order as hath been saide before in the chapter of the splent. But when the hair beginneth to grow again, then fire the fore place with right lines from the pattern down to the coffin of the hoof; and let the edge of the drawing Iron be as thick as the back of a meat-knife, and burn him so deep as the skin may look yellow: that done, cover the burning with Pitch and Rozen molten together, and clap thereon flockes of the Horses own colour, or somewhat nigh the same, and about three days after lay again some of the laft mentioned plaifer, or Ointment; and also
new flocks upon the old, and there let them remain, until they fall away of themselves.

But if their Ring-bones, or knobs, breed in any other place, then in the Cronet, you shall cure them as is before said, without firing them.

**Of the Ring-bone.**

The Ring-bone is an ill disease, and appeareth before on the foot above the hoof, as well before Markham. as behinde, and will be swollen three inches broad, and a quarter of an inch or more of height, and the hair will flare and wax thin, and will make a Horfe halt much. The cure is: Catch the Horfe, and with an iron made flat and thin, burn away that gristle which annoys him; then take Wax, Turpentine, Rozen, Tar, and Hogs-grease, of each like quantity, mingle them together Plaifter-wife, and with it cure the sore: This Plaifter will also cure any other wound or ulcer whatsoever.

**Of the Crown-sab.**

This is a kinde of filthy and linking Scab, breeding round about the feet upon the Cronet, and is an elfish and painful disease, called in Italian, Crijaria. It feemeth to come by means that the Horfe hath been bred in some cold wet foil, striking corrupt humors up to his feet; and therefore the Horfe that hath this grief is worfe troubled in Winter then in Summer. The figines be these: The hair of the Cronet will be thin and itaring like bristles, and the Cronts will be always mattering, and run on a water. The cure according to Martin is thus: Take of Sope, of Hogs-grease, of each halfe a pound, of Bole-armony a little, of Turpentine a quartern; and mingle them all together, and make a Plaifter, and binde it fast on, renewing it every day once, until it leave running, and then wash it with strong Vinegar, being luke-warm, every day once, until the sore be clean dried up, and let him come in no wet until it be whole.

**Of hurts upon the Cronet crossing one foot over another, which the Italians call Suprapofoe.**

Martin faith, wash it well with white Wine, or with a little Stale, and then lay unto it the white of an Egge, mingled with a little Chiminy foot and Salt, and that will dry it up in three or four days, if it be renewed every day once.

**Of the Quitter-bone.**

This is a hard round swelling upon the Cronet, betwixt the heel and the quarter, and growth most commonly on the inside of the foot, and is commonly called of the Italians, Setula or Seta. It cometh by means of gravel gathered underneath the shoe, which freteth the heel, or else by the cloying or pricking of some nail evil driven, the anguish whereof looseth the gristle, and so breedeth evil humors, whereof the Quitter-bone springeth. The figines be these: The Horfe will hale, and the swelling will be apparent to the eye, which in four or five days coming to a head, will break out with matter at a little deep hole like a Fisula. The cure according to Martin is thus: First, burn about the quitter-bone with a hot Iron, in manner of half a circle, and then with the fame Iron draw another right strike through the midst thereof. Then take of Arsenick the quantity of a Bean beaten into fine powder, and put it into the hole, thrumming it down to the bottom with a quill, and flop the mouth of the hole with a little tow, and binde it so fast with a cloth, and cord, as the Horfe may not come at it with his mouth, and so let it reit for that day. And the next day, if you fee that the sore looketh black within, then it is a figne that the Arsenick hath wrought well and done his part. Then to allow the burning thereof, tent the hole with flux dipt in Hogs-grease, and Turpentine, molten and mingled together, and cover the tent with a bolster of Tow dipt also in the Ointment aforefaid, continuing fo to do every day once, until you have gotten out the core. Then shall you fee whether the loofe gristle in the bottom be uncovered or not; and if it be uncovered, then feel with your finger, or with a quill, whether you be nigh it or not. And if you be, then raise the gristle with a little crooked instrument, and pull it clean out with a pair of small nippers, meet for the pufope. That done, tent it again with a full tent dipt in the aforefaid Ointment, to affwage the anguish of the last drelling, and flop it hard, to the intent that the hole may not think together, or close up; and the next day take out the tent, and tent it a new with the Salve or Ointment taught in the Chapter of the Shakel-gall, renewing it every day once until it be whole, keeping always the mouth of the fore as open as you may, to the intent that it heal not up too fast; and let not the Horfe be in any wet, nor travel, until he be perfectly whole.

**Of the Quitter-bone.**

Quitter-bone is a round hard swelling upon the Cronet of the hoof, betwixt the hoof and the quarter, and for the most part growth on the inside of the foot; the Original effect thereof is the fretting of gravel underneath the shoe, which bruifeth the heel; or else by means of some flub,
The History of Four-footed Beasts.

Blundevile.

This is a fretting under the foot, most commonly in the inside, and sometimes in the outside, and sometime in both sides together of the heel. It cometh by means of little gravel stones getting between the hoof, or caking, or sponging of the flooe, which by continual labour and treading of the Horfe, doth eat into the quick, and the rather, if his heel be soft and weak, or that the flooe do lie flat to his foot, so as the gravel being once gotten in, cannot get out. The signes be these: The Horfe will halt, and covet to tread all upon the toe, to favour his heel. The cure according to Marty is thus: First pare the hoof, and get out the gravel with a corret, or drawcer, leaving none behind, for if you do, it will breed to a Quitter-Bone. That done, flop him with Turpentine and Hogs-grease molten together, and laid on with tow or flax, and then clap on the flooe to keep in the flopping, renewing it every day once until it be whole. And suffer the Horfe to come in no wet, until he be thoroughly whole. If a graveling be not well slop to keep down the fleth, it will rife higher then the hoof; and not only require more busines in bolstering it, but also put the Horfe to more pain.

Of Graveling.

Mukham.

Ravelling is a hurt will make a Horfe to halt, and cometh of gravel and little frogs, that goeth between the flooe and the heart of the foot. The cure is: Take off the flooe, and let him be well pared; then fet on the flooe again, and flop it with Pitch, Rozen, and Tallow, and this shall help.

Of Surbating.

Mukham.

This is a beating of the hoof against the ground, called of the Italian, Sobatina; it cometh sometime by means of evil flooting, lying too flat to his foot; or by going long bare-foot, and sometime by the hardness of the ground, and high lifting of the Horfe. And tho Horfes that be flat-footed, the coffins whereof are tender and weak, are most commonlysubject to this forance. The signes be these: The Horfe will halt on both his fore-legs, and go stiffely and creeping, as though he were half foundered. The cure according to Marty is thus: Take off his flooes, pare him as little as may be; and if the flooes be not easie, that is to say, long, large, and hollow enough, then make them fo, and then tack them on again with four or five nails. That done, flop his feet with Bran, and Hogs-grease boiled together, so hot as may be; and also cover all the coffin round about with the same, binding all in together with a cloth, and a lint fastened about the joynet, renewing it every day once, until it be whole, and give the Horfe during that while warm water; and let him stand dry and warm, and not be travelled until he be whole.

Of A Prick in the Sole of the Foot, by treading on a nail, or any other sharp thing that doth enter into the Foot.

Blundevile.

The signes be these: If a man be on his back when he treadeth on any such thing, he shall feel that the Horfe will lift up his foot, and covet to stand still to have help. And if it chance at any other time, the halting of the Horfe, and the hurt it self will shew. The cure according to Marty is thus: Pull off the flooe, and pare the foot; and with a drawer uncover the hole, making the mouch fo broad as a two penny piece, then tack on the flooe again. That done, flop it, by pouring into the hole Turpentine and Hogs-grease molten together, and lay some flax, or tow upon it; and then flop all the Horfes foot with Horfe-dung, or rather with Cow-dung, if you can get it; and splent it either with fitches, or else with an old flooe-sole, fo as the flopping may abide in, renewing it every day once until it be whole, and let the Horfe come in no wet. If this be not well cured, or looked to in time, it will caufe the hoof to break above, and so loothen round about, and perhaps to fall clean away. But if you fee that it begins to break above, then make a greater issue.
Of the Horse.

Of the Horse. 323

Issue beneath by opening the hole wider, and taking more of the hole away, that the flesh may have the more liberty. Then take of Bone-armory half a quarter, Bean-flower, and two Eggs. Beat them, and mingle them well together, and make a plaster thereof upon Tow, and lay it round about the Crone, bind it fast on, and so let it remain the space of two days, and then renew it again, not failing to do every two days until you see it wax hard and firm above. For this plaster being restrictive, will force the humors to refort all downward, which must be drawn out with Turpentine and Hogs-grease as before, until it leave mattering, and then dry it up with burnt Allum beaten to powder, and thrown upon it, with a little flax laid again upon that, continuing so to do every day once, until it be hardened; and let not the Horse come in any wet, until he be whole.

Of Accloyd or Prickit.

Accloyd is a hurt that cometh of shooing, when a Smith driveth a nail in the quick, which will make him to halt. And the cure is: to take off the shooe, and to cut the hoof away, to lay the fore bare: then lay to it Wax, Turpentine, and Deer-sweet, which will heal it.

Of the Fig.

If a Horse having received any hurt, as before is said, by nail, bone, splent, or stone, or otherwise in the sole of his foot, and not be well dressed and perfectly cured, there will grow in that place a certain supernuous piece of flesh, like a Fig: and it will have little grains in it like a fig, and therefore is rightly called of the Italians, Unfo. that is to lay, a Fig. The cure whereof according to Martin is thus: Cut it clean away with a hot Iron, and keep the flesh down with Turpentine, Hogs-grease, and a little Wax laid on with Tow, or Flax, and dip the hole hard, that the flesh rise not, renewing it once a day until it be whole.

Of a Retreat.

This is the pricking of a nail, not well driven in the shooing, and therefore pulled out again by the Smith, and is called of the Italians, Tratta maffa. The cause of the pricking may be partly the rash driving of the Smith, and partly the weakness of the nail, or the hollowness of the nail in the shank. For if it be too weak, the point many times bendeth away into the quick when it should go right forth. It flatteth and thieveth in the driving into two parts, whereof one part slatheth the quick in pulling out, or else perhaps breaketh clean afunder, and so remaineth still behind, and this kind of pricking is worse than the cloying, because it will rackle worfe, by reason of the flaw of Iron remaining in the flesh. The signe be there: If the Smith that driveth such a nail be so lewd, as he will not look unto it before the Horse depart, then, there is no way to know it, but by the halting of the Horse, and searching the hoof firft with a hammer by knocking upon every clinging. For when you knock upon that nail, where the grief is, the Horse will shrink up his floor. And if that will not serve, then pinch or grip the hoof with a pair of pinfons round about, until you have found the place griev’d. The cure according to Martin is thus: Firft, pull off the shooe, and then open the place griev’d with a Butter or Drawer, so as you may perceive by feeling or seeing, whether there be any piece of nail or not; if there be, to pull it out, and to stop the hole with Turpentine, Wax, and Sheeps-sweet molten together, and so pour’d hot into the hole, and then lay a little Tow upon it, and clap on the shooe again, renewing it thus every day, until it be whole, during which time, let not the Horse come in any wet, and it must be so stopped, though it be but prickt without any piece of nail remaining. And if for lack of looking to it in time, this retreat cause the hoof to break above, then cure it with the Plaster restrictive in such order as is mentioned in the last place saving one before this.

Of Cloying.

Cloying is the pricking of a whole nail, called of the Italians, Inciduitura; passing through the quick, and remaining still in the same, and is clenched as other nails be, and so causeth the Horse to halt. The griev’d place is known by searching with the hammer and pinfons, as is before said: If the Horse halt immediately, then pull off his shooe, and open the hole, until it begin to bleed; and if it with the Ointment aforefaid, in the same page of the Retreat, and clap on the shooe again; and the hoof may be so good, and the harm so little, as you may travel him immediately upon it, but if he be rankled, then renew the stopping every day once, let him come in no wet, until it be whole.
of loosening the Hoof.

This is a parting of the hoof from the crocet, called of the Italians, Diffolatura del ungua, which it be round about, it cometh by means of foundering; if in part, then by the anguth caused by the pricking of the canel nail, piercing the sole of the foot, or by some Quetter-bone, Retreat, Gravelling, or Cloying, or such like thing: The signes be these: When it is loosened by foundering, then it will break first in the fore-part of the Crocet, right against the toes, because the humor doth covet always to descend towards the toe. Again, when the pricking of a canel nail, or such like cankered thing is the cause, then the hoof will loosen round about, equally even at the first. But when it proceedeth of any of the other hurts last mentioned: then the hoof will break right above the place that is offended, and most commonly will proceed no further. The cure according to Martin is thus: First, of which ever of these causes it proceeds, be sure to open the hoof in the sole of the foot, so as the humor may have free passage downward, and then refrain it above with the Plaister restrictive before mentioned, and in such order as is there written, and also heal up the wound, as is before taught in the Chapter of a prick in the sole of the foot.

Of casting the Hoof.

This is when the coffin falleth clean away from the foot, which cometh by such causes as were half rehearsed, and is so apparent to the eye, as it needeth no signes to know it. The cure according to Martin is thus: Take of Turpentine one pound, of Tar half a pinte, of unwrought Wax half a pinte: Boil all these things together, and stir them continually until they be thoroughly mingled, and compact together. Then make a Boot of Leather with a good strong sole meet for the Horse's feet, to be laced or buckled about the pattern; and dress his foot with the Salve aforefaid laid upon the Flax or Tow, and boil or fluffe his foot with soft Flax, so as the Boot may griewe him in no manner of way, renewing it every day once until it be whole, and then put him to grafts.

Of the Hoof-bound.

This is a shrinking of all the whole hoof. It cometh by drought; for the hoofs perhaps are kept too dry, when the Horse randeth in the stable, and sometimes by means of heat, or of over-draught shooing. The Italians call the Horse thus griev'd Insoluzione. The signes be these: The Horse will halt, and the hoofs will be hot; and if you knock on them with a hammer, they will sound hollow like an empty bottle, and if both the feet be not hoof-bound, the fore foot will be ieller than the other, and appear fo to the eye. The cure according to Martin is thus: Pull off the shoes, and thooce him with half Moon-shooes called Lunette; the order and shape whereof you shall finde among the Farriers, and rafe both the quarters of the hoof with a drawcr, from the crocet unto the sole of the foot, so deep as you shall see the dew it self come forth. And if you make two rases on each fide, it shall be so much the better, and inlarge the hoof the more. That done, anoint all the hoof about, next unto the crocet round about, with the Ointment prefcribed before in the Chapter of casting the hoof, continuing to do every day once until he begin to amend for the space of a month; and if he goeth not well at the months end, then take off the half shoes, and pare all the soles, and thrufhiles, and all so thin as you may see the dew come forth, and tack on a whole shoe; and stop all the foot within with Hogs-grease and Bran boiled together, and laid hot to the foot; renewing it dayly once the space of nine days, to the intent the sole may rife. But if this will do no good; then take away the sole clean, and clap on a whole shoe, and stop the foot with Nettles and Salt brayed together, renewing it once a day, but not over hard, to the intent the sole may have liberty to rife, and being grown again, let him be shod with the lunets, and sent to grafts.

Of the running Frush.

The Frush is the tenderest part of the hoof towards the heel, called of the Italians, Fetone, and because it is fashioned like a forked head, the French men call it Fourbette, which word our Farriers, either for not knowing rightly how to pronounce it: or else perhaps for earneifs sake of pronunciation, do make it a monyllable, and pronounce it the Frush; in which Frush breedeth many times a rottenness or corruption proceeding of humors that cometh out of the leg, whereby the leg is kept clean from the Windgals, and all other humors and feelings by means that the humors have passage that way. Notwithstanding the discommodity of the offence is greater then the commodity, because it maketh the Horse's feet so weak and tender, as he is not able to treader upon any hard ground. The signes be these: The Horse will halt, and specially when the passage of the humor is slop with any gravel gathered in the Frush, and not being slop it will continually run, the flavour whereof will be so strong, as a man is not able to abide it, and in some places it will look raw. The cure according to
Off the Horse.

The Fruth is the tenderest part of the sole of the foot, which by humors inflining many times down from the legs, occasion inflammations in that part, which may easily be perceived by the inflammation of the same. The cure is thus: First having taken off the shoe, pare away all the corrupted and naughty matter, until the fore look raw, then nail on a hollow shoe made for the same purpose; and take of foot a handful, of the juice of Houfe-leek and of Cream, with the white of an Egge or two, as much as will thicken the fame: with this stop up the fore, and splint it, fo as it may not fall out, renewing it until it be whole; but during the cure, have regard that the fore foot touch not any wet, for that is very much hurtful.

Of disøves or griefs indifferently incident to any part of the body, but fiø of the Leprofe, or universal Mangines, called of the old Writers Elephantia.

This is a cancred Mangines, spreading over all the body, which cometh of abundance of melancholy, corrupt and filthy bloud. The signes be these: The Horse will be all mongy and furry, full of scabs, and raw spots about the neck, and evil favoured to look on, and always rubbing and fratching. The cure according to Martin is thus: Let him bloud the firft day in the one side of the neck, and within two days after that, in the flank veins; and fall of all, in the vein under the tail. Then wash all the fore places with Salt brine, and rubbing them hard with a wip of thraw hard twisted, fo as they may bleed well, and be all raw. That done, anoint the place with this Ointment: Take of Quick-silver one ounce, of Hogs-greas one pound, of Brimtone beaten into powder a quart, of Rape Oyl a pinte; mingle these things well together, until the Quick-silver be thoroughly incorporated with the rest; and having anointed all the raw places with this Ointment, make it to sink him in the flesh, by holding and weeping up and down over it a hot broad bar of Iron, and then touch him no more again the space of two or three days; during which time, if you see that he rubbeth still it, any place, then rub that place again with an old Horse-combe, to make it raw, and anoint it with fresh Ointment. But if all this will not help, then with a hot Iron, and blunt at the point, fo big as a mans little finger; burn all the mongy places, making round holes, passing only through the skin, and no further. For which intent it shall be needful to pull the skin first from the flesh, with your left hand, holding it still until you have thruf the hot Iron through it, and let every hole be a span off one from another, and if need be, you may at oint those holes with a little Sop, and let the Horse be thin dieted, during his curing time.

Of the Farcin, called in Italian of some il verme, and of some Tarcina.

This kind of creeping Ulcer growth in knots, following a long some vein, and it proceedeth of corrupt bloud ingendered in the body, or else of some outward hurt, as of spur-galling, or the biting of some other Horse; or of biting of ticks, or of Hogslice, or such like extrinquities: Or if it be in the legs, it may come by injuring it. It is easily known, partly by the former description, and also it is apparent to the eye. The cure according to Martin is thus: Let him bloud in that vein where it cometh, as nigh the fore place as may be, and let him bleed well; then fire every knot one by one, taking the knot in your left hand, and pulling it so hard as you can from his body, to the intent you may better pierce the knot, with a blunt hot Iron, of the bignes of a mans fore-finger, without doing the body any hurt, and let out the matter, leaving none unburnt, be it little or much. That done, anoint every knot so burned with Hogs-greas warmed every day once, until the coars be ready to fall away: and in the mean time prepare a good quantity of old Urine, and when you see the coars ready to fall, boil the Urine, and put therein a little Copper and Salt, and a few strong Nettles, and with that water being warm, wash out all the coales, and the corruption. That done, fill every hole immediately with the powder of flesh's time, continuing thus to do every day once, until the holes be closed up; and if any be more ranker then other, fille those with Verdigrase, and during this cure let the Horse be thin dieted, that is to say, with straw and water only, unless it be now and then to give him a loaf of bread; for the lower he be kept, the sooner he will be whole. And in any case let his neck be yoked in an old bottomless spal, or elite bna.
with short knives to keep him from licking the fores, and the left rein hath, the better. Or do thus:
Take a good great Dock-root clean scraped, and cut thereof five little rundles or cakes to be used as followeth First with a knife make a slit right down in the Horse's fore-head three inches long, then with a Cornet loosen the skin within the flesh, so as you may easily put therein five rundles of Dock, that is to say, two on each side of the slit one above another, and put the slit rundle in the very midle between the other four: that done, fasten to each of the slits two short Shoookers ends, to serve as laces to tie in the forefaid, rundles, so as they may not fall out, and cleanse the fore every day once, for the venture of the root is such, as it will draw all the filthy matter from any part of the body: yes, though the Farcion be in the hinder-legs, which matter is to be wiped away from time to time, and new roots be thruf into the slit according as you fee it needful.

Of the Farcion.

Marham.

The Farcion is a vile diseafe, ingendered of ill blood, flegmatick matter, and unkindly feeding; it appeareth in a Horse like unto little knots in the flesh, as big as a Hasel-nut; the knots will encrease daily and inflame, Impoftume, and break; and when the knots amount to threescore, they will every night after breed so many more, till they have over-run the Horse's body, and with the poiyon, which is mighty and aloft strong soon bring him to his death: this diseafe is very infectious and dangerous for some Horses, yet if it be taken in any times, it is eafe to be holpen: The cure thereof is in this manner: Take a fhrap Bodkin, and thru it through the neither part of his nose, that he may bleed: or if you will, to let him bleed in the neck-vein shall not be amis, then feaft the knots, and as many as are foft fance them and let them run; then take strong Lyce, Lime, and Allum, and with the fame bath all his fores, and it fhall in fhort space cure him. There is also another manner of curing this diseafe, and that is thus: Take a fhrap lance-kife, and in the top of the Horses fore-head, put between his eyes, make a long flit even to the skull: then with a blunt iftrument for the purpofe los the flesh from the fcalp a pretty compafs: then take Carret-roots cut into little thin round pieces, and put them between the skin and the skull, as many as you can, then clofe up the wound, and once a day amont it with frefh Butter: This is a moft fane and approved way to cure the Farcion, for look how this wound thus made, fhall rot, waft, and grow fownd, fo fhall the Farcion break, dry up, and be healed, because all the poiyons that feedeth the diseafe fhall be altogether drawn into the fore-head, where it fhall die and waithe away. The only fault of this cure is, it will be somewhat long, and it is a fowl eye-fore until it be whole. Some use to burn this fortune, but that is naught and dangerous, as whofo proves it fhall finde.

A moft approved medicine to cure the Farcion.

Marham.

Take of Aqua-vite two spoonfuls of the juice of Herb of grace as much; mingle them together, then take of Plegants or Bal of Flax or Tow, and fleep them therein, and flop them hard into the Horses ears; then take a needle and a thread, and ftitch the tips of his two ears together, by means whereof he cannot ftake out the medicine, and fume him thus but three feveral mornings, and it will kill any Farcion whatfoever, for it hath been often approved.

Another medicine of the fame.

Silt every hard kernel with a fhrap knife, and fill the hole with an Ointment made of old Lard, Sope, and gray Salt, for that will eat out the coar, and caufe it to rot, and fo fall out of the own accord.

Of the Canker, called of the Italian, il Camaro.

Blundevile.

A Canker is a filthy creeping Ulcer, fretting and gnawing the fleshe in great breadth. In the beginning it is knotty, much like a Farcine, and spreadeth itself into divers places, and being exulcerated, gathereth together in length into a wound or fore. This proceedeth of a melancholy and filthy blood ingendered in the body, which if it be mixt with Salt humors, it caufeth the more painful and grievous exulceration, and sometime it cometh of fome filthy wound that is not cleanly kept, the corrupt matter whereof cankereth other clean parts of the body. It is eafe to be known by the description before. The cure whereof according to Marin is thus: First let him blood in thofe veins that be next the fore, and take enough of him. Then take of Allum half a pound, of green Copperas, and of white Copperas, of each one quarter, and a good handful of Salt: Boil all these things together in fair running water, from a potiche to a quart. And this water being warm, wafh the fore with a cloth, and then sprinkle thereon the powder of unfeck't lime, continuing fo to do every day once the space of fifteen days: and if you fee that the lime do not mortifie the rank flesh, and keep it from spreading any further, then take of black Sope half a pound, of Quick-silver half an ounce, and beat them together in a pot, until the Quick-silver be fo well mingled with the Sope, as you can perceive none of the Quick-silver in it. And with an Iron flafe, after that you have wafted the fore with the Strong water aforefoied, cover the wound with this Ointment, continuing to do every day once, untl the Cankey leave spreading abroad. And if it leave spreading, and that you fee the rank flesh is mortifie;
Of the Horse.

Fistula is a deep hollow crooking Ulcer, and for the most part springs of malignant humours, ingendered in some wound, fore, or canker, not thoroughly healed. It is easy to know by the description before. The cure according to Martin is thus: First, search the depth of it with a quill; or with some other instrument of Lead, that may be bowed every way, meet for the purpose. For unlefs you finde the bottom of it, it will be very hard to cure: And having found the bottom, if it be in such a place as you may boldly cut, and make the way open with a lancet or rafor, then make a slit right against the bottom, so as you may thrust in your finger, to feel whether there be any bone or gristle perfified, or spongious or loose flesh, which must be gotten out, and then tent it with a tent of flux dip in this Ointment: Take of Hony a quartem, and of Verdigrise one ounce beaten into powder. Boil them together, until it look red, straining it continually, let it run over; and being lake-warm, drefs the tent wherewith, and bolster the tent with a bolster of flux. And if it be in such a place, as the tent cannot conveniently be kept in with a band, then stuff on each side of the hole, two ends of Shoemakers thread right over the bolster to keep in the tent, which ends may hang there as two laces, to tie and untie at your pleasure, renewing the tent every day once until the fore leave mattering. And then make the tent every day leffer and leffer, until it be whole. And close it up in the end, by sprinkling thereon a little fleckt lime. But if the Fistula be in such a place as a man can neither cut right against the bottom, or nigh the fame; then there is no remedy, but to pour in some Strong-water, through some quill, or such like thing, so as it may go to the very bottom, and dry up all the filthy matter, dressing him so twice a day, until the Horfe be whole.

Of an Aubury.

This is a great spungy Wart full of bloud, called of the Italian, Mer, or Self, which may grow in any place of the body, and it hath a root like a Cocks bone. The cure according to Martin is thus: Tie it with a thread, so hard as you can pull it, the thread will eat by little and little in such sort, as within seven or eight days it will fall away by it self. And if it be so flat as you can bind nothing of it, then take it away with a sharp hot Iron, cutting it round about, and so deep as you may leave none of the root behinds, and dry it with Verdigrise. Rufius faith, that if it grow in a place full of finewes, so as it cannot be conveniently cut away with a hot Iron, then it is good to eat out the core with the power of Rasafar, and then to stop the hole with flux dip in the white of an Egg for a day or two; and latly, to dry it up with the power of unbleck't Lime and Hony, as before is taught.

Of Wounds.

Wounds come by means of some stripe or prick, and they are properly called wounds, when some whole part is cut or broken. For a wound according to the Phyfitians, is defined to be a solution, division, or parting of the whole; for if there be no solution or parting, then methinks it ought rather to be called a bruise then a wound. And therefore wounds are most commonly made with sharp or piercing weapons, and bruises with blunt weapons. Notwithstanding, if by such blunt weapons, any part of the whole be evidently broken, then it ought to be called a wound as well as the other: Of wounds some be thallow, and some be deep and hollow: Again, some chance in the flethy parts, and some in the bony and finewie places: And those that chance in the flethy parts, though they be very deep, yet they be not so dangerous as the other; and therefore we will speak first of the most dangerous: If a Horfe have a wound newly made, either in his head, or in any other place that is full of finewes, bones, or gristles: First, Martin would have you to warm the wound well with white Wine well warmed: That done, to search the bottom of the wound with some instrument meet for the purpose, suffering it to take as little winde in the mean while as may be.

Then having found the depth, stop the hole close with a clot, until your salve be ready: Then take of Turpentine, of Mel Rosatum, of Oyl of Rofes, of each a quartem, and a little unwright Wax, and melt them together; and if it be a cut, make a handfome roll of clean picked Tow, fo long and fo big as may fill the bottom of the wound, which for the most part is not so wide as the mouth of the wound: then make another roll greater than that, to fill up the rest of the wound, even to the hard mouth, and let both thefe rolls be anointed with the ointment aforesaid lake-warm: But if the hurt be like a hole made with some prick, then make a little tent, such as a man may reach the bottom, anointed with the aforefaid Ointment, and bolster the fame with a little Tow: And if the mouth be not wide enough, fo as the matter may easily run forth, if it be in

F f 2

such
The History of Four-footed Beasts.

If such place you may do it without hurting any fine, then give it a pretty slit from the mouth downward, that the matter may have the freer passage, and in any wise have a special regard, that the tent may be continually kept in by one means or other, as by binding or tying the same with the ends of Shoemakers thread asis aforesaid. And if the hole be deep, and in such place as you may not then make your tent of a Spunge, and so long as it may reach to the bottom, and the tent being made somewhat full, with continual turning and wringing of it, you shall easily get it down, and then dress the wound with this twice a day, cleaning the wound every time with a little white Wine lukewarm. For this Spunge, anointed with the Ointment aforesaid, will both draw and suck up all the filthy matter, and make it so fair within as is possible: and as it beginneth to heal, so make your tent every day leffer and leffer, until it be ready to close up, and never leave tenting it, so long as it will receive a tent, be it never so short. For hasty healing of wounds breedeth Fistula's, which properly be old wounds, and therefore must be cured like Fistula's.

Of Wounds in the flabby parts.

Use the same Ointment and manner of proceeding as before. And if the wound be large, then to keep in the tent or roll, you shall be fain to put two or three Shoemakers ends on each side of the fore, leaving them so long as you may tie them together, and loofen them when you will like laces.

Of old Ulcers or Wounds.

To cure an old Ulcer, as Fistula, Gall, or Botch, or any new received wound, these are the best Salves, and most approved in mine experience: Take of Hony half a pinte, of Deer-sewe two ounces, of Versdiglaze beaten into powder as much; boil all these exceeding well upon the fire, then with the same luke-warm, tent or plaister any venemous fore, and it will recure it. If you take of Wax, Turpentine, Oyl of Roses, of Hogs-greas, of each like quantity, and half so much Tar as any one of the other simples; melt all these together, and being well incorporated together, either tent or plaister any wound, and it will heal it. Also, if you take the green leaves of Tobacco bruised, and put them into a green wound, they will heal it: the ashes of Tobacco burnt, if they be strew'd upon any fore that is near skinning, it will also skin it perfectly, and it will incarnate well, if the Ulcer be not too deep and dangerous. There be many other Salves, Plasters, and Unguents which I could set down; but since I have experienced these for most effectual, I omit the others as superfluous.

Of an hurt with an Arrow.

If the Horse be hurt with an Arrow, tent the hole with Hogs-greas and Turpentine molten together, renewing it every day once until it be whole.

Of pulling out Shivers or Thorns.

Artis faith, that if it be not very deep, Sop being laid unto it all night will make it to appear, so as you may pull it out with a pair of nippers. But if it be very deep, then you must open the place with a knife or lancet, and get it out, and afterward heal up the wound as hath been taught you before. Russius faith, that the roots of Reed being lamp't and mingled with Hony, will draw out any thorn or shiver: and so will Snails, as he faith, being lamp't and wrought with fresh Butter; and if the place be bawl'd, he faith it is good to mollifie it with Hogs-greas and Hony, which will asswage any new swelling, that come by stripe or otherwise.

Of bruisings or swellings.

Artis faith, First prick it with a steamen. Then take of Wine lees a pinte, as much Wheat-flowre as will thicken it, and an ounce of Cumin; boil them together, and lay this somewhat warm unto it, renewing it every day once until the swelling either depart, or else come to a head. And if it do, then lance it, and heal it up as a wound.

Of Sinsens, pricks, or bruised.

Take of Tar, and Wheat-flowre, and a little Oyl of Roses, and lay it hot unto the place. And if this do no good, then take Worms and Saltier Oyl fryed together, or else the Ointment of Worms, which you shall have at the Apothecaries, and one of these will knit it again, if it be not clean sunder.

Of
Of the Horse.

How to cure a wound made with Huareale/hs flet.

Marin faith; First seek with an instrument whether the pellet remain within or not, and if ye do, you must get it out with an instrument meet for the purpose. Then to kill the fire: Take a little Vermis, and thrust it into the wound with a feather, anointing it well within with the teather, and after that, stop the mouth fair and softly with a little soft flax, to keep the wind out; and on the outside, charge all the swelling with this charge: Take of Boile-smovy a quarter, of Linsef beaten into fine powder half a pound, of Bean-flowre as much, and three or four broken Egges, and of Turpentine a quarter, and a quart of Vinegar, and mingle them well together over the fire, and being somewhat warm, charge all the fore place with part thereof, and immediately clap a cloth, or a piece of leather upon it, to keep the wound from the cold air, continuating both to anoint the hole within with Vermis, and also to charge the swelling without; the space of four or five days, and at the five days end leave anointing of it, and tent it with a tent reaching to the bottom of the wound, and dipped in Turpentine and Hogs-greasen melt together, renewing it every day twice until it be throughly killed, which you shall perceive by the mattering of the wound, and by falling of the swelling: for so long as the fire hath the upper hand, no thick matter will issue out, but only a thin yellowish water, neither will the swelling affwage. And then take of Turpentine, washed in nine several waters, half a pound, and put thereon three yolks of Egges, and a little Saffron, and tent it with that Ointment, renewing it every day once until the wound be whole.

Of burning with Lime or any other fiery thing.

Marin faith; First wash away the Lime, if there be any, with warm water. Then kill the fire with Oyl and Water beaten together, drefling him so every day until it be all raw, and then anoint with Hogs-grease, and threw thereupon the powder of flecked lime, drefling him so every day once until it be whole.

Of the biting of a mad Dog.

If a Horfe be bitten with a mad Dog, the venom of his teeth will not only pain him extremely, but also infect all his blood, and make him to dye mad. The cure according to the old Writers is thus: Take of Goats dung, of fleis that hath laid long in Salt, and of the herb Ebulus, called of some Danewort, of each half a pound, and forty Walnuts. Stamp all these things together, and lay thereof unto the fore, and this will fack out the venom, and heal the wound. It is good also to give the Horfe Treacle, and Wine to drink: yea, and some would have the fore place to be fiered with a hot Iron.

Of hurts by tusks of a Boar.

If a Horfe be hurt with the tusk of a Boar, lay Vitriol, and Copperas thereunto, and the powder of a Dogs head being burned, but let the tongue be first pulled out and call away.

To heal the biting or stinging of Serpents.

Aurelius Russus faith: Take a good quantity of the herb called Saculaca, flamp it, and disfem-
er it with the milk of a Cow, that is all of one colour, and give him that to drink, and that will heal him.

Another Medicine for the same purpose.

Make a plaiuer of Onions, Hony and Salt, flamp and mingled together; and lay that to the fore place, and give the Horfe Wine and Treacle to drink. Abfrius would have you to give him white Pepper, Rhue, and Thyme, to drink with the Wine.

Of drinking of Horfe-leaches.

If a Horfe chance to drink Horfe-leaches, they will continually suck his bloud, and kill him. The remedy, according to Abfrius, is to pour Oyl into the Horfes mouth, which will make them to fall away and kill them.

Of swallowing down Hens dung.

If a Horfe swallow down Hens dung in his Hay, it will frett his guts, and make him to avoid filthy matter at the fundament. For remedy whereof, Abfrius would have you to give him drink made of Smallage-feed, Wine, and Hony, and to walk him throughly upon it, that he may empty his belly.
The History of Four-footed Beasts.

**Blundevile.**

They be like Geese Lice, but somewhat bigger; they will breed most about the ears, neck, and tail, and over all the body. They come of poverty, and the Horse will be always rubbing, and scratching, and will eat his meat; and not prospere withal, and with rubbing, he will break all his mane and tail. The cure, according to Martin, is thus; Anoint the place with Sope and Quicksilver, well mingled together, and to a pound of Sope, purk half an ounce of Quicksilver.

**Markham.**

Here be Horses that will be Louise, and it cometh of poverty, cold and ill keeping, and it is oftenest amongst young Horses, and most men take little heed unto it, and yet they will die thereon. The cure is, to wash them three mornings together in Stau-aker and warm water.

**How to save Horses from the stinging of flies in Summer.**

A Noit the Horses coat with Oyle, and Bay-beries mingled together, or tie to the headd of his collar, a sponge dip in strong Vinegar, or sprinkle the stable with water wherein Herb-grace hath been laid in steep, or perfume the stable with Ivie, or with Calamint, or with Gith burned in a pan of coles.

**Of bones being broken out of joynt.**

Few or none of our Farriers do intermeddle with any such griefs, but do refer it over to the Bonefetter, whose practised hand, I must needs confesse, to be needful in such busines. Notwithstanding, for that it belongth to the Farriers art, and also for that the old writers do make some mention thereof, I thought good not to passe it over altogether with silence. Albeit, they speak only of fractures in the legs beneath the knee. For they make little mention or none of bones above the knee, taking them to be incurable, unleffe it be a rib, or such like. If a bone then be broken in the leg, it is easie to perceive, by feeling the roughness and inequality of the place griev'd, one part being higher then another. The cure whereof, according to Abijtan and Hierocles, is in this fort:

First put the bone again into his right place: that done, wrap it about with unwash't wool, binding it fast to the leg with a small llenen roller, foaked before in Oyl and Vinegar mingled together. And let that roller be laid on as even as is possible, and upon that again lay more wool dip't in Oyl and Vinegar, and then splent it with three splents; binding them fast at both ends with a thong, and let the Horses leg be kept straight, and right out, the space of forty days, and let not the bones be loosen'd above three times in twenty days, unleffe it thinketh and do require to be new drest, and bound again. But fail not every day once, to pour on the fore place, through the splents, Oyl and Vinegar mingled together. And at the forty dayes end, if you perceive that the broken place be dower'd together again with some hard knob or gristle; then loosen the bones, so the Horse may go fair and softly, using from that time forth to anoint the place with some softe greaze or Ointment.

**Blundevile.**

If a Horses knee or shouder be clean out of joynt, and no bone broken, Martin faith the readieft way is, to bind all the four legs together, in such fort as hath been taught before in the Chapter of Incoirding, and then to hoifie the Horses somewhat from the ground, with his heels upward; so shall the weight and poise of his body, cause the joynt to shoo in again into the right place: for by this means he pleasured not long since a friend and neighbour of his, who going with his Cart from S. Alburn, towards his own house, his Thiller fell and put his shouder clean out of joynt, so as he was neither able to rife, nor being holpen up, could stand on his legs: to which mischance Martin being called, made no more ado, but taking his friends Cart-rope, bound the Horses legs all four together, and with a lever being laid upon the Cart wheel, they putting their shoulders to the other end, hoifie up the Horfe clean from the ground, the poife of whose body made the bone to return into his
Of the Horse.

his right place, with such a loud knack or crack, as it might be heard a great way off, and the Horse immediately laid the use of his leg, so as he drew in the Cart, and went also safe home without complaining thereof ever after.

Certain receipts of Plasters, very good for broken bones, taken out of the old Authors, writing of Horse-ouch crafts.

T Aked of Spuma argenti, of Vinegar, of each one pound, of Saller Oyl half a pound, of Ammoniacum, and Turpentine, of each three ounces, of Wax, of Robin, of each two ounces, of Gumum, of Pitch, of Vetoigniente, of each half a pound. Boy the Vinegar, Oyl and Spuma argenti together, until it wax thick, then put thereunto the Pitch, which being molten, take the pot from the fire, and put in the Butumen, without stirring it at all; and that being also molten, then put in all the rest, and let the pot again to the fire, and let them boy all together until they be all united in one: that done, strain it, and make it in a plaster form, and this is called Hieroles Plaster.

Another receipt for broken bones.

T Aked of liquid Pitch one pound, of Wax two ounces, of the purest and finest part of Frankincense, of each ounce, of Ammoniacum four ounces, of dry Rose, and of Gallacum, of each one ounce, of Vinegar two pints. Boy first the Vinegar and Pitch together, then put in the Ammoniacum, dissolve first in Vinegar, and after that, all the rest of the aforefaid drugs, and after they have boyed together, and be united in one. Strain it, and make it plasterwise; and this is called Emplesium plaster, that is to say, the Yellow plaster.

An Ointment for broken bones.

T Aked of old Saller Oyl a quart, and put thereunto of Hogs grease, of Spuma nitri, of each one pound, and let them boy together until it begin to bubble above, and let this ointment be very warm when you use it.

Hitherto of all the diseases belonging to a Horse. Now therefore my promise was made unto you to speak of those things wherein the cure of all diseases do conftit, that is to say, in letting of blood, in taking up of veins, in purging, and in giving the fire; yea, and also order it let bindeth me to treat of the said things presently, and first of letting blood.

In how many veins a Horse may be let blood, and to what end.

As touching the order, time of the year, Moon, and day, and other circumstances belonging to letting of blood, we have sufficiently spoken already in the keepers Office, in the 22 Chapter. I rereit therefore here to shew you what veins shoul be opened when the Horse is sick of any disease, according to Vegetius opinion. But first I will rehearse unto you once again, in how many veins a Horse may be let blood, and the rather for that I follow Vegetius. A Horse then may be let blood in the two Temple veins. Item, in the two eye veins, which are eafe to finde in the face of the Horse, somewhat beneath the eyes. Item, in the two palat veins of the mouth. In the two neck veins. Item, in the two palat veins which are in the breast. Item, in the two fore thigh veins. Item, in the four shalke veins before. Item, in the two toe veins before. Item, in the two side veins, which may be otherwyse called Shank veins. Item, in the tail vein. Item, in the two banch veins. Item, in the four hough veins. Item, in the four shalke veins behind. Item, in the two toe veins behind; so that by this account, a Horse may be let blood in 31 veins. All which veins are eafe enough to know, because that every one lyeth in a little gutter, which by feeling softly with your finger, you shall finde immediately.

And Vegetius faith, that if any Horse be pained with any grief in his head, as with ach, heavenes, frenzy, falling-evil, or such like, then it is good to let him blood in the two temple veins with a feiam. If his eyes be waterish, bloodshotten, or grieved with pin, web, or haw, then it is good to strike the eye vein with a feiam. If he have any heavenes or weariness of body, or be diathed in the throat with the strangullion, quinsz, or swelling of the arteries, either within or without, then it is good to let him blood in the mouth, in the palat veins with a Corner. If he be vexed with an Ague, or with one other disease universally hurtung the body, then let him blood in the neck veins. If his grief be in the lungs, liver, or in any other inward member, then let him blood in the brest veins, which we called before the palat veins. If he be grieved in the shoulder, then let him blood in the fore-thigh veins above the knee with a lancet, and that very warily, because that place is full of finewes, and if he be grieved in his joints, then let him blood in the shalke veins, and that warily, because that place is also full of finewes.

And if he be foiled on his fore-feet, by foundering or otherwyse, then let him blood in the toe veins, making way first with your drawer, or Corner in the hoof to come to the vein. If he be diathed in the kidnes, reins, back, or belly, then let him blood in the flank veins, and in the tail. If he hath any grief in his hips, or houghs, then let him blood in the hip or hough veins. And if
The History of Four-footed Beasts.

his hinder-legs, joints, or feet be griev'd, then let him bloud in the shakel veins, and toe veins, as is aforesaid.

The order of taking up Veins, and wherefore it is good.

Blandwine.

The order observed by Martin, is in this fort: First, if the Horfe be very curf, and threfh'd, then call him upon a dunghill, or fome straw, then having found the vein that you would take up, marke well that part of the skin which covereth the vein, and pull that fomewhat afide from the vein with your left thumb, to the intent you may flit it with a Razor, without touching the vein: And cut no deeper then only through the skin, and that longift wife, as the vein goeth, and not above an inch long. That done, take away your Thumb, and the skin will return again into his place, right over the vein, as it was before: Then with a Coronet uncover the vein and make it up, and being bare, thrufh the Coronet underneath it, and raife it up, fo as you may put a Shoomakers threed underneath, somewhat higher then the Coronet, to knit the vein when time is. And if your Coronet had a hole in the small end to put in the threed, it fhould be the eafieft done. Then the Coronet flanding fo flit, flit the vein longift wise that it may bleed, and having bled fomewhat from above, then knit it up with a fure knot, fomewhat above the flit,uffering it to bleed only from beneath, and having bled sufficiently, then knit up the vein also beneath the flit with a fure knot, and till the hole of the vein with Salt, and then heat up the wound of the skin with Turpentine and Hogs greafe molten together, and laid on with a little Flax. The taking up of veins is very neceffary, and doth eafe many griefs in the legs: for the taking up of the fore-thigh veins eafe Farcins, and swellings of the legs; the taking up of the shakel veins before, eafe the Quarter-bone and swelling of the joints, feabs, and cratches. The taking up of the hinder veins, helpeith the Farcin, Swellings, and both the Spavens; the taking up of the shakel veins behind, helpeith swelling of the joints, the pains, and kibed heels, and fuch like difeafes.

Of Purging with Purgation or Glyfter.

Purgations is defined by the Phyficians, to be the emptying or voiding of superfluouf humors, annoying the body with their evil quality. For fuch humors bring evil juice and nutriment, called of the Phyficians Cacochymia, which when it will not be corrected or holpen with good diet, alteration, nor by the benefit of nature and kindly heat, then it muft needs be taken away by Purging, Vomit, or Glyfter. But forasmuch as Horfes are not wont to be purged by Vomit, as men be, I will speak here only of Glysters and Purgations. And first becaufe a Horfe is griev'd with many difeafes in his guts, and that nothing can purge the guts fo well as a Glyfter, and efppecialy the thick guts, I wish that our Farriers would learn to know the diversities of Glysters, to what end they ferue, and with what drugs or fimples they fhould be made, for as the difeafe requireth, fo muft the Glyfter be made; fome to allay griefs and fcarpifes of humors, fome to bide, fome to loofen, fome to purge evil humors, fome to cleanfe Ulcers: but our Farriers ufe Glysters, only to loofen the belly, and for no other purpole; yea, few or none do that unleef he be Martin, and fuch as he hath taught, who is not ignorant that a Glyfter is the beginning of purging. For a Glyfter, by cleaning the guts, refrefheth the vital parts, and prepareth the way before. And therefore whenever a Horfe is furfeited and full of evil humors, needing to be purged, and specially being pain'd in the guts, I would with you to begin firft with a Glyfter. left by purging him by medi- cine upon the sudden, you flir up a multitude of evil humors, which finding no palage downward, because the guts be fopit with winde and dregeges, do strike upwards, and fo perhaps put the Horfe in great danger.

But now you shall understand, that Glysters be made of four things, that is to fay, of Decoctions, or Drugs, of Oyls, or fuch like unchift matters, as Butter and foft greafe, and fourthly of divers kinds of Salt to provoke the virtue expellive. A Decoction is as much to fay as the broth of certaine hearts or fimples boyled together in water till the third part be confume. And sometimse in deed of fuch Decoction, it fhall be needfull perhaps to ufe fome fat broth, as the broth of Beef, or of Sheeps heads, or Milk, or Whay, or fome other fuch like liquor, and that perhaps mingled with Honey or Sugar, according as the difeafe fhall require, the Glyfter to be either Lentive, that is to fay, eating pain; or Glutinative, that is, joyning together; or elfe Abferfive, that is to fay, cleaning or wiping away filthy matter, or which Decoction of broth being drained, you fhall need to take three pints or a quart at the leaft. And then into this, you may put fuch drugs as fhall be needfull to the weight of three or four ounces, according as the fimples fhall be more or leffe viol- ent. Or Oyl at the leaft halfe a pint, and of Salt two or three drams, and then to be mingled luke-warm with a horn or pipe made of purpole, when the Horfe is not altogether full paunch'd, but rather empty, be it either in fore-morning, or after-morning. And as touching the time of keeping Glysters in the body, you fhall understand, that to Glysters abferfive half an hour or leffe may suffice: to Glysters Lentivse, a longer time if it may be: and to Glysters Glutivse, the longest time of all is most needful.
Purgations for Men may be made in divers sorts and forms; but Horfes are wont to be purged only with pilis, or else with purging powders put into Ale, Wine, or some other liquor. But the simples whereof such pilis or powders be made, would be chosen with judgment and aptly applied, so as you may purge away the hurtful humors, and not the good. Learn first therefore to know with what humor or humors the Horse is griefed, be it Choler, Phlegm, or Melancholy, and in what part of the body such humors do abound; then what simples are best to purge such humors, and with what property, quality, and temperaments they be induced. For some be violent and next cousins to poyson, as Scammony, or Colocynthis. Some again are gentle, and rather mean than medicines, as Manna, Cassia, Whay, Prunes, and fuch like. And some again be neither too violent, nor too gentle, but in a mean, as Rub rhubarb, Garriek, Sene, Aloes. The old men did use much to purge Horfes with the pulp of Colocynthis, and sometime with the roots of Wilde Cowcumber; and sometime with the broth of a foated Whelp mingled with Nitrum, and divers other things, whereof I am sure I have made mention before in the curing of Horfes diseafes.

Notwithstanding I would not wish you to be rash in purging a Horse after the old mens example. For as ther simples many times be very violent, so the quantities thereof by them prescribed are very much, and dangerous for any Horfe to take in these days, in the which neither man nor beast, as it seemeth, is of fuch force or strength as they were in times past. And therefore wherely you would purge him with such like kindes of Purgations as Martin writeth, whereof you have example before in divers places; and whensoever you lift for knowledge faking to deal with other simples to prove them firt upon fuch Jades as may well be spared. For whosoever mizeth to purge a Horfe well, that is, to fhow him good and no hurt, had need to consider many things: as the nature of the Horfes diseafe, and the Horfes strength: also the nature, strength and quantity of the medicine that he minifieth: the Region, or COUNTRY, the time of the difafe, the time of the year and day. For as the diseafes and evil humors causing fuch diseafes are divers, fo do they require to be purged with divers medicines, diversly compounded, wherein confifteth a point of Art to be learned at the Phytifians hands, and not at mine.

Again, weak, delicate, and tender Horfes may not be purged in fuch forte: as thofe that be of a strong lurdy nature. And therefore in fuch cafes the quality and quantity of the simples is not a little to be confidered: neither is the hotnefs or coldnefs of the Region to be neglected, nor the time of the difafe. For some require to be purged in the very beginning: fome not until the matter be thorougly digefed: and though the difafe proceed perhaps of cold and cold humors, yet a man may not minifher fuch hot things in Summer, as he would do in Winter, nor in the contrary cafe, fuch cold things in Winter as he would in Summer. And therefore the time and reafon of the year is alfo to be obfervet: yea the day and time of the day. For the more temperate the day is, the better; not in an extreme hot day, for making the Horfe to faint; nor yet when the winde bloweth in the cold North, for that will fop and hinder the working of the medicine, but rather in a temperate moift day, when the winde is in the South, if it may be; for that will further and help the working of the medicine, and make the body loofe and soluble.

Again for a Horfe, whether you purge him with pilis or drink, it is best for him (as Martin faith) to take them in the morning, after that he hath fafted from meat and drink all the night before. And having received his medicine, let him be walked up and down, one hour at the leaft, and then let him up, and fuffered to fland on the bit two or three hours without any meat, but in the mean time fee that he be well littered, and warm covered: and three hours after, offer him a little of a warm maff made with Wheat-meal, or with Bran, or elle with ground mault. Give him little meal, or none until he be purged: all which things have been shewed you before in divers places, and therefore I think it not good to be tedious unto you with often recital thereof.

Of Cauterization, or giving the fire, as well actual as potential.

Forasmuch as the Fire is judged of all the old Writers to be the chiefest remedy, and as it were the laft refuge in all diseafes almost whereunto a Horfe is subjed, I thought good therefore to talk of it in this place; and the rather, for that few or none of our Farriors, unless it be Martin, or fuch as have been taught, do know how to give the fire, or to what end it ferveth. But first you fhall understand, that according to the learned Chirurgions, yea, also according to my old Authors, there be two kindes of Cautery, the one actual, and the other potential. The Cautery actual is that which is done only by fiering of the grievedy place with a hot Iron. The potential Cautery is done by applying unto the grievede place fome medicine corrosive, putrefactive, or cautel. But we will speak firft of the actual Cautery, fhowing you whereunto it is good, then of what metal and fashion your instrument should be made, and finally how and when to ufe them.

Actual faith, that an actual Cautery moderately used, is a noble remedy to flop corruption of members, to refolute the compexion of the fame, and alfo to flanch bloud. Howbeit you must beware (faith he) that you touch not the fines, cords, or ligaments, let the member be weakened, or that the Cramp enueth. Vegetius also writing of Horfe-leach-craft, praifeth the actual Cautery very much, speaking in this forte: The actual Cautery faith he, bindeth togeth
Cauteries Potential, as Johannes Vigo faith, are medicines Corroffive, Putrificative and Calulick.

This word Corroffive, is derived of the Latin word Cordo, which is as much to say, as to gnaw and fret; and of such Corroffives, some be simple and some compound.

The simple, as Vigo faith, be such as these be, Roch Alum, as well burnt as not burnt, Spunge of the Sea somewhat burnt, Lime, red Coral, powder of Mercury. Compound Corroffives be thebe, Unguentum Apofolorum, Unguentum Egyptianum, Unguentum Ceracum. Medicines Putrificative, called of the learned fort, Sepice, according to Avisen, be those that have strength to corrupt the composition of the member, and to induce any farke like dead flesh, causing great pain; yea and Fevers, and therefore ought not to be minihibited but to strong bodies and in strong diseases, as in Carbuncles, Canker, Ulcers, and such like; and they be thebe, Aftenicke, Sublimate, Refalger, and order medicines compound therewith. Silioiu also addeth thereunto Sandaraca, Chryfcola, and Acuum, but he doth not agree with Avisen in the description of the putrificative medicines: For he faith, that they have little pain or none, neither be they so hot and drie as those that are called Efobaratica; that is to say, Crucive: which be hot in the fourth degree, and do breed a cruel and fear, and caufe great pain, as unfeck't Lime, and the burned dregs of Wine: wherefore it seemeth that Avisen description belongeth rather to the crucive then to the Putrificative medicines.

Notwithstanding, I must needs say that our Chirurgions and also Farriers, do finde both Aftenicke and Refalger, to be so sharp, hot and burning things, as when they minihter the lame to any part of the
Of the Horse.

The receipt of a Cautick used by Chiron, to dry up the superfusious moisture, and to bind parts loosened, and to strengthen parts weakened.

Take of Bitumen Judaeicum two pound, of Bitumen Apollinis two pound, of the purest part of Frankincense fix ounces, of Deersweat two pound, of Peperatum two ounces, of Galbarum two ounces, of the drops of Storax two ounces, of common Wax two pound, of Rosin Gabriel one pound, of Vitium Italium three ounces, of Aperium two ounces, of the juice of Hytop two ounces, of the drops of Armoniack two ounces, of Pitch one pound.

Another Cautick used by Pelagonius, to dry up Swellings, Bladders, Wind-galls and Splenès in the legs and joynets.

Take Virgin Wax one pound, of Rosin two pound and a half, of Galbarum three ounces, of Aperium Judaeicum two pound, of Mirrhe secondary two pound, of Bitumen one pound, of Armoniack fix ounces, of Cofus fix ounces. Boy all these things together in an earthen pot, laying the Aperium, Armoniack and Coftum, which being first ground like fine flour, mall be added unto the other things, and after that they have been boiled and cooled, and then boiled all together again, and well stirred, so as they may be incorporated together, and made all one substance. These kinds of Emplasters or Ointments ought in my judgement to be so called, as I said before, rather binding charges then Cautikk medicines, because there be no such extreme Corrosive or burning simples in these, as are before recited. Nowthwithstanding I refer my judgment to those that be better learned, and so end for being over tedious. For if I would, I could take very good occasion here to speak of divers other medicines, whereas some are called Anodyne, easing pain and grief. Musin calleth them Linoges, which are made of Linseed, Camomile, soft grease and such like things, as are hot in the first degree; some again are called Narcotics, that is to say, allaying or bringing to sleep, as those that are made of Opium, Mandragora, Poppy, and such like cold and groffe things. And some are called Seroctics, that is, Breeding flesh, as Barly flource and Frankincence. And many other kinds of Emplasters, Ointments, waters and falves, which would occupy a book of no small volume, to be written hereafter by some other perhaps, if not by myself, and in the mean time, let this that I may have already written suffice.

Of the Anticors.

A N Anticor cometh of superfluity of evil blood or spirit in the arteries, and also of inflammation Musum. In the liver, which is ingendered by means of too choyle keeping, and overmuch reat, which choaketh the vital powers, and occasions unnatural swellings in the breet, which if they ascend upward and come into the neck, they are instantly death. The cure whereof is in this fort; Let him bleed first as he may bleed abundantly, then with a sharp knife in divers places cut the swelling: when done, let a cupping-glasse thereon, and cup it till the glasse filled with foul water. fall away it fell; then give the Horse to drink three mornings together a pint of Malmsey well stirred with Cinnamon, Licoras, and a little Bezar stone, and during his sickness, let his drink be warmed, and mingled with either Bran or Male.
The History of Four-footed Beasts.

Of the Cords.

The Cord is a disease that maketh the Horse stumble, and many times fall, and they appear in a Horse's fore-legs: this is the cure thereof; Take a sharp knife, and cut a slit even at the top of his nose, just with the point of the gristle, open the slit being made, and you shall perceive a white string, take it up with a Boars tooth, or some crooked bodkin, and cut it in sunder, then stitch up the slit and anoint it with Butter, and the Horse doublets shall be recovered.

Of the Millets.

The Millets is a grief that appeareth in the Fetlocks behind, and caueth the hair to shed, three or four inches long and a quarter of an inch in breadth, like as it were bare and ill to cure. But thus is the cure; First wash it well with wrong lie, and rub it till it bleed, then bine unto it Hony, unfeck't Lime, and Deers fewer, boyled and mingled together, this do for the space of a week, and it shall be whole.

Of the Strew.

A Serew is a foul forance, it is like a Splent, but it is a little longer, and is most commonly on the outside of the fore-leg, as the Splent is on the inside. The cure is thus; Take two spoonfuls of strong Wine Vinegar, and one spoonful of good Sallet Oyl, mingle them together, and every morning before one hour in rubbing the forance with it altogether downward till it be gone, which will not be long in going.

The medicines arising out of Horses.

Pliny.

The Grecians have written nothing at all concerning Wilde Horses, because in their Country there was none of them usually bred or gotten: yet notwithstanding the fame we ought to think that all medicines or any other things, which do proceed from them, are more strong in operation, and have in them greater force and power than any common Horses have, as it falleth out in all sorts of other beasts.

The blood of a Horse (as Pliny affirmeth) doth gnaw into dead flesh with a putrefactive force; the same virtue hath the blood of Mares, which have been covered by Horses: Also the blood of a Horse (but especially of one which is a breeder) doth very much make and help against impotences, and small bunches which do arise in the flesh. Moreover it is said that the blood of a young Ass is very good against the Jaundies, and the over-flowing of the gall, as also the same force and effect is in the blood of a young Horse. The Horse-leaches do use the blood of Horses for divers diseases which are incident unto them, both by anointing or rubbing the outward parts, as also in their bodies.

Furthermore if one do cut the veins of the palate of a Horse's mouth, and let it run down into his belly, it will presently destroy and confuse the maw or belly-worms, which are within him. When a Horse is sick of the Pestilence, they draw blood out of the veins in his spurring place, and mingling the same upon a stone with Salt, make him to lick it up. The blood of a Horse is also mingled with other medicines, and being anointed upon the arms and shoulders of men or beasts, which are broken or out of joynt, doth very much help them. But a Horse which is weary or tyred, you must cure after this manner; First, draw some blood out of his matrix or womb, and mingle it with Oyl and Wine, and then put it on the fire till it be lake-warm, and then rub the Horse all over against the hairs.

If the sinews of Horses do wax stiffe or shrink in together, it is very necessary that the sick parts should be anointed with the hot blood which doth proceed from him, for Horses also which are fed in the field use their flesh and dung, against the biting and stinging of Serpents.

We also finde that the flesh of Horses being well boiled is very medicinable for divers diseases. Moreover it is very usuall and common with the women of Occitania to take the fat or grease of Horses to anoint their heads to make the hair of their heads multiply and increase; and certain Latine Physicians do mingle the marrow of a Horse with other Ointments for a remedy against the Cramp.

The marrow of a Horse is also very good to loosen the sinews which are knit and fadned together, but first let it be boyled in Wine, and afterwards made cold, and then anointed warmly either by the fire or Sun. If a Horse do labor in that kind of impotune which they vulgarly call the Worm, either any where as well as in the nose, they do open the skin with a fearing iron, and do sprinkle Verdigrise within the Horfes mouth being brent, and being added thereofunto sometimes the feed of Henbane.
Of the Horse.

The teeth of a male Horse not gelded, or by any labour made feeble, being put under the head, or over the head of him that is troubled, or darteth in his dream, both with hand and reftit all unquietness which in the time of his rest might happen unto him. Play also doth affent that flower doth heal the Sores of a Horse's teeth and gums, and the cleats and thines of a Horse's feet.

The teeth also of a Horse is very profitable for the curing of the Chilibances which are rotten and full of corruption when they are swollen full ripe. Marcellin faith, that the tooth of a Horse being beaten and crushed into very small powder, and being sprinkled upon a Man's genital doth much profit and very effectually help him: but the teeth which were first ingented in a Horse, have this virtue in them, that if they should touch the teeth of Man or Woman, who are mollied and grieved with the tooth-ach; they shall presently find a final end of their pain, if in the like manner a child do kife the nose or frowt of a Horse, he shall never feel pain in his teeth, neither at any time shall the childe be bit by the Horse.

The teeth which do first of all fall from Horses, being bound or fastned upon children in their infancy, do very easily procure the breeding of the teeth, but with more speed and more effectually if they have never touched the ground, wherefore the Poet doth very well apply these Verfes, saying:

Collo jugur molli dentes et quoties equi, Qui prima fuerit pullo coferente vultus.

It is also said, that if the hair of a Horse be fastned unto the Horse of a mans enemy it will be a means that neither little flies or small goats shall flie by his dwelling place or abode. The tongue of a Horse being never accustomed unto wine, is a most present and expedient medicine to slay or cure the milt of a Man or Woman (as Cæcilius Boni reporteth unto us, that he learned it of the Barbarians.) But Marcellin faith, that the Horse tongue ought to be dryd and beaten into small powder, and put into any drink, except wine only, and forthwith it will shew the commodity which rifereth thereupon, by eating either Man or Woman, of the pain of the Spleen or Milk: divers also do think that a Horse's tongue used after this manner, is a good means or preservative against the biting of Serpents or any other venomous creatures.

But for the curing of any fores or griefs in the inward parts, the genital of a Horse is most of all commended: for as Pliny fuppofeth, this genital of a Horse is very medicinal for the loofing of the belly, as also the bloud, marrow, or liver of a Goat, but these things do rather dry up and close the belly (as before we have taught) concerning the Goat.

In the heart of Horses there is found a bone, most like unto a Dog's tooth, it is said that this doth drive away all grief or sorrow from a man's heart, and that a tooth being pulled from the cheeks or jaw bones of a dead Horse doth shew the full and right number of the sorrowes of the party so grieved. The duit of a Horse hoof anointed with Oyl and Water, doth drive away impoiltumes and little bunches which rife in the flieh, in what part of the body forever they be: and the duit of the hoof of an Affe anointed with Oyl, Water and hot urine, doth utterly expell all Wens and kernels which do rife in the neck, arme-holes, or any other part of the body, of either man or woman.

The genital of a gelded Horse dryd in an Oven, beaten to powder, and given twice or thrice in a little hot broth to drink unto the party so grieved, is by Pliny accounted an excellent and approved remedy in the Sores of a woman. The foam of a Horse, or the duit of a Horse hoof dryd, is very good to drive away flame-Salliness, being anointed with a certain titulation. The scrapings of the Horse's hoofs being put in wine and poured into the Horse's nostrils, do greatly provoke his urine.

The ashes also of a Horse hoof, being mingled with wine and water, doth greatly ease and help the difeafe called the Colick or Stone: as also by a perfume which may be made by the hoofs of Horses being dryed, a childe which is still born is cast out.

The milk of Mares is of such an excellent virtue, that it doth quicke expell the poison of the Scabare, and all other poison whatsoever: drink also mingled with Mares milk, doth make the body ftoke and laxable. It is also counted an excellent remedy against the falling ficknes, to drink the stones of a Boar out of a Mares milk or water. If there be any filth or matter lying in the matrice of a woman, let her take Mares milk boiled and thoroughly strained, and prefently the filth and excrements will void clean away. If so be that a Woman be barren and cannot conceive, let her then take Mares milk (not knowing what it is) and let her prefently accompany with a man, and she will conceive. The milk of a MARE being drunk doth affwage the labor of the matrice, and doth causeth a still childe to be cast forth. If the feed of Henbane be beaten small and mingled with Mares milk, and bound with a Harts skin, so that it may not touch the ground, and fastened or bound to a woman, it will hinder her conception.

The thinneft or laftest part of the milk of a Mare, doth very easily, gently, and without any danger purge the belly. Mares milk being dailily anointed with a little Hony doth without any pain or punishment take away the wounds of the eyes being new made. Cheefe made of Mares milk doth repreffe and take away all wringings or eches in the belly, whatsoeuer. If you anoint a comb with the foam of a Horse, wherewith a young man or youth doth use to comb his head, it is of fuch force as it will caufe the hair of his head neither to encreafe, or any what to appear. The foam of a Horse
The History of Four-footed Beasts.

Horset is also very much commended for them which have either pain or difficulty of hearing in their ears, or else the duit of Horse dung being new made and dryed, and mingled with Oyl of Roses. The grief or foresens of a man's mouth or throat, being washed or anointed with the foam of a Horse which hath been fed with Oates or Barly, doth presently expell the pain of the foresens, if so be that it be two or three times washed over with the juycy of young or green Sea-crabs beaten small together; but if you cannot get the Sea-crabs which are green, sprinkle upon the grief the small powder which doth come from dryed Crabs which are baked in an Oven made of Bratle, and afterward wash the mouth where the pain is, and you shall finde prentent remedy. The foam of a Horse being three or four times taken in drink, doth quite expell and drive away the Cough. But Marcellus doth affirm that whosoever is troubled with the Cough, or consumption of the lungs, and doth drink the foam of a Horse by it self alone without any drink, shall finde prentent help and remedy: but as Sextus faith, the Horse will presently die after it. The same also being mingled with hot water, and given to one who is troubled with the same diseas, being in manner palt all cure, doth presently procure health; but the death of the Horse doth instantly enuie. The sweat of a Horse being mingled with Wine, and so drunk, doth cause a woman which is very big and in great labor, to calfe or till the child.

The sweat of any Beall, (but as Albertus faith only of a Horse) doth breed wind in a man or womans face, being put thereupon, and besides that, doth bring the Smince or Snequity, as also a filthy thinking sweat. If Swords, Knives, or the points of Spears when they are red fire hot, be anointed with the sweat of a Horse, they will be so venemous and full of poision, that if a man or woman be flitten or pricked therewith, they will never cease from bleeding as long as life doth laft. If a Horse be wounded with an Arrow, and have the sweat of another Horse, and breed which hath been, being mingled in mans urine, given him to drink, and afterwards some of the same being mingled with Horfe grease put into the wound, it will in short time procure him eafe and help. There are some which will affure us, that if a man be troubled with the belly worms, or have a Serpent crept into his belly, if he take but the sweat of a Horse being mingled with his urine, and drink it, it will presently caufe the Worms or the Serpent to issue forth.

The dung of a Horse or Affe which is fed with garlette, being dryed and afterward dipped in wine, and so drunk, is a very good remedy against the bitings and blows of Scorpions. The same medicines they do also ufe, being mingled with the genital of a Hare in Vinegar, both against the Scorpion, and against the Shrew-mouse. The force is so great in the poiyon of a mad Dog or Bitch, that if his pargeted Urine doth much hurt, especially unto them that have a fore boil upon them; the chiefest remedy therefore against the same is the dung of a Horse mingled with Vinegar, and being warmed put into the scab or fore. The dung as well of Aisses as of Horses, either raw, or cold, or burnned, is excellent good against the breaking forth or issues of the bloud.

The dung of Horses or Aisses being new made or warm, and so clapped and put to a green wound, doth very eafe and speedily flanch the bleeding. If the vein of a Horse be cut, and the bloud do issue out in too much abundance, apply the dung of the same Horse unto the place where the vein is cut, and the bleeding will presently ceafe, wherefore the Poer doth very well express it in these Verles following;

Vere fium manni cum tefis aritur ovf,  
Et reprimis fluidos mirificamine cuftus.

The same doth also very well drive away the corruption in mens body which doth cause the bloud to thinke if it be well and fully applied unto the corrupt place. The same also being mingled with Oyl of Roses, and new made, and so applied unto the ears, doth not only drive away the pain, but also doth very much help for hearing: There is another remedy also for the hearing, which is this, to take the dung of a Horse which is new made, and to make it hot in a furnace, and then to pour it on the middle of the head against the Eade, and afterward to tie the aforefaid dung in a linen or woollen cloth unto the top of the head in the night time.

The dung of a young Affe when he is first foiled, given in Wine to the quantity or magnitude of a Beann, is a present remedy for either man or woman who is troubled with the Jaundice or the overfowing of the gall, and the same property hath the dung of a young Horese or Cole when he is new foiled. But the dung of an old Horese, being boiled in fair water, and afterward strained and so given to the party to drink, who is troubled with Water in his belly or stomach, doth presently make vent for the same.

There is also an excellent remedy against the Colick and Stone, which is this, to take a handful of the dung of a Horse which hath been fed with Oates and Barly, and not with garlette, and mingle very well it with half a pinte of Wine, all which I do give will amount unto the weight of eighteen ounces, and then boil them all together untill half of them be boyled or conformed away, and then drink the same by little and little until it be all drunk up, but it will be much better for the party that is troubled to drink it up all together if he be able.

There is moreover a very good and easie way by Horfe dung to cure the Ague or Quarterly Fever, which is thus, to burn the forefaid dung, and to mingle the very dutt it self thereof in old wine, and then beat it unto small powder, and so give it unto the party who is troubled therewith, to drink or suck without any water in it, and this will very speedily procure eafe and help. If that a woman
woman supposed her child which is in her womb to be dead, let her drink the milk of a Horse in some sweet water, not to the smell, but to the tale, and she will presently cast the childe.

The namee virtue are in the perfume which is made of a Horse's hoof, as also in the dry dung of a Horse. There is some which do use this means against the falling sickness, or the sickness called Saint John's eveil, that is to mingle the water or urine which a Horse doth make with the water which cometh from the Smiths trough, and so to give it the party in a potion. There is a very good help for Cattell which do avoid blood through their Noftrils or secret parts, which is this, to make a palle of Wheat flower, and beat it and mingle it together with Butter and Eggs in the urine of a Horse which hath lately drunk, and afterward to give that palle or pouletis baked even to ashes to the beast so grieved.

To provoke urine when a mans yard is flrop, there is nothing so excellent as the dung or filth which proeedeth from the urine which a Horse hath made, being mingled with wine, and then strained, and afterwards poured into the Noftrils of the party so vexed.

There are certain Tsetters or Ring-wormes in the knees of Horses, and a little above the hoofs in the bending of these parts, there are indurate and hardned thick skins, which being beaten into small powder and mingled with Vinegar, and so drunk, are an exceeding good preservative against the Falling sickness: the name is also a very good remedy for them which are bitten with any wide Beast whatsoever. By the Tetter or Ring-worm which groweth in a Horses knees or above the hoofs, beaten and mingled with Oyle, and so poured in the ears, the teeth of either man or woman which were weak and feble, will be made very strong and falt. The aforefaid Tetter, without any mingling with Oyl, doth also heal and cure the head-ache and Falling-sickness, in either man or woman. The same also being drunk out of Clarret Wine or Mufcadel for forty dayes together, dothe quite expell and drive away the Colick and Stone if that any man do get and put up the phoe of a Horse being bruack from his hoof as he travelleth in his pace (which doth many times happen) it will be an excellent remedy for him against the filling in the stomache called the Hicket.

Of the Hyana.

We are now to discouer of a Beast whereof it is doubtfull whether the names or the kinds thereof be more in number, and therefore to begin with the names, it seemeth to me in general, that it is the same Beast which is spoken of in Holy Scripture, and called Zeb-reeb, and Arabbus, Zophon. 3. Principe urbis Hierosylyme velut Leones sujicientes, judices ejus similis sunt lupis Vesciniae qui alia non relinquunt ad illicum: Their Princes are roaring Lions and their Judges are like to night-wolves which leave not the bones till the morning, as it is vulgarly translated. In like forse Jer. 5. calleth them Zeb-Abaroth, Wolves of the wilderneas, and the Prophet Habakkuk, Cap. 1. useth the word Zeeb-reeb, Wolves of the evening. By which it is made easie to consider and discouer what kinde of Beasts this Hyana may be deemed; for the Hyana, as I shall shew afterward, is a Greek word. And first of all I utterly exclude all their opinions, which translate this word Arabian Wolves, for the Hebrew notes cannot admit such a verion or exposition: But seeing we read in Opisthocom and Taineus, that there are kinds of Wolves which are called Hamagges, more hungry then the residue, living in Mountains, very swift of foot, and in the Winter time, coming to the gates of Cities, and devouring both fheep and bones of every living creature they can lay hold on, especially Dogs and men, and in the morning go away again from their prey, I take them to be the same Beasts which the Grecians call Hyana, which is also the name of a Fift much like in nature hereunto. It is also called Glanor, and by the Phrygians, and Bythnians, Genus, and from one of these came the Ilyrian or Scythian word Sans, and it feemeth that the Grecians have given it a name from Swine, because of the gristles growing on the back, for an Hyana can have no better derision then from Eum or Hym. Julius Caesar in his place where he recordeth that there were deceased Bibliys hab Gandians, ten Hyas or in the days of Gordians: And the reason of this name is not improbably derived from Belba a City of Egypt. Phinianus a learned man calleth the Greek, because it hunteth the Sepulchres of the dead. Albertus in his de Hyana, calleth it Ame. The Arabians call it Kete, and Zeb, or Zeba and Asara. I take it also to be the same Beast which is called Lata, and Ana, and Zibe, because that which is reported of thee, is true in the Hyana; they frequent graves, having sharp teeth and long nails, being very fierce, living together in herds and flocks, and loving their own kinde most tenderly, but most pernicious and hateful to all other, being very crafty to fet upon a fit prey, defending it selfe from the rage of stronger Beasts by their teeth and nails, or else by flight or running away. Wherefore we having thus expresed the name, we will handle the kinds, which I finde to be three, the first Hyana, the second Papio or Dabob, the third Groans, and Lachomous whereunto by conjecture we may add a fourth, called Muntchera.
The Figure of the first *Hyæna*.

His first and vulgar kinde of *Hyæna*, is bred in *Africa* and *Arabia*, being in quantity of body like a *Wolfe*, but much rougher haired, for it hath bristles like a *Horse* mane all along his back, and in the middle of his *back* it is a little crooked or dented, the colour yellowish, but blesckled on the sides with blew *spots*, which make him look more terrible, as if it had so many eyes. The eyes change their colour at the pleasure of the beast, a thousand times a day, for which cause many ignorant writers have affirmed the same of the whole body, yet can he not see one quarter so perfectly in the day as in the night; and therefore he is called *Lupus vesperinus*, a *Wolfe* of the night. The skilful *Lapidarius of Germany* affirm that this beast hath a *cone* in his eyes (or rather in his head) called *Hyæna* or *Hyænus*; but the Ancients say, that the apple or pulpe of the eye is turned into such a *cone*, and that it is indued with this admirable quality, that if a man lay it under his tongue, he shall be able to foretell and prophesie of things to come; the truth hereof I leave to the reporters. Their back-*bone* stretcheth it felf out to the head, fo as the neck cannot be bend except the whole body be turned about, and therefore whensoever he hath occasion to wray his neck, he must supply that quality by removing of his whole body.

This Beast hath a very great heart, as all other Beasts have which are hurtful, by reason of their fear. The genital member is like a *Dogs* or *Wolfs*; and I marvail upon what ocasion the writers have been so poifeld with opinion that they change *sexes*, and are sometime *male* and another *female*, that is to say, male one year, and female another, according to these *Verfes*:

```
Si tamen est aliquid mina novitatis in ipsis
Alterare vitae, & que non sit fiamina tere
Paffa mens ed, male ed, mens miserrima Hyænam.
```

Both kindes have under their tails a double note or *passage*, in the male there is a *scifice* like the secrets of a female, and in the female a *bunch* like the *bones* of the male, but neither one nor other inward, but only outward; and except this hath given cause of this opinion, I cannot learn the ground thereof: only *Orus* writeth, that there is a *Figit* of this name which turneth *sex*, and per-adventure some men hearing so much of the *Figit*, might mistake it more easily for the *Four-footed Beast*, and apply it thereunto.

Their *procreation*. Thefe engender not only among themselves, but also with *Dogs*, *Lions*, *Tygers*, and *Wolves*, for the *Ethiopian Lion* being covered with an *Hyæna*, beareth the *Crested*. The *Therion* of whom we shall speak more afterward, are generated betwixt this Beast and a *Wolfe*; and indeed it is not without reason that *God himself* in holy Scripture calleth it by the name of a *Vesperine Wolf*, seeing it resembles a *Wolf* in the quantity, colour, in voracity and glutonning in of flesh, in infubility to overcome *Dogs* and *Men*, even as a *Wolfe* doth *fily* *Sheep*. Their teeth are in both Beasts like *fawes*, their genitals alike, and both of them being hungry, range and prey in the night *seasone*.

This
The female is far more subtil then the male, and therefore more seldom taken, for they are afraid of their own company. It was confidently affirmed that among eleven Hyænas, there was found but one female; it hath been believed in ancient time that there is in this beast a Magick or enchanting power, for they write, that about what creature so ever he goeth round three times, it shall stand and one still and not be able to move out of the place: and if Dogs do but come within the compass of their shade and touch it, they presently lose their voice: and that this doth most wholly in the full moon; for although the swiftness or other opportunity of the Dogs helpeth them to flye away from her, yet if she but call her shadow upon them, she easly obtayneth her prey. She can also counterfeit a mans voice, vomit, cough and whistle, by which means in the night time she cometh to Houses or folds where Dogs are lodged, and so making as though the vomited, or else whistling, draweth the Dogs out of doors to her, and devoureth them. Likewise her nature is, if she finde a Man or a Dog on sleep, she considereth whether or he have the greater body, if she, then she falleth on him, and either with her weight, or some secret work of nature, by stretching her body upon him killeth him, or maketh him senseless; whereby without resisting the eateth off his hands: but if she finde her body to be shorter and leffer then his, she taketh her heels and flyeth away.

If a Man meet with this Beast, he must not set upon it on the right hand, but on the left, for it hath been often seen, that in haste it did run by the Hunter on the right hand, he presently fell off from his Horie senseless; and therefore they that secure themselves from this beast must be careful to receive him on the left side, that so he may with more facility be taken, especially (faith Pliny) if the cords wherein he is to be enframed be fastened with seven knots. Abianus reporteth of them, that one of thefe coming to a Man asleep in a Sheep-cot, by laying her left hand or fore-foot to his mouth, made or called him into a dead sleep, and afterward digged about him such a hole like a grave, as she covered all his body over with earth, except his throat and head, whereupon the fat until the suffocated and stifled him; yet Pliny attributeth this to her right foot. The like is attributed to a Sea-calf, and the fifth Hyæna, and therefore the old Magicians by reason of this examining property, did not a little glory in these beasts, as if they had been taught by them to exercise Diabolical and prodigious incantation, whereby they deprived men of life, motion, and reason. They are great enemies to men, and for this cause Saltinus reporteth of them, that by secret accomplishing themselves to Houses or yards, where Carpenters or such Mechanicks work, they learn them to call their names, and so will come being an hungry and call one of them with a difficult and articulate voice, whereby he causeth the man many times to forsake his work and go to see the person calling him; but the subtile Hyæna goeth further off, and so by calling allureth him from help of company, and afterward when she feeth time devoureth him, and for this cause shee her proper Epithet is Eum. Texier, and soye-counterfeiter.

There is also habit breadth between a Pardell and this Beast, for if after death their skins be mingled together, the hair falleth off from the Pardell skin, but not from the Hyæna; and therefore when the Egyptians decribe a superiour man overcome by an inferiour, they picture these two skins; and so greatly are they afraid of Hyænas, that they run from all beasts, creatures and plates, whereas any part of their skin is fastened. And Abianus faith, that the Bin bird which liveth upon Serpents, is killed by the gall of an Hyæna.

He that will go safely through the mountains or places of these beasts abode, Refis and Abybris say, that he must carry in his hand a root of Colloquintida. It is also believed that if a man compleasse his ground about with the skin of a Crocodile, an Hyæna, or a Sea-calf, and hang it up in the gates or gaps thereof, the fruits enclosed shall not be molested with hail or lightning. And for this cause Pallasius reporteth of the Seamen, who were wont to cover the tops of their sails with the skins of this Beast, or of the Sea. Reis. and Hemes faith, that a man clothed with this skin may passe without fear or danger through the muddiest of his enemies: for which occasion the Egyptians do picture the skin of an Hyæna to signify feasable audacity. Neither have the Magicians any reason to ascribe this to any prodigious enchantment, seeing that a Fig-tree alio is never oppreessed with hail nor lightning.

And the true cause thereof is affirmed by the Philosophers to be the bitterness of it; for the influence of the heavens hath no destructive operation upon better, but upon sweet things, and there is nothing sweet in a Fig tree, but only the fruit. Allo Columella writeth, that if a man put three bushels of feed grain into the skin of this Beast, and afterward sow the same, without all controversy it will arife with much encreas. Gensam worn in an Hyænas skin, seven days instead of an Amulet, is very foeveraign against the biting of mad dogs. And likewise if a man hold the tongue of an Hyæna in his hand, there is no Dog that dareth to seize upon him. The skin of the forehead, or the bloud of this Beast, refilith all kind of Witchcraft and Incantation. Likewise Pliny writeth, that the hairs layed to Woman's lips, maketh them amorous. And so great is the vanity of the Magicians, that they are not ashamed to affirm, that by the tooth of the upper jaw of this Beast on the right side bound unto a man arme or any part thereof, he shall never be molested with Dart or Arrow.
Likewise they say, that by the genital of this beast, and the Article of the back-bone which is called Atlantis, with the skin cleaving unto it preferred in a House, keepeth the family in continual concord, and above all other, if a man carry about him the smallest and extreme gut of his intrails, he shall not only be delivered from the Tyrany of the higher powers, but also foreknow the successe and event of his petitions and futes in Law.

If his left foot and nails be bound up together in a Linnen bag, and so fastened into the right arme of a Man, he shall never forget whatsoever he hath heard or knoweth. And if be cut off the right foot with the left hand and wear the same, who soever seeth him shall fall in love with him, besides the Beast. Also the marrow of the right foot is profitable for a Woman that loveth not her Husband, if it be put into her nostrils. And with the powder of the left claw, they which are anointed therewith, being first of all decocted in the blood of a Weald, do fall into the hatred of all men. And if the nails of any beast be found in his maw after he is slain, it signifies the death of some of his hunters. And to conclude, such is the folly of the Magitians, that they believe the transmigration of souls, not only out of one man into another, but also of man into beasts. And therefore they affirm, that their men Symis and religious votaries departing life send their souls into Lions, and the religious women into Hyannes.

The excrements or bones coming out of the excrements when it is killed, are thought to have virtue in them against Magical incantations. And Demagirius writeth, that in Cappadocia and Mycia, by the eating of the herb Theriisaroba, all wilde beasts fall into a deadly sleep, and cannot be recovered but by the aspersions of the urine of this beast. And thus much for the first kinde, now followeth the second.

The Second kinde of $H T E N A$, called Papio or Dabub.
Of the Crocuta.

The region, proportion, and other qualities, of the third kind of Hyenas, except the coats of Hair, which are in all the Hyenas, of the same kind of Hair, as the rest of their Body.

The third kind of Hyena is called Crocuta, not the Galon aforefaid, but another different from that, which is said to be an Ethiopiaan four-footed Beast, because it is engendred betwixt a Lyonef and an Hyena. His teeth are all of one bone, being very sharp on both sides of his mouth, and included in the flesh like as in a cafe, that they may not be dulled: with their teeth they break any thing. It is said alfo by Sulpitius, that it is never wined, and that their nature seemeth to be tempered betwixt a Dog and a Wolf, yet is it more fierce then either of both, more admirable in strength, and especially of the teeth and belly, having power to break and digest any bone: it imitates all the voyce of a man to devour them, as is said before in the Hyena.

The Beasts and Wilds of the Regions about the Levant.

The Beasts and Wilds of the Regions about the Levant.

Of the Mantichora.

This beast or rather Monster (as it is fain written) is bred among the Indians, having a treble row of teeth beneath and above, whose greatnes, roughnes, and teeth are like a Lyon, his face and ears like unto a man, his eyes gray, and colour red, his tail like the tail of a Scorpion, of the earth, armed with a thine, calling forth sharp pointed quills: his voyce like the voyce of a small Trumpet or Pipe, being in course as foffes as a Hare: his wildenes such as can never be tamed, and his appetite is especially to the fith of man. His body like the body of a Lyon, being very apt both to leap and to run, so as no distance or pace doth hinder him: and I take it to be the fame Beast which Philo.

Advocatus callcth Maniida: and Manius, with her tails the woundeth her Hunters, whether they come before her or behind her, and presently when the quills are cast forth new ones grow up in their room, wherewithal the overcome all the Hunters: and although India be full of divers ravening Beasts, yet none of them are filled with a title of Anthropophagi, that is to fay, Men-eaters: except only this Mantichora. When the Indians take a Whelp of this Beast, they all to bruife the buttocks and
and tail thereof, that so it may never be fit to bring itarp quills, afterwards it is tamed without peril. This also is the same Beart which is called *Lycencmna* about the bigness of a wilde As, being in legs and Hoofs like a Hart, having his mouth reaching on both sides to his ears, and the head and face of a female like unto a Badgers. It is called also *Martius*, which in the *Pecifon* tongue signifieth a devourer of men; and thus we conclude the story of the *Hyæna* for her description, and her several kinds: Now followeth the medicines arising out of her several parts.

### The Medicines of the Hyæna.

The Oyl in which a Fox is baked either alive or dead, doth either altogether cure and make whole those which are troubled with the Gout, if so be that the disease or sicknesse be green or new, or at the leaft not of too long continuance; yet it may happen to return again, yet it will be much more milde and gentle then before it had been. But the Oyl which proceedeth from Foxes doth nothing more drive away the forenamed disease, then that which like-wise is got or prepared out of the *Hyæna* for that hath an excellent and eminent quality of dissolving and dispersing. The flesh of the *Alanas* is both hot and cold, and being baked with Oyl, doth very much help either men or women which have their feet Gowy, or have any pain in their joynts, which may happen or come by the occasion of cold: for it is of a slender and dissolutive sub stance.  

The vanity of the *Magi*, or Wise-men, which is witty in nothing but in circumstance of words, doth say, the best time to take *Hyæna's*, is, when the Moon paseth over the signe called *Gemini*, and that for the most part the hairs be kept and preserv'd. The *Magi* do also affirm, that the skin of an *Hyæna* being spread upon a fore which was bitten by a mad *Dog*, doth presently and without any pain cure the same. The fame also being bound to that part of the head, which doth ache, will immediately drive away the pain and grief thereof.

The same doth very effectually and speedily help them which are troubled with the Gout, or swelling in the joynts. The flour of Barley being mingled with the bloud of an *Hyæna*, and fried or baked over the fire, and so taken, doth very much alligwe the wringings and wrinchings either in the guts or belly of a man or woman. If the bloud of an *Hyæna* being hot be anointed on them which are infected with the Leprofe, it will without delay very effectually cure them.

The *Hyæna's* flesh being eaten, doth much avail against the bigness of ravenous *Dogs*; but some are of opinion, that the liver being only eaten is of more force and power to cure or heal them. The nerves or linews of an *Hyæna*, being beaten to small powder, and dryed and mingled with *Frankincense*, together, and so drunk, doth restore fertility and plenty of seed in that woman which before was barren.

There is also for the bigness of a ravenous Dog another excellent remedy, which is this, first to anoint the place to be bitten with the fat or grease of a Sea-calfe, or else to give it in drink: and then to make the operation more effectual, mingle the marrow of an *Hyæna*, and Oyl that cometh from the Matlick tree and Was together, and being so applied and anointed upon the fore, it will presently cure the same. The fame marrow of the *Hyæna* is very good and effectual against the pain and grief in the finews, as also for the loofenes and weaknes of the reins.

The marrow which proceedeth from the Cline-bone of an *Hyæna*, being mixed with his Gall and old Oyl together, and so boiled until they come unto a soft temperature, and mollifying medicine, being anointed upon the finews, doth expel and force away all pain of grief thereof whatsoever. The same marrow being bound unto the back of either man or woman, who are troubled with vain phantasties or dreams in their sleep, doth very speedily and very effectually help them. The fat or grease of an *Hyæna* being burnt, doth drive away all venomous Serpents from the place where it is used.

The same being mingled with leaven, and so being wrought into a plaister, is a very good cure or remedy for the falling of the hair, or the disease called the Foxes evil. The left part of the brain of an *Hyæna* being either anointed upon the nostrils of either men or beasts, is of such vertue, that it will cure diseases upon them which are in a manner mortal. For the slendriness and barrennes of women, the eye of an *Hyæna* being mixed with *Lycoras*, and the herb called *Dill*, and so taken in drink, is of such force and power, that in three days it will make them fit for conception.

The teeth of an *Hyæna* either touched, or bound in order unto the teeth of any man or woman who are troubled with the tooth-ache, will presently ease and vaxation thereof. One of the great teeth of an *Hyæna*, being bound with a string unto any that are troubled in the night times with shadows and phantasties, and which are fray'd out of their sleep with fearful visions, doth very speedily and effectually procure them ease and rest. The tooth of an *Hyæna* (called *Alcaba*) being bound upon the right arm of any one which is either oblivious or forgetful, and hanging down from the arm unto the middle finger or wrif, doth renew and refresh their decayed memory.

The pate of an *Hyæna* being dried and beaten to powder, and then mingled with Egyptian *Allum*, and so made hot and mixed altogether, being three times turned in any ones mouth, which hath either sore or ulcer init, will in small time procure them remedy and help of their vexation and trouble. The flesh which greweth upon the hinder part of the neck, being burned, and then eaten of taken in druk, doth very speedily help and cure the grief and aches of the loins.
The History of Four-footed Beasts.

The shoulders likewise being used in the aforesaid manner, doth profit much for the healing of any who are vexed with any anguish or pain in their shoulders or sides. The lungs being dried and taken in drink, do ease any, either man or woman which is troubled either with Colick or Stone. But being dried into powder, and mingled with Oyl, and so anointed upon the belly, it killeth the Worms, and expelleth all aches away from the belly. The Heart being used in the aforesaid manner and taken in drink, doth ease and help all aches, pains or griefs in the body whatsoever. The white flesh being taken from the breast of an Hyaena, and seven hairs, and the genital of a Hart, being bound all together in the skin or hide of a Buck or a Doe, and afterwards hanged about the neck of a woman which is in travel, will greatly hinder her for bringing forth her child.

If there shall be any flesh or bones of men found in the body of a dead Hyaena, being dried and beaten to powder, and then mixed with a certain perfume, they will be very excellent to help the Govt, or drive away the Convulsion of the sinews. The kail or calw wherein the bowels are contained, being used in the aforesaid manner, and also mixed with Oyl, will be a present remedy against the burning and inflammations of fores, botches, and Ulcers.

The chine bone of an Hyaena being bruised and beaten into small powder, and so dried, and then mingled with the tongue and the right foot of a Sea-calf, the gall of an Ox being added thereunto, and all of them boiled or baked together, and anointed upon the hide or skin of an Hyaena, and so lapped about the legs or joynets of them which are troubled with the Govt, will in short time ease the pain, and rid them altogether of the grief thereof.

The chine bone being also beaten to powder, and given in Wine to drink, is very profitable and necessary for those which are in tore travel or pain of child-birth. The first or eighth rib of the fame Beel, being beaten and mingled with a certain perfume, is very good and medicinable for fores and botches which do break through the flesh.

Their flesh also being eaten, doth quickly cure and heal the bitings or tearings of a ravenous Dog; but their liver being so used, is more effectual and speedy for the curing thereof. The liver of the aforesaid Beel is also very curable for Agues or quartern Feavers being beaten to powder, and drunk in Wine, before the augmentation or second assault thereof. The same also is an excellent and speedy remedy for the wrangings and aches of the belly, as also for that grievous and painful disease called the Colick and Stone. For the same diseas, the gall of a Sea-scorpion, and of a fish called Halops, and of a Sea-crab, and of an Hyaena, being beaten to powder, and mixed together, and so drunk in Wine, is a very good and effectual cure and help. The gall of an Hyaena, by it self, alone being rub'd or anointed upon the head of either man or woman whose hairs are fallen off, doth presently procure the hair to renew and grow again; it will also bring hair upon the eye-lids, being rubbed thereupon.

The gall of an Hyaena being mingled with Hony, and anointed upon the eyes; doth sharpen and clear the eye-fight, and expel and drive away all blemishes and small skins which cover the sight of the eyes; as also the pain in the eyes called the Pin and the Web. But Apollonia Pitonace doth say, that the gall of a Dog being used in the aforesaid manner, is better to cure the sight of the eyes than the gall of an Hyaena. But Pliny whom I think beft to follow, and worthyeft to be believed, doth (ay) it is of this substance but the gall of an Hyaena is the best for the purpose; and also for the expelling of certain white spots in the eye, which do hinder the sight thereof.

The gall of a Bear and of a Hyaena, being dried and beaten to powder, and so mixed with the best Hony which is possible to be had, and then stirred up and down a long time together, doth help them unto their eye-fight which are stark blinde, if that it be daily anointed and spread upon the eyes for a reasonable space together: The gall of a Hyaena being baked in a cruet of Athei- nian Hony, and mingled with the crooked herb Crescis, and so anointed upon the brows or fore-head of them which are purblind, doth speedily help them; it doth also ease them which are troubled with the water or rheume which falleth in the eyes. Democritus doth affirme, that if the brow of either man or woman be anointed with the gall of an Hyaena only, it will drive away all darknings, and blemishes in the eyes, and expel the water or rheume thereof, and also affwag the pain or grief which may come or happen in them whatsoever it be.

The marrow which proceedeth from the chine-bone of an Hyaena, being mixed with his own gall, and with old Oyl, and then baked or boiled in a cruet until it come into a temperate and mollifying medicine, and then being laid or anointed upon the fines or nerves, who is in those parts troubl'd, will throughly heal and cure any default or pain which may happen therto. The gall of a male Hyaena being pounded or beaten, and bound about the left thigh of any woman that is barren, doth help for conception. The gall of the same Beel being drunk in Wine, to the value of a dram, with the decoction or liquor which cometh from Spike-lavender, called Oyl of Spike, is a very good remedy and help against the Typhany or house-pest of the belly. The gall also being beaten and mixed with the flower called Est-flees, is very good and profitable for them which are troubled with the Govt. The milt of an Hyaena is very effectual to cure and heal any pain or grief in the mil of either man or woman. The lungs being dried and beaten to powder, and mingled with oyl, and anointed upon the loins of any one who is grieved or troubled in those places, will speedily cure the aches or griefs thereof.

The bladder of an Hyaena being drunk in Wine, is a very good and effectual remedy against the incontinency of man or womans urine, or the running of the reins. But if there be any urine in the bladder of the Hyaena found when he is taken, let it be poured forth into some clean vesse, and mixed with
with Oyl which proceedeth from the pulpe or corn of India, and so drunk up, and it will much ease and help them who are troubled in minde, and are full of care and grief. The secreet parts of a female Hyaza beaten and mixed with the rinde or skin of a Pomegrante, and taken in drinke, is very profitable to cure the inconveniences or pain of a woman's secreet parts.

The genital of a male Hyaza dryed and beaten to powder, being mingled with a certain perfume, both cure and help those which are troubled with the Cramp, and Convulsion of the fineurs. The feet of an Hyaza being taken, both heal and cure those which are sand-blinde, and such as have botches and ulcers breaking through the skin and flesh; and also such as are troubled with inflammations or breedings of wind in their bodies, only by touching and rubbing them over.

The durt or dung which is found in the interior parts of an Hyaza, being burned, and dryed into powder, and so taken in drink, is very medicinable and turuable, for those which are grievd with painful excoriations and wringings of the belly, and also for those which are troubled with the Bluody-flux. And the same being mingled with Goose-grease, and anointed over all the body of either man or woman, will ease them of any pain or grief which they have upon their body whatever. The dung or filth of an Hyaza also, being mingled with certain other medicines, is very excellent to cure and heal the bites and slincings of Crocodiles, and other venemous Serpents. The dung it self is also very good to purge and heal rotten wounds and fores which are full of matter, and filthy by corruption.

Of the IBEX.

This Beast Deut. the 14, is called Ago, and is there rehearsed among the clean Beasts, which although the Septuagints translate Tragelaphus, yet we have thrwed already in that story, that it cannot stand with the meaning of the holy Ghoft, because that Beas is found now where but near the River Paphis, or in Arabia, (as Fifth and Dioecus write;) and besides the Cheles tranlation hath Jerda; the Persians, Catelan; the Arabians, Obul; all which by Abraham Ezra, and Rabbi Selmon, and many other of the learned Jews, are interpreted to be the Beas, which of the German is called Steinbock, and the female of the Hyl firearm is called Thoythen, and Thiegefs; which words seemeth to be derived from the Latin word ibex, and the Cyfaphine French, which speak Italian, dwelling about Mililain, retain the German word for the male, but the female by a proper word they call Vejina, and so also do the Hyl firearm. The Tranfaphine French, Bouc efante; the Illyrians, Kozaraziec, and some Latin Authors call him Capricornut, The Graciant, Illalut, and Aggerors: Although I have never read Capricornus to signifie a Beas, but only a flar, excepting some Poetical Grammarians, who affirm this Beas to be a monfter of the Sea; and that Pan when he fled out of Egypt, with other Gods from Tyburn the Giant, their great Enemy, call himfelf into the water, and was transformed into this Beas. But Jupiter admiring his wit, placed him among the Stars near to Leo, according to this verse:

Humidas Aggerors, nec plus Leo tollitur urna.

Although there be some that affirm, this Capricorn to be placed among the Stars by Jupiter, because he was nursed with him. And that Pan hath his hinder parts like a fishe, and his foore-parts like a Goat, according to thefe verses:

Tun gelidum valida de pellio frigis anchelant,
Corpora semiferae, magna capricornus in orb.

Wherefore by the signes Cancer and Capricornus, the Ancients were wone to understand the defending and ascenting of the foul: that is to say, by the Cancer or Crab which goeth backward, the soules descant, by Capricornus, (because the Goat clibmeth) the soules ascet: and therefore they place it in the Zoodiac, where the Sun after the short days begins to acent, for no other caufe then for that which I have rehearsed. The Epithets that are given unto this Capricorn, do also belong unto the Ibees, such as are thefe, moift, cold, swift, horn-bearing, watery, snowye, of this Beast. wool-beaster, rough, brittle, cared, horrible, fierce, tropick, frrowing, flowing, threatenning, black, and such like.

To return therefore unto the Ibees, although I do not dislike the opinion of them, which take it to be a wilde Goate, yet I have reserved it into this place, because of many eminent differences, as may appear by the flory. Firft there are bred in the Alpes, and are of an admirable celerity, although their heads be loaded with fuch horns, as no other Beasts of their nature beare. For I do read in Ephasis, that their horns are fitten palms long, or five fpees and one palm, and sometimes feaven fpees, and with the horn confecrated at Delb, being two cubits and a fpan long, and fix and twentie pounds in weight. This Beas (faith Poblius) in his neck and haires is like a Buck, bearing a foare under his chin of a fpan long, as thick as a Colets tail, and in other parts of his body resembeth a Harp.

It feemeth that his Hebrew name Paal, is derived of climbing, and Sidus faith that Ibees are the places of most Aves, that is like Birds, because like Fowles of the air, they inhabit the tops of cliffs, Rocks, and

and
and Mountains, far from the view and sight of men. Their horns reach to their buttocks or hips, so that if at any time hedoth chance to fall, he cowseth his whole body betwixt his horns, to break the strong force and violence of his own weight, and also he is able to receive upon his horns the strokes of great stones which are shot or cast at him; they are knotty and sharp, and as they encrease in age, so do their horns in strength and other qualities, until they be twenty years old.

Thefe Beasts inhabit and keep their abode in the tops of those Mountains, where the ice never thaweth or dissolveth; for it loveth cold by nature, otherwife it would be blinde; for cold is agreeable to the eye sight and beauty. It is a noble Beaff, and very fat. In the small head, and lean legs, it refembleth a Hart; the eyes are very fair and bright; the colour yellowish; his hoof cloven and sharp like wilde Goats. It far excelleth a wilde Goat in leaping; for no man will believe how far off, or what long space it will leap, except he saw it. For there is no place fo steep or cragged, that if it afford him but fo much space as his foot may hand on, but he will pafs over it with a very few jumps or leaps. The Hunters drive them to the smooth and high Rocks, and there they by enclo- sing them, take them in ropes or toils, if they cannot come near them with shot or swords. When the Beaff seeeth his hunter which defendeth to him by some Rock, he observeth very diligently, and watcheth if he can fee any distance or space betwixt him and the Rock; yea, but so much as his eye- sight can pierce through: and if he can, then he leapeth up and getseth betwixt the Hunter and the Rock, and so casteth him down head-long; and if he can escape no distance at all, then doth he keep his standing until he be killed in that place.

The hunting of this Beaff were very peflant, but that it is encumbered with much labour and many perils, and therefore in these days they kill them with guns. The Inhabitants of Valon (near the River Sidamo) take them in their infancy when they are young and tame them, and until they be old, they are contented to go and come with the tame Goats to pulture, but in their older and riper age they return to their former wilde nature.

a triflote affirmeth, that they couple or engender together (not by leaping up each other) but standing upright, upon their hinder legs: whereunto I cannot content, becaufe the joynts and nerves...
erves of their hinder-legs will not be stretched to such a copulation; and it may be that he or his
relator had seen them playing together as Goats do, flanding upright, and so took that gesture
in their palate for carnal copulation. The female hath left horns then the male, but a greater body;
and her horns are very like to a wide Goats.

When this Beast feeleth insensible tokens of her death, and perceiveth that her end by some wound
or course of nature approaceth, and is at hand; it is reported by the Hunters, that the attendent
the top of some Mountain or high Rock, and there fathem one of her horns in the same deep
place, going round continually and never flanding still, until the have worn that horn asunder,
whereby he layeth her fell, and so at length at the infiant or point of death, breaking her horn,
falleth down and periseth. And because they die among the Rocks, it falleth out feldom that their
bodies are found, but times when the Snow falleth from the Mountains in great and huge ma-
fi even with a living Ibex, and other wide Beasts, and so oppreaffing them driveth them down
to the foot of the Hills or Mountains, as it doth trees and small houfes, which are built upon the fides
of them.

In Greece they make bows of the horns of these Beasts. And concerning their taking it is not to
be forgotten how the Hunter which periceth her from one rock to another, is forced many times for
the fagard of his own life, to forfake his flanding, and to obferve the Beaff when it maketh force
at him, and to rid himfelf from danger of death by leaping upon his back, and taking falt hold on his
horns, whereby he efcapeth. In the house of Pompey, where the memorable Forrest of Cordibus
was painted, there were among other Beafes two hundred Ibexes, which Pompey gave unto the people at
the day of his triumph, for to make ipoil thereof at their own pleafure.

The Medicines of the Ibex.

Some do commend the blood of the Ibex to be a very good remedy against the fume of the blad-
der, being used in this manner: Firft, they divide it in parts, and put one part of the blood, and
about fome fix parts of Wine Apis, and Hony mixed together, and do boil them both together
lufe-warm, and afterwards they referveth in a clean veffel, and the third day in the morning they
give it unto the party to drink who is grieved, and then they put them into a Bath about noon time,
and in the evening, and this order is to be observed for three days together, for it come to pafs,
that in that space the Stone will be dilolved and turned into fand or gravel, and fo by that means
will have vent together with the urine.

There is also by the dung of the aforefaid Beaff, an excellent remedy againft the Sciatica or Hip-
gout, by which that moft excellent Phyffitian Avfionius himfelf was healed, and many other lying de-
perate of remedy, which is this; to gather the dung of this Beaff in the feventeenth day of the
Moon, neither is it any grea matter whether you gather it in some part of the old Moon, for it will
have the fame operation: you fhall therefore take as much of this dung as you can hold in your
hand or fift at one time: fo that the quantity of the dung be unlike, and you fhall put it in a morter
and beat it to powder, and caft twenty grains of Pepper into the fame time, being very diligently
pounded or bruifed, and then you fhall add e nine ounces of the beft Hony unto the aforefaid mixture,
and four pounds of the beft Wine, and mix the potion in the manner of a compound Wine, and the
dung or dirt being dried and beaten fift; you fhall mingle all the reft, and put them together in a
vesel made of glafs, that when you have any need, you may have the medicine ready prepared, to
comfort him or her which is fo afflicted.

Of the ICHNEUMON.

Marcellus and Sallust, do make queftion of this Beaff (Icneumon) to be a kinde of Otter, or
the Otter a kinde of this Icneumon, which I find to be otherwife called Enydrus or Emydrus,
because it liveth in water; and the reafon of this name I take to be fetched ab injugifienta, because
like a Dog or hunting Hound, it diligently fearcheth out the feats of wide Beafes, especially the
Crocodile and the Afp, whose Egg is deftroyeth. And for the eminency unto Serpents, it is called
Oplio-
mousus. Icndrus is of opinion, that the name of this Beaff in the Greek is given unto it, because by the
favour thereof, the venom and wholefomes of meates is defcribed, Whereof Dracontius writeth in
this manner:

Predict Sallius vnumiufcung us: vmen t.

The Icneumon forretheth the power, and presence of all po{on. And it is called Sallius in Latine, be-
cause like a Hog, it hath briffles in head of hair: Albertus alfo doth call it Neonum, miftaking it
for Icneumon.

There be fome that call it an India Mouse, because there is some proportion or fimilitude in the
outward form between this Beaff and a Mouse. But it is certain, that it is bred in no other Nation
but only in Egypt, about the River Nilus; and of fome it is called Mur Piuans, Pharaonth Moule. For
I berod was a common name to all the Egyptian Kings.

H h

Hermolani, Gilius.
There be some that call it Thyamon, and Anfibycamon, and also Damula, mistaking it for that Weasel which is an enemy to Serpents, called by the Italians, Donula: yet I know no learned man but taketh these two names, to signify two different Beasts. The quantity of it or stature is sometimes as great as a small Cat or Ferret, and the hairs of it like the hairs of a Hog; the eyes small and narrow, which signify a malignant and crafty disposition; the tail of it very long like a Serpents, the end turning up a little, having no hairs but scales, not much unlike the tail of a Moule. Eledanus affirmeth, that both sexes bear young, having seed in themselves, whereby they conceive. For those that are overcome in combates one with another, are branded with a warlike mark of Villanage, or subjection to their Conquerours; and on the contrary side they which are conquered and overcome in fight, do not only make vassals of them whom they overcome, but in token thereof for further punishment, fill them with their seed by carnal copulation, so putting off from themselves to them, the colours and torments of bearing young.

This first picture of the Ichneumon was taken by Bellonius except the back be too much elevated.

The second picture taken out of Oppianus Poems, as it was found in an old Manuscript.

When it is angry the hairs stand upright, and appear of a double colour, being white and yellowish by lines or rows in equal distance, entermingleed, and also very hard, and sharp, like the hair of a Wolf, the body is something longer than a Cats, and better set or compacted; the back black, and sharp at the nose like a Ferrets, and without beard; the ears short and round; the legs black, having five claws upon his hinder-feet, whereof the laft or hindmost of the inner side of the foot is very short; his tail thick towards the rump: the tongue, teeth and ftones are like a Cat's, and this it hath peculiar, namely a large passage, compassed about with hair, on the outside of his excrement hole like the genital of a woman, which it never openeth but in extremity of heat; the place of his excrements remaining shut, only being more hollow then at other times. And it may be that the Authors aforesaid, had no other reason to affirm the mutation of feeble or common transmigration of genital power, beside the observation of this natural passage in male, and female. They bring forth as many as Cats and Dogs, and also eat them when they are young; they live both in land and water; and take the benefit of both elements; but especially in the River Nibus, amongst the Reeds, growing on the banks thereof, according to the faying of Nemetian;
Of the Ichneumon.

--- Et placidis Ichneumonis quartae ripis, Inter amandissimae figiers.

For it will dive in the water like an Otter, and seem to be utterly drowned, holding in the breath longer then any other four-footed Beasts, as appeareth by his long keeping under water, and also by living in the belly of the Crocodile, until he deliver forth himself, by eating through his bowels, as shall be thewed afterwards. It is a valiant and imble creature, not fearing a great Dog, but fetteth upon him and biting him mortally, but especially a Cat; for it killeth or strangleth her with three bites of her teeth, and because her bow or snout is very narrow or small, it cannot bite any thing, except it be left then a mafs fift. The proportion of the body is much like a Bidders, and the nose hangeth over the mouth, like as it were always angry; the nature of it, is finding the Crocodile afeep, fuddly to run down into his throat and belly, and there to eat up that meat which the Crocodile hath devoured, and not returning out again the way it went in, doth make a paffeage for it felf through the Beasts belly.

And because it is a great enemy and devourer of Serpents, the common people of that Countrie do tame them, and keep them familiarly in their houses like Cats, for they eat Mice, and likewife be- wray all venemous Beasts: for which caufe as is faid before, they call it Pharaonis Mouse, by way of excellency. At Alexandria, they sell their young ones in the Market, and nourifh them for profit; it is a little Beaf, and marvellously flidious of purity and cleanlines.

Bellonis affirmeth that he faw one of them at Alexandria, amongf the ruins of an old Cafle, which suddenly took a Hen and eat it up, for it lovethe all manner of fowls, especially Hens and Chickens, being very wary and cafty about his prey, oftentimes standing upright upon his hinder-legs, looking about for a fit bottom, and when it eypeth his prey near him, it flieth fo clofe to the ground, as is very admirable, until it be within the reach, and then leapeth upon it with incredible celerity, flying to the throat, and like a Lion killeth all by ftrangling. It eateth diffe-
rently every living thing, as Snails, Lizards, Camelions, all kinds of Serpents, Frogs, Mice, and Afs. For Strato, faith, when he findeth an Afp by the water fide, it catcheth hold on the tail, and doth draweth the Beaf into the water, and receiveth help from the flocks to devour his enemy; and whereas we have faid already, that the Ichneumon entereth into the belly of the Cro-
codile, Ammianus Marcellinus, Strabo, Piny, and Oppianus, maketh thereof this discours following. When the Crocodile hath filled his belly, and over-gluttoned himself with meat, he cometh to the land to fleep.

Now there is in Egypt, a certain Bird called Crocillus, whose natures is to wait upon the Cro-
codile, and with her breath and claws, gently and with a kinde of delight, to pull out the remnants of the meat flicking in the Crocodiles teeth; wherewithal the Crocodile being pleased, openeth her mouth wide, to be thus cleaned by this Bird, and so falling faf afeep gaping, watched all the while by the vigilant eye of the Ichneumon, perceiving him to be deeply plunged in a fefilefs security, goeth prefently and walloweth in land and dirt, and with a fingular confidence entereth into the gate of death, that is, the Crocodiles mouth, and suddenly pierceth like an Arrow through the Monifors wide throat down into his belly.

The Crocodile feeing his unlooked for evil, awaketh out of fleep, and in a rage or madness, void of counfel, runneth to and fro, far and wide, plunging himfelf into the bottom of the river, where finding no cafe, returneth to land again, and there breatheth out his untolerable poyson, beating himself with all his power, striving to be delivered from this unfeizable fuffering. But the Ichneumon careth not for this all, fitting clofe upon the liver of the Crocodile, and feeding full sweetly upon his intrails, until at laft being satisfied, eateth out her owne paffeage through the belly of her hoaf. The felf fame thing is related by Pinfarch: but I wonder for what caufe the Beaf fhould rowl her felf in land and dirt, to enter into the Crocodiles belly; for fright of all, if after her rolling in dirt, the dry her felf in the Sun, yet will not that hard cruf be any fufficient armour of proof to defend her fmall body from the violence of the Crocodiles teeth, and besides, it encreafeth the quantity of her body, making her more unfit to glide down through the Crocodiles narrow throat: and therefore, the Authors cannot be but deceived in afcribing this quality to her, when she is to enter into the Crocodile, but rather I believe, the ufheth this defence againft the Afp, as Artiflate faith, and therefore the Author afcribing her fo covered with mud, might eafily be miftaken in her purpofe. For it is true indeed that when the fheeth the Afp upon the land, the calleth her fellows, who arm themselves as before faid before the combate, by which means they are safely preferved from the bitings of their enemies; or if it be true that they wallow themselves in the mud, they do not dry themselves in the Sun, but while their bodies are moist, glide down more eafily into the Crocodiles belly.

Concerning their fighting with Afs, and the arming of themselves as aforesaid, the Egyptians make this Hieroglyphick of the Ichneumon, to alimine a weak man, that wanteth and cra-

veth help of others; Piny also faith that when the Afp fighteth with this Beaf, the Ichneumon turneth to her, her tail, which the Afp taking for defiance, prefently maketh force at it, whereby the is overtaken and destroyed by the Ichneumon, but in my opinion this combate is better ex-

pressed by Oppianus.

H a 2 For
For faith he, the Ichneumon covereth her body in the sand, as it were in a grave, leaving nothing uncovered but her long Serpentine tail, and her eyes, and so expecteth her enemy. When the Aip eipophy her threatening rage, presently turning about her tail, provoketh the Ichneumon to combat, and with an open mouth and lofty head doth enter the lift, to her own perdurion. For the Ichneumon being nothing afraid of this great bravado, receiveth the encounter, and taking the head of the Aip in his mouth, biteth that off, to prevent the casting out of her poylon: afterwards tearing her whole body in pieces, although gathered together wound in a circle; for the successe of these two combattants, lyeth in the first blow. If the Aip first bite the Ichneumon, then doth her poylon destroy her adversary; and so on the contrary, if the Ichneumon first bite the Aip, then is the Ichneumon conqueror; and for this cause she covereth her body as aforesaid.

Furthermore, this Beast is not only enemy to the Crocodile and Aip, but also to their Egs, which the hunsteth out by the fagacity of her nofe, and doth destroyeth them; yet doth the not eat them: whereby the merciful providence of God doth notably appear, for the safeguarde of mankind, in those Countries where these nostome Beasts are bred, hath provided such an enemy to destroy them, both Egs and Birds, as is friendly and tameable by the hand and wit of man.

For which cause the blinde Pagans, consecrated this Beast to Latona, and Lucina, and the Heraclopiltes did think that they possessed al religion; the Egyptians themselves did worship them, because as their Country is all other plagued with Serpents, so they are much eased by the help of this little Beast. And when they die, they do not only lament them, but also bury them religiously. And thus much for the description of the Ichneumon. Now followeth their medicinal vertues.

The Medicines of the Ichneumon.

The skin of the Ichneumon, being dried and beaten into small powder, afterwards mingled with Wine Vinegar, and anointed upon those which are grieved with the venemous or poisonous bites of the same Beast; doth very effectually and speedily cure them of the same. The precious stone called by the name of Eis, which is very hard, as Herus faith, being burned, and afterward beaten or pounded into powder, is an excellent remedy against the venemous biting of the Ichneumon. It is also said, that all Beasts (but especially the Crocodile) do for the most part hate and detest the society of this Beast. There is moreover a very rank and venemous poylon, which proceedeth from the genital or groin of this Beast.

The hairs of the Ichneumon being taken in a certain perfume, doe very much help and cure those which are troubled or grieved with the Maw-worms. The dung of a Cat, or the dung of this Beast, is very medicinable to be put in any salve, or potion, for the strengthening and confirming of the body. The urine or tallow of an Ichneumon, being mixed with the milk of a black Cow, and given unto those which are troubled with that grievous disease, called the Colick and Stone, for the space of three days together in any kinde of drink, will easily and speedily cure them of their pain. The fones of an Ichneumon, being either beaten in powder, or taken raw, either in Wine or any other drink, is very medicinable, and curable for the ealing of all such as are troubled or grieved with any acht, pain, or disease in their belly: And thus much shall suffice concerning the cures, and medicines of the Ichneumon.

Of the LA MIA.

The signification of the word La mia, hath many significations, being taken sometime for a Beast of Lyibia, sometymes for a fish, and sometymes for a Spectre or apparition of women called Phairies. And from hence some have ignorantly affirmed, that either there were no such Beasts at all, or else that it was a compounded monster of a Beast and a Fish, whose opinions I will briefly set down. Aristophanes affirmeth, that he heard one say, that he saw a great wide Beast having several parts resembling outwardly an Ox, and inwardly a Mule, and a beautiful Woman, which he called afterwards Empusa. When Apollonius and his companions travelled in a bright Moon-shine-night, they saw a certain apparition of Phairies, in Latine called Lamia, and in Greek, Emusa, changing themselves from one shape into another, being also sometimes visible, and presently vanishing out of sight again: as soon as he perceived it, he knew what it was, and did rate it with very contumelious and despifeful words, exhorting his fellows to do the like, for that is the best remedie against the invasion of Phairies. And when his companions did likewise ratt at them, presently the vision departed away.

The Poetical Lamia.

The poets say, that Lamia was a beautiful woman, the daughter of Beulai and Lyibia, which Jupiter loved, bringing out of Lyibia into Italy, where he begot upon her many sons, but Juno jealous of her husband, took them as soon as they were born, punishing Lamia also with a reftlesse estate, that she should never be able to sleep, but live night and day in continual mourning, for which occasion she also stealth away and killeth the children of others, whereupon came the fable of changing of children: Jupiter having pity upon her, gave her exemptile eyes that might be taken in and out at her own pleafure, and Likewise power to be transformed into what shape she would; And from hence also came the faigned name of Acho, and Alpho, where-
Of the Lamia.

Tertullianus, Ec. i. quas Pampithiis
Institutio. Num. 1, 2, 3, &c.

Of these Angelus Politianus relateth this old wives story; in his preface upon Aristides first book of
Analytica, that his Grand-mother told him when he was a child, there were certain Lamiae in the
Wildernefs, which like Bug-bears would eat up crying boys, and that there was a little Well near to
Fesulanum, being very bright, yet in continual shade, never seeing Sun, where these Phairy women
have their habitation, which are to be seen of them which come thither for water.

Plutarch also affirmeth, that they have exemptile eyes as aforesaid, and that as often as they go
from home, they put in their eyes, wandring abroad by habitations, streets, and crofs ways, entering
into the assemblies of men, and prying so perfectly into every thing, that nothing can escape them,
be it never so well covered: you will think (faith he) that they have the eyes of Kites, for there is no
small mote but they espy it, nor any hole so secret but they finde it out, and when they come home
again, at the very entrance of their house they pull out their eyes, and cast them aside, so being
blinde at home, but seeing abroad. If you ask me (faith he) what they do at home, they sitting
and making of wool, and then turning his speech to the Florentines, speaketh in this manner: Vidi-
fiusque oitro Lamiis ibat, lei Fùrentinis, quas se & suis neciunt, alios & aliena specerunt. Negati? atqui tamen
sunt in ubiquum frequenter: verum perscrutata incendunt, homines credunt. Lamia sunt: that is to say, O ye Flo-
rentines, did you ever see such Phairies, which were bufe in prying into the affairs of other men, but
yet ignorant of their own? Do you deny it? yet do there commonly walk up and down the City,
Phairies in the shapes of men.

There were two women called Macha, and Lami, which were both foolish and mad, and from the
strange behaviours of them, came the first opinion of the Phairies: there was also an ancient Lybian
woman called Lamia, and the opinion was, that if these Phairies had not whatsoever they demanded,
prefently they would take away live children, according to these verses of Horace.

\[ \text{Vidi siueque oitro Lamiis ibat, \text{Florentinis, quas se \& suis neciunt, alios \& aliena specerunt.} } \]
\[ \text{Negati? atqui tamen sunt in ubiquum frequenter: verum perscrutata incendunt, homines credunt. Lamia sunt: that is to say, O ye Florentines, did you ever see such Phairies, which were bufe in prying into the affairs of other men, but yet ignorant of their own? Do you deny it? yet do there commonly walk up and down the City, Phairies in the shapes of men.} \]
\[ \text{There were two women called Macha, and Lami, which were both foolish and mad, and from the strange behaviours of them, came the first opinion of the Phairies: there was also an ancient Lybian woman called Lamia, and the opinion was, that if these Phairies had not whatsoever they demanded, prefently they would take away live children, according to these verses of Horace.} \]
It is reported of Memphis the Lycean, that he fell in love with a strange woman, who at that time seemed both beautiful, tender, and rich, but in truth there was no such thing, and all was but a fantastical illusion; she was fized to incant herself into his familiarity, after this manner: as he went upon a day a lone from Corinth to Cenchrea, he met with a certain phantasm or spirit like a beautiful woman, who took him by the hand, and told him that she was a Phoenician woman, and of long time had loved him dearly, having fought many occasions to manifest the same, but could never find opportunity until that day, wherefore she entreated him to take knowledge of her house, which was in the Suburbs of Corinth, therewithal pointing unto it with her finger, and so desired his presence: The young man seeing himself thus woosed by a beautiful woman, was easily overcome by her allurements, and did oftentimes frequent her company.

There was a certain wife man, and a Philosopher, who espied the same, and spake unto Memphis in this manner: O Zorba, or a Zorba, expirte multihibus, opin thalpetis, eti so opo? that is to say, O fair Memphis, beloved of beautiful women, art thou a Serpent and doth nourish a Serpent? by which words he gave them his first admonition, or inking of a mischief; but not prevailing, Memphis purposed to marry with this Sperit, her house to the outward seem being richly furnished with all manner of household goods; then said the wife man again unto Memphis, this gold, silver, and ornaments of house, are like to Tantalus Apples, who are said by Homer to make a fair show, but to contain in them no substance at all: even so whatsoever you conceive of this riches, there is no matter or substance in the things which you see, for they are only inchant images and shadows, which that you may believe, this your next Bride is one of the Empusa called Lamia or Moromete, wonderful defirous of copulation with men, and loving their flesh above measure, but those whom they do entice, with their venereal arts, afterward they devour without love or pity, feeding upon their flesh: at which words, the wife man caused the gold and silver plate and houhold luffle, Cooks and Servants, to vanish all away; Then did the Spirit like unto one that wept, entreat the wife man that he would not torment her, nor yet cause her to confels what manner of person she was; but he on the other side being inexorable, compelled her to declare the whole truth, which was, that she was a Phairy, and that she purposed to use the company of Memphis, and feed him fat with all manner of pleasures, to the intent that afterward she might eat up and devour his body; for all their kind love was but only to feed upon beautiful young men.

These and such like stories and opinions there are of Phairies, which in my judgement arise from the prestigious apparitions of Devils, whose delight is to deceive and beguile the minds of men with error, contrary to the truth of holy Scripture, which doth no where make mention of such incanting creatures; and therefore if any such be, we will hold them the works of the Devil, and not of God, or rather I believe, that as Poets call Harlots by the name of Chrypsides, which devoureth and swalloweth whole Ships and Navies, alluding to the infaubtable gulph of the Sea, so the Lamia are but Poetical allegories of beautiful Harlots, who after they have had their lust by men, do many times devour and make them away, as we read of Domedis daughters; and for this cause also Harlots are called Lepes, She-wolves, and Lepores, Hares.

To leave therefore these fables, and come to the true description of the Lamia, we have in hand, In the fourth and thirty chapter of Echo, we do finde this heath called Lilibb in the Hebrew, and translated by the Ancients Lamias; which is there threatened to possess Babylon. Likewise in the fourth chapter of the Lamentations, there it is said in our English translation, that the Dragons lay forth their breasts, in Hebrew they are called Sasmim, which by the confession of the belt Interpreters, cannot signify Dragons, but rather Sea-calves, being a general word for strange wild Beasts. Howbeit the matter being well examined, it shall appear that it must needs be this Lamia, because of her great breasts, which are not ccbestible, either to the Dragon or Sea-calves; so then we will take it for granted, by the testimony of holy Scripture, that there is such a Beast as this. Chryphiasmus Dian also writeth that there are such Beasts in some part of Asia, having a womans face, and very beautifull, also very large and comely shapes on their breasts, such as cannot be counterfeited by the art of any Painter, having a very excellent colour in their fore-parts without wings, and no other voice but hissing like Dragons: they are the swiftest of foot of all earthly Beasts, so as none can escape them by running; for by their celerity they compass their prey of Beasts, and by their fraud they overthrow men. For when as they see a man, they lay open their breasts, and by the beauty thereof, entice them to come near to conference, and so having them within their compasses, they devour and kill them unto the same things subscribe Caucus and Circeuus; adding also, that there is a certain crooked place in Libya, near the Sea-shore, full of sand like to a sandy Sea, and all the neighbour places thertounto are Deserts.

If it fortune at any time, that through shipwreck men come there on fire, these Beasts watch upon them, devouing them all, which either endeavour to travel on the Land, or else to return back again to Sea, adding also that when they see a man they stand by one, and firt not till he come unto them, looking down upon their breasts, or to the ground; whereupon some have thought, they seeing them at the firft sight, have such a desire to come near them, that they are drawn into their compass, by a certain natural Magiical Witch-craft: but I cannot approve their opinions, either in this or in that, wherein they describe him with Horses feet, and hinder-parts of a Serpent; but yet I grant that he doth not only kill by biting; but also by poysoning, feeding upon
Of the Lion.

B eing now come to the discourse of the Lion (justly styled by all writers the King of Beasts) I cannot chuse but remember that pretty fable of Esfe, concerning the society and honour due unto this beast: For (faith he) the Lyon, Affe, and the Fox entered league and friendship together, and foraged abroad to seek convenient booties, at last having found one and taken the same, the Lion commanded the Affe to make division thereof, the filly Affe regarding nothing but society and friendship, and not honor and dignity, parted the same into three equal shares; one for the Lion, an other for the Fox, and the third for himself: Whereat the Lion dinding, because he had made him equal unto the residue, preently fell upon him and tore him in pieces; then bidding the Fox to make the division, the crafty Fox divided the prey into two parts, assigning unto the Lion almost the whole booty, and referring to himself a very small portion, which being allowed by the Lion, he asked him, who taught him to make such a partition, Marry (quoth the Fox) the calamity of the Affe, whom you lately tore in pieces.

In like manner, I will be loath to be so simple, in shewing out the discourse of the Lion, as to make it equal with the treatise of the Beasts lately handled, but rather according to the dignity thereof, to exprefle the whole nature, in a large and copious tractate. For such is the rage of illiterate or elie envious men, that they would cenfure me with as great severity, if I should here-in, like an Affe, forget my self (as I were in their power) as the Lion did his colleague for one foolifh partition.

And therefore as when Lyfemonchus, the son of Agabocler, being ealt by Alexander to a Lyon to be destroyed, because he had given poison to Callisthenes the Philosopher, that was for the ending of his misery, who was included by the said Alexander in a cave to be famished to death; upon some fitie displeasure the said Lyfemonchus, being fo cast unto the Lyon, did not like a cowardly perfon offer himself to his teeth, but when the Lyon came gaping to him to devour him, having wrapped his arm about his liken garment, held him faft by the tongue, until he flopped his breath, and flew him; for which caufe, he was ever afterwards the more loved and honored of Alexander, having at the time of his death, the command of all his treasure.

In like fort, I will not be afraid to handle this Lyon, and to look into him both dead and alive, for the expressing of so much of his nature, as I can probably gather out of any good writer.

First of all therefore to begin with his several names, almost all the Nations of Europe do follow the Greeks in the nomination of this Beast, for they call him Lion; the Latins, Le; the Italians, Leone; the French and English, Lion; the Germans and Italians, Lox; the reason of the Greek name Leora, is taken para to leum, from the excellence of his sight; or from Lao signifying to see, and Athis significeth blinde; for indeed there is no creature of the quantity of a Lion, that hath such an admirable eye-light. The Lionelle, called in Greek, Leona, which word the Latins follow, from whence also they derive Lea for a Lionelle, according to this Verse of Lucretius:

Irrita Lea jaciebat corpora fallari.

The Hebreus have for this Beast male and female, and their young ones, divers names: and first of all for the male Lyon, in Deut. 33, they have Aria, and Ari, where the Chaldees tranflate it Arumon, the Arabians, Aqad; the Persians, Gerad; and plurally in Hebrew, Assur, Arain, Arua, as in the ftire of Zeph. Aratba, Sefhann, roaring Lions; and from hence comes Aria, signifying valiant and strong, to be the name of a Prince; and I.fai. 59. Ezek. 43. it is taken for the Altar of Burnt-offerings, because the fire that came down from heaven, did continually lie upon that Altar, as a Lion in his den; or else because the fashion of the temple was like the proportion of the Lion; the Assyrians call a Lionelle, Aria, the Hebreus also call the male Lyon, Labi, and the female Leah, and they disfiguing Ari, and Labi, making Ari to signify a little Lion, and Labi a great one; and in Num. 23. in this verse, containing one of Gods promises to the people of Israel for victory against their enemies; Behold my people shall arise like Labi, and be lifted up the Aria: there the Chaldeen tranlation rendeth Labi, letto, the Arabians, Jebu, the Persians, Siler; and Mossefs faith that Labi is an old Lyon. In Job 38. Lebaim signifies Lion, and in Psal. 57. Labe signifies Lionelles. In the Prophet Nahum the 2. Lea is by the Hebreus translated a Lion, and the same word Lea, the 30. is by the Chaldees translated a Lions whelp: and in the forefaid place of the
The several kinds of Lions, born in different countries, are described as follows:

1. The Lion of Persia, or the Persian Lion, because it is the most feared and is considered the king of beasts. It is described as having a long, thick mane and a powerful, menacing appearance.
2. The African Lion, or the Lion of Africa, is known for its strength and ferocity. It is described as having a powerful build and a fearsome appearance.
3. The Lion of Europe, or the European Lion, is considered the most aggressive and is known for its ferocity. It is described as having a powerful build and a fearsome appearance.
4. The Lion of Asia, or the Asian Lion, is known for its size and strength. It is described as having a powerful build and a fearsome appearance.

These lions are known for their strength, ferocity, and fearlessness, and are considered the kings of the beasts.

The History of Four-footed Beasts.

Prima Leo, psferena Draco, media ipfa Chimera.

There be also many Fishes in the great Sea, about the Ille Tarpona, having the heads of Lions, Panthers, Rams, and other Beasts. The Tygers of Praia are also engendered of Lions, and are twice so big as they. There are also Lions in India, (called Forence) about the bigness of Egyptian Wolves. Carnaophorales have their binder parts like Lions. The Monekbraa hath the body of a Lion, the Lyon crocata the neck, tail, and beast like a Lion, and there is an allogorical thing called Demoonium Leximun, a Lion Devil, which by Bellamensis, is interpreted to be an allegory, signifying the mingling together reasonable understanding with malicious hurtful actions.

It is reported also by Eelianus, that in the Island of Chnos, a Sheep of the flock of Nicippus, contrary to the nature of those beasts, in stead of a Lamb, brought forth a Lion, which monstrous prodigy was seen and considered of many; whereof divers gave their opinions what it did portend, namely, that Nicippus of a private man should effect superiority and become a Tyrant: which shortly after came to passe, for he ruled all by force and violence, not with fraud or mercy: for Frauf (faith Cicer) quasi Vulpecule, in Leoania esse videtur; that is, Fraud is the property of a Fox, and violence of a Lion.

It is reported that Meles the first King of Sardis, did beget of his Concubine a Lion, and the Soothsayers told him that on what side ever of the City he should lead that Lion, it should remain impregnable, and never be taken by any man; whereupon Meles led him about every tower and rampier of the City, which he thought was weakest, except only one tower, flanding towards the River Tmolus, because he thought that fide was invincible, and could never by any force be entr'd, fealed or ruinated. Afterwards in the reign of Grefus, the City was taken in that place by Darius.

There are no Lions bred in Europe, except in part of Thrace, for the Nemean, or Colchian Lion is but a fable; yet in Aristotles time, there were more famous and valiant Lions in that part of Europe, lying betwixt the Rivers Aetenaus and Nesius, then in all Africa and Asia. For when Xerxes led his Army through Ponsia over the River Cydnos, the Lions came and devoured his Camels in the night time: But beyond Nesius towards the East, or Adderius towards the West, there was never man saw a Lion in Europe; but in the region betwixt them which was once called the Country of the Aderius, there were such flore, that they wandered into Olympus, Macedonias, and Thessalia; but yet of purpose Princes in Castles and Towers for their pleasures fake, do nourish and keep Lions in Europe, where sometimes also they breed, as hath been seen both in England and Florence. Telephomeus also hath no Lions, and therefore when Homer make mention of Diason hunting in the mountains of Ermenos and Teygern, he speaketh not of Lions, but of Harts and Bears.

All the Countries in the East and South, lying under the heat of the Sun, do plentifully breed Lyons, and except in hot Countries they breed feldom, and therefore the Lions of Elys, Tenebra, Angal, Hippo, and Tintus, are accounted the most noble and audacious Lions of Africa, because they are hot Countries. But the Lions of colder Countries have not half so much strength, stomach,
The History of Four-footed Beasts.

The colour of Lions.

Vartomannus.

The colour of Stars.

Carduanus.

The several parts.

Plutarch.

A Lion hath a most valiant and strong head, and for this occasion, when the Nymphes were terrified by the Lions and fled into Curysyn, the Promontory wherein they dwelt was called Co-leon, that is, the Lions-head, where afterwards was built a goodly City. It fortunated as Themisfoles went thither to manage the affairs of the Gracies, Epitrites the Perisys, preident of Phrygia, intended his destruction, and therefore committed the business unto one Ifi, with charge that he should behead Themisfoles, who came thither to execute that murder; but it happened as Themisfoles slept at the noon day, he heard a voice crying out unto him, O Themisfoles effige leonum cepit se in leonem incursus; that is to say, O Themisfoles get thee out of the Lions head, lest thou fall into the Lions teeth: whereupon he arose and saved his life.

The face of a Lion is not round as some have imagined, and therefore compared it unto the Sun, because in the compass thereof, the hairs stand out eminent like Sunbeams, but rather it is square figured like as his forehead, which Aristates faith, you may chuse whether you will call it a forehead, or Epipodium frontis, that is, the superficies of a forehead; for like a cloud it seemeth to hang over his eyes and nose, and therefore the Germans call a man that looketh with such a countenance, Niben of Nabilar, to be cloudy, and it betokeneth either anger or sorrow; also it is called Septimus affellum, because the Septimans were always wont to look as though they were ready to fight.

The eyes of a Lion are red, fiery, and hollow, not very round nor long, looking for the most part awry; whereof the Poets style the Liones Tauris locans. The pupils or apples of the eye shine exceedingly, insomuch as beholding of them, a man would think he looked upon fire.

His upper eye-lid is exceeding great, his Nose thick, and his upper chap doth not hang over the neck, but meet it just: his mouth very great, gaping wide, his lips thin, so that the upper parts fall in the neck, which is a token of his fortitude: his teeth like a Wolves and a Dogs, like faws, lofing or changing only his canine teeth, the tongue like a Cat or Leopards, as sharp as a file, wearing through
through the skin of a man by licking; his neck very flexible, because it is conformed but of one bone without joints, like as in a Wolfe and an Hyæna; the flesh is so hard as if it were all a sinew: There are no knuckles or turning joints in it called Spondylis, and therefore he cannot look backward.

The greatness and roughness of his Neck, betokeneth a magnificent and liberal minde; Nature hath given a short Neck unto the Lion, as unto Bears and Tygers, because they have no need to put it down to the earth to feed like an Ox, but to lift it up to catch their prey. His shoulders and breasts are very strong, as also the forepart of his body, but the members of the hinder part do degenerate. For as Pliny faith, Leones via jumma in pectore, the chiefest force of a Lion is in his breast.

The part above his throat-hole is loose and soft, and his Metaphrenon or part of his back against his heart (so called) between his shoulder-blades, is very broad. The back bone and ribs are very strong, his ventricle narrow, and not much larger than his maw. He is most subject to wounds in his flank, because that part is weakest, in all other parts of his body he can endure many blows.

About his loynes and hip-bone he hath but little flesh. The lionesse hath two udders in the midst of her belly, not because the bringeth forth but two at a time, for sometimes the bringeth more, but because she aboundeth in milk, and her meat (which the getteh feldom) and is for the more part flesh, turneth all into milk. The tail of a Lion is very long, which they shake oftentimes, and by beating their sides therewith, they provoke themselves to fight. The Greeens call it Aceris: and Aceratn maketh this excellent emblem thereof upon wrath.

Alcaeus veteres caudam discre Leonis,
Qua simulacra iras concitat ile graver.
Luna quam fortis bilu crudaedit, & abro
Felle dolor, furiae excitat indomitas.

The neither part of his tail is full of hairs and gristles; and some are of opinion, that there is therein a little sting wherewithal the Lion pricketh it self, but of this more afterwards.

The bones of Lions have no narrow in them, or else it is so small that it seemeth nothing: therefore they are more strong, solid, and greater than any other beast of their natur, and the males have ever more harder bones then the female, for by striking them together you may beget fire, as by the percussion of Flints; and the like may be said of other beasts that live upon flesh, yet are some of the bones hollow. The legs of a Lion are very strong and full of Nerves, and in head of an ankle-bone it hath a crooked thing in his pattern, such as children use to make for sport, and so also hath the Lynx.

His forefeet have five distinct toes or claws on each foot, and the hinder feet but four. Mislaws Plin." are crooked, and exceeding hard, and this seemeth a little miracle in nature, that Leopards, Tygers, Cardani, Panthers, and Lions do hide their claws within their skin when they go or run, that so they might not be dulled, and never pull them forth except when they are to take or devour their prey: also when they are hunted, with their tails they cover their footstepps with earth, that so they may not be bewrayed.

The Epithets of this beast are many, whereby the authors have expressed their several natures, such are these, the curst kind of Lions, full of flomach, tharp, bold, greedy, blunter, froth-enter, Caflian, Cleomen, the Lord and King of the beasts and woods, fierce, wild, furry, yellow, strong, fretting, teeth-grasning, Nemian, thundering, raging, Getulian, rough, lowering, or wry-faced, impa-ient, quick, untamed, free, and mad, according to this saying of the Poet;

Febris Prometheus insini Leonis
Vim flamacho oppugnus nostris.

For as the Eagle is fainfed upon the heart of Prometheus; so also is the Lion the ruler of the heart of man, according to the Aristotelus. And from hence it cometh that a man is failed to bear a stomach when he is angry, and that he should be more subject to anger when he is hungry, then when he is full of meat.

These also are the Epithets of Lions, wrathful, maned, Lybian, deadly, flouth, great, Misstian, Main- tisanian, Farthian, Throgian, Molochean, Carthaginian, preying, ravening, ribbourn, sucking, wrinkle, cruel, bloody, terrible, swelling, vaft, violent, Marmaecian.

The voice of these also are the Epithets of the Lionesses, African, bold, flon-hearted, vengible, caves-lodging, fierce, yellow, Getulian, Hyrcanian, ungentele, Lybian, cruel, frowning, and terrible. By all which the nature of this Beast, and several properties thereof, are comprehendedly expressed in one word.

The voice of the Lion is called Rugitus, that is, roaring, or bellowing; according to this Verse of the Poet;

Tigris indeinque vastus, rugiunt; Leonis.

And
The History of Four-footed Beasts.

And therefore cometh Regium Leo, the roaring of the Lion. It is called also Genitus, and Fennius, as Virgil, Fennit leo es cruento. And again;

Hinc exaudiri gemitus, irae; leonum
Vincla receuantur, et fora jub natæ rudendent.

And when the young Lions have gotten a prey, in token thereof they roar like the bleating of a Calf, thereby calling their elders to participate with them. The places of their abode are in the mountains, according to this saying; Leo ecocumina montium amas.

Their sight and their smelling are most excellent, for they sleep with their eyes open, and because of the brightness of their eyes, they cannot endure the light of fire: for fire and fire cannot agree: also their smelling (for which cause they are called Odoarti) is very eminent, for if the Lionesses have committed adultery with the Leopard, the male discovereth it by the sense of his Nose, and for this cause also they are tamed in Tartaria, and are used for hunting Boars, Bears, Hares, Roe-bucks, wilde Asles, as also for wilde and outlawd Oxen, and they were wont to be carried to hunting, two Lions in a Cart together, and either of them had a little Dog following them.

There is no beast more vehement then a fhe or female Lion, for which cause Semiramis the Babylonian tyrannies, elecemed not the slaughter of a male Lion or a Libbard; but having gotten a Lionelle, above all other she rejoyned therein. A Lion when he eateth is most fierce, and also when he is hungry, but when he is satisfied and filled he layeth aside that savage quality, and theweth himself of a more meek and gentle nature, so that it is leffe danger to meet with him filled then hungry, for he never devoureth any till famine constraineth him.

I have heard a story of an Englishman in Barbary which turned Moor, and lived in the Kings Court, in a day it was said in his presence that there was a Lion within a little space of the Court, and the place was named where it lodged. The Englishman being more then half drunk, offered to go and kill the Lion hand to hand, and therewithal armed himself with a Musket, Sword and Dagger, and other complements, and he had also about him a long Knife; so forth went this regenerate English Moor, more like a mad man then an advised Champion to kill this Lion, and when he came to it, he found it a sleep, so that with no peril he might have killed her with his Musket before the saw him: but he like a fool-hardy fellow, thought it as little honour to kill a Lion sleeping, as a flout Champion doth to strike his enemy behind the back. Therefore with his Musket top he fomite the Lion to awake it, whereat the beast suddenly mounted up, and without any thankes or warning, he struck his forefeet on this Squires brest, and with the force of her body overthrow the Champion, and so flod upon him, keeping him down, holding her grim face and bloody teeth over his face and eyes; a sight no doubt that made him with himself a thousand miles from her, because to all likelihood they should be the grinders of his flesh and bones, and his first executioner to send his cursed soul to the Devil for denying Jesus Christ his Saviour. Yet it fell out otherwise, for the Lion having been lately filled with some liberal prey did not presently fall to eat him, but flod upon him for her own safegarde, and meant so to stand till she was an hungry; during which time, the poor wretch had liberty to gather his wits together, and at the last, seeing he could have no benefit by his Musket, Sword, or Dagger, and perceiving nothing before him but unavoidable death, thought for the faving of his credit, that he might not die in foolish infamy, to do some exploit upon the Lion whatsoever did betide him; and thereupon seeing the Lion did betide him, standing over his upper parts, his hands being at some liberty, drew out his long Barbarian knife, and thrust the same twice or thrice into the Lions flank: which the Lion endured, never hurting the man, but supposing the wounds came some other way, and would not forfake her booty to look about for the means whereby she was harmed. At last finding her self sick, her bowels being cut aunder within her (for in all hot bodies wounds work presently) she thedeparted away from the man above some two yards distance, and there lay down and dyed. The wretch being thus delivered from the jaws of death, you must think made no small brags thereof in the Court, notwithstanding, he was more behold to the good nature of the Lion, which doth not kill to eat except he be hungry, then to his own wit, strength, or valour.

The Male Lion doth not feed with the female, but either of them apart by themselves. They eat raw flesh, for which cause the Grecians call them Omphister, Omobrosi, and Omophagi: the young ones themselves cannot long be fed with milke, because they are hot and dry; being at liberty they never want meat, and yet they eat nothing but that which they take in hunting, and they hunt not but once a day at the morn, and eat every second day: whatsoever they leave of their meat, they return not to it again to eat it afterwards, wherefore some affigned the cause to be in the meat, because they can endure nothing which is unwholesome, hot, or flinking; but in my opinion they do it through the pride of their nature, renfeting in all things a Prince-like majesty, and therefore licent to have one dith twice presented to their own table. But tame Lions being constrained through hunger, will eat dead bodies, and also cakes made of meal and honey, as may appear by that tame Lion which came to Afuliaenis, and was fed to have the soul in it of Amosis King of Egypt, which story is related by Philostratus in this manner.

There was (faith he) a certain man which in a land led up and down a tame Lion like a Dog, whithersoever he would, and the Lion was not only gentle to his leader, but to all other persons that
Of the Lion.

That met him; by which means the man got much gains, and therefore visited many Regions and Cities, not sparing to enter into the temples at the time of sacrificing, because he had never shed blood but was clear from slaughter, neither licked up the blood of the Beasts, nor once touched the flesh cut in pieces for the holy Altar, but did eat upon Cakes made with meal and honey; also bread, Gourds, and sod flesh, and now and then at customary times did drink wine. As Apollinus sat in a Temple, he came unto him in more humble manner, laying down at his feet, and looking up into his face, then ever he did to any, as if he had some special supplication unto him, and the people thought he did it for hope of some reward, at the command and for the gain of his Master: At last Apollinus looked upon the Lion, and told the people that the Lion did entreat him to signify unto them what he was, and wheresoever he was pooffeled; namely that he had in him the foul of a man, that is to say, of Amafit King of Egypt, who reigned in the Province of Sai. At which words the Lion sighed deeply, and mourned forth a lamentable roaring,Graphing his teeth together, and crying with abundance of tears; whereat Apollinus stroked the Beaf, and made much of him, telling the people that his opinion was, forasmuch as the foul of a King had entered into such a kingy Beaf, he judged it altogether unfit that the Beaf should go about and beg his living, and therefore they should do well to lend him to Leontopolis, there to be nourished in the Temple. The Egyptians agreed thereunto, and made sacrifice to Amafit, adorning the Beaf with Chains, Bracelets, and branches,fo sending him to the inner Egypt, the Priests finging before him all the way, their idolatrous Hymns and Anthems; but of the transfiguration of men into Lions, we shall say more afterward, only this I verfe in this place to shew the food of tame and en-<ref>Elephant</ref> cased Lions.

The substance of such transfigurations, I hold to be either Poetical, or Diabolical. The food therefore of Lions is most commonly of meek and gentle Beasts, for they will not eat Wolves or Bears, or such Beasts as live upon ravening, because they beget in them melancholy: they eat their meat very greedily, and devour many things whole without chewing, but then they eat afterwards two or three days together, never eating until the former be digested; but when they fall, that day they drink, and the next day they eat, for they seldom eat and drink both in one day: and if any fish in his stomach which he cannot digest, because it is overcharged, then doth he thrust down his nails into his throat, and by straining his mouth pulleth it out again; the felie same thing he doth when he is hunted upon a full belly: And also it must not be forgotten that although he come not twice to one carcase, yet having eaten his belly full, at his departure by a wilful breathing upon the residue, he so corrupteth it, that never after any beast will taste thereof: for so great is the poison of his breath, that it putrifeth the flesh, and also in his own body after it is suddenly ripped up, the intrails stink abominably. The reasons whereof I take to be their great voracity which cannot but corrupt in their stomach, and also the seldom emptying of their belly, for they utter their excrements not above once in three days, and then also it is exceeding dry like a Dogs, stinking abominably, and sending forth much winde: and because their urine smelleth strongly, which also they render like a Dog holding up one of their legs: They never make water, but first of all they smell to the tree, I mean the male Lion. They fall upon some creatures for defire of meat, and especially when they are old, and not able to hunt they go to Towns and Villages, to the stables of Oxen, and folds of sheepep, and sometimes to men and devour them, wherefore they never eat herbs but when they are sick.

Polybius affirmeth that he saw them besiege and compass about many Cities of <ref>Africa</ref>, and therefore the people took and hanged them up upon crowses and gallows by the high way to the terror of others. Wherefore as they excel in strength and courage,so also they do in cruelty. The cruelty of devouring both men and beasts, setting up troops of Horfemen, depopulating the Rocks and herds of Lions. Cattel, bringing home alive to their young ones, killing five or six at one time, and whatsoever they lay hold on, they carry it away in their mouth, although it be as big as a Camel; for they love Camels flesh exceedingly.

And therefore the Lions that set upon the Camels of <ref>Xerxes</ref>, neither medled with the Men, Oxen, nor vitals, but only the Camels: so that it seemeth no meat is so acceptable unto them.

They hate above measure the wilde Asse, and hunt and kill them, according to the saying of the Wiseman, <ref>Lion</ref> venatic agent; the wilde Asse is the game of Lions, Ecclus. 13. They also hate the <ref>Dog</ref>, and will not come near their meat, because both of them live upon flesh; of whom <ref>Elephant</ref> writeth;

They eat also Apes, but more for Physick then for nourishment. They set upon Oxen, using their own strength very prudently, for when they come to a stall or herd, they terrifie all, that they may take one. They eat also young Elephants, as we have shewed before in the story of Elephants: and so terrible is the roaring of the Lion, that he terrifieth all other Beasts, but being at his prey, it is said he maketh a circle with his tail, either in the snow, or in the dust, and that all Beasts included within the compass of that circle, when they come into it presently know it, and dare not for their live passe over it (believe this who that lift.)
It is also in, that when the Beasts do hear his voice, all of them do keep their standing and dare not stir a foot; which affertion wanteth not good reason, for by terour and dread they stand amazed. And the writer of the Gloss upon the Prophet Amos, upon these words of the Prophet, *Nonquid rugiæ Leo in salut, nefi baberit prædam?* Will the Lion roar except he have a prey? *Le*, (faith he) *cum famem petitum, svidet prædam dat rugiæ, quæ audio* fire *stant fixo gradu stupenda;* that is to say, the Lion when he is hungry and feeth his prey roareth, and then all the wilde Beasts stand still amazed.

They drink but little, and also seldom, as we have said already, and therefore *Cyrum* praising good Solliers in *Xerophan uelthe* these words, *Vos famem habetis pro essoio, & hydropofan de raon von Leonum fortere;* that is to say, hunger is your shambles, and you are more patient of thirft then Lions, although you drink water. Nevertheless this great valancy of Lions, yet have they their terours, enemies, and calamities, not only by Men, but also by Beasts, over whom they claim a soveraigny. We have shewed already in the story of Dogs, that the great Dogs in *India* and *Hircania* do kill Lions, and forfake other Beasts to combat with them. There is a Tygre also called *Lazæni,* which in many places is twice as big as a Lion, that killeth them, and depieth the huge quantity of Elephants. *Martius* also writeth, that he saw a tame Tygre devour a wilde Lion. A Serpent, a Snake doth easily kill a Lion, whereof *Ambrosius* writeth very elegantly; *Eximia Leonis pulchritudo per comantes terricis tros executur, cum suisto a serpente os vellere tentat altiliter, itaque Coluber cervum fugit iel Leonem interficit.* The splendent beauty of a Lion in his long curled mane is quickly abated and alloyed when the Serpent doth but lift up his head to his breach; for such is the ordinance of God, that the Snake which runneth from a fearful Hunt, should without all fear kill a courageous Lion; and the writer of *S. Mamos* *alla,* *Alta O men utram, &c.* How much more will he fear a great Dragon, against whom he hath not power to lift up his tail? And *Arifilæ* writeth that the Lion is afraid of the Swine, and *Kæstum* affirneth as much of the Mouse.

The Cock also are both seen and heard for his voice and comb, is a terror to the Lion and Buffalo, and the Lion runneth from him when he feeth him, especially from a white Cock; and the reason hereof is, because they are both partakers of the Sun qualities in a high degree, and therefore the greater body feareth the lesser, because there is a more eminent and predominant funny property in the Cock, then in the Lion.

*Lucianus* describeth this terour notably, affirming that in the morning when the Cock croweth the Beasts become themselves to flight, because there are certain seeds in the body of Coocks, which when they are pent and appear to the eyes of Lions, they vex their pyples and apples, and make them against nature become gentle and quiet; the Verres are thefe;

Quintetiam gallum nūle excludantibus aliis
Auream clarâ confructam voce vocare,
Quem necuenent rapidi contra confurse Leones
Ing, tuti; its continuo meminecre fugiæ.

Nimium quia sunt gallorum in corpore quedam
Sermina, quæ quum sūt ocula immittis Leonum
Pupillias interfudent, serem, dolorem
Decembur, ut necerant contra duræ feroces.

We have spoken already of the *Leonoponus* how the rendreth a urine which poisoneth the Lion; the noise of wesbeles and chariots do also terrifie them, according to the saying of *Seneca, Leonit provia sunt ad hujusmodis firiimis petens.* The high stomach of a Lion is afraid of a little strange noife. *Ambologin* hath an excellent Epigram of one of *Cybels* Priests, who travelling in the mountains by reason of frost, cold, and snow, was driven into a Lions den, and at night when the Lion returned, he feared him away by the found of a Bell. The like also shall be afterwards declared of Wolves in their story.

They are also afraid of fire, *Arístes;* faces, quae quamvis fænit horret; For as they are inwardly filled with natural fire (for which cause by the *Egyptians* they were dedicated to *Vulcan*) so are they the more afraid of all outward fire, and so licipios is he of his welfare, that if he tread upon the rinde or bank of Oke or the leaves of Olvy, he trembleth and randeth amazed. And *Demoretius* affirneth that there is a certain herb growing no where but in Armenia and Cappadocia, which being laid to a Lion, maketh him to fall presently upon his back and lie upright without flaming, and gaping with the whole breadth of his mouth, the reason whereof (Pliny faith) is because it cannot be bruised.

There is no Beast more defirous of copulation then a Liones, and for this cause the males oftentimes fall for, for sometimes eight, ten, or twelve males follow one Lioness, like so many Dogs one Half Bitch; for indeed their natural constitution is hot, that at all times of the year both sexes desire copulation, although *Arifilæ* fecemeth to be against it, because they bring forth only in the spring.

The Liones (as we have shewed already) commiffceth adultery by lying with the Libbard, for which thing the is punished by her male if the wath be not her self before she come at him; but when she is ready to be delivered, the flyeth to the lodgings of the Libbards, and there among them bideheth her young ones, (which for the most part are males) for if the male Lion finde them, he knoweth them and destroyeth them, as a battard and adulterous ifieu, and when the goeth to give them fhe taketh as though the went to hunting.
Of the Lion.

By the copulation of a Lioness and an Hyena is the Ethiopian Cheetah brought forth. The Aryan Parias, Dogs, called Lesangmess, were also generated betwixt Dogs and Lions. In all her life long the heareth but once, and that but one at a time, as if she seemed to set down in that fable, where he expresseth that contention between the Lioness and the Fox, about the generosity of their young ones: the Fox objecteth to the Lioness, that the bringeth forth but one whelp at a time, but lie on the contrary begetteth many cubs, wherein he taketh great delight; unto whom the Lioness maketh this answer: Paterque quidem aquea sed Leones; that is to say, the bringeth forth indeed but one, yet that one is a Lion; for one Lion is better then a thousand Foxes, and true generosity confifteth not in popularity, or multitude, but in the gift of the mind joyed with honorable defect. The Lionesses of Syria bear five times in their life; at the first five, afterwards but one, and lastly they remain barren. Hieronymus speaking of other Lions, fay, they never bear but one, and that only once, whereas he giveth this reason, that when the whelp beginneth to thr in his Dams belly, the length of his claws pierce through her matrix, and so growing greater and greater, by often turning leaveth nothing whole; so that when the time of littering commeth the cafgeth forth her whelp and her womb both together, after which time she can never bear more: but I hold this for a fable, because Homer, Pliny, Oppianus, Solinus, Philostratus, and Aelianus affirm otherwise contrary, and besides experience fieweth the contrary.

When Apollonius travelled from Babylon by the way they saw a Lioness that was killed by hunters: the Beait was of a wonderful bignes, such a one as was never seen: about her was a great cry of the Hunters, and of other neighbours which had flocked thither to fee the monster, and wondering so much at her quantity, as that by opening of her belly, they found within her eight whelps, whereon Apollonius wondring a little, told his companions that they traveling now into Indus should be a year and eight months in their journey: for the one Lion signified by his skill Philostrat an one year, and the eight young ones eight months. The truth is that a Lion beareth never above thrice, that is to say, fix at the first, and at the moft afterwards two at a time, and lastly but one, because that one groweth greater, and fuller of stomach, then the other before him; wherefore nature having in that accomplished her perfection, giveth over to bring forth any more. Within two months after the Lioness hath conceived the whelps are perfected in her womb, and at fix moneths are brought forth blinde, weak, and (some are of opinion) without life, which do so remain three dayes together, until by the roaring of the male their father, and by breathing in their face they be quickned, which also he goeth about to eafterdash by reason; but they are not worth the relating. Ifidius on the other side declareth that for three dayes and three nights after their littering, they do nothing but sleep, and at last are awaked by the roaring of their father: so that it should seeme without controversy, they are senfles for a certain space after their whelping: At two months old they begin to run and walk: They say also that the fortitude, wrath, and boldnes of Lions, is conspicuous by their heat, the young one containeth much humidity contrived unto him by the temperance of his kind, which afterwards by the driesnes and caldity of his evacuation groweth vifcous and flimie like bird-lime, and through the help of the animal Spiritis prevaileth especially about his brain, whereby the nerves are fo topp'd, and the spirits excluded, that all his power is not able to move him, until his parents partly by breathing into his face, and partly by bellowing, drive away from his brain that vifcous humor; these are the words of Physiologus, whereby he goeth about to eafterdash his opinion; but herein I leave every man to his own judgment, in the mean reaon admiring the wonderful wisdom of God, which hath so ordered the several natures of his creatures, that whereas the little Partridge can run so soon as it is out of the fleg; and the ducking the first day swim in the water with his dam, yet the harmful Lions, Bears, Tygres, and their whelps are not able to fee, fland or go, for many moneths; whereby they are expos'd to destruction when they are young, which live upon destruction when they are old: so that in infancy, God cloatheth the weaker with more honor.

There is no creature that loveth her young ones better then the Lioness, for both shepherds, and hunters, frequenting the mountains, do oftentimes see how truly she fightheth in their defence, receiving the wounds of many Darts, and the troakes of many thones, the one opening her bleeding body, and the other pelting the bloud out of the wounds, flaming with incivile grief yielding till death, yes death it felwe were nothing unto her, fo that her young ones might never be taken out of her Den; for which cause Homer comparath Ajax to a Lioness, fighting in the defence of the carcasse of Paratuc. It is also reported, that the male will lead abroad the young ones, but it is not likely, that the Lion which refuseth to accompany her female in hunting, will so much asbe his noble spirit, as to undergoe the Lionesses duty in leading abroad the young ones. In Fangius a mountain of Thracia, there was a Lioness which had whelps in her den, which the den was observ'd by a Bear, the which Bear on a day finding the den unfortified, both by the absence of the Lion and the Lionesses, entred into the same and flew the Lions whelps, afterward went away, and fearing a revenge, for her better security against the Lions rage, climed upon a tree, and there fast as in a sure castle of defence: at length the Lion and the Lionesses returned both home, and finding their little ones dead in their own bloud, according to natural affection fell both exceeding sorrowful, to see them so slaughter'd whom they both loved; but smelling out by the foot the murderer, followed with rage up and down until they came to the tree whereinto the Bear was ascended, and seeing her, looked both of them gaily upon her, oftentimes assaying to get into
the tree, but all in vain, for nature which adorned them with singular strength and nimbleness yet had not endued them with power of climbing, so that the tree hindring them from revenge, gave unto them further occasion of mourning, and unto the Bear to rejoice at her own cruelty, and deride their sorrow.

Then the male forsook the female, leaving her to watch the tree, and he like a mournful father for the loss of his children, wandered up and down the mountain making great moan and sorrow, till at the last he saw a Carpenter hewing wood, who being the Lion coming towards him let fall his Axe for fear, but the Lion came very lovingly towards him, sawning gently upon his breast with his forefeet, and licking his face with his tongue; which gentleness of the Lion the man perceiving, he was much astounded, and being more and more embraced, and fawned on by the Lion, he followed him, leaving his Axe behind him which he had let fall; which the Lion perceiving went back, and made signs with his foot to the Carpenter that he should take it up; but the Lion perceiving that the man did not understand his signs, he brought it himself in his mouth and delivered it unto him, and led him into his cave, where the young whelps lay all embrewed in their own blood, and then led him where the Lioness did watch the Bear, the therefore seeing them both coming, as one that knew her husbands purpose, did signify unto the man that he should confider of the miserable slaughter of her young whelps, and showing him by signs, that he should look up into the tree where the Bear was, which when the man saw, he conjectured that the Bear had done some grievous injury unto them; he therefore took his Ax and hewed down the tree by the roots, which being cut, the Bear tumbled down headlong, which the two furious Beasts seeing, they roar her all to pieces: And afterwards the Lion conducted the man unto the place and work where he first met him, and left there him, without doing the least violence or harm unto him.

Neither do the old Lions love their young ones in vain and without thanks or recompence, for in their old age they require it again, then do the young ones both defend them from the annoyances of enemies, and also maintain and feed them by their own labor; for they take them forth to hunting, and when as their decipt and withered estate is not able to follow the game, the younger pursueth and taketh it for them: having obtained it, roareth mightly like the voice of some warning piece, to signify unto his elder that he should come on to dinner, and if he delayed, he goeth to seek him where he left him, or else carr eth the prey unto him: at the sight whereof, in gratulation of natural kindnese, and also for joy of good success, the old one first licketh and kiseth the younger, and afterward enjoy the booty in common betwixt them.

Admirable is the disposition of Lions, both in their courage, society and love, for they love their nourisshers and other men with whom they are conversant: they are neither fraudulent nor sulficious, they never look awry or squint, and by their good will they would never be looked upon.

Their clemency in that fierce and angry nature is also worthy commendation, and to be wondere at in such Beasts, for if one prostrate himself unto them as it were in petition for his life, they often spare, except in extremity of famine; and likewise they seldom deftroy women or children: and if they see women, children, and men together, they take the men which are strongest, and refuse the other as weaklings and unworthy their honor; and if they fortune to be harmed by a Dart or Bone by any man, according to the quality of the hurt, they frame their revenge; for if it wound not, they only terrify the hunter, but if it pinch them further, and draw blood, they increase their punishment.

There is an excellent story of a Souldier in Arabia, who among other his colleagues, rode abroad on gendings to see some wild Beasts: now gendings are so fearful by nature, that where they conceive any fear, no wit or force of man is able by spur and rod to make him to come near the thing it feareth, but those which are not gendied are more bold and courageous, and are not at all afraid of Lions, but will fight and combat with them. As they road they saw three Lions together, one of the Souldiers seeing one of them stray and run away from his fellows, cast a Dart at him, which fell on the ground near the Lion's head, whereas the Beast fled a little and paused, and afterward went forward to his fellows. At last the Souldier road betwixt him and his fellows which were gone before, and run at his head with a spear, but missed it, and fell from his Horse to the earth, then the Lion came unto him and took his head in his mouth, which was armed with a Helmet, and prefing it a little did wound him, taking of him no more revenge, then might require the wrong received, but not the wrong intended; for generally they hurt no more then they are harmed.

There is an obscure Author that attributeth such mercy and clemency to a Beast which he called Meloes, for he persecuteth with violence and open mouth flout men, and all whom he is able to refit, but yet is afraid of the crying of children. It is probable that he mistaketh it for the Lion, for besides him, I have not read of any Beast that spareth young children. Solinus affirmeth that many Captives having been set at liberty, have met with Lions as they returned home, weak, ragged, sick, and disarmed, fairly without receiving any harm or violence.

And in Libya the people believe that they understand the petitions and entreaties of them that speak to them for their lives; for there was a certain Captive woman coming home again into Gerhia her native Countrey through many woods, was let upon by many Lions, against whom she used no other weapon but only threatening and fair words, falling down on her knees unto them,
365

Of the Lion.

them, beceathing them to spare her life, telling them that she was a stranger, a captive, a wanderer, a weak, a lean and loft woman, and therefore not worthy to be devoured by such courageous and generous Beasts as they: at which words they spared her, which thing she confedted after her falte return: the name of this woman was called Ἴπα. Although about this matter there were bendency opinions of men, some making question whether it be true, that the Lion will spare a prostrate suppliant, making confession unto him that he is overcome; yet the Romans did fo generally believe it, that they caused to be inscribed so much upon the gates of the great Roman Palace in these two Verfes;

Ἐρατος χειμος, προς δεινις ἱππα λεονις;

In fatis præstato, hoc negat effer ferum.

It is reported also, that if a man and another Beast be offered at one time to a Lion to take his chiose whether of both he will devour, he spareth the Man and killeth the other Beast. These Lions are not only thus naturally affected, but are enforced thereunto by chance and accidental harmes; as may appear by these examples following: Mentor the Syracusan, as he travelled in Syria met with a Lion, that at his first flight fell prostrate unto him, rolling himself upon the earth like some distrefled creature, whereas the man was much amazed, and not understanding the meaning of this Beast, he indeavoured to run away; the beast still overtook him, and met him in the face, licking his footsteps like a flatterer, thwed him his heel, wherein he did perceive a certain dwelling, whereas he took a good heart, going unto the Lion, took him by the leg, and seeing a splint sticking therein, he pulled it forth, so delivering the Beast from pain; for the memory of this fact, the picture of the man and the Lion were both pictured together in Syracusus, until Finier time, as he reporteth. The like story is reported of Elys the Seamian, who coming into Africa by ship, and there going a shore, had not walked very far on the Land, but he met with a Gaping Lion, at which being greatly amazed, he climbed up into a tree, forasmuch as there was no hope of any other flight, and prayed unto Bacchus (who in that Country is esteemed as chief of the Gods) to defend him, as he thought, from the jaws of death; but the Lion seeing him to climb into the tree flood still, layed himself down at the root thereof, directing him in a manner, by his heave roaring, to take pity upon him, gaping with his mouth and shewing him a bone sticking in his teeth, which through greediness he swallowed, which did to pain him that he could eat nothing; at the last the man perceiving his mind (moved by a miracle) laid aside all fear, and came down to the dumb-speaking distrefled Lion, and eafeed him of that misery: which being perform'd, he not only shewed himself thankful for the present time, but like the best natured honest man, never forlooke shore, but once a day came to shew himself to the man his helper, during the time that they abode in those quarters; and therefore Elys did afterward dedicate a Temple unto Bacchus in remembrance thereof. And this seemeth to me most wonderful, that Lions should know the vertue of mens curing hands above other creatures, and also come unto them against nature and kinde, but so much is the force of evil and pain, that it altereth all courtes of savage minds and creatures.

When Antrocles a servant ran away from a Senator of Rome, because he had committed some offence (but what his offence was I know not) and came into Africa, leaving the Cities and places inhabited to come into a defert region: Afterwards when Antrocles had obtained a Matter being Confuill of that Province of Africa, he was compelled by daily stripes to run away; that his fides might be free from the blows of his Matter, and went into the solitary places of the fields, and the fides of the wilderness: and if he should happen to stand in need of meat, he did purpose to end his life by some means or other; and there he was so chortched with the heat of the Sun, that at last finding out a cave, he did cover himself from the heat of it therein; and this cave was a Lions den. But after that the Lion had returned from hunting, (being very much pained by reason of a thorn which was fastened in the bottom of his foot) he uttered forth such great lamentation & pitiful roarings, by reason of his wound, as that it should seem, he did want some body to make his moun unto for remedy; at last coming to his cave, and finding a young man hid therein, he gently looked upon him, and began as it were to flatter him, and offered him his foot, and did as well as he could pray him to pull out the piece of splint which was there fastened. But the man at the first was very fore afraid of him, and made no other reckoning but of death: but after that he saw such a huge savage beast so meek and gentle, began to think with himself, that surely there was some fore on the bottom of the Beast, because he lifted up his foot fo unto him, and then taking courage unto him, lifted up the Lions foot, and found in the bottom of a great piece of splint, which he plucked forth, and so by that means eafeed the Lion of his pain; and prefed forth the matter which was in the wound, and did very curiously without any great fear throughly dryt, and wipe away the bloud: the Lyon being eafeed of his pain, laid himself down to refl, putting his foot into the hands of Antrocles.

With the which cure the Lion being very well pleased, because he handled him fo courteously and friendly, not only gave him for a recompence his life, but also went daily abroad to forrage and brought home the fattert of his prey. Antrocles whom all this while (even for the space of three years) he kept familiarly, without any note of cruelty or evil nature in his den, and there the Man and the Beast lived mutually at one common, the man roasting his meat in the hot Sun, and

the
The History of Four-footed Beasts.

The Lion eating his part raw, according to kind. When he had thus lived by the space of three years, and grew weary of such habitation, life, and society, he betought himself of some means to depart; and therefore when the Lion was gone abroad to hunting, the man took his journey away from that hospitality, and after he had travelled three days (wandering up and down) he was apprehended by the legiornary Souldiers, to whom he told his long life and habitation with the Lion, and how he ran away from his Mafter a Senator of Rome; which when they understood, they also sent him once again to Rome to the Senator.

And being received by his master, he was guilty of so great and foul faults, that he was condemned to death, and the manner of his death was, to be torn in pieces of Wild beasts. Now there were at Rome in those days many great, fearful, cruel, and ravening beasts, and among them many Lions: it fortuned also, that shortly after the taking of the man, the aforefaid Lybfon Lion with whom he lived long, seeking abroad for his companion and man-friend, was taken and brought to Rome, and there put among the residue, who was the most fierce, grim, fearful, and savage, above all other in the company, and the eyes of men were more fastened upon him then all other beside. When Antroche was brought forth to his execution, and caft in among these savage beasts, this Lion at the first sight looking steadfastly upon him, stood still a little, and then came toward him softly, and gently, spitting to him like a Dog, and wagging his tail: the poor examineate and forlorn man, not looking for any thing but present death, trembled and was scarce able to stand upright in the presence of such a beast: not once thinking upon the Lion that had nourished him so long, but the Beast Aceptii benefcioi memelii mindful of former friendship, licked gently his hands and legs, and so went round about him touching his body, and so the man began to know him, and both of them to congratulate each other in that their imprisoned occurrence, and to figure to all the beholders their former acquaintance and conversation, the man by iroking and killing the Lion, and the Lion by falling down prostrate at the mans feet.

In the mean time a Pardall came with open mouth to devour the man, but the Lion role up against her, and defended his old friend, and the being inhaft, the Lion tore her in pieces, to the great admiration of the beholders, as it could not otherwise chufe. Then Cafiur which had caufed those spectacles, fent for the man, and asked him the caufe of that fo rare and prodigious an event, who incontinently told him the ftrife before expreffed. The rumor whereof was quickly fped abroad among the people, and tables of writing were made of the whole matter, and finally all men agreed that it was right that both the man and the Lion should be pardoned and restored to liberty: and afterward (faith Afpion) all the people and beholders of that comedy were feters to the Senat for the accomplishment thereof, and to the man was pardoned, and the Lion was given unto him for a reward or fuffrage, who led him up and down the streets in a team or flip; Antroche receiving money, and the Lion adorned with flowers and garlands, and all men that faw or met them faid, His eft Leo benefcioi, bic eft mendo Liou: Here goeth the Lion which was thy Mans foff, and here is the man which was this Lion Pofciau.

Sence alfo in his book De benefcioi, out of Gallius writeth fo much of another Lion: and indeed there is no man or other Beast more fixed and constant in their love and friendship, or more ready to revenge the breach of amity and kindness, then is a Lion; as appeareth by this ftrife of Inimicis, who writeth of a certain young man, that he nourished together many years a Dog, a Bear and a Lion, who lived in perfect peace and concord without breach, flaring, or appearance of anger. On a day as the Bear and Dog played together and biting one another gently, it happened that the Dog fatten his teeth (in sport) deeper then the Bear cold digget, and therefore prefently he fell upon him, and with his claws tear out the soft part of his belly, whereof he prefently dyed: the Lion fitting by, and feeing this cruelty, and breach of love, amity, and concord among them that had fo long lived together, fell to be inflamed to revenge that perfidie, and like a true king of Beasts, measured the fame measure to the Bear as he had done to the Dog, and served him with the same fauce, tearing him infancy in pieces.

There is alfo in the life of S. Jerome, a ftrife of a Lion that was cured by him, as you have read before the Lion was by Elfis, and that the Beaf in gratitude of that good turn, did ever afterward follow the Aife which brought him home his carriage and provifion through the woods; till at laft the Lion being alfeep, the Aife was stolen away, for sorrow whereof, the Lion put himself in the Aifes stead, to bear burthens as he did; within fhort time after he found out the Aife in the thieves fable, and brought home again; but I am of Eresfum minde concerning this ftrife, that the Author thereof took upon him to write wonders and not trufh.

The Kings of Egypt and Syria did keep tame Lions, to accompany them into their wars, which were led about their own bodies for their guard and cultoby, againft all peril and invasion.

It is alfo very pertinent to this place, to express the emenency of these Beasts towards the Martyrs and fervants of Jesus Christ, both men and women, that so we may obferve the performance and accomplishment of that Prophefie, Pali. 91. They fould walke upon the Afe, and the Cockatrice, and feely tread upon the Lion and the Dragon: This we are not to attribute to the nature of Lions, but rather to the over-running hand of our and their Creator, who in remembrance of his own promise, and advancement of his own glory, foppeth the mouth of Lions, and restrained all violence both of living creatures and elements; yet I will not impose any necelitv of believing these ftrifes upon the Reader, for I my felf report them not for trufh, but because they are written.
Of the Lion.

When S. Anthony went about to make a grave for the interring of the carcases of Paul the first Ana- lyst, conit, and wanted a shovel or spade to turn up the earth, there came two Lions, and with their claws opened the earth so wide and deep, that they performed therein the office of a good grave-maker. The Prophet Daniel was cast unto the Lions, to whom (according to the Babylonian story) was given for their diet every day, two condemned men, and two sheep, and yet by power of the Almighty whom he served, the Angel of the Lord came down andaptop the Lions mouths, so that in extremity of hunger, they never so much as made force at him, but sat quietly at his feet like so many little Dogs; by which means he escaped all peril and torments of death. Eluberus being cast to the Lions at the command of Adrian the Emperor, and Prisca a Noble Virgin, at the command of Claudius Caesar, both of them in their several times, tamed the untamed Beasts and escaped death.

Martyrs being in the Wilderness or Mountains, it fortuned a Lioness had a dens nest unto its cell, wherein she had long nourished blinde whelps, to whom the holy man (as it is reported) gave the use of their eye and light; the Lioness required the same with such gratification as lay in her power, for the brought him very many sheep-skins to clothe and cover him. Prosperus, and Facilius, Thracia, Vitus, Modestus, and Crescens, all Martyrs, being cast unto Lions received no harm by them all, but the beasts lay down at their feet, and became tame, gentle, and meek, not like themselves, but rather like Doves. When a Bear and a Lion fell upon Tres the Virgin, a Martyr, a Lioness came and fought eagerly in her defence against them both. When Martina, the daughter of a Cesar, could not be terrified or drawn from the Christian faith by any imprisonment, chains, or stripes, nor allured by any fair words to sacrifice to Apollo, there was a Lion brought forth to her, at the commandment of Alexander the Emperor, to destroy her; who, as soon as she saw her, he lay down at her feet wagging his tail, and fawning in a loving and fearful manner, as if he had been more in love with her presence, than dehors to lift up one of his hairs against her. The like may be said of Daria, a Virgin, in the days of Numerian the Emperor, who was defended by a Lioness; but I spare to blot much paper with the recital of those things (which if they be true) yet the Authors purpose in their allegation is most profane, unlawful and wicked, because he thereby goeth about to establish miracles in Saints, which are none gone ceas'd in the Church of God.

Some Martyrs also have been devoured by Lions, as Ignatius Bishop of Antioch, Saturus and Perpetua, he under Trajan the Emperor, and they under Valerian and Gallienus. In holy Scripture there is mention made of many men killed by Lions. First of all it is memorable of a Prophet, 1 King, 13. that was sent by the Almighty unto Jeroboam, to cry out against the Altar at Bethel, and him that erected that Altar; with charge, that he should neither eat nor drink in that place:

Afterward an old Prophet which dwelt in that place hearing thereof, came unto the Prophet, and told him that God had commanded him to go after him, and fetch him back again to his house to eat and drink; wherewith being deceived, he came back with him contrary to the commandment of the Lord given to himself; whereupon as they sat at meat, the Prophet that beguiled him, had a charge from God to prophesy against him, and so he did: afterward as he went homeward a Lion met him and killed him, and sold by the corps, and his Ashes not eating of them till the old Prophet came and took him away to bury him.

In the twentieth chapter of the same Book of Kings, there is another story of a Prophet, which as he went by the way he met with a man, and bade him in the name of the Lord to wound and smite him; but he would not, preferring yet before the service of the Lord; Well (said the Prophet unto him) seeing thou refuseth to obey the voice of the Lord, Behold we saw not what thou art departed, a Lion shall meet thee and destroy thee: and so it came to pass, for being out of the presence of the Prophet, a Lion met him and tore him in pieces.

The Idoltalous people that were placed at Jerchem by the King of Bethel, were destroyed by Lions; and unto these examples of God his judgements, I will add other out of humane stories. Papges, a King of Ambracia, meeting a Lioness leading her whelps, was suddenly set upon by her and torn in pieces, upon whom Ovid made these verses:

Fate tibi occurrat patrio popularis in urvo; Song; Papgesae causa leona necis.

Hyas the brother of Hyades, was also slain by a Lioness. The people called Ambraciota in Africk, do most religiously worship a Lion; because a notable Tyrant which did oppress them was slain by such an one. There is a Mountain near the River Idus (called Licinius) of a Shepheard so named, which in that Mountain did most superstitiously worship the Moon, and contented all other Gods, his sacrifices were performed in the night season; at length (faith the Author) the Gods being angry with him, sent unto him a couple of Lions who tore him in pieces, leaving no monument behind but the name of the Mountain for the accident of his cruel death. The Inhabitants of that Mountain wear in their ears a certain rich stone (called Citrine) which is very black, and bred no where else but in that place.

There is a known story of the two Babylonian lovers, Pyramus and Thisbe, who in the night time had covetted to meet at a Fountain near the sepulchre of Nymus, and Thisbe coming thither first,
The History of Four-footed Beasts.

as the fate by the Fountain, a Lion being thirsty, came thither to drink water, (after the slaughter of an Ox:) at sight whereof, Thibes ran away and let fall her mantle, which the Lioness tore it in pieces with her bloody teeth. Afterward came Pyramus, and seeing her mantle all bloody and torn asunder, suspecting that the that loved him, being before him at the appointed place had been killed by some wild beast, very inconsiderately drew forth his sword, and thrust the same through his own body, and being scarce dead, Thibes came again, and seeing her lover lie in that distress, as one love, one caufe, one affection had drawn them into one place, and there one fear had wrought one of their destructions, the also sacrificed her self upon the point of one and the same sword.

There was also in Scythia a cruel Tyrant (called Therosmus) who was wont to cast men to Lions to be devoured of them, and for that caufe did nourish privately many Lions: unto this cruelty did Ovid allude, saying:

Therosmonstes ut qui senfere Liones.

And again:

Non tibi Therosmon crudelis: vocabitur Ateus.

Unto this discourse of the blood-thirsty cruelty of Lions, you may add the puissant glory of them, who both in Sacred and profane stories are said to have destroyed Lions. When Sampson went down to Timnah, it is said, that a young Lion met him roaring to destroy him, but the Spirit of the Lord upon him, and he tore it in pieces like a Kid; wherein he was a Type of Jesus Christ, who in like forte being set upon by the roaring of the Devil and his members, did with facility (through his divine nature) utterly overthrow the malice of the Devil. Afterward Sampson went down to the Philistine woman whom he loved, and returning, found that Bees had entered into the Lions carcases, and there builded, whereupon he propounded this Riddle: A vosel exitus cibus, & ex forti eigressa eff dulced: Out of the devourer came meat, and out of the strong came faintnels.

Benisih the son of Jephaiada one of David Worthies, did in the Winter time in the snow kill a Lion in a ditch: David himselfe feeding his fathers flock, slew a Lion and a Bear which had robbed him of a Lamb.

It is reported of Perdiccas (one of the Captains of Alexander) a valiant man, that he went alone into the Den of a Lions, but not finding her therein, took away her wholes, and brought them forth to the admiration of all men; for the Lions both among the Barbarians and Graecians is accounted the strongest and most unfeizable beast. The Lion, and in the Northern parts of the World (fa
wore continually that Lions sain which was given him by Hercules: and therefore he could not be wounded: But I take this to be but a fable: rather this was the truth: Alex was a valiant soldier, and so warily carried himself in many battails, that he never received wound, but at last he flew himself with his own sword, thrusting it through his neck; and for this cause it was fabled, that he never could be wounded, by a vertue (as was imagined) conferred on him from Hercules. Ovid hath a witty fction of one Phylus, who fell so deeply in love with a little boy, that at his pleasure he took many wilde Beasts, Birds, and Lions, and tamed them to the delight of his Amours: at length the infaile Boy required him to do the like by a Bull, which he had overcome, but Phylus denying that request, they Boy presently call himself down from a Rock, and was afterward turned into a Swan; by which the Poet declarth, the unmerciful regard which wretches and childish minds bear towards the greatest labours and deferts of the best men; and that in fuch fociety a man is no longer beloved, then he giveth; alfo the denial of one small request cannot be endured, although a thousand good turns have gone before it; wherefore fuch minds may well be transmuted into Swans, which forfake their owners and breeders, going and swimming far from their firft and proper habitation.

Having but mentioned fuch a fary, it is no exorbitant to add in one word other fictions of Metamorphosing, and transmuring men into Lions which we promised in the former discourse of Atlas and Apollo, when I discovered of the food of Lions.

And firft of all, it is not improper to remember the caution of Timoec the Pythagorean, who affirned, that the mutation of men into_beasts, is but a fiction brought in to the terror of wicked men, who seeing they cannot be restrained from vice, for the love of well doing, they may be deterred for the fear of punifhment, which is meant by fuch beffally transfigurations.

And this thing is thought to be most confonant to the opinion of Plato, for inconsideration of the habit, and not of the kinde; a good house-keeper, and charitable nourishing man, is said to be transmuted into a tree: He which liveth by catching and snatching, to ferve his own concupifcence, into a Knave; he which for love of military discipline and Martial affairs, into a Lion, he that was a Tyrant and a devourer of men, into a Dragon: and Empefcoals also faid, that if a man depart this natural life, and be transmuted into a brute beaft, it is most happieft for him if his foul go into a Lion: but if he looke his kinde and lenes, and be tranfmutted into a plant, then is it beft to be metamorphosed into a Laurel or Bay-tree. And for thefe caufes we read of Hipp changed into a Lion, and Atlas into a Lion, and the like I might lay of Heracles, of the Curetes, and others: and generally all the Eastern wise men believed the transmigration of fpirits from one into another, and inftancd fo much to their symmirs and dignities, making little or no difference betwixt the natures of men and brute beafts. Therefore they taught that all their Priests after death were turned into Lions, their religious Vellals or women into Hyrana, their Servants or Minifters in the Temples, about the service of their fpirit God into Crows and Ravens; the Fathers of families, into Eagles and Hawks; but thofe which ferved the Leonick Altars, naming Nemea farea, inftituted for the honour of Hercules, were transformed diverfly: but of all thofe we have already expressed our opinion; namely, to believe and think fo basely of mankinde, created after Gods image, as once to conceive or entertain one thought of fuch paffing of one from another, were moft lewd and Diabolical; but to conceive them as allegories, by which the minds of the wise may be inftucted in divine things, and God his judgements; it is Poetical, fo is it not againft any point of learning, or good Religion.

As that which hath been already expressed moft notably defcribith the nature of the Lion, which fo that succedeth hath the fame use for the manifelfation of the dignity and honour of Beauf.

First of all therefore, to begin with his understanding, and to fiew how heere he cometh to the nature of man. It is reported by Alliana, that in Lybia they retain great friendfhip with men, enjoying many things in common with them, and drinking at the fame Well or Pountain. And if at any time he be deceived in his hunting, and cannot get to satisfies hunger, then goeth he to the houses of men, and there if he finde the man at home, he will enter in and defroy, except by wit, policy, andrength, he be refilled; but if he finde no man, but only women, they by railing on him and rebukes, drive him away, which thing argueth his understanding of the Lybian tongue; The rum and manner of thofe fpeeches and words which the ueth among the Liones, and many Kight men, or at leaft beffed, being a Lion, the King of Beaufs, to come to my por tafhe to big meat at the hands of a woman? and like a fick man, disfurred with the weaknes of body, to fall into the hands of a woman, that by her mercy thou maft attain thofe things which are requeftible for thy own maintenane, and fuffelevation? you rather thou fhouldf keep in the Mountains, and live in them, by hunting the Hare and other Beaufs, provided in nature for the Liones food, and not after the fatisfition of little bague Dogs, come and live in beaufs to take meat at the hands of men and women.

By fuch like words the enchanceth the minde of the Lion, fo that like a reasonable perfon, overcome with strong arguments, notwithstanding his own want, hunger, and extremity, he calleth his eyes to the ground affhamed and affiicted, and departeth away without any enterprise: Neither ought any judicious or wise man think this thing to be incredible; for we fee that Horfes and Dogs which live among men, and bear their continual voyces, do differne alfo their tearms of threatening, chiding, and rating, and fo stand in aw of them; and therefore the Lions of Lybia, whereof
many are brought up like Dogs in houses, with whom the little children play, may well come to the knowledge and understanding of the Montana tongue.

It is also said they have understanding of the parts of men and women, and discern sexes, and are induced with a natural modesty, declining the sight of women's privy parts. And unto this may be added the notable story of a Lion in England, (declared by Grammarians) which by evident token was able to distinguish betwixt the King, Nobles, and vulgar sort of people.

As the ears of Horses are a note of their generosity, so is the tail of Lions, when it flarethimmovable, it sweareth that he is pleasant, gentle, meek, unmoved, and apt to endure any thing, which salleth out very seldom, for in the sight of men he is seldom found without rage. In his anger, he first of all beateth the earth with his tail, afterwards his own sides, and lastly leapeth upon his prey or adversary. Some creatures use to wag their tails, when they feele suddenly those which are of their acquaintance, as Dogs; but Lions and Bulls, do it for anger and wrath. The reason both of one and other, is thus rendred by Aproadesius. The back-bone of such Beasts is hollow, and containeth in it marrow, which reacheth to the tail, and therefore there is in the tail a kind of animal motion, and power. For which cause when the Beast seeth one of his acquaintance, he waggeth his tail by way of salutation for the same reason that men shake hands, for that part is the readieft and nimbleft member of his body; but Bulls and Lions are constrained to the wagging of their tails for the same reason that angry men are light fingered, and apt to strike: for when they cannot have sufficient power to revenge, they either speak if they be Men, or else bark if they be Dogs, or smite their sides with their tail if they be Lions; by that means uttering the fury of their rage to the cave of nature, which they cannot to the full desire of revenge.

But we have shewed before that the Lion striketh his sides with his tail, for the stirring up of himself against dangerous perils, for which cause Lucan compareth Cæsar, in his warlike expedition at Pharsalia, against his own Country, before his passage over Rubicon, (whilest he exhorted his followers) to a Lion beating himself with his own tail in these veres:

Inde mora soluit bello, tumidumque: per annum,
Sicque tails propere: sicque fialentibus avus
Et ffera; Lybici, visi Leo conitus bofe,
Subsidat dubius, tantum dum colligat iram;
Max imi le fave stimulavit verbere cauda,

There are many Epigrams, both Greek, and Latine, concerning the rage, force, friendship, and society of Lions with other Beasts, whereof these are most memorable: the first of a Hare, which through sport crept through the mouth of a tame Lion, whereof Martial writeth in this fort, teaching her to fly to the Lions teeth against the rage of Dogs in these veres:

Rithibus his Taurus non ripiure magisfis,
Per quos prada fugax ieg; reditq. lepuri.
Quando magis mirum, velocius exit ab bofe,
Nec nibil à tanta nobilitate refert.

There is another of the same Poets, about the society of a Ram and a Lion, wherein he wondereth, that so different natures should live together, both because the Lion forgettesth his prey in the Woods, and also the Ram, the eating of green grass, and through hunger, both of them constrained to taste of the same dithes; and yet this is no other, then that which was foretold in holy Scripture, the Lion and the Lamb should play together: the Epigram is this:

Maffici Leo fama jugi, pecoris; maritus
Lanigeri, mirum qua poliue fide,
Ipfe licet videm, cavaa Habitudinem in una;

For we have shewed before, that a Lion in his hunger will endure nothing, but fiercely falleth up

on every prey, according to these veres of Mariantus:

Quis dubitet, quia sit natura Leonis?
Quaeque, siue aliqua signa melcontentibus atque?
Hic novem semper fugas, multa bella ferarum
Apparit, & pereunt omnium spolia, atque rapinis.

Concerning the hunting and taking of Lions, the Indian Dogs and some other fierce Hunters do set upon Bulls, Bares, and Lions, as we have said before in the History of Dogs: but Dogs, which are begotten of Tygers, amongst the Indian, and chioe of Hyrcania, especially do this thing: as it is noted by Mariut, concerning the fortiitude and courage of a Dog, saying:

Et truculentus Helor certare Leonibus sudens.
Of the Lion.

In the Province of Gignis, which is subject to great Cham King of Taenaria, there are very many Lions which are very great and cruel: and in that Region the Dogs are accounted so bold and strong, as they will not fear to invade or eat upon those Lions; and it is often times cometh to pass, that two Dogs and a hunting Archer sitting on Horse-back do kill and destroy a Lion: for when the Dogs perceive the Lion to be near them, they set upon him with great barking, but especially when they know themselves backed with the help of a man, they do not cease to bite the Lion in his hinder parts and tail: and although the Lion doth oftentimes threaten them with his frowning and terrible countenance, turning himself this way and that way, that he might tear them in pieces, notwithstanding the Dogs looking warily unto themselves, are not easily hurt by him, especially when the hunting Horse-man following them, doth seek the belt means to flay his Dart in the Lion, when he is beaten of the Dogs, for they are wise enough to consider their own help. But the Lion then flyeth away, to fear left the barking and howling of the Dogs, may bring more company both of Men and Dogs unto him. And if he can he betaketh himself nighly unto some tree, that he may enjoy the fame for a place of defence for his back, then turning himself with a scornful grinning, he fighteth with all his force against the Dogs. But the Hunter coming nearer upon his Horfe, refeth not to throw Darts at the Lion until he kill him: neither doth the Lion feem to feel the force of the Darts until he be flank, the Dogs do unto him so great hurt and trouble.

If a Lion be seen in the time of hunting, being ashamed to turn his back, he doth a little turn away himself if oppressed with a multitude: but being removed from the sight of the Hunters, he doth hastily prepare for flight, thinking that his fame is cleared by concealing himself; and therefore knoweth that the Woods cannot give testimony of his fear.

He doth want in his flight the leaping which he useth in pursuing either Beasts He doth craftily difsemble and abolish his foot-steps to deceive the Hunters: Pollux affirmeth, that if a Hunter do fight against any wilde Beasts, as a Bore, he must not trifle with his legs wide abroad, but keep them together within the compass of a foot, that he may keep his ground steadfast and sure, even as the manner is in Wrestling: for there are some wilde Beasts, as Panthors and Lions, when they are hunted, and are hindered in their course by their Hunters, if they be any thing near them, do presently leap upon them. But the stroke which is given ought to be directed or levelled right against the breast, and the heart, for that being once stricken is incurable. Xenophon faith, in his Book concerning hunting, that Lions, Leopards, Bears, Pardals, Lynxes, and all other wilde Beasts of this fort which inhabit Defert places (without Greece) are taken about the Pangeean Mountain, and the Mountain called Cyrtus, about Macedony: some in Olympus, Myliss, and Pindus: some in Mytia above Syris, and in other Mountains which are fit for the breeding and nourishing Beasts of this kinde. But they are taken partly in the Mountains by poyon of Wolf-bane; for the sharpness of the Region (because that can admit no other kinde of hunting as by Nets and Dogs) but mingling this with that thing in which every wilde Beast delighteth; the Hunters do call it unto them near the Waters.

There are some also which do descend down in the night time, who are taken in regard that all the ways by which they should ascend unto the Mountains are flopped with Hunt-men, and weapons, neither being so excluded, are they taken without great peril unto the Hunt-men.

There are some also which make pitfalls or great ditches in the ground to catch Lions, in the midst whereof, they leave a profound lofty pillar, upon which in the night time they tie a Goat, and do heap the pitfalls round about with boughs, left that it might be seen, leaving no entrance into the fame. The Lions hearing the voce of the Goat in the night, do come unto the place and walk round about the hedge, but finding no place where they may enter, they leap over and are taken.

Oppianus doth describe three manner of ways of hunting Lions, which also Bellarminus doth, but he doth describe them my minde very unskillfully.

The first of them is rehearsed out of Xenophon; we will notwithstanding also add thereunto Oppianus: for he doth in very both of them. The second is made by fire. The third by whips or scoures.

The first manner of way is therefore as Gillius for the most part translating out of Oppianus; in this fort: Where the Hunters of Libya do observe the beaten path or way of the Lion going out of his Den unto the Water, they make a broad and round Ditch near unto it, in the midst whereof they raise up a great pillar, upon this they hang a fucking Lamb; and compasse the Ditch round about with a wall of stones heaped together, left that when the wilde Beest cometh near he perceive the deceit. The Lamb being fatneth upon the top of the pillar, doth incite the hunger-flaven heart of the Lion by his bleating, therefore coming near, and not being able to stay longer about the wall, he doth prefently leap over and is received into the unlooked for Ditch, in which being now included, he vexeth himself in all the parts of his body, lifting himself up rather at the Lamb, then to go forth, and being again overthrown, he maketh force again. These things Gillius affirmeth.

The other manner of hunting by fire, is the device of the people which inhabit about the River

The secon, Equorates, who hunt Lions after this manner: The Hunters some upon strong Horfes, and some upon gray Horfes, with glafen eyes, which are mott swift, and which dare only meet Lions, when other Horfes dare not abide the fight of Lions: other being on foot do fet the Nets. Three of them being placed in the shores remain to underprop the Nets, with flys and flakes: one in the middle, all the rest in both the bendings or turnings of the fame, so that he which is in the middle can
can hear both the other at the farther ends: some setting round about in warlike manner, holding pitchy fire-brands in their right hands, and bucklers in their left, for with those they make a very great noise and clamor, and with thwelling their fire brands, put the wide Beasts in an incredible fear: Therefore when all the Horfe-men being spred abroad invade the Beasts, and the Foot-men likewise do follow with a great noise: the Lions being terrified with the crying out of the Hunters, not daring to refit, give place: and all for fear of fire, as of the men, they run into the nets and are taken: like as fishes in the night time, by fire are compell'd and driven into the nets of the fifters.

The third manner of hunting is done with leffer labour: that is, four strong men armed with shields, and fortified all over with thongs of leath'rs, and having helmets upon their heads, that only their eyes, noses, and lips may appear, with the brandishing of their fire-brands, ruffle in upon the Lion, and the Lion, lying in his den: he not bearing this indignation, with a gaping and open wide mouth, the lightning or burning of his eyes being inflamed, breaketh forth into a great roaring, and with such celerity ruleth upon them, as if it were some form or tempest: they with a firm and constant courage abide that brute: and in the mean while that he coveth to catch any of them in his teeth or claws, another of them, provoking him behind, doth him in, and with a loud noise or clamour doth vex him: then the Lion in heat leaving the first which he had taken in his mouth, turneth his back upon the hinder: each of them in several parts do vex him; but he breathing forth warlike strength, runneth here and there, this man heleaveth, that he snatcheth up on high: at the length being broken with long labour, and weary'd, foaming in his mouth, he lyeth down straight upon the ground, and now being very quiet they bind him, and take him from the earth as if he were a Ram. I do also finde that Lions are intrenched in inares or traps, bound unto some pole or pike, nigh unto some narrow place, by which they were wont to pafs.

But 

Pliny, that in times past it was a very hard and difficult manner to catch Lions, and that the chiefest catching of them was in Ditches.

In the Mountain Zæronius in Africa, the strongest men do continually hunt Lions, the bell of which being taken, they fend them unto the King of Feffe: and the King ordereth his hunting in this manner: in a very spacious field there are little hutches built of that height as a man may stand upright in them: every one of these is shut with a little gate; and within flangeth an armed man, the Lion being raised, and forced to that place the dores being open, then the Lion seeing the dores open, runneth with great force, which being shut again, he is provoked to anger: Afterward they bring a Bull to combat with him, where beginneth a cruel fight, in which, if the Bull shall kill the Lion, the honour of that day is finisht; but if the Lion overcome him, all the armed men, which in number are almoft twelve, come forth to fight against the Lion; some of them having Boar-spears of fix cubits long: but if the armed men shall seem to overcome the Lion, the King commandeth the number to be diminished, and if on the contrary, the armed men be overcome, the King with his Nobles sitting in an high place to fee the hunting kill the Lion with CROFS-BOWS; but it cometh oftentimes to pafs, that every one of them is slain before the Lion.

The reward of those which combat with the Lion, is ten golden Crowns, together with a new garment: neither are any admitted unto this fight, except they are of a moli pregnant and valorous strength, and born in the Mountain Zæron, but those which do fight of all provoke and give on-fer to the Lions, are born in the Mountain Zæronius.

To conclude this discourse of the hunting of Lions. If it fortune that he be followed with men and Dogs, yet in the plain fields he never mendeth his pace, as some writers affirm, oftentimes turning about and looking upon his pursuers, as if they did dare their approchment, and to give defiance unto all their pretences: yet having gotten the thickets, he looketh to his safety with his belt celerity and speed, so wisely tempering his fear before his foes, that it may seem a boldness, and so politicly when he thinketh no eye doth him, no longer dissembleth with himself, but runneth away like a fearful Hart, or Hare, laying down his ears, and striking his tail betwixt his legs, like a Cur-dog, seldome times looking behind him, but most irefully upon those that come before him, especially if he receive from them any wound, whereunto Horace alluded, saying:

Quid ut noverrca me intueris,
Aut ut petitas ferro bellus?

In his course he spareth no Beasts that he meeteth, but felleth upon it like a mad Dog, (except Swine) for he is afraid of their bristles: and if a man do not attempt to wound him, he will snatch at him, and overthrow him, but do him little harm; according to these verses of OVID:

Corpora magnanimo satie est prostrasse Leoni;
Pagna sump famen, cum jacet bolis, habet.

He observeth most vigilantly the hand that woundeth him, and laboureth to take revenge for the evil turn, and so it remaineth in his minde, till opportunity send him his adversaries head: as may appear by this story following.
When *John King of Moors* (the Father of whom when he was a childe was brought in triumph) travelled through the Wildernefs with an Army of Souldiers, to repris certain rebels in one part of his Dominion, which had shaken off his government, and to settle them again in their first allegiance. There was a noble young Souldier in his Train, of the race of the Nobility, and not only very strong, but also well experienced in hunting, and by the way he with other of his fellowes met with a Lion, at whom he presently call a Dart, and gave him a fore wound, but not mortal; after the wound received, the Lion went away guilty of his hurt, and the young men did not profecute him, but went forward on their journey: After a whole year, the King returned homeward the same way, and his company that he carried with him, among whom was this young gallant that wounded the Lion: The Lion having recovered his hurt, and having his Den near the way and place of his harm, perceiving a return of the Army, went inumally among them, and found out the man whole hand had wounded him, and could not by any help of his officiates belayed from a revenge, but core the young souldier in pieces and departed away safe, for the residue seeing his rage, ran all away, thinking him to be some Devil in the likeness of a Lion.

After the taking of Lions, it followeth that we should intrest of their taming, and first of all, they which are tamed in their infancy while they are whelps, are most meek and gentle, full of sport and play, especially being filled with meat; so that without danger, a stranger may meet with them: but being hungry, they return again to their own nature, for as it is true (which Seneca laeth, *Leonibus manus magiilerreferit, cie ad tigrum funt quibus, this is to say; The Master of a Lion may put his hand in his mouth, and the Keeper of a Tyger may kiss him*, yet is it also to be feared, *Tigeb Lœnig, magnam feratitum innocent, aliquando submittitur, & cœm minime exsolutus*, *tigiz magist no texit.* Lions and Tygers do never leave off their wildefnes, although sometimes they yeeld, and seem to be submissive, yet upon a sudden when a man expecteth not, their malignant wrath breaceth forth, and they are exasperated.

Wherefore after they grow to be old, it is impossible to make them utterly tame; yet we read in divers stories of tame Lions, whether made fo from their luttering, or else constrained by the Art of fuch, fuch are thefe which follow: *Hanno* had a certain Lion, which in his expeditions of war carried his baggage, and for that cause the *Carthaginians* condemned him to banishment, for they said, *Male crebi libertas et cui in tantum estis et ferae,* it is not safe to truft fuch a man with the government of the Common-wealth, who by wit, policy, or ftrengt, was able to over come, and utterly to alter the wilde nature of a Lion: for they thought he would prove a Tyrant, that could bring the Lion to fuch meekness, as to wait on him at Table, to lick his face with his tongue, to smooth his hand on his back, and to live in his preffence like a little Dog.

The Indians tame Lions and Elephants, and let them to plough. *Onanarchus* the Tyrant of *Cattana* had Lions with whom he did ordinarily converse. In the Country of *Elymian* there was a Temple of *Adonis*, wherein were kept many tame Lions which were fo far from wildefnes, and ferceness, that they would imbark and fature the people that came in thereto to offer: Alfo if any one called them to give them meat, they would feme gently, and depart from them with quietnes. Likewise in the Kingdom of *Per*, in a plain called *Adebas*, there are certain Forrells wherein live tame and gentle Lions, which if a man meet, he may drive away with a small ftick or wand withont receiving any harm. And in another region of *Africk*, the Lions are fo tame, that they come dailiy into Cities, and go from one freet to another, and eating bones withoile cleft preffence neither women nor children run away. Likewise in many parts of *India*, they have Lions to tame, that they lead them up and down in leams, and accout them to the hunting of *Boars*, *Bulls*, and wilde *Affes*, like Dogs; for their nofes are as well fittet for that purpofe, as the fokt Hounds; as we have shewed before of the King of *Tartary.*

And the belt means of taming them is the rule of *Apolonius*, which he faid was the precept of *Phaeton*, which is, that they be neither handled too roughly, nor too mildly, for if they be beaten with stripes, they grow over fubborn; and if they be kept in continual fatteries, and ufed over kindly, they grow over proud: For they held opinion, that by an equal commiffion, of threatening and fair speaking, and gentle ufage, by which means they are more eafily brought to good defired conditions: and this wisdom the Ancients did not only ufe in the taming of Lions, but also in restraining of Tyrants, putting it as a bridle to their mouths, and a hock in their noftiles, to reftain them from fury and madnefs.

*Allartus* faith, that the belt way to tame Lions, is to bring up with them a little Dog, and oftimes to keep the fame Dog in their preffence, by which discipline the Lion is made more tractable to the will of his Keeper. It is faid of *Heligobulus*, that he nourifhed many tame Lions, and Tygers, and other fuch noifome beasts, calling himfelf their great mothere; and when he had made any of his friends drunk in the night time, he fhu them up together (who quickly fell asleep) through the heavines of their heads: who being fo asleep, he turned in amongst them some of his forefuid children, both Lions, Bears, Tygers, and fuch like; at whole preffence in the morning, his drunken friends grew fomewhat amazed, that oft times, some of them fell dead for fear: and to conclude, there is a R injury in a certain Epigram, of a Lion wandering abroad in the night time, for the avoiding of froft, and cold, came into a fold of *Goats*: at the fight wherein of the Goat-heards were much afraid, calling in question not only the lives of the flock, but also their own; because every one of them, thought himfelf bound to fight unto death in defence hereof: whereupon

*Ode taming of Lions.*

*Eliasen.*

*Leo Afer.*

*Elisian.*

The belt means to tame Lions.
according to the manner of men in extremity, they all made their prayers, desiring God to be delivered from the Lion, and according to their wishes it came to pass; for after the Lion had lodged in the warm fold of Goats a whole night, he departed in the morning, without doing any harm to man or beast; wherefore I take this Lion to be of the same kind, and as in all beasts there are differences both of natures, and inclinations, as we may see in Dogs, some of them being more apt after the manners of men, and to be ruled by them others; so also I see no reason, but that in the fierce, and royal nature of Lions, some of them should be more inclinable to obedience, subjection, and submission; whereunto being once won, they never afterwards utterly flake off their vassalage and yoke of them which overcome them.

From hence it came, that there were so many spectacles at Rome; as first of all Lucius Sulla, in the office of his addity, or oversight of the Temple, brought into the Roman circle or ring, one hundred great maned Lions loose, which always before that time, were turned in bound or muffled. And King Bocchus sent so many valiant Archers, and Dart-casters, to fight with them and destroy them. After him Pompey the greatest, in the same place brought in a combate, confounding of six hundred great Lions, and among them there were three hundred fifty maned Lions: Also he instituted hunting of Lions at Rome, wherein were slain five hundred. Cæsar when he was Dictator, presented in spectacle four hundred Lions. Quintus Scævola cauèd Lions to fight one with another.

But Marcus Antorius, in the civil War, after the battle of Pharsalia, did fight all of cause Lions to be yoked, and draw the Chariot of triumphs; where he himselfe fate, with one Cebes in a jeller: which thing was not done, without shew and observations of a prodigious and monstous action, and especially in those times, wherein it was interpreted, that as the noble spirits of those Lions were so much abased, and vassalaged, in stead of Horfes to draw a Chariot, they being in nature the King of Beasts, so it was feared that the ancient Nobility of Rome, the grave Senators, and gallant Gentlemen, Commanders of the whole Common-wealth, should in time to come, through civil wars, and pride of the people, be deprived of all honour, and brought down to the basest offices of the whole State. Antominus Pius nourished a hundred Lions. Domitian the Emperor, called for Aciusus Cabis the Consul, into Albania, about the time that the games were celebrated, for the prosperity of youth and young men, which were called Jovemates, to fight with a great Lion, and Aciusus coming wildy into the combate, did ealy kill him. In ancient time when Lions could not be tamed, they did discern them by their teeth, and nails, and so taking it as the flinging and playon from the Serpent, and the weapons wherein consisteth all their strength, they were without all peril, lent into the publick Assemblies, at the time of their general meetings, and great feasts. Martial hath an excellent Epigram, of the great Lion before exhibited in publick spectacle by Domitian, wondering that the Marsianus and Aciusus shepheards were so afraid of this Lion and made as great a noise, and murmure, about his presence, as if he had been a heard of Lions, and therefore he commendeth the Lybian Countrey for breeding such a beast, and withal expresseth the joy of the shepheards for his death, as are shown in these verses following:

```
Auditor quantum Mæphla per avia murmur
Lamvuoque quitas fyva Leo furi;
Fælidas aevitius ad pleta magalia pafior
Cum rasscet tarnos, & fine mente pecus;
Tantus in Auentia fremmit modo terror arena;
Quis non esse gregem credere? unus erat;
Secundus tremere inti quoq; jura Levites;
Cui diadema darer marnore pila Namus.
```

```
O quantum per colla decus, quem ferrar honorem
Aurea baneate cum fexi unda jube;
Grandia quam decusit laetum veninula pelus;
Quanta; de maga gandea morte sult?
Unde tuis Lybio felix gloria felix?
A Cybeles unguia venerat ille jugis?
Annegius Herculis gemenica mist ab ~bro
Hanc tibi vel fater, vel patre ipsa fera?
```

We have shewed already that Lions although never so well tamed, become wilde again, and that through hunger, which breakeath through stone walls, according to the common proverb, and therefore maketh them to destroy whatsoever cometh in their way, according to these verses of Virgil:

```
Impassus eum plena Leo per ovilia turbans,
(Snadat eum velena famae) mandiqt; trabitiq;
Molle pecus, mutuam metus, frtem ore cruento.
```

```
Such a one was the Lion of Boresius Duke of Ferrara, who being in his cave would devour Bulls, Bears, and Boars, but with a Hare or little Whelp he would play, and do them no harm; at last leaving all his tamable nature, he destroyed a young wench, who oftentimes came unto him and stroke his mane, and allo to bring him meat and flowers, upon whom Struze made these two verses:
```
Suffult insipratus cui quandam plurima debens
Petendijs jubis, & fora collo dabas.
```

The like unto this allo, was the tame Lion that Martial spekeoth of, who returning to his first nature, destroyed two young children, and therefore he faith juftly, that his cruelty exceedeth the cruelty of war; the Epigram is this:

```
Verbus
Having thus spoken of the taming and taking Lions, it also now followeth to entrest of the length of their life, and the diseases that are incident unto them, with their several cures: first therefore, it is held that they live very long, as threefour, or fourfour years: for it hath been seen, that when a Lion hath been taken alive, and in his taking received some wound whereby he became lame, or lost some of his teeth, yet did he live many years; and also it is found that some have been taken without teeth, which were all fallen out of their head through age, and **Elianus** faith, that a Lion and a Dolphin, do both confume away through multitude of years. The sicknefles wherewithal they are annoid, are not very many, but those that they have are continual: for the most part their intails or inward parts, are never found, but subject to corruption, as may appear by their fritile, and also by their biting, and scratching of their nails; for a man lightly touched by them at some times is as much poyfoned, as the biting of a mad Dog: also by reason of his extreme hot nature, every other day he suffereth one sicknefe or other, at which time he lyeth prostrate upon the earth, roaring not all the day long, but at certain hours, and in his wrath he is confumed through the heat inclofed in his own body. And in his belt effate he is afflicted with a quartane Aqué, even then when he feemeth to be in health, and except this difeafe did refrain his violence and malice by weaking of his body, he would be far more hurtful to mankind then he is: and this is to be understood, in the Summer time he falleth into this difeafe fometime at the fight of a man, and is cured by the bleed of Dogs, according to **Albertus** and Physiologus, when he feeleth himself sick, through abundance of meat, he falleth a vomiting, either by the strengthe of nature, or elle helpeth himfelf by eating a kind of grasfs, or green corn in the blade, or elle rapes; and if none of their prevail, then he faileth, and eateth no more till he finde eafe; or elle if he can meet with an Ape, he devoureth and eateth his flesh, and this is the principal remedie and medicine which he receiveth against all his difeafes, both in youth and age; and when he groweth old, being no more able to hunt Harts, Boars, and fuch beasts, he exerciseth his whole strengthe in the hunting and taking of Apes, whereupon he liveth totally; and for these caufes, there is a comparifon betwixt the Lion and the Dolphin, in **Elianus**. **Léonis, & Delphino multa sunt communia, uterq; imparant, ille terrerit, hic aquatibus deliri, fen- nelibus ambo tabescunt, & cum fum in agratia, illi terreris finea medetur, hic marina que; finea reme-dio ift; that is, the Lion and the Dolphin do agree in many things, both of them are Kings, this rul eth over the beasts of the Earth, and that over the beasts of the Sea; both of them confume through age, and long life; and as the Lion recovereth by eating an Ape of the Sea, fo is the Dol-phin cured by eating an Ape of the Sea; and thus much for the diseafes and cures of Lion.

Unto this natural discourse of Lions belongeth the use of their parts, both outward and inward, and also the pictures and ftructures erected for their fingular monuments. First therefore with the skins of Lions were the ancient **Mores** and **Barbarians**, inhabiting betwixt the Mountain Caucwus, and the River Copheus, and fo they appeared to **Apollonius**, and his companions; as also in the skins of Pantheres, with both which, they did not only clothe themselves in the day time, but also slept upon them in the night: and therefore **Hercules** is pictured wearing a Lions skyn: that the world might be admonifhed, what was the antient attire of their fore-fathers. **Virgil** describeth **Aventinus** covered with a Lions skin in this fort:

---

**Quem sylva Leonis**

\*Pellis obit tum praefulgens unguibus anores.*

**And again:**

\*Ipse pedes tegmin torquenti immune Leonis, Terribilis impexum feta, cum dentibus albis, Indutus capitis,* &c.

---

**And Aeneas** sleeping upon a Lions skin, saying

---

\*Futiq; infernor pelle Leonis.*

**And elsewhere,**

\*Præcipuum; tor, & villof pelle Leonis*  
\*Accepit Aeneas.*

---

**Adrasius** was commanded by the Oracle to marry his Daughters to a Boar and a Lion, when they came a wooing unto them. Whereupon **Tydeus** came in a Boars skin, and **Panhintes** in a Lions skin, unto whom he gave his Daughters in marriage, taking it to be the meaning of the Oracle, that men clothed in these skins should be the Husbands of his Daughters. From hence came the common proverb: \*Indutis me Leonis exuviam,* you put upon me a Lions skin, to significie a man that taketh upon him more then he is able to perform, and spend more then their condition will afford, and the beginning of the proverb was taken from **Hercules**, who clothed in a Lions skin

---

**Of the Lion.**
skin as we have said before, and baring in one hand a Club, and in the other a Bow, in which attire he went down to Hell to fetch out Cerberus.

Afterwards there was one Bocclus, which clothed with the same weed, and armed with the same weapons as like fort, in the imitation of Hercules, went down to Hell, to hear the famed disputations betwixt the two Poets, Euriptides, and Aeschylus, at the time when of Hesiodus laughing, told him, that such apparel did nothing at all become him, because he was wanton, tender, and enfeemled. For it is not available to have a rich ceremony, and that the true substance; a glorious outside, and a shameful inside; the armour of a Champion, and the heart of a base Coward; the outward show of holiness, and the inward love of profaness. Others do think that the proverb was taken from that Aes called Aesopus Cynamus, who being weary of his servitude and bondage, flipt collar, and ran away into the wilde Woods, where finding by chance a Lion skins, he crept into it, and wore it upon his body. Under colour whereof he ruffled up and down the Woods, to the terorr of all the Beasts, both with his tail and his fearful voice; and the Cunners themselves, which had never seen a Lion, were not a little afraid of this counterfeit beast. In this fashion he domineered a good time, until at last there came a stranger to Come, who seeing the counterfeit personate Aes-lion by the way, having oftentimes seen both Lions and Aes, knew it for an Aes in a Lions skin; for if all other conjurers failed, yet this proved true, namely the length of his ears; wherefore he beat him well, and brought him home to his Mafter, before whom he pulled off the Lions skin, and then his Mafter knew him to be his Aes. From which Socrates concludes wisely, that no man ought to be afraid of outward greatnes, because though the Aes was clothed with a Lions skin, yet he was but an Aes. And that the skins of Lions was used in garments, the saying of Euripides the Locandermonian doth sufficiently prove; for when he was blamed for his outward pomp, whereby he beguiled others, therefore condemned for foolish hypocrisy, he made this answer, *Siue Leo trium perrute pellic non potest, vulpinam effusse decerti, every man ought to have two futes of apparel, one of a Fox, and another of the Lion. For whither the Lions skin cannot come, the Fox will creep, and where the Fox cannot come, the Lion can. Clothes wrapt in a Lions skin killeth moths: also a mans body adorned with the fat of a Lion mingled with Garlick, so as the favour of the Garlick may overcome the Lions greatful, he shall never be molest with Wolves. Alfo if the folds of Sheep be compassed about with the melted greatful of Lions, there is no Wolves, nor ravishing beaws shall annoy the flock. And fo great is the fear of Lions to Wolves, that if any part of a Lions greatful be cast into a Fountain, the Wolves never dare to drink thereof, nor to come near unto it. Alfo Phiny affirmeth, that if an Amulet be made of Lions greatful, no man shall be harmed, wounded, or killed, by treachery or deceit: but you must understand, that this was an invention of the Magicians or Wise men, that by such pretences and promises of great matters, they might insnuffe themselves into the favour of Princes and Noble men, and so make fools of the world; and therefore they preface the fat which is taken from betwixt the eye lids, or from the right part of their mouth or teeth, and the hairs from the neather chap. It is likewise affirmed, that a man annoited all over with the bloud of a Lion, shall never be destroyed by any wild Beast.

There is an herb which Democritus calleth Helianthe; growing in the Maritime Mountains of Cilicia, and Lycia, therewithal the fat of Lions decocted with Saffron, and Paulm Wine, with which all the Kings of Persia were annoited, to make them beautiful bodies to look upon: And above all other things, the Magicians prescribed this composition, to make a man invincibl: the tail and head of a Dragon, the hairs of a Lions fore-head, and the marrow of his bones, the snume or white mouth or a conquering Horse, bound up together with a Dogs claws in a Harts skin, with the nerves of a Hart or Roe. The dung of a Lion drunk in Wine, maketh a man for ever more to abhor Wine.

It was also wont to be obserued, that when Lions forsook the Mountains and Woods, to come and live in fruitful and fertile foils, it did fore-shew some great drought; and the like divination did Agras the Mother of Pericles make upon her dream, when she was with childe, for the thought she brought forth a Lion, and so in short time after she brought forth Pericles, who was a valiant man, and a great Conqueror in Gracia. The fight alfo of a Lion as a man travelleth by the high ways, is very ominous, and taken for an evil figne. There was alfo a Propheye given out by Pythias, concerning Osipileus, the fon of Acteion, which fayd in this manner;

*Conspit in petris aqua emicura Lemen*  
*Rhabulium, fevum, genua & qui multa refolvat.*  
*Hec bene nunc animi verfate, Cornitiba prolis*  
*Quo collit pulchrum Pallatium, atque Cornimum.*

A monster live a Lion. The Images and several Attributes of Lions.

In the year of our Lord 1274. there was a certain Noble woman in the Bithoprick of Kefhiner, which brought forth a childe like to a Lions in all parts, but it had the skin of a man: Unto this diſcourſe I may add the Images of Lions, both in Temples, and also upon ﬁelds; and firt of all in the Temple where the shield of Agamemnon hung up, (as Pausanias writeth) there was the picture (f. e.) drawn with a Lions head, because as the Lion fleapeth little, and in his sleep his eyes be open; for in the condition of Fear, for we have shewed already, that the Lion when he sleepeoth hath his eyes open, and when he waketh he flurreth them, and therefore the Ancients did symbollically picture
Of the Lion.

picture of a Lion upon the doors of their Temples, and upon the Ships also, in the fore-part of them, they ingraved the figure of Lions, according to this saying of Virgil:

Aeneis puppis
Prima tenui rostro, Phrygios subjecdai Leones.

It was also a usual custom to picture Lions about Fountains and Conduits, especially among the Egyptians, that the water might spring forth of their mouths; Quamiam Nilus avum Aegypti novum aquam invexit, sed transeunte Leones; because that Nilus did overflow the fields of Egypt, at what time the Sun pass’d through the sign Leo. Therefore also the River Alpheus was called Leontius po- ros, the Lions, because at the heads thereof, there were dedicated the pictures of many Lions. There was a noble Harlot called Leans, which was acquainted with the tyrannies of Har- modius, and Aristogiton; for which cause she was apprehended, and put to grievous torments, to the intent she should disclose them, but the endured all unto death, never bewraying any part of their counsel: After her death, the Athenians devising how to honour that vertue, and because she was a Harlot or common Curtizan, they were not willing to make a statue for her in the likeness of a Woman, but as her name was Leans, that signifieth a Lioness, so they erected for her the picture of a Lioness; and that they might express the vertue of her ferrelee, they cau’d it to be framed without a tongue. Upon the grave of Lairs, there was a covering containing the picture of a Lion, holding a Ram in his fore-feet by the buttocks, with an inscription that a Lion held the Ram; so do Harlots hold their lovers, which Alciatus turned into this Epigram:

Quid sculptus fibi vult aries, quem parte Leans
Unguis abpreensum postieriora tenet?
Non alter captio quod & ipsa tenet amantes,
Vir gregis efl aries, clausa tenetur amantis.

There was also a Lion at Delphi, which weighed ten talents of gold; and at the entrance of Thespis upon the Tombe of Leonidas the Captain of the Spartains, there stood a Lion of stone: Upon the steps of the Capitol of Rome, there were two Lions of black Marble touch-flone. And the Cyziceni ingraved upon one side of their money the picture of a Lion, and on the other side the face of a woman. King Solomon built his Ivory Throne upon two Lions of Brass; and upon the steps or stairs ascending up to that Throne were placed twelve Lions, here and there. And from hence it came, that many Kings and States gave in their Arms the Lion, Rampant, Passant, and Regardant, distinguished in divers colours in the fields of Or, Argent, Azure, and Sables, with such other terms of Art. The Earth it self was wont to be expressed by the figure of a Lion; and therefore the Image of Aeternus was supported with Lions. Oehele the famous Goddess of the Mountains was carried upon Lions. And it is signified that the Curtizan, which nourish’d Jupiter in Creet, who was committed to them by his mother Rhea, by the anger of Saturn, were turned into Lions, who afterwards by Jupiter when he reign’d, were made the Kings of beasts, and by him enjoyed to draw the Chariot of his Mother Rhea, according to this verse;

EI jujde currum Domine subiere Leones.

There is a constellation in Heaven called the Lion, of whom Germanicus writeth in this sort, that he is the greatest and most notable amongst the figures of the Zodiac, containing three stars in his head and one clear one in his breast, and that when the Sun cometh to that signe which happeneth in the month of July, at which time the vehement heat of Summer burneth the earth, and dryeth up the Rivers. And therefore because the Lion is also of a hot nature, and seemeth to partake of the sublimate and quantity of the Sun, he hath that place in the Heavens. For in heat and force he excels all other beasts, and as the Sun doth all other stars.

In his breasts and fore-part he is most strong, and in his hinder-part more weak, so is the Sun, encreasing until the noon or fore-part of the year, until the Summer, and afterwards seemeth to languish towards the setting, or later part of the year called the Winter. And the Lion also seemeth always to look up with a fiery eye, even as the Sun which is patent with the perpetual and infaetical flight upon the earth. The Lion also is a signification of the Sun, for the hairs of his mane do resemble the streamings of the sun’s beams, and therefore this constellation is figured with the same Epithets that the Lion and the Sun are, as heat-bearing, seifive, ardent, ardent, calent, hot, flam- mant, burning, Hercules, mad, horrible, dreadful, cruel, and terrible. It is signified of the Poets, that this Lion was the Nemean Lion slain by Hercules, which at the commandment of Jove was fostered in Arcadia, and that in anger against Hercules after his death, she placed him in the heavens.

To conclude this story of the Lions, it is reported of the Devils called Omphali, that they flew themselves sometimes in the shapes of Lions and Dogs, and the Dog of Serrpis, which was signified to have three heads, on the left side a Wolves, on the right side a Dogs, and in the middle a Lions. We have shewed already, that the people called Aempraio, did worship a Lioness, because
The History of Four-footed Beasts.

Lions nourished in Temples; & worhipped, because they killed a Tyrant. And the Egyptians built a City to the honor of Lions, calling it Leontopolis, and dedicating Temples to Vulcan for their honor. And in the porches of Helios, there were common thimpes for the nourishing of Lions.

As in other places where they are fed daily with Beef, and have also windows in their lodgings, with great Parkes and spaces allotted unto them for their recreation and exercises: with an opinion that the people that came unto them to offer and worship them, should see a speedy revenge through divine judgement upon all those that had wronged them by perjury, or broken the oath of fidelity.

To conclude, in holy Scripture we finde that our Saviour Christ is called the Lion of the tribe of Judah; for as he is a Lamb in his innocency, so is he a Lion in his fortitude. The Devil also is called a roaring Lion, because Lions in their hunger are mofk of all full of fury and wrath. And so I will conclude and end this story of Lions with that Emblem of Aletia, describing how little Hares did rejouyce and leap upon dead Lions:

\[ \text{Execlude maris piscibus fulsidae Hector,} \\
\text{Quy vites foftes victor ante suus;} \\
\text{Confrimere haud patis vocem infultus illius,} \]

\[ \text{Dum curtus \& pedibus metrre vincis parant.} \\
\text{Disfrabite ut hibitum est; facessi leone Leonis} \\
\text{Comellant barbam vel timidi Lepores.} \]

The medicines of the Lion.

The blood of a Lion being rubbed or spred upon a Canker, or upon a sore which is swelled about the veins, will presently and without any pain cure and ease the grief thereof. Whosoever doth anoint his body all over with the blood of a Lion, may safely and without any danger travel amongst any wilde beasts whatsoever.

\[ \text{Albiterius.} \]
\[ \text{Sextus.} \]

\[ \text{Alculeptor.} \]

The flesh of a Lion being eaten either by a Man or Woman which is troubled with dreams and fantasies in the night time, will very speedily and effectually work him safe and quietness. The same also being boiled or baked, and given to them which are drunke of their wits to eat, doth bring them safe and comfort, and renew their wits again; it is also very good for the pains of deafness or the ears. And being taken in drink, it helpeth those which are troubled with the shaking of the jounts or the Pallite.

Whosoever shall have those made of the hide or skin of a Lion or Wolf, and wear them upon his feet, he shall never have any pain or aches in them. They will also defend him that useth them from the Gowt, or swelling in the feet or leg. The skin or hide of a Lion is also very good for either Man or Woman which are troubled with the piles or swelling of the veins, if they shall but at some several times stir it upon it.

The fat of a Lion is reported to be contrary to poision, and venomous drinks, and being taken in Wine, it will by the fent expell all wilde Beasts from any one; and it doth also refit and drive away the fent or smell of Serpents, by which they follow men to destroy them. Whosoever doth anoint his body all over with the tallow or sweat of the reins or kidney of a Lion, shall by the fent and flavour thereof expell and drive away from him all Wolves, how greedy and ravenous soever they be.

A Man being thoroughly anointed with the grease of a Lion being melted, doth drive away from him and put to flight any living creature whatsoever, and also venomous and poifonous Serpents themselves.

If any wilde Beast be anointed with the tallow or sweat of a Lion which is dissoiled and clarified, he shall neither be troubled with the stinging of Flies or Bees. The fat or grease of a Lion being mingled with Oyl of Roses doth keep the skin of the face free from all blainings and blemishes, being anointed thereupon, and doth also preferve the whitenees thereof, and being mingled with Snow-water, doth heal any flesh which is burnt or scorched upon a man, and doth also cure the swelling of the jounts.

The sweat or fat of a Lion being mingled with other ointments, and anointed upon the places of either Man or Woman who have any blemishes in any part of their bodies, doth presently expell the same. The same virtue hath the dung or dirt of a Lion being mixed with the aforefaid unguent.

The grease of a Lion being dissoiled and presently again conglutinatet together, and so being anointed upon the body of those who are heavie and sad, it will speedily extirpate all sorrow and grief from their hearts. The same also being mixed with the marrow of a Hart and with Lettice, and so beaten and bruised, and afterwards mingled all together; it is an excellent remedy against the thinning of the Nerves and ffinews, and the aches of the bones and knuckles about the legs, being anointed thereon.

The grease of a Lion by it self only, mixed with a certain ointment, is also very profitable to expell the Gout. The same being mingled with Oyl of Roses, doth eafe and help those which are troubled dayly with Agues and Quarten Fevers. The same also being dissolved and powered into the ears of any one which is troubled with any pain in them, will presently free him from the same.
There is also in this Lion’s greese, another excellent virtue which is this, that if the jawbone of any one be swelled and anointed over with this greese being melted, it will very speedily avoid the pain thereof.

The fat or fewel of a Lion being melted and mixed with certain other things, and so mixed unto any one that is troubled with the wringing of the bowels, and bloody flux, in the same manner as a glytter is used, is commended for an excellent remedy for the same. The same also being mingled with a certain Oyl and warmed together, and anointed upon the head of any one, whose hair doth fled, or is troubled with the Foxes evil, doth immediately help and cure the same. The seed of a Hare being mixed with the fat of a Lion, and anointed upon the privie members of any one, will stir and incite them up to hui, how chait forever they shall be.

The fat of a Lion mingled with the fat of a Bear, and melted together, being anointed upon the belly, doth alay and affiige the hardneth thereof, as also any other pain or grief in the same.

The brains of a Lion, as also of a Cat, being taken in drink, doth make him mad unto whom it is given. The same being mingled with some small quantity of Oyl of Spike, and powered or distilled into the cares of any one which is deaf or thick of hearing, will very effectually cure the deafnes.

If the eye teeth of a Lion be hung about the neck of a young child before that he eat his teeth, and the beginning of his second or new teeth, they will keep him for ever from having any ait or pain in them. The heart of a Lion being beaten into small powder, and taken in drink, doth very speedily cure and heal those which are troubled with Agues or Quaetain Fevers.

The liver of the Lion being dryed, and beaten to powder, and put in the purest wine which is possible to be gotten, and so drunk, doth take away the pain and grief from any one which is troubled with his liver.

The gall of a Lion being taken in drink by any one, doth kill or poison him out of hand. But some do impute this venom to be in the gall of a Leopard. The gall of a Lion being mixed with pure water, and anointed upon the eyes of any one, will take away the blemishes thereof, and cause them to see clearly: and the fat of the Lion being added thereunto, is an excellent remedy against the Falling sickness. A very little part or dram of the gall of the Lion being put in wine and so drunk, will speedily help and cure those which are troubled with the Yellow Jaundice. The same disease is also cured by yellow Carets being flamed and put in wine, and so given in drink.

For the fores or blemishes in the eyes, the gall of a Lion being mingled with Hony, and so anointed upon them, is commended for a very special and effectual cure or healing. The gall of a Lion, a Bear, or an Ox being mixed with certain other unguents, is very much used for the extending or moving forward of conception.

The right stone of a Lion being beaten together with Roses, and so strained hard till some liquid juice or water doth proceed from them, and so taken in drink, doth make that party barren unto whom it is given: it hath the like effect in it, if it be eaten either roasted or broyled, or raw and bloody.

The fat which proceedeth from the privy or secret parts of a the Lion being put in a vellif made of Ivory, and so being temperately mollified, is commended for a very effectual and speedy means to hinder conception.

The dung or dirt of a Lion being dryed into powder, and mixed with some certain soft and easie ointment, with which any one may be easily anointed over all his body, doth drive away the blemishes and spots in the skin.

The hurts or fores which are bitten either by a male or female Lion, are so full of matter and filthy corruption, that the running thereof can be played and reprefed neither by lapping of clothes about them, nor by washing them by spunges: they are cured by the same means as the fores which are bitten by ravenous Dogs are, as I have before declared in the cures of the Hyenas.

The wounds which are made by the teeth of a Lion are very hurtful; for as much as the venome of their interior parts doth go into the wounds, and when the wounds are tied, the venome issueth from them into the things with which they are tied, and the same being again bound upon the wound, doth so infect it, that it can be cured by no other means but by the aforefaid medicine.

The biting of Lions and such like Beasts are so dangerous, in regard of their strength and fierceness, for they do not only bite, but also wrack and tear the wounds which they make with their teeth or nails. And thus much shall suffice for the cures of the Lion.
The History of Four-footed Beasts.

Of the **L I N X**.

The figure of a Linx once in the Tower of London, which was first described by Doctor Cay.

The names of the Linx, or as others write Lux, or Lux: among the Germans is named Lucibs, by making a name from the Linx; or Lucius: amongst the Italians is at this day called Lupo servoro, or Cervecio, being engendered betwixt a Hinde and a Wolf; and likewise amongst the Rhetians which speak Italian: and the Sabaudians, and the Dalmatians or Illyrians, Cerviri. But there was a certain Bohemian of late, which declared that the Linx as he conjectured, was called among the Illyrians, Kys, (and that it was called Lucibs among the Germans) but that amongst the Illyrians was lesser than the other, yet very like. The Spaniards do as yet call him by the Latin name Lince, even as certain Italian writers in their vulgar tongue, as Alumnus doth tell us. In certain places in Helvetia, and about Sedunae, they call him Thierwolf. Amongst the barbarous writers he is called by the name of an Ounce: which I do suppose to be a Panther. Fr. Alumnus doth say, that this Beast was called of certain Italian writers in the vulgar tongue, Lanza, some interpreting it to be a Lion's, some a Pardal, a Panther, or a Wolf, engendred of a Hinde and a Wolf.
Of the Linx.

381

Ounces do commonly seem to be called rather Linxes then Panthers; but although some late belles, writers do attribute the name to a Leopard or a lefser Panther, it seemeth notwithstanding corrupt from the Linx: for he is a creature very like him both in his craft and shape of his body, but a Linx hath his tail shorter, and his longer. Libardsbane doth kill Leopards and Linxes.

Avicenna.

These Figures were taken by Olaus Magnus, wherein the Linx pursueth a wilde Cat.

The Latin call this beast Lupus Cersevius, and Lynx of the Greek word Lux, from whence the German, ein Lufti: and it hath been believed, that the Latin name was given unto it, because they were ingendred between a Wolf and Hind, but there is no wise man that will suppone or be easily induced to believe, that Beasts of such holithy, and advers dispositions in nature, should ever ingender or suffer copulation together; and therefore I rather suppone that it is called Cersevius, either because it hunteth Harts and Hinds, or else because it imitateeth their young ones in the outward colour and spots in the skins.

There was a Beast (faith Pliny) which was called Chaos, and by the French, Rapflus, brought in publick spectacle by Pompey the great, out of France, which in shape refemblith a Wolf, and in spots a Leopard; and therefore I think that Chaos, Rapflus, and Lupus Cersevius, are divers names of one and the same wilde Beast, and yet by divers writers it is confounded with the Thers, or with the Panther, or with the Ounce.

But I cannot agree thereunto, seeing it is written by Pliny, that about the River Padus in Italy, there are certain Beasts called Lynxes, from whence cometh the Lynxew, which by Zosimus are called Lange, and by others Langwite. And Solinus alfo agreeeth thereunto, taking Lupus Cersevius, for a kind of Linx.

Some have faid, that there is a Beast called Lynceum, which Swedes and Varnus call Oruderchers: Two kinds of Linxes, and they say, that the eyes of it are the bell sighted of all the Beasts in the world. Oppianus maketh two kind of Linxes, one a greater, and hunteth Harts and great Beasts; the other a smaller, and hunteth wilde Cats and Hares. And first of all I will let down the description of this Beast, according as it was taken in England by that learned Phyfitian D. Cary, whose words I do here expreffe.

There is in the Tower of London, (faith Cary) a Beast which earath felfi, his whole body being of the greatness of a Lamb of two moneths old, having his head, mouth, eye, and nails like to a Cat. But concerning his beard and tail, his beard hangeth down on both fides, divided in the middle with fundry colours, the former being white, and the latter black; his tail is fhort and thick, being from the middle to the uppermoft part red, and to the lower part black; his eyes being yellow, the hair of the eye-lids obscurely waxing white, his ears ered upright, as the ears of a Cat, being replenifhed within with white hair, without covered with white and black, but fo that the upper part is black, the middle (for it is divided into three parts) be white, and the lower black again. Neither is it content to be ended in his own course, except alfo that his former parts, or the firthelf briskes or edges, and alfo his latter may be bended on the other fide, in like manner as the edges of the Priëls hat of the Gretean Church are folded a- mongt the Venetians.

In the top of his ears there are placed some black hairs, as it were a foteropor tuft. The colour of this beart in the outmoft parts ered, in the innermoft white, but sprinkled here with black spots, and almoft by rows, and there with spots somewhat lighter then the other, all his hair being for the moft part white all over: all his body, except the aforesaid spots, as it is in certain black skins of young Cowes. And on both the fides of his nofe there are four spots fet in order. In both his lips, as now we will declare: in his uppermoft lip there are five or odd rows, being of a very equal distance.
The History of Four-footed Beasts.

In the first row, and the upper, four; in the second, five; in the third, eight; in the fourth, five; in the fifth, there are four; and these also everyone in his order, having an equal distance. In the lower lip there are only seven more manifest and evident, being placed in two rows. In the first, four, to the very mouth of the lip; in the second after them three others; after these, other fewer but not placed with so certain and true order as the uppermost.

In the upper lip on both sides there are certain white hairs being rougher then those in Cats and Lions. His nose is somewhat of a pale red colour, being somewhat diffus, or apart from the rest it of his face on every side with a black line. Another line also doth divide the outermost part of his nose by length (as in an Ounce) but only being lightly lead by the top or highest parts, not improved higher by the lowermost.

The skin of his feet are exceeding hard, and his nails are hid in his feet (as the nails of an Ounce and a Cats are) neither doth he put them forth at any time, unless in taking of his prey as they do.

He doth climb wonderfully, so that what he may be able to do in that thing (either in his cave or den) nature her self doth teach. He is a quick-moving creature, and cannot stand still in a place, so that except (by more chance) the voice of a Wood-pecker in the basket of a certain Countryman (who came then only to see the Lions) had made him quiet and attentive, there had been no hope of the portraiture out the picture of his body. He being present he was most quiet; but he going away, he would never stand still: wherefore I was constrained to send my man after the Countryman to buy the bird, which being present, he stood very still until the businees was dispatched and the work absolutely perfected.

Our Countrymen call it Lucarnus, it is doubtful whether we should call it Leucus, or Lynx, in the affinity of the words. His skin is used by Noble men, and is sold for a great price. He is angry at none but them which offer him injury; his voice is like a Cats, when he would snatch away the food from his fellow. He is loving and gentle unto his keeper, and not cruel unto any man. So far Didor Cay.

Unto this description of Doctor Gaius, I may add another description that was taken by the sight of the skin of this Beast. The length whereof from the tip of the nose unto the very tail, was four spans and five fingers; and the length of the tail, four fingers; the breadth of the shoulder-blades of his back, and the top of his neck, was two palms fix fingers and a span; the length of his forelegs, a span and five fingers; and the length of his hinder-legs, a span and three fingers; the hair was very soft, but yet thick and deep. The tips of the hair upon his back were white, but in the tendermost parts they were red, and they are most white which fall downwards on both sides from the middle of his back.

In the middle they are more red and dusky, the middle of the belly, and especially the lower part is white, but both sides of it are white and red, and every where upon his belly there are black spots; but most plentiful in the bottom of the belly, and on both sides. The uppermost part of his neck, right over against his ears, hath great black spots, his ears are small, and not bigger then a little Triangle, in the edges they are black, although with the black hairs there are mingled some white. His head is mixed with black and white hair, which hair is great like to bristles. The teeth are most white, and the upper canine teeth hang over the nother the breadth of a finger, whereof six are small, and of those six two are the greatest, and all the residue are very small on the outer chap; and to conclude, all the teeth were like a common Weasils or Martil. His feet were very rough, being five distinct claws upon the fore-feet, and four upon the hinder, which claws were very white and sharp.

The tail was of equal bigness and thickness, but in the tip thereof it is black. These skins are fold for three Nobles a piece, and sometimes for six, and sometimes for less, according to the quantity of the skin and Country where in it is fold. And unto this description do Bellonius and Bonarius agree. For Bellonius at Constantinople lwe two Linxs, much like unto Cats; and Bonarius had oftentimes seen them hunted in Molunina, Lutonia, Polonia, Hungary, and Germany; but he commendeth above all the Linxes of Scotland and Swedia, as most beautiful, having Triangular spots upon their skins. But the Indian and African Linxes, he faith have round spots, tharp-brilty short hair, and full of spots all parts of their body, and therefore they are not so delicate as the Linxes of Europe, which with good cause he conjectureth to be the Linx that Flinck speakes of, and not unlike to that which is bred in Italy. There are Linxes in divers Countries, as in the forenamed Russia, Lutonia, Polonia, Hungary, Germany, Scotland, so also they are most abundant in Scandinavia, in Swedia, so also about Thysfia, and Hellympia: likewise in all the Regions upon the Atles, and in Sylva Martinus, they are also very plentiful in Ethiopia, in France and Italy, about the River Padus, and in the Island Capribarth, and thus having discoursed of their Country and proportion, whereby their differences and kinds may be discerned, we will leave every one of them to their particular, and proceed to the treatise and description of their general natures.

There is no great difference between their outward shapes and proportion, for both the smaller and the greater have bright eyes, divers coloured skins, a little head, a nimble and clear eye, and the (Albertus faith) that their body is longer then the body of a Wolf, but their legs shorter, mistaking the Linx for the Tybes. Their eyes stand forth of their heads very far, their tongue like the tongue of a Serpent, and Textor affirmeth that they have paps or udders in their Breasts, but surely he taketh Lynx for Sphinx.
Their meat goeth into the belly straight through the maw, without buying, and therein is a note of their insatiable voracity, for none but inatifiable Beasts or Birds are so affected, as in Birds, the \textit{Commanant}. It hath no ankle bone, but a thing like unto it; the nails are very long, as you may see in two of the former pictures, but he hideth them within his skin till he be angry, ready to fight or climb, or otherwise affected, as you may see by the picture of the Linx taken in the Tower of London.

The inward proportion and anatomy of their bodies is like unto a man, and therefore Galen giveth this leffon to students in Phisick, \textit{Præfert imum hominim quod hominimum usu differentum sunt in exemplo exsetere infirmus, fina non deret, aliquanet proximam deliquia, at si nulla omnino Simia repertaria, Cynocepbalum, vel Satyrum, vel Lincem, summatim communi quibus attinente extrema in digites quibus, differentes font; } that is to say, It is good to digest their bodies which are likest to a man, when one would instruct himself in Anatomy, and if he cannot finde an Ape, let him take a Baboon, a Satyr, or a Linx, and generally any creature, the exteriority of whole lines and joints are divided into five fingers or toes.

There be some that have thought, that Panthers, Pardurs, Linxes, or Tygers, had been all of the kind of Cats, because of mutual resemblance in the greatness and strength of their nails, in the distinction of their skins, which are party coloured and fair, having also a round head, a short face, a long tail, a nimble body, a wild mind, and get their meat by hunting: but here in I leave every man to this own bent liking and opinion: for when we have done our best to expresse their natures and several properties, it shall be idle to spend time about disputacion to what rank or order every beast ought to be referred. For every one that readeth our story, and seeth our pictures may either be satisfied, or else amend our labour.

The Linx therefore biteth most cruelly and deep, and therefore is accounted, \textit{Rapax animal, instar lapi, led callis}, a Beast as ravening as a Wolf, but more crafty; they get up into trees, and from them leap down upon very great beasts, and destroy them, being enemies both to men and beasts, and at their pleasure, according to necessity, let upon both. They are taken sometimes in Germany, in the Dutchy of Wurtzberg, and that it was once credibly affirmed, one of them leaped down from a tree upon a Cowtrey man, as he passeth under the same tree, but being weary, and having an Ax on his neck, received her on the thirp edge thereof, and so killed her, otherwise she would soon have killed him.

They live in the mountains also, where they are killed by poifon, or else hunted by armed men on Horsfe-back, and included with multitudes, for their hunting is perilous; and therefore they must be inclosed with great company. Some take them with ditches, as we heard before Lions were taken; others in snares or guns laid upon the rocks, and stones, and whenever they are hunted with Dogs, they run directly to the woods or to the next trees, wherein they are killed by gun flor.

In the Summer time they are very weak and live among the Rockes, never straying far from their own lodging, hurting no man till the Autumn. They hunt wilde Goats, whom they follow from Rock to Rock, leaping as fast or slower then the Goats. They hunt also wilde Cats and Hares, and some other little Beasts; but the greatest Linxes hunt Haris and Alves, and their manner is, as we have said already, to get up into trees, and there to lie in wait for their prey; until they epy it under the boughs, and then suddenly leap into the neck thereof, whether it be a Man or a great Beast, wherein they fix their claws so fast, that no violence can shake them off, but with the thorns of their teeth, bite into the skull, and eat out the brains, to the utter destruction of the Man or Beast, whomsoever they light upon, but if it be a small Beast, they eat the whole body thereof, and not only the brains.

Yet this is a wonderful secret in their nature, that although they be long affected with hunger, yet when they eat their meat, if they hear any noife, or any other chance caufe them to turn about from their mea, out of the sight of it, they forget their prey notwithstanding their hunger, and go to seek another bootie, never remembering that which they had before them, nor yet return back again to eat thereof. The voice of this Beast is called by a special word in Latin, \\
\textit{Oroso,} or \\
\textit{Corcor,} which I may English Croaking, or Whining, for the voice thereof is not great, and therefore the Author of Philonela, faith, \textit{Dum Linces arcando fremunt, usus fumus usque; } While the Linx croaketh, the wilde bear whineth, and \textit{Arctius} faith, \textit{Corcorum vocis lapis Corvus; } to croak is the voice of a Linx. The voice of Linxes.

It is thought that of all Beasts they see most brightly; for the Poets saigne, that their eye fight pierceth through every solid body, although it be as thick as a wall; yet if you offer unto it any thing which is transparent, it is much offended, and sometimes blinded, but I cannot tell, whether the light be attributed to the Linx truly according to nature, or fabulously in imitation of the Poetical fiction of \textit{Lynx}, of whom it was said in ancient time, that he saw through stone walls, of whom \textit{Horace} writeth thus:

\begin{quote}
\textit{Si pennis aculea, quantum contendere Linxus,}
\textit{Nun tamendico coruscans lippus inangis.}
\end{quote}

\textit{Marcus Tullius} also faith in this manner, in the admiration of \textit{Lynx} eye-fight, as though darkness \textit{Orpheus}, did not hinder it, \textit{Quis est tam Lynxus qui in tanta terribi nil obsolet? } \textit{Apollonius} faith, that so great

\begin{quote}
\textit{Marcus Tullius also faith in this manner, in the admiration of Lynx eye-fight, as though darkness Orpheus, did not hinder it, Quis est tam Lynxus qui in tanta terribi nil obsolet? } \textit{Apollonius} faith, that so great
\end{quote}
great, and was the perfection of this man eye-light, as he was believed to see perfectly down into the earth, and what was done in Hell. Plutarch faith, that he could see through trees and rocks. Pausanias writeth, that he was a King, and raigned after Danaus. Pindarus writeth, that Idas and Lynceus were the sons of Aphareus, and that a contention growing betwixt Idas, and Caflor, and Pallas at the marriage of Helen, because they twain would have ravished Phoebe and Lycus, the wives of Idas and Lynceus, Idas did therefore slay Caflor, and afterwards Lynceus slew Pallas when he fpyed him like under an Oak, from the mountain Lyg LONG. Wherefore Jupiter flew Ides with lightning vp, and placed Calli and Pallas in heaven amongst the stars. There was another Lynceus husband of Hypereuryphora, Daughter of Danaus, which Danaus having commanded all his Daughters in the night time to kill their Husbands, the only spared her husband Lynceus. But the trutl is, that Lynceus of whom there is so many fables of his eye-light, was the firit that found out the mines of Gold, Silver and Braffe in the earth, and therefore fimple people seeing him bring Gold and Silver out of the earth, and coming now and then upon him while he was digging deep for it, using the light of Candles which he never brought out of the pits, they foolishly imagined, that by the light of his eyes he was firit of all led to seek for thefe treasures, and from hence came the common proverb, Light of their eye-light, for a man of excellent eye-light. And to conclude, others fay, that Lynceus could see the new Moon the fame day or night that he changed, and that therefore the fame of his eye-light came to be celebrated, because never any mortal man faw that light, himself excepted. And from these fables of Lynceus came the opinion of the singular puflicanufity of the Bealt Lynx: of whom as I faid before, as the light is very excellent, and to fo exhaling men (as Go Provincial) like as is alfo the fight of Eagles, fo I do not hold any fuch extraordinary and miraculous fenfe to be in this Bealt, after any other manner, then the Poets did fay it to be in Lynceus, except as before faid, Omnne imbexline fanum cernit pastisai, fialcarum Q Lynce ocumibus confervatur. And therefore the proofere before fpoken of, may as well be applied metaphysically to the Bealt Lynx, as Poetically to the man Lynceus; and fo much may fufice for the fight. It is reported alfo that when they fee themselves to be taken, they do fend forth tears and weep very plentifully. Their urine they render all backwards, not only the female but the male alfo, wherein they differ from all other Beasts: and it is faid of them, that they know a certain virtue in their urine, do hide it in the Sand, and that thereof comes a certain precious flone called Lynceum, which for brightness resembleth the Amber, and yet is fo congealed and hardned in the Sand, that no Carbuncle is harder, thinning like fire, wherewithal they make sealing Rings, which caufed Ovid to write thus;

Vita racemifera Lynce dedit Julia Bacche.
E gaftus, ut memorum, quicquid vestis remisit
Vertitur in Lpides, & congetat aere tatio.

But they fay that of the male cometh the fiery and yellow Amber, and of the female cometh the white and pale Amber. In Italy they call it Lararium, and the Bealt Languria, and Lange. This Lynceum is called of some Elecrum, Piercyphoron, and they fay it is the fame which will draw unto it leaves, fraw, and plates of Braffe and Iron, according to the opinions of Dioses and Theophras,us, and that being drunk out of water is good for the stomack, and very convenient for the flux of the belly, according to Diocritides; and that it cureth the pains of the reins, and healeth the Kings evil, according to Selinus: And Theophrasus goeth about to effallath this opinion by reafon, and laboreth to perswade it as probable, that the urine of a Lynx should congeale into a flone among fand, as well as the urine of a man, to ingender a flone in the reins or in the bladder.

And of this opinion is Pliny, Theophrasus, Hefychius, Varinus, Zonithmus, Plutarch, and Arifotle. But in my opinion it is but a fable: For Theophrasus himself confefeth that Lynceum, which he calleth Lyngurus, and Amber Hauser, is dugg out of the earth in Lynxia. Aquinor and Mecenes fay that there is a certain tree in Lignyia, out of which Amber is taken, and this tree is the black Popler, and it is also very probable, that seeing this Amber was firit of all brought into Greece out of Lynxia, according to the denomination of all strange things, they call it Lyngurium after the name of the Country, whereon the ignorant Latin did fake an etymology of the word Lyncium, quafi Lynce urinam, and upon this weak foundation have they raifed that vain building: and for further demonstration of this truth, Diocritides fay in his discourse of the Popler, that it growing about the River Eidona, tendeth forth a certain humor like tears, which groweth hard, whereby they make that which is caufed Elecrum, being rubbed, it smelleth sweet, and for that it hath not only power to draw unto it Braffe, Iron, and fuch things, but alfo Gold: it is alfo called Cherfephtes: unto this Lucianus subscribeth: and whereas it was faid that in Italy this Amber-flone is begotten, near the River Perus, where fland many white Poplers; my conjecture is, that fome fuch like humor may ifue out of them, and not only by accident, but through affinity of nature, and condeafiate into a flone, which the people finding, covered in the sand under the trees, and through their former per- swation, might eafily take it for the flone engendred by the urine of the Lynx.

Hermolauis alfo writeth this of the Lyngurium, that it groweth in a certain flone, and that it is a kind of Myfrocn, on Pafstilone which is cut off yearly, and that another groweth in the roome of it, a part of the root or foot being left in the flone, groweth as hard as a flint, and thus doth the flone encerne, with a natural fecundity: which admirable thing (faith he) I could never be brought to believe, until I did eat the: in mine own house.
Of the Linx.

Linx (as it is recited by Sylvaticus) saith that the urine of the Linx, *diminutus, general optimus fungus parid quanamia*, referred at home in ones house, bringeth forth every year the belt Moftrons. This is also called Lapis Lintae, and *Lapis prastis*, which is divided into three kindes, that is, *Lapis Armeniacus*, and *Lapis pitygium*, called also *Eliminatis*; wherewithal the Chyrurgians of Prussia and Fomerania, cure green wounds, and the Physitians break the stone in the bladder. But the true Linxurium which is extant at this day, and currant among the Apothecaries, is as light as the Pamet-fonne, and as big as fillith a mans fist, being of a blackish colour, or of a rufset, the rufset is more solid, sandy, and fat, and being bruised or eaten, tafeth like earth: both kindes are covered with little white skins, and there is apparent in them, a spungy tenacious substance, and this I take to be the Moftron whereof Hermaus Speaketh. And by the little stones and small skins, it may be con-jectured to be *Corpus heterogenet*, *in terra caedere* : A *Heterogenet* body increasent in the earth, wherewithal it hath no affinity.

There was another Stone of the urine of a Linx, to be seen in Savoy, the substance whereof was clearly crystall, the form of it was triangular, the hardeffe, as you might strike fire with it, and the colour partly white, and partly like Wine mingled with water; so that I will conclude, that the urine of a Linx may engender a stone, though not in such manner as is beforefaide. For the *Abraham* hath affirmed, that within seven daies after the rendring, it turneth into a stone; but it is not the Linxurium properly so called, for that is the Amber or Gum before spoken of, although catachreftically so called.

And if it be true, that there be certain Moftrons near the Red-fea, which by the heat of the Sun are hardened into stones, then also it may follow very naturally, that those stones may produce Moftron again, for both the dissolution and the constitution of things are thought to be grounded upon the same principles. And thus much shall suffice for the urine of the Linx, and the Stone made thereof.

The skins of Linxes are most precious, and used in the garments of the greatest fates, both Lords, Kings and Emperors, as we have shewed before, and for that cause are sold very dear. The claws of this Beaf, especially of the right foot, which he useth in feate of a hand, are excluded in silver, and fold for Nobles a piece, and for Amuletis to be worn against the falling sickness. The love of these beads to their young ones is very great, like as the Pardals, Lions, and Tygers. The King of Tartaria hath tane Linxes which he useth in hunting, in feate of Dogs. The antient Pagans dedicated this Beaf to Bacchus, feigning that when he triumphed in his chariot of Vine branches, he was drawn by Tygers, and Linxes. And therefore *Virgil* saith ;

*Quid Lynceus Bocchi varia.*

And *Ouid*;

*Dilige recemisero Lynces dedit India Bacthe.*

All the nails of a Linx being burned with the skin, beaten into powder, and given in drink, will make very much cohbithe and restrit abominable Lecchery in men : it will also restrit the luft in women, being sprinkle upon them; and also very effectually and speedily take away either itch or scurf in man or womans body. The urine of this Beaf is accounted very medicinable for those who are troubled with the Strangury, and running of the reins.

The fame is also very good and wholesome for the curing of any pain or grief in the winde-pipe or throat; *Bonarius Baro* both a affirm that the nails of Linxes which are in their Country, are had in great effimation and price amongst their Peers and Noble men, for there is a very certain opinion amongst them, that those nails being put upon the yard of either Horfe or Beaf whose urine is kept back or restraited, will in very short space cause them to void it without any grief at all. He reporteth also that their nails do there wax white, and that they include them all in silver, and do commend them for an excellent remedy against the Cramp, if they be worn (peradventure cause they are bending and crooked) by which periwafion there are some superflitious men which hang certain roots which are crooked and knotty about them against the Cramp. There are some which do a certify that these nails are good and ready helps for the foreneis of the Uvula which is in the Horfes mouthes: and for that cause there are many Horfemen which carry them continually about them.

The Linx or Wolf, which is begotten of a Wolf and a Hinde, the Musk-cat, the Weasill and all such other like Beas, do more hurt men by their biting teeth-wounds then by poifon. There was a certein Hunter, as *Colliner* reporteth, which told him that the flefh of a Linx being fed in some hot potage or broth, and afterwards eaten, would be a very good and wholesome medicine for the expelling of the Ague, or Quartan Fever; and that the bones of the same Beaf being burnt and pounded into powder, would be a very excellent remedy for the curing of wounds which are old and flale, and full of putrification, as also the Fufilaeas which grow in the thighs or hips of men.

*Arnoldus.*
The several names.

Two kinds of Martins.

Places of their abode.

The use of their skins, and how to chafe the beft.

Of the Marsder, Martel, or Marten.

This beast is called in the Hebrew, Oach, or as some say Zim; amongst the Arabians, Easte, or rather Kachbebon, or Kachimos; in Latine, Martes; the Germans, Marsar, or Matter, like the English; the Italians, Marta, Marta, or Martorella; the French, Marsar, or Poyne; the Spaniards, Mala; the Illyrians and Polonians, Kuna; and some latter Latines use the words Marta, Martarua, Martura, and Marturelias; and the reason, or etymology of this Latine word is taken from Martia, which signifieth Martial, because this beast in warlike and hostile manner, doth destroy her adversaries, and liveth upon the prey of Hens, Birds, and Mice. The Germans divide these into two kinds, which they call by the names of Teckmarder, Hufsmarder, Steinharder, Fuchsmander, Feldmarder, Wildmarder, Thammarder, Finckmarder, that is to say, the Fir-martin, the Rock-martin, the Tame-martin, the Beech-martin, the Field-martin, the Wilde-martin, and the Wall-martin. For they live either in houses, walls, and Temples, or else in rocks, fields, and woods: And yet is not their distinction taken only from the places of their abode, but also from the goodness of their skins.

And therefore the French call the word Martin by the name of Faines: And the skins of the Fir-martin, or House-martin, are far more beautiful to look upon; than those that live wide in the trees or Woods. Agricola calleth the Wood-martin Baummarder, because it liveth for the most part in trees, and faith that it never forfaketh the Woods, or very seldom, and therefore in that thing differeth from the Fir-martin. But herein he feemeth to be deceived, that he ascribeth to the Beech-martin, a loamy or red throat, and also a continual abode among the Woods. For they come sometimes to houses, and to Rocks; for which, as we have said already, it is called a House-marder, and Rock-marder. And all these multitude of names, do but express the two kinds afore-named, whereof the Fir-martin is most excellent; for Princes and great Nobles are clothed therewith, every skin being worth a French crown, or four shillings at the least. And they are so much the better, when there are more white hairs interpersed among the yellow.

For their ordinary colour is a deep brown yellow, and these that are clean white, are four times worfe then the former; and therefore are not sold for above three or four groats a piece, howsoever the saying of Martial, Venator capta Marte superstes est. Here cometh the proud Hunter that hath killed a Martin, may very well be applied unto them which take any of these beasts, for they cannot chafe but be very joyful, which get a good sum of money for a little labour, as they have for a Martins skin. By inspection of the Faines, that is, the Martins of the beeche; for the French men called a Beech, Fau, from whence cometh the word Faines, you may see, that their skins are more dusky, having a tail both greater and blacker then the Martins of the Firs. And therefore you must understand, that they of the Firs are by way of excellency called Martin,
and the other of the woods called Fonsa. There is no great difference betwixt their bigness: and if by their skins at any time there seem any inequality, in breadth, or length, it must be attributed to their age and difference of years, and not to any proportion in nature or disposition of kind. And as we have said that the Fir-Martins are absolutely the best, yet that is not to be understood generally. For the Martins of Poland are so brown, that they are altogether disliked, and are accounted no better than the common Beech-Martins. Wherefore the bright-brown alpèred with white hairs, is ever accounted more precious without all exception, and by that colour upon the back of the skin, the Skinner judgment of the worth, and not by the yellowness of the throat.

Of the Beech-Martins there are great plenty in the Alpes, especially on the South-side, which look towards Italy, but very few of the Wal-Martins. But on those parts of the Alpes which look towards Germany and the North, there are abundance of Fir-Martins with yellow throats, for you must remember that the wide Martin hath a white throat, and the Fir-Martin a yellow throat.

There are also of both kinds in Helvetia, and the most excellent are in the vales towards Cors Stella. In France there are no Mantins of the wall, but the Beech-Martins live in hollow beeches. There are also woods full of the Beasts in Drusia, which the people there call Gami. Lantacruza a wood of Scandentavia fourcore miles long, is full of Mantins. Also Mufcova, and Lithuania have store of these Beasts, and Sabtes. But they of Lithuania, are the whitenest in the world.

The people of Sarmatia in Europe, wear garments of these in Sables; and the inhabitants of Fe Bakemuri, Sycitia, Hungaria, near Tanais, do pay yearly unto the Emperor of Russia, once called the Duke of Muscovia, a certain number of Sabtes and Mantins skins. There are also store of Mantins neer Brahania, and generally in all parts of Europe except in England.

They are in quantity about the bigness of a Cat, having longer bodies, but shorter legs, with heads and tails like a Fox, their skins ordinarily brown, white on the throat, and more yellow on the back.

Their teeth are exceeding white, and unequal, one longer then another, being above measure sharp, and the canine teeth both above and beneath hang out very long. Amongst which on the either chap, stand fix small cutting teeth in a right line over against one another, which I think happeneth not in any other Beast of the world. The grinding teeth are like a saw, being triangular in fashion, eight above and eight beneath. Whereof the furthermost upon the uppermost side of the mouth, are more deep and inward in the palate, then all the residue, the whole number is thirty two. The long hairs upon their upward lip doe bend clean backwards.

Notwithstanding that there be two kindes of this Beast, as already we have said, yet do the Wood-Martins, or Beech-Martins, greatly defire' copulation with the other, wherefore Albertus, the Faec genus, & Martes phagi, sive sequitur, Martem abriuam, tanquam nobilissimam, ut faciam ex ea nobilissimam acquirat. The Beech-Martin followeth the Fir Martin, and defireth her copulation as the nobler kind, that he may thereby dignifie his own issue. It should seem that they breed in March, and make their nefts like the draies of Squirrels, and bring forth many at a time; for it was constantly affirmed by a Country-man of Germany, that he found a nest of these Mantins builded like a Squirrels, having four young ones in it, in the beginning of April.

If they be taken when they are young, both one and other kind grow wonderful tame and familiar with Men and Dogs. And Geiser had one of these, which loved a little Dog wonderfully, and would follow him abroad whithersoever he went, far or near. It would also play with Dogs and Men, with teeth and nails, lying flat upon the back like a Cat, and never give any little hurt. But looofed from his chain it would wander abroad into the neighbourhoods houles, and many times far off, but always returne home again. They which tame them, because that they are easily exasperated, and bite deeply when they are angry, do break off the tops of their canine teeth, with a pair of pinsons for the preventing of that mischief. Ruellius affirmeth, that the excrement of this Beast filvileth like a Musk-cat, and faith the reason of it is, because they feed upon sweet fruits; but we have heard that they eat Pullet-birds, Eggs, and Mice, but that they eat of fruits it cannot be proved. I rather attribute it unto their own nature. For as the Martine-ape filvileth sweetly after her meat, so may this Martin-wexel with a sweet excrement. To conclude, the skins of these beasts is applied to gowry legs, and the white hairs of the throat made into a cap, is very soverain for the head-act. They may be taken with Dogs, or in traps, but commonly they are taken in ditches or pitchals, according to this Verse of Cæleste, wtherewith I will conclude;

Et laqueo vulps, & discipe caii soles.
Of the Mole or WANT.

I do utterly dissent from all them that hold opinion that the Mole or Want is of the kind of Mice, for that all of them in general, both one and other, have two long crooked foreteeth which is not in Moles, and therefore wanting those as the ineparable propriety of kind, we will take it for granted that it pertaineth not to that rank or order of four-footed Beasts. But concerning the Hebrew name thereof, there is much variance and little certainty amongst writers. Some of them calling it Tintemebem, which word is found Deut. 14. which is also translated by the Chaldee, Bara or Beaver, a Swan, and the Septuagint and Jerom, Bat, and Rabbi Solomon in another place of the same Chapter tranlateth it a Bar, which the French call Claueter-fuivre. But in that place of Levit. 11. where the Sibio, the Lizard, and Tintemem, are reckoned unclean Beasts; Rabbi Solomon interprets it Talpum, the Mole. The Septuagint, Aphelox; the Chaldee, Achkata; the Arabian, Lambarras; the Per- sian, Angurab-dedex. There is a sentence, Isa. 2. in Hebrew thus, Lachap ferit vertepletim; which by Munster is thus translated, In die present homoaurus et argentos dies, in suflaurum Talpum et sepulturum. In that day shall a man cast away his goods of silver and gold into the holes of Moles and Bats. By S. Jeron it is translated thus, Proiecto bomo Idole, utque ut ad aereas talpes et sepulturem. A man shall cast away his Idols to worship Moles and Bats. Some again make but one word of Lacheprsetum, and translate it a Beast digging ditches; and the Septuagint, Idols or abominations, and think that they were so called, because their outward forme reprelenteth some fuch reptile creature, and Symmactium, unprofitable things; but Acilla, Ourum, digging Beasts: and therefore at this day all the learned take Prot for Moles, so called by reason of their digging. Aulica calleth it Pelagez, a blinde Moufe. In Grec it is called sometime Spalx, but more often Aphelox: yet Albertus calleth it a strange Grecian name Culti and Ksky, which he took from Aoicen. The Italians retain the Latin word Talpa; the Spaniards, Tepo, by which word the Italian at this day call a Moufe. The French call it Taupe; the German, Molwe, and in Saxen, Molweff, from whence is derived the English Mole, and Molewarp. The Helvettians, Seheb and Schermowe, and the Moebli they call Scherwen of digging. The Holander and the Flemings call it Mol and Molms, in imitation of the German word: the Hibernians, Kirke. And generally the name is taken from digging and turning up the earth with her nose and back, accord- to the saying of Virgil;

Aul calls capti solere cubilia Talpa.

Some are of opinion, that it is called Talpa, because it is appointed to an everlastings darkness in the earth; of which sort Ifidurus writeth thus, Talpa diffus est e gaud perpetuar e terrae dominata, et enim solique evis. It is called also in Greek, Indwnos, and Sophwos, or Sephemon the earth, because it liveth in the earth, and turneth it upward to make it hollow for passage. The like I might say of his other names, Ibiheba, and Orthoquentus. But this shall suffice for his name.

In Etruria about the Champagne's called Ochomontus agar, there are the greatest store of Moles in the world; for by digging they undermine all the fields, and yet in Lembata another Coun- try of Etruria, there are none at all, and if they be brought thither from any other place they will never dig but die. Rodolphus, Oppianus, and Albertus affirm, that they are created of themselves of wet earth and rain water, for when the earth beginneth to putrid, the Mole beginneth to take life.

They are all for the most part of a black duskie colour, with rough, short and smooth soft hair as wool, and those hairs which were whitem when they are young, are most glistering and perfect black when they are old: and Geher affirmeth that he saw in the end of October, a Mole taken which was very white, mixed with a little red, and the red was most of all upon her belly, betwixt her forelegs and
and the neck, and that it could not be a young one, because it was two palms in length between his head and tail.

The Beasts are all blinde and want eyes, and therefore came the proverb *Tulis ceteris, Tuli hodie*, robber blind then a Mole: to signify a man without all judgment, wit or foresight; for it is most elegantly applied to the mind. Yet if any man look earnestly upon the places where they should grow, he shall perceive a little passage, by drawing up the membrane or little skin which is black, and therefore *Aristratus* faith of them in this manner probably:

All kinds of Beasts want their fight, because they have not their eyes open and naked as other Beasts, but if a man pull up the skin of their brows about the place of their eyes, which is thick and shadoweth their fight, he shall perceive in them inward covered eyes, for they have the black circle, and the apple which is contained therein, and another part of the white circle or skin, but not apparently eminent; neither indeed can they, because nature at the time of generation is hindered, for from the brains there belong to the eyes twi strong nervie passages, which are ended at the upper teeth, and therefore their nature being hindered, it leaveth an imperfect work of fight behind her.

Yet there is in this Beall a plain and bald place of the skin where the eyes should stand, having outwardly a little black spot like a Millet or Poppy-seed, fasten'd to a nerve inwardly, by presting it, there followeth a black humor or mofliness, and by dissection of a Mole great with young, it is apparent (as hath been proved) that the young ones before birth have eyes, but after birth, living continually in the dark earth without light, they cease to grow to any perfection; for indeed they need them not, because being out of the earth they cannot live above an hour or two.

*Eph* hath a pretty fable of the Aife, Ape, and Mole, each one complaining of others natural wants; the Aife, that he had no horns, and was therefore unarm'd; the Ape, that he had no tail like other Beasts of his nature and quantity, and therefore was unhandome; to both which the Mole maketh answer, that they may well be silent, for that the wanteth eyes, and is unfasted, that they which complain, shall finde by consideration and comparision of their own wants to others, that they are happy and want nothing that were profitable for them.

*Opium* faith, that there was one *Piusius* which was first deprived of his eye-fight, and afterward turned into a Mole: It should seem he was condemned first to loofe his eyes, and afterward his life.

These Moles have no ears, and yet they hear in the earth more nimbly and perfectly than men can above the fame, for at very step or small noise and almoft breathing, they are terrified and run away, and therefore (Pity faith) that they understand all speeches spoken of themselves, and they hear much better under the earth than being above and out of the earth. And for this cause they dig about their lodging long passages, which bringeth noises and voices to them, being spoken never so low and softly, like as the voice of a man carried in a trunk reed or hollow thing.

Their snout is not like a Weasle, as *Solus* faith, but rather like a Shrew-moufle, or (it be lawfull to compare small with great) like to a Hogs. Their teeth are like a Shrews and a Dogs; like a Shrews in the neither teeth and furthermost inner teeth, which are sharp pointed and low inwardly: and like a Dogs, because they are longer at the sides, although only upon the upper jaw, and therefore they are worthily called by the *Grecians, Marmotation*; that is dangerous biting teeth, for as in Swine the teeth stand out above the upper, and in Elephants and Moles, the upper hang over the neather, for which cause they are called *Hypophorius*.

The tongue is no greater then the space or hollow in the neather chap, and they have in a manner as little voice as fight, and yet I marvel how the proverb came of *Loquus Tolpis*, a prating Mole, in a popular reproach against wordy and talkative persons, which *Ammianus* faith, was first of all applied to one *Julianta Capella*, after he had so behav'd himself, that he had lost the good opinion of all men.

The neck seemeth to be nothing, it is so short, standing equal with the forelegs. The lights are nothing else but dislinguished and separeated *Fibres*, and hang not together upon any common root or beginning, and they are placed or feated with the heart, which they encole, much lower toward the belly then in any other Beast. Their gall is yellowish, their veins like a Bears, and short legs; wherefore they move and run but slowly; their fingers or toes wherewithal they dig the earth, are armed with sharp nails, and when they feeleth any harm upon her back, frankly the turreth upward and defendeth her self with her snout and feet: with her feet the diggeth, and with her nose casteth away the earth, and therefore such earth is called in *Germany*, *Mol werff*, and in *England*, *Mole-bill*; and the lovethe the fields, especiall meddowes and Gardens, where the ground is soir, for it is admirable with what celerity the casteth up the earth.

They have five toes with claws upon each footsees, and four upon each foot behing, according to *Albertus*, but by diligent inspection you shall finde five behind also, for there is one very little and reuered backward, which a man lightly and negligently looking upon, would take to be nothing. The palm of the fore-feet is broad like a mans hand, and hath a hollow in it if it be put together like a fill, and the toes or fingers with the nails are greater then any other beasts of that quantity. And to the end that he might be well armed to dig, the forepart of her fore-legs consist of two solid and found bones which are fastened to her shoulders, and her claws spread abroad not bending downward, and this is peculiar to this Beall not compatible to any other, but in her hinder legs, both before and behing they are like a Mouns, except in the pate beneath the knee, which confiseth but
but of one bone which is also forked and twified. The tail is short and hairy. And thus much for the Anatomy and several parts.

They live as we have said in the earth, and therefore Cardus faith, that there is no creature which hath blood and breath that liveth so long together under the earth, and that the earth doth not hinder their expiration and inspiration; for which cause they keep it hollow above them, that at no time they may want breath, although they do not heave in two or three days; but I rather believe when they heave, they do it more for meat than for breath, for by digging and removing the earth they take Wormes, and hunt after virtuats.

When the Wormes are followed by Moles, (for by digging and heaving, they foreknow their own perishition) they fly to the superacies and very top of the earth, the filly beast knowing that the Mole their adversary, dare not follow them into the light, so that their wit in flying their enemy is greater, than in turning again when they are trod upon. They love also to eat Toads and Frogs; for Albertius faith, he saw a great Toad whole leg a Mole held taft in the earth, and that the Toad made an exceeding great noise, crying out for her life, during the time that the Mole did bite her. And therefore Toads and Frogs do eat dead Moles; they eat also the root of Herbs and Plants, for which cause they are called by Oppianus, Poisibagi Herbivores, herb-eaters.

In the month of July they come abroad out of the earth, I think to seek meat at that time when wormes be scanty. They are hunted by Wewflis, and wilde Cats, for they will follow them into their holes and take them, but the Cats do not eat them: whereas we have said already, that they have an understanding of mens speech when they hear them talk of them.

I may add thereunto a story of their understanding, thus related by Gillius in his own experience and knowledge. When I had faith he put down into the earth an earthen pot made of purpose with a narrow mouth to take Moles, it fortuned that within short space as a blind Mole came alone he fell into it and could not get forth again, but lay therein whining; one of her fellows which followed her seeing his mate taken, heaved up the earth above the pot, and with her nose cast in so much, till she had raised her companion to the brim and was ready to come forth: by which in that blind creature confined to darknes, doth not only appear a wonderful work of Almighty God, that endoweth them with skill to defend, and wisely to provide for their own safety, but also planted in them such a natural and mutual love one to another, which is so much the more admirable, considering their beginning or creation as we have shewed already. Because by their continual hearing and laboring for meat, they do much harm to Gardens and other places of their abode, and therefore in the husband-mans and house-wifes common-wealth, it is an acceptable labor to take and destroy them. For which cause it is good to observe their passages, and mark the times of their coming to labor, which being perceived, they are easily turned out of the earth with a spade, and this was the frist and most common way.

Some have placed a board full of pikes which they fasten upon a small fiek in the mole hill or passage, and when the mole cometh to heave up the earth, by touching the fiek the bringeth down the pikes and sharp nailed boards upon her own body and back. Other take a Wyar of Iron, and make it to have a very sharp point, which being fastened to a faffe and put into the earth where the Moles passage is, they bend and set up, that when the Mole cometh along, the pipe runneth into her and killeth her.

The Greecius (faith Palladius) did destroy and drive away their Moles by this invention, they took a great Nat, or any other kind of fruit of that quantity, recept and solidity, wherein they included Chaffe, Brimstone and Wax, then did they stop all the breathing places of the Moles, except one at the mouth, wherein they set this devise on fire, so as the smoke was driven inward, whereby they filled the hole and the place of their walk, and so stopping it, the moles were either killed or driven away.

Also Parmarum sheweth another means to drive away and take Moles: If you take white Hellebor, and the rindes of wilde Mercury in head of Hemlock, and dry them and beat them to powder, afterward sift them and mix them with meat and with milk beaten with the white of an Egge, and so make it into little morsels or bals, and lay them in the Mole-hole and passages, it will kill them if they eat thereof, as they will certainly do.

Many use to kill both Moles and Emets with the frooth of new Oyl. And to conclude, by fetting an earthen pot in the earth and Brimstone burning therein, it will certainly drive them for ever from that place. Unto which I may add a superfetitious conceit of an obscure Author, who writeth, that if you whet a mowing fythe in a field or medow upon the featl day of Chrifts Nativity (commonly called Christmas day) all the Moles that are within the hearing thereof, will certainly for ever forfake that field, medow or Garden.

With the skins of Moles are purfes made, for the rough and soft hair, and also black ruffet colour is very delectable. Pity hath a strange laying, which is this: Expelibum talpum cubicularia ut demus frigore; adeo ne religio quidem a se rentis summovet delicat; that is, We have seen the hangings of Chambers made of mole skins, so that no confience of religion cannot avert the monstros love of delights from the affection of men.

For all the ancient Wise men and Magicians did hold, that this beast was capable of Religion, Nullis aequus credenti existis: nullum Religione expansus judicant animal, ut quis ex ejus recentem regulationes; divaristi, divinationis et rerum efficiendarum eorum primitit; they give not so much credit to any intrails
intrials as to theirs; for they judge that no beast is fo capable of Religion, because if a man eat the heart of a Mole newly taken out of her belly and paniting, he shall be able to divine and foretell in- fallible events. Another faith, *Venerum monumentis traditum Gallus scelerum fibras maxime dies gratia ubi- derti sunt Talpaurum visera Magi verissima dixerat, ubi fide hac fedet quem sollemni verissima liteari, hoc enim sunt extra anys libera in quibus divina mens in se cruciat: that is, the fibres of Cocks were won among ancient Monuments to be accounted most acceptable to the Gods, even as the bowels of Moles (as the wife men say) and to offer thefe as a most Solemn sacrifice grateful to the Gods, and that in thefe intrials it was believed that the minde and pleasure of God was feared and engravèd; and a little alter he faith, that the bowels of Moles and Icogs do foretell many great and fortunate events.

But I will leave this paganism, and let it never enter into the heart of a reasonable man, that such beasts can love Religion, or that God hath planted in their bowels and corrupt parts, such letters of his wisdom and lore-knowledge, which he hath not granted to the immortal and incorruptible soul of man. Only this I finde by experience that before any rain and change of weather, the filly beasts heave up the earth more abundantly than at other times; and that in *Thessaly (as Varro faith) a whole Town was once undermined by Moles. They were wont to sacrifice this beast to Neptune, because of the affinity between their names, for in Greek *Alphalus, signifies Neptune, and *Alphax, a Mole. Almouno also writeth, that they were fancied and dedicated to Hell, because they keep continually within the bowels and bowels of the earth; and to conclude, because that Moles would not live in Coruces a part of *Bootea, before spoken of, and thereof came the common proverb, *Alphalea in *Corusum, A Mole is brought to Coruces, to signifie the hatred of a gift or ghelt to him that is forced to receive him. Thus much for his natural and moral story; now followeth his medicinal.

The Medicines of the Mole.

*There is nothing which is more profitable or medicinable for the curing of the bites of a Shrew, than a Mole being laid and clapped thereunto. The fame doth also very effectually cure and heal the blows or bites of a Scorpion. Pills being made with that which proceedeth from Moles with Hony, eaten nine days together, doth preserve the body of any one from swellings or bunches in the flesh, who shall eat them. For the avoiding or driving away the hairs which grow in any part of man's body, that they may never return or be renewed again: Take a Mole and lay her in water to be steeped or soaked, as long as the shall not have any hairs left upon her, with this water anoint the place which is full of hairs, and afterwards wash it with lie made of ashes, and then rub it with a linen cloth; then if you shall see the hairs to return again, wash it twice or thrice in the afore- named manner, and they will be quite expelled away, and by no means can be made either to renew or come again. For the renewing, and bringing again of those hairs which are fallen or decayed, take a Mole, and burn her whole in the skin, and minige the dust or powder which cometh from the same with Hony unto the thickness or fashion of an Ointment, and this being rubbed or anointed upon the bare or bald place will without doubt in some short time or space procure the hair to grow thick. For the renewing of hairs which fall from Horfes; Take a Mole and boil her in Oyl, until all the flesh be consumed and quite dissolved into a liquid juycye, with this Oyl anoint the place which is bare or deftitute of hairs twice every day for some short space, and it will make the hairs to grow in great abundance.

For the changing of the hairs of Horfes from black to white, take a Mole and boil her in Salt water, or lye made of ashes three days together, and when the water or lie shall be quite consumed, put new water or lie thereunto: this being done, wash or bathe the place with the water or lie fome what hot; presently the black hairs will fall and hide away, and in some short time there will come white. Whosoever shall take a Mole and hold her in his right hand until the die, shall have such an excellent vertue therein, that the shall ease the pain of a woman's breasts only by touch- ing them.

The dust of a Mole being burnt, mingled with the white of an Egg, and anointed upon a Sheep, is an excellent and medicinable remedy against the Lepric, which cometh oftentimes upon them. The dust of a Mole mixed with Oyl or Hony, and anointed upon the skin of either man or woman which is full of Lepry, will very speedily and effectually cure and heal the same. The fame being used in the aforefaid manner, is very good for the curing of those which are troubled with the disease called the Kings Evil, as also for those which have hard bunches or kernels arizing in their arm-holtes, and in other parts of their body.

The whole body of a mole being taken and burned in the skin into dry dust, or powder, is an excellent remedy against the disease called the Phitala, as also for the purging of the corruption in them and healing of them, being once taken by any man. The fame being also mixed with Hony, and rub'd upon the teeth of any one who hath pain in them, doth not only ease the pain and grief thereof, but also doth strengthen and make them fat. The blood of a Mole being killed, spread or anointed upon the head of any one which is bald, will very speedily renew and bring the hairs again. The head of a mole being cut off and beaten together with the earth which is thrifed up by Moles, and wrought into a paste, and rowled together like a little loaf, is very much used for the healing of all swellings, and for those things which they call Impolultes; as also for all swellings or kernels.
The History of Four-footed Beasts.

which arise in the neck; so that in the time of the curing of these things, the party which is pained and grieved, be not suffer'd to eat any Swine's flesh.

The tooth of a living Mole taken out and tyed or bound to the teeth of any who is grieved there- in, is commended by the Magi, or Wise-men to be an excellent remedy and cure for the same. The heart of a Mole being eaten nine days together, doth very speedily and effectually cure either him or her which shall so eat it, of that pelliterous disease call'd the Kings Evil, if it be so that it hath not been of too long continuance with them. The same is also very good and profitable for the affwaging of Wens, being used in the aforesaid manner. The liver of a Mole being beaten between the hands of him that is troubled with bunches or swellings in his back, and afterwards put upon the same, is a present help and cure. The same effect hath the right foot of a Mole for the affwaging of bunches and swellings arising in the fleth.

of the vulgar little M O U S E.

As we have handled the natures, and delivered the figures of the great beafts, so alo mult we not disdain in a perfect History to touch the smallest: For Almighty God which hath made them all, hath disseminated in every kinde both of great and small beafts, seeds of his Wildom, Majesty, and glory. The little Moulfe therefore is jufly termed, Incola domus nostre, an inhabitant in our own houses, Et auro omnium rerum, a gnawer of all things. And therefore from the found of her teeth which the maketh in gnawing, she is called Sorex. Although we shall shew you afterwards, that Sorex is a special kinde, and not the name of the general. Wherefore seeing there be many kindes of Mofe, and every one of them defireth a particular tractate, I thought good to begin with the Vulgar little Mofe, and so to defend to the severall species and kindes of all, according to the method of the Philofopher, A natura ad minum nota, from things that are most known to them that are left known. In Hebrew it is called Anc, Levitz. 11. where the Sepuwigins tranlate it Mous; the Cludens, debra; the Arabians, Fyf., or Fber; from whence cometh the Sorex, the word Pte- ra. The Seldianis, Au Mus, the Latines, Mous; the Italians, Topa, or Sorex, Alergius. O Ratz, Di cafe, although Ratz signifieth a Rat, both among the Germanis, French, and English. The Spaniards call the little Mofe, Ratt; and the great Rat, Rattaz; the French the little Mofe, Sauris; which word seems to be derived from the Latins, Sorex, and the Great Mofe they call Ratt. The Germanis the great ones Ratx, and the little one Mufs; the Englifh and Polonius, My佛is, which is the Greek word; and the great one they call Scebro; the Venetians call the Rat Pantege, of Pontis the vulgar Greek name, and the Romans, Sourco. Now the dignity of this little beaft, may appear by the name, which hath spread it self both to beafts, fiftis, men, herds, and Cities. To beafts as we have shew'd before in the Icneumon, which is vulgarly called the Indian Mofe, or Phobobis Mofe And to fiftis, for there is a little fift called Musculus, and in France, Myfetus, the Whale-mofe, because it leadeth the way, and fheveth the Whale whither hover the Swimmeth; for the avoiding of Rocks, (according to Pliny) although Ron- deletius affirmeth otherwise, namely, that that guide of the Whale is call'd Egeron, and Egetur, and Myfetus (he feaeth) is a fifti-fish. Generally molt kinde of Oyters are also call'd Mysis, because sometimes they gape and make a noife like a Mofe, and clofe their thells again. The purple fiftes be also call'd Mysis; there is likewise a kinde of precious Stone called Myse, about Bofborus Taracius, and many other fuch kinde, hath the name of this beaft attained.

There was one Myse, the fervant of that famous Philofopher Epicurus; likewise the name of a Champion or Challenger, in Suidas and Varinz, and there was another called Mus, of excel- lent skill for ingraving in Silver, and therefore did draw upon the Shield of Mineraz, the fight betwixt the Latitha, and the Continus, and many other things. Whereupon Martial made this verfe;

Quis labor in Ibia? deae Myse? an me Myronis?

There
Of the Mouse.

There was a Conful of Rome, whose name was Mure, and therefore Camerarius made this Riddle of the Mouse; *Paras mihi domus est, sed jam aetern openata. Acutissimi lanceae, faturae vivae, & cedad mihi non met. * Rome quoque, Confal habebit.* The Thracians call’d Algiar a Mouse, and the City which he built Argol. His city was a City of Mines, and a Citizen of that City was called Mytius. Mytius a City of Luci in Epirus, and the people thereof are called Moiures. Mytius, a little Region between Tanur & Lebogia, and according to Stephanus, an Island near Egipt; the first Port or Haven of Egipt, called Mus morus, the Moiures haven, and Mys also seemeth to be derived from their stem. There is an Island under the Equinoctial line, called Ulydra Marium, the Moiure Island, because of the abundance of Mice therein; and to conclude, even the herbs and plants of the earth, have received names from this little beast, as Herodium Marium Myconob, Spriga, Myperus, Myoton, Myrurus, Mytturn, Moue-foot, and fich like. There have been also Comedies made of Mys, as that of Carfu, called Myt, wherein the Wefal stript the night-wandering Mys. And another Greek, called Logopontus, that is a fight between Cats and Mice, wherein the Poet doth most plainly fign names of Mys, as their King he calleth crelius, that is, a lecherous, and his eldest Son Pteropax, a corn-eater, and his fcond Son Pterolopax, bread-eater, and his eldest daughter, Leptopsite, candle-eater; and all his Ancestors Carpopontus, that is, fruit-eaters. And then he bringeth other Mice in as Turbicis, Psycedizes, Cobolocyllos Homer in his Iliad, such is, a fight between Frogs and Mice, doth very eagerly describe divers proper names of Mice. As Pteropax, whose father was Typhon, and his mother Lyconile, daughter of Petronelaea the King, and then other Mice, as Lycopon, Tropicis, Embaflactis, Lyconile, Troglogites, Apholus, Pterolopax, Pteronopas, Copenkylactes, Stibopas, Anthropas, Medarsopa, and Tboleopox, all which are not only out of the abundance of the Authors wit, but invented for the expressing of the Moiures nature.

The Epithets of Mice are thefe: short, small fearful, peaceable, ridiculous, ruffick, or Country Mouse, urbane, or City Mouse, greedy, wary, unhappy, harmful, black, obscene, little, whiner, biter, and earthly. And the Greek ones are express'd before in the proper names, and thus much may suffice for the names of Mice. Now to come to their several nature and fignifications.-First of all concerning their colour. It is divers, for although Callus muralus be a common term for a Moiure colour of Alles, yet notwithstanding Mice are sometimes black, somete times white, somete times yellow, somete times brown, and somete times another colour. There are white Mice among the people of Sauve, and Drophus in France called Albroges, which the Inhabitants of the Country do believe they feed upon food. But the white Moiure is above all other most valuable and serviceable; and therefore it came into a proverb, *Myt Lucare, Myt Cannabis,* the white Moiure is an ill Moiure, or of whole milk Aristocles made this Emblem; Delis a & bulimia, Mus eredius altus, Aspera, at rati, non fat aperta mihi es, An quad in natura fatix, & multa libi es?

Ornant Romanus an naule pelle meus? Sarramini Musurus devest pigment, zelobum, Est celebris fatis es & hisque Musar Arabs.

Of all which conjurers of the Poets, the firft is most probable; for the Ancients were wont to call wanton and effeminate men Pyrgari, and Leuopygot, from their beauty and whiteness. And as there is difference in their colours, fo also there is in their quantity: for some are very great, some meanly great, and some very small. Their heart is very great, and their liver and lungs increase in the Winter time. Alfo the fibres that are in them, do increafe and decrease with the waxing and waning of the Moon. For every day of the Moons age, there is a fibre increafed in their liver. And therefore Lucullus said well, *Luna sit fera, & implet equinoctia, & Musibus fibris auger:* that is to say, The Moon feedeth Oysters, fillith Hedgehogs, and encreafeth fibres in Mice. Some of these Mice have a gall, and some have none, as Aristocles and Pliny fwear in many places.

The Moiures place of conception have many holes in it, during the time the bearings her young ones. There is no creature that hearth more perfectly then a Moiure, they dwell in holes of men, especially near fuppofing and dining rooms, kitchens, or larders, where any meat is liring. And they make themselves places of abode by gnawing with their teeth, if they finde not convenient lodgings prepared to their hand, and they love the hollow places of walls, or the roofs of houses; and therefore the Waps which in Aristotles names are Called Drophe, that is, gnawers of roots, are to be understood to be Mice, because Myt Drophiis is a Moiure in the houfe top. In the day time they lie ftil, as long as they either fee or hear a man, or any other beast harmful unto them, for they defcrve their enemies, not fearing an Ox, though they run away from a Cat.

They are very defirous of bread, and delight in all those meats which are made of fruit, for the nourishment of men. It is a creature very diligent and equipt, both to compas, feek out and chufe the fame, fo that therefore it doth often endanger and lofe its own life: and finding any cubboards, wood, or fuch like hard matter, to withiland his purpofe, and hinder his paffage, it ceafteth not to weary it felf with gnawing, until it obtain the purpofe. All kinds of Moiure love grain and corn, and prefer the hard before the foft; they love alo Cheete: and if they come to many Cheeyes together, they rath far, but they eat of the bell. And therefore the Egyptians in the Hieroglyphicks do picture a Moiure, to fignifie a found judgement and good choice. Buclinus is very accknowledgable to Moiure, and the Moiure in the Ile Pan, in Tarches, in the Iland Cyprus, which is one of the Ilands of the Speicles in Cyprus, and in Chelee, they did eat Iron, as appeareth by Aristocles, Allemont, and Hercules. And
The History of Four-footed Beasts.

Pliny.

Albatus.

Mice cannot drink without danger.

Theophrastus.

Generation of Mice, and their carnal copulation.

It was also found, that in a certain Island near Clithber, Mice eat and devour gold, and therefore the Gold-smiths did cut them in pieces among their metals. Plutarch, in the life of Marcus, faith, that there were many prodigies and fearful figures that did precede the war of Marius, amongst other, he faith that Mice did eat the Gold hanging in the Temple, and that one of the Temple-keepers in a certain trap took a female Mouse alive, who litted five little Mice in that place, and devoured three of them. Anthologians reheareth a witty Hexamilion of Antipathus, upon a Mouse that was fit for another, for certain Gold-dufl, which she had devoured, whereby was signified how men procure unto themselves exquisite tortures, and unavoidable mortal harms by feeling, and increasing of riches signified by Gold. vulgar Mice do runimate or chew the cud as well as the Pontick, and they drink by licking or lapping, although their teeth be not sawed. It is reported that the Mice of Ajfick, and especially of Lyiba, die as soon as they drink. And the reason thereof we will afterwards in the taking of Mice, when we come to discourse of their poisons. And for the present it should feem their temperament, or constitution is so moit, that nature can endure no addition. Yet in the plains of Arcadia, there are Mice which drink of a certain Fountain without any harm.

The generation and procreation of Mice, is not only by copulation, but also nature worketh wonderfully in ingendering them by earth and small flowers, as we will shew in the discourse of wide Mice.

But the house Mouse whereof we now treat, is engendered by copulation betwixt male and female, and they are in general most libidinous, as may appear by that saying of Cratinus against Xenophon, flere non ex abitores Kastapisamen muros affropo Xenophontes, go to now, for from the skies I will strike by lightning the Marius wantonness of Xenophon: and the female is much more venerate than the male, as appeared by that fable of Ispiratis describing the rage of a lustful woman. Poetram judici me delectabilis lera, dederant per Dionam, per quiddam, per Periphatastum, fe esse vitalum, esse virginem, effe pulchrum, effe innotian, et ilia myenia erot. Then followed me that detestable band, swearing by Diana, and Periphatastus, that she was a Heifer never touched, a Virgin never dined, and a Celt never covered; but the truth is, she was as good a Maid as a Mouse. Politianus in Read of et ilia myenia erot, hath et ilia carum erot Mortoni, that the she was a Mouses hole, signifying that her virginity was lost, and that she suffered any lovers, as a Mouse-hole doth any Mice. And from hence came that verse of Martial, describing the speech of a lover to his love, calling him her Mouse and her Joy:

Nam cum me Murentus, cum mea lumina dies.

So that in general all Mice, and not only the white Mouse, are most defirous of copulation. And when they are in copulation, they embrace with their tails, filling one another without all delay. By raffing of Salt, they are made very fruitful, and therefore Aristophane, and the Soul-diers of Alexander the Great, do report, that Mice by licking one another, and by the licking of Salt, do indender & conceive with young without any other copulation. But what reasons they have to lead them to that opinion, I know not; but this wonder reported by Pliny and Arisippo, that in a certain part of Persia, a female Mouse being fit for another alive, all the young females within her belly are also found pregnant conceived with young.

It is very certain, that for the time they go with young, and for the number they bring forth, they exceed all other beasts, conceiving every fourteen or sixteen days, so that it hath been found by good experience, that a female Mouse having free liberty to litter in a vessel of millet-feed, within less compas then half a year the hath brought forth one hundred and twenty young ones.

They live very long, if they be not prevented of their natural course, and dying naturally, they perish not at once, but by little, and little, first one member, and then another, (Pliny faith) E volutibus birundineis sunt indiciles, et terrefribus Mures, among the Fowls of the air, the Swallows are undiscourable, and among the creatures of the earth, a Mouse; Albatus writeth, that he saw in upper Germany, a Mouse hold a burning Candle in her feet, at the commandment of her Master all the time his guests were at Supper.

Now the only cause why they grow not tame, is, their natural fear, such as is in Conies, Hares, and Deer. For how can any man or beast love or hearken unto him, who are persuaded lyeth in wait for their life, and such is the perwission of all them that fear; which perwission being once removed by continual familiarly, there is no cause in nature, but that a Mouse may be docile as well as a Hare or Cony, which we have shewed heretofore in their stories.

It is also very certain that Mice which live in a House, if they perceive by the age of it, it is ready to fall down or subject to any other ruin, they foreknow it and depart out of it, as may appear by this notable story which happened in a Town called Helice in Grecia, wherein the Inhabitants committed this abominable act against their neighbours the Greeks. For they slew them, and sacrificed them upon their Altars: Whereupon followed the ruin of the City, which was premonished by this prodigious event. For five days before the destruction thereof, all the Mice, Weasils, and Serpents, and other reptile creatures, went out of the same in the presence of the Inhabitants, every one affembling to his own rank and company, whereat the people wondered much, for they could not conceive any true cause of their departure; and no marvel. For God which had appointed to take
Of the Mouse.

395

to take vengeance on them for their wickednes, did not give them so much knowledge, nor make them so wise as the beasts to avoid his judgement, and their own destruction; and therefore mark what followed. For these beasts were no looner out of the City, but suddenly in the night time, came such a lamentable Earth-quake and strong tempest, that all the houses did not only fall down, and not one of them stood upright, to the slaughter of men, women, and children, contained in them; but left any of them should escape the strokes of the timber and gable-rops, God put a flood such a great flood of waters, by reason of the tempestuous wind which drove the waters out of the Sea upon the Town, that swept them all away, leaving no more behinde then naked and bare sig-ification of former buildings. And not only the City and Citizens perished, but also there was ten ships of the Lacedemonians in their port all drowned at that instant.

The wildom of the Mouse appeareth in the preparation of her house; for considering she hath many enemies, and therefore means must be sought from place to place, she committed not her self to one lodging alone, but provideth many holes; so that when she is hunted in one place the may more falsely repose her self in another. Which thing Plautus expresseth in these words; Sedamen cognitus, Mus pullius, quam apies sit festa, atatum qui mai cubilis numquam commitit suam; cum omnem objiceret, atunde perfugium querit; that is to say, it is good to consider the little Moufe, how wise a beast she is, for she will not commit her life to one lodging, but provideth many habres, that being molested in one place the may have another refuge to flee unto.

And as their wildom is admirable in this provision, so also is their love to be commended one to another, for falling into a vessel of water or other deep thing, out of which they cannot afford again of themselves, they help one another, by letting down their tails, and if their tails be too short, then they lengthen them by this means: they take one anothers tail in their mouth, and so hang two or three in length, until the Mouse which was fallen down take hold on the heathermoft, which being performed, they all standed up, and drew her out. Even so Wolves holding one another by their tails, do swim over great Rivers: and thus hath nature granted that to them which is denied to many men, namely, to love, and to be wise together. But concerning their manners, they are evil, apt to theft, invidious, and deceitful; and men also which are of the same disposition with these beasts, learning to do any thing publicly, and yet privately entice many deceits, are justly reproved in imitation of such beasts. For this cause was it forbidden in Gods Law unto the Jews, not only to eat, but also to touch Mouse, and the Prophet Elias. ch. 66. faith, Comedentes earnem suillum, et abominationem, atque maren, fimul conjugantur, inquit Dominus, that is, they eat Swines flesh, abomination, and the Mouse, shall be defroyed together,faith the Lord: wherein the Prophet threateth a curse upon the people, that broke the first Law of God in eating flesh forbidden; and the Physitians also say, that the eating of the flesh of Mice engendereth forgetfulness, abomination, and corruption in the stomach.

The eating of bread or other meat which is bitten by Mice, doth encrease in men and children a certain distempe in their face, and in the flesh, at the roots of the nails of their fingers certain hard bunches, called by the Venetians, Stelli; and by the German, Leidjiffen; and by the Latines, Dentes Maria: yet it is affirmed, that the flesh of Mice is good for Hawks, by giving them every day, for each one other day together with the skin; for it helpeth their intrails, purgeth flesh and choler; restrainseth the fluxions of the belly; driveth our stones and gravel; stayeth the dilatation of the head to the eyes; and finally corroborateth the stomach. Yet we have heard that in the Kingdom of Calcut, they do eat Mice and Fishes roasted in the Sun. And it is said by some Physitians and Magicians, that the flesh is good against melancholy, and the pain of the teeth: but the medicinal vertues we referre it to its proper place.

Pline affirmeth a strange wonder, worthy to be remembred and recorded, that when Hanmbilé besieged Caselum, there was a man that fold a Moufe for two hundred pieces of coin, so great was the extremity of famine, that the man which fold it, dyed for hunger, and as it should seem through the want of it, but he which bought it lived by eating thereof; the which thing argueth, that necessity, hunger, and famine, maketh men for the safegard of life, to make more reckoning in extremity of the basest creatures, then in prosperity they do of the belt. For that person which gave so much money for a Moufe, at another time would have reverence to have given so much for four Oxen.

And on the other side, the wretched love of gain, which causeth a man to endanger his own life for love of silver. But I rather think that it was the hand of God himself taking vengeance of such a covetous disposition, which would not suffer him to live, that like Midas had gotten so much gold.

The enemies of Mice are many, not only men, which by sundry artificial devices kill them, because of harm, but also beasts and wilde fowl do eat their flesh, and live upon them. And first of all Cats and Weefils do principally hunt to catch Mice, and have been therefore by the late Writers called Marius, for their taking of Mice. And the nature of the Weefil is not only more inclined to hunt after them, then the Cat, but is more terrible also unto them; for if the brains of a Weefil, the hair or remet be sprinkled upon Cheefe, or any other meat whereeto Mice refert, they not only forbear to eat thereof, but also to come in that place. They are also driven away by the sprinkling of the ashes of Weefils; and as all noises make them afraid, so none so much as the sketching or crying of a Weefil, for at the hearing thereof they all fall asomnous. And beside, they have more opportunity to follow and take them then Cats, because their bodies are leerrer, and their noises and howers longer, and therefore they follow them many times into their holes, and very
nibly pull them forth when they think they are most secure. Foxes also kill Mice; and in Italy there is a black Snake called Carbonarius, from his colour, resembling coals, which I think to be the same that the Graecians call Mygros, from his hunting of Mice: This Snake doth also eat and devour Mice. Hawks eat Mice, and all the night-birds, especially the night-crows and Owls. How hateful a Mouse is to the Elephant, we have shewed already in that story, how in the presence thereof he will not touch his meat, nor eat any thing over which a Mouse doth run. Nor yet eat in the cratch or manger wherein a Mouse hath been. Postumus affirmeth, that there is great love between Mice and Serpents, for sometimes they play together.

There is a hatred betwixt Bats, Frogs, and Mice, as may appear by Anthologius, Museus, and others. It is said also that they are hateful to Oysters, whereof I know no reason, except it be because they love their fish. And Alciatus hath a pretty embleme, which he entitlèth Captivus ob gulaem, wherein he sheweth, that a Mouse watcheth an Oyster when he gapeth, and seeing it open, thrusteth in his head to eat the fish; affoone as ever the Oyster felt his teeth, presently he closeth his shell again, and so crusheth the Mouses head in pieces, whereby he decipeth the condition of those men which destroy themselves to serve their bellies. And thus much for the love and enmity betwixt Mice and other Beasts.

Now concerning the actions of men, they hunt Mice to be rid from their annoyances, because they do not only destroy the things they eat, and live upon other mens colt; and therefore parasites are compared unto unto them whom the Germans call SCHERMOERZER, and Tellerlecker, that is, small-sea, and lick-spickets, are compared to Mice, because they live at other mens tables. But also Mice do defile and corrupt, and make unprofitable whatsoever they touch; and therefore the Egyptians when they would describe corruption, do picture a Mouse.

For these causes have men invented many devices, snares, and gins, the general whereof is called by the Latins, Musépula: and by the Graecians, Mânpula, and Myggra, the divers and several forms whereof I will not dilate to set down. For the wise Reader must consider, that it is as necessary, or rather more necessary for most men to know how to take Mice, then how to take Elephants.

And although every woman, and sily Rat-catcher can give instruction enough therein, yet their knowledge cannot excuse my negligence, if I should omit the inventions and devices of the Ancients, whereby they delivered themselves from the annoyances of these beasts. And therefore first of all to declare the manner of catching them in places where corn is kept: Let your Mousetrap be placed to catch Mice, right against the door, but let there have room to come in, and in short time it will to fear them, that they will trouble you no more. But if Mice breed in the ground under crevices, except you fill all the crevices with Mousetrap, you will never catch them, which the inhabitants of the illand Pamataria are fain to do.

There are other kinds of Mousetraps which do catch Mice alive: and others which do kill them, either being prised down with the weight of it, or lifted with water, or otherwise, as with a strong piece of Iron being small, and hung right against the button of the trap, on the which piece of Iron they hang meat, and so by that means the Mouse is catched by putting her head through the hole to snatch at the meat; for by lifting the Iron doth loosen the button, and so her head is shut fast in the hole. And there are other kinds of Mousetraps which are covered all over, into the which the Moue may run; and if you have put any water therein they are presently stifled. Of all which kinds of traps shall be severally tractèd: And first of all those which do catch Mice alive.

The common kinds of this Moue-trap is made of wood, long, and four-cornerwise, and is framed of four boards, but the hinder part is strengthened with strong wiers of Iron, that it may without danger look in to see what the mouse may get there; and that the smell of that which the findeth there, may allure her to come to it. And the former part hath a hole in the top, through which there is put a small piece of Iron; and also there is made a trap-door in form of a Peculis, to the which the Iron is very lightly hung, that when the Mouse cometh to catch at the meat, the is suddenly taken by falling of the same; but the meat which you fallen to the nearest end of this Iron hook must be fat, or the crust of cheese or bread; which if it be a little toasted at the fire, it will not be amiss, that the Mouse may smell it far off. Some do make these kinds of traps double, with one door at one end, and another door at another end. These kinds of Moue-traps PETRUS CRESENT. doth call traps belonging to holes, which shall be spoken of hereafter.

The other kind of Moue-trap is made with Iron hooks hung in the round circle; in the midst of which is put a great many of the same wiers, which being made sharp at every end, are after the form of the top of a crest, or helmet, or as it is made in a bow-net to catch fishes; and upon the hook let there be hung meat, by which means the Mouse coming to the meat, foothers herself upon the hooks. The manner of making leffer Moue-traps is with Walnut-tree, and that the middle part of it be not covered, and that there be put to the mouth or brim thereof some kinder of mistle, so that the open part may bend inward, and that the Mouse may not gnaw that which is within, except the crepseth under; which if the shall do, the shall presently be shut in by lifting the trap.

Also there is another kind of Moue-trap which is covered with the bark of a tree, which is cut into equal pieces, and laid cross one over another; but there is tied a Swineskin in the middle, and also an earthen pot covered with the same bark, being first sprinkled with corn, that the Mouse may eat it to come to it, and being dryed with lying, they break in pieces, but you must lay them together.
Of the Mouse.

397
together again, and fill your pot with water, by the which means alone as ever they are upon the same, they fall into the pit, and so are lifted.

And alo it is reported of thefe which have tryed the fame, that if Mice fall into a vessel without water, and remain there a long time without meat, that then they devour one another, but if they remain there fo long until one among them all be left alone, that is to say, the strongest of them all, and that he be suffered to go out, wherewith he shall finde any Mice he will eat them up, and they shall have much ado to escape him, because he hath been so long accustomed unto them. I was told alo of a certain friend of mine, that a man of Senenfis did set a purlie in a hollow place, and made it to open and shut by some devise, so that at length he took a Mouse, which Mouse he fed only with the fleethylene, and after he had fed it fo a long time, he let it go, who killed all the Mice he did meet, and was not satisfied with them, but went into every hole that he could finde, and eat them up alo. Alo Mice are taken in vefells, from Creffeufien, whence they cannot escape, upon the which vefell let there be put a small cffe, which is fo cut in the middle, that the may only hold her self by the meat, and when you have fo done, put the kernel of a Nut upon the middle of the cffe, to the which the Mice coming, doth fall into the vefell with the cffe, and they will be lifted if there be any water: but if there be none the will be killed.

And again, he telleth of another manner of catching of Mice, which is as great as the firft, and it is after this manner: Take two smooth boards about the length of thy arm, and in breadth half thy arm, but joyn it fo together, that they may be dilfant from the lower part in length some four fingers or little les, with two small stiples or clefts, which must be at every end one, and fallen Paper under them, and put a piece of paffe therein, being cut overthwart in the middle, but you must not fallen it nigh the middle, and let it be fo bound, that it may easily be lifted up between the stiples, that if by flipping it should be altered, it might be brought again to the fame form. But the two stiples spoken of before, ought to be joyned together in the ends above, and beyond them another small pindle to be made, which may hold in the middle a crooked wedge or botten, upon the which may be hanged a piece of Hogs skin, so that one of them may easilie be turned updidedown with the skin, and put thereunto a little piece of earth or flock, that the Mice may easilie come to it: So that how many Mice ever so shall come thereto, and to the meat, shall be taken, always by rowing the Paper into his wonedt place.

There is another manner alo, which is to make a round piece of wood fastened on both sides with Needles, and made fo that the hinder part of it weigh heavier then the former, and that it stand an inch higher then the other, and then when you have fo placed it, throw some corn thereon, that the Mice may be allurethereto, and tie alo a piece of cffe upon the former end of it; and fo the Mouse going into the middle, by the rowling of the fame, flippeth into the cffe which standeth under it, which must be half full of water, the circle prentient being as it was before, that very often many Mice are caught in one night by this work, all falling into the cffe. Alo there are many kinds of Mouse-traps, where Mice do perih by the weight thereof, and they are made of a small piece of wood made hollow, into the which shall fall down another small piece of wood; but it must be made fo, that it may fall weightily to press down the Mice going to the meat, and let the meat be tied to another little small piece of wood, which being touched, the heavy piece doth presently fall down, and fo by that means the Mouth is taken.

Our Country men do make a trap which is somewhat like to this, let two pieces of boards be joyned together one foot broad, & two four long, and afterwards let there be put in them a wooden pin, which you must fallen to the lower board, so that it may not touch the uppermoft, and you must let it fo, that the former part may easilie move backward and forward; but moreover, the former board must be fastened to the hinder, like the fashioned of a Giber or Gallows, with two pieces of wood standing upright, one being put overthwart, or after the fashioned of the Greek letter ι, and it must stand some nine inches high, and as broad as the board will suffer you, and let the meat be hung in the middle of it, but that board which is uppermoft, must touch both the ends of the other, and notched according to the breadth, the notch made after the form of a wedge divided into two parts; and another small piece of wood must be put to that which is uppermoft, almoft two fingers long, and one finger broad, and let there be put into the lower notch a piece of wood with meat at it, fo that it may be lightly fastened to the brim of the uppermoft, that the meat be presently touched, the other may be easilier fall.

And you may lay a stone upon the uppermoft board, that it may fall the heavier. And there are some alo which to the lower board do fallen iron pins, made very sharp; against the which the Mice are driven by the weight of the fall. Furthermore, there is another kind of trap made to cover them alive, one part of it cut out of a small piece of wood, the length of the palm of thy hand, and the breadth of one finger, and let the other part of it be cut after the form of a wedge: and let this piece of wood be erected like a litte pillar, and let the wedge be put into the notch of another piece of wood, which must be made equal with the other, or very little shorter: and this pillar must be so made, that the Mouse may not perih before he come to the meat: the wood where the meat muft stand, ought to be a span long, and you must fallen the meat about the middle of it, but the former part of it must have a cleft, which must begin a little from the brim, and shall be made almoft the length of two fingers, and you must make it with two straight corners, and take away half the breadth of the wood. These three pieces of wood being thus made ready, thou
The History of Four-footed Beasts.

thall ereat a little pillar, so that the wedge may be downward, whereby the Moufe may see the meat every where: and let the meat be hung in the former corner of the pillar, so if the Moufe shall touch the meat, he shall be pressed down with the fall of the board. Mice also by the fall of a cleft board are taken, which is held up with a pillar, and having a little fpatticular of wood, whereon the meat shall lye, so made that the pillar doth not open being parted, except when the Moufe cometh to touch the meat, and so by that means it is taken.

There is also another manner of Moufe-trap used among us, which is, let there be a hole made and compassed about with a board of a foot long, and five or fix fingers broad, the compass whereof of must be four fingers; into this hole let there be put a veffel made of wood the length of one or fift, but round and very deep; and in the middle of each fide of this veffel let there be made a hole, wherein there is put in a thread made of Iron with meat, and let it be compassed about with a finall thread which musl be falfed over and the hole: and the part of the thread which hangs down must be crooked, that the meat may be falled thereto, and there must be a piece of the thread without, to the which may be tied a stronger piece of wood, which is the thread whereon the meat is hanged, by the which the Moufe is taken, by putting her head into the veffel to catch at the meat.

And also Mice are taken otherwife, with a great Cane wherein there is a knot, and in the top of it let there be made a little bow with a Lute string, and there fliek a great needle in the middle of the pole of the Cane, and let the pole be made just in the middle, and let there be bound a piece of flieh beneath, fo prepared, that when the Moufe shall bite, and move the skin, that then the fling flippeth down, and fo the needle pierceth through his head, and holdeth him that he cannot run away. But among all the reft, there is an excellent piece of workmanship to catch Mice; which I will here fer down: Take a piece of wood, the length of both thy fifts, one fift broad, and two fingers thick, and let there be cut off about some two fingers, a little beyond the middle of half the breadth. And that breadth where it was cut, ought to be more declining and lower, after the manner of this letter A. And you might put to the fide of this a piece of wood, half a circle long, bending, and in the middle part of each fide holes pierced through, fo that the half circle may be lipt, and plainly placed to the foundation of the wood, that the trap being made, it may reft upon the fame half circle, and upon this half circle let there be placed Iron nails very fthrap, fo that the instrument by falling down may cover the Irons of the half circle afoon as ever they touch the fame.

Furthermore, there is another manner of trap, when a veffel out of which they cannot ecape, is filled half up with water, and upon the top thereof Oatmeal is put, which will swim, and not sink, making the uppermoft face of the water to seem white, and fold, whereunto when the Moufe cometh, the lepeth into the Oatmeal, and so is drowned: And the like may be done with chaffe mingled with Oatmeal: and this in all traps must be obferved, wherein Mice are taken alive, that they be prefently taken forth, for if they make water in the place, their fellows will for ever fupset the trap, and never come near it, till the favour of the urine be abolition.

Pliny faith, that if a Moufe be gelded alive, and fo let go, the will drive away all the reftinate; but this is to be underfoot of the Sorex. If the head of a Moufe be flead, or if a male Moufe be ffead all over, or her tail cut off; or if her leg be bound to a poft in the houfe, or a bell be hung about her neck, and fo turned going, she will drive away all her fellows. And (Pliny faith) that the fmoke of the leaves of the Ewe tree, becaufe they are a poifion, will kill Mice, fo also will Libbards-bane, and Henbane-feed, and Wolf-bane, for which caufe they are fervially called Mydalia, and the roots of Wolf-bane, are commonly fold in Surrey unto the Country people for that purpofe.

In Germany they mingle it with Oatmeal, and fo lay it in ball to kill Mice. The fume of Wallwort, Calcante, Parfcly, Orignon, and Deaths-herb do also kill Mice: you may also drive them away with the fume of the fone Hamatric, and with green Tamartis, with the hoof of a Mule, or of Nitre, or the afhes of a Weefil, or a Cat in water, or the gulf of an Ox put into bread.

The feed of Cowcumber being fod, and sprinkled upon any thing, Mice will never touch it, likewise wide Cowcumber and Coloquintida, kill Mice. To keep Mice from Corn, make morter of the froth of Oyl mingled together with chaffe, and let them well dry, and afterwards be wrought throughly, then plainfer the walls of your garnery therewith, and when they are dry cast more froth of Oyl upon them, and afterwards carry in your corn, and the Mice will never annoy it.

Wormwood laid among clothes, and skins, defend them from Mice: And also the water of Wormwood fod, sprinkled upon clothes hath the fame operation.

Ink tempered with water, wherein Wormwood hath been washe, or fod, canfeath that the Parchment and Paper written therewith, shall never be eaten, or touched with Mice.

Antolini and Tarentinus, in the difcoufe of the granery or barn, do write, that Milk-thiffe mingled with Hony, Water, and fine Flower, or Mil-duft, made into little balls, and laid where Mice may eat of it, doth make them blind e if they tafi thereof. White Hellebore mixed with potage, or the seeds of wide Cowcumber, Coloquintida, and Meal, mingled with black Hellebore, and put
Of the Mouse.

Put into Cheese or Bread, or any other kind of fat meat, killeth both Rats and Mice. So likewise a white Camelion fod in broth, mingled with water and Oyl, killeth Dogs, Swine and Mice.

The Joyce of the root of the herb Camelion, mixed with Water and Oyl, draweth Mice unto it, and killeth them by tainting thereof, if they drink not presently: so also doth Henbane. The roots of the bramble Tree, mingled with Butter, Bread, or Hony, Elicampane, and Sea Onions, Scammony, wilde Sparagine, Arckeneck, Mug-wort, otherwise called Moule-wort, mingled with Lard in small pieces, with Auripigment, killeth Wolves and Mice; and in some Countries, for the better dispersing of the poiyon, let drink befoide the same, whereof afoon as they take, they swell and die; but I have seen them die without drinking at all. Mice and Wolves, if they taft of the wilde Roife, and drink after it, do not only die, but also fall into madness and bite their fellows, communickating the quality of the disease to every one they bite. Flesh cut into little pieces, and fried with Butter in a fying-pan, and afterwards when it is cold, addhe halfe of much foft pitch thereto, and mingle it together, rowling up the flesh in the Pitch, then distribute it uppon little bords, and let it in the place, and places wherunto the Mice do much refort, and water before it, and when that they have taited of it a little, they are fo eagerly a thirlth, that they drink and die.

The like I may lay of Rats-bane, Quick silver, Sublimate, and Precipitate, and divers other things; and thus much may suffice for the catching, taking, and killing of Mice, whereunto I may add the use of their members and parts, not medicinal, but natural, although I have toucht it here-tofore in part.

The Scythians were wont to clad with the skins of Mice and Wolves, and it is observed, that when Mouse cry and sreeketh above their ordinary custom, it presageth an alteration and change of the weather; and thus much shall suffice for their natural discourse.

Having thus discoursed of the nature of the vulgar Mouse, I may also add the moral use thereof, as I finde it recorded among learned Writers, delivered either in History, or in Proverbs. It is reported of Glaucus the fon of Minos and Peipho, that while he followed a Mouse to take her, he fell into a veffel of Hony; and after Polypes the Prophet, by laying an herb on him, raised him again to life. Hatto an Archbishop of Metz in the frontiers of Germany, was destroyed by Mice, or as other fay by Rats; but the words of Textor are:

Hatto Archiprefcopus Moguntinus a muribus feterus deditur.

And the error may proceed, because that Muis is a general word for the Rat and Mouse; and therefore they which have thought it an unreasonable thing, that fo small beasts should destroy fo mighty a Prince, have rather atributed it to the Rats then to the Mice; but they ought to have remembred, that it was an extraordinary judgement of God to punish a cruel covetous wretch, and that therefore it was as easie for him to make the little Mouse his instrument, as the great Rax: for we read, that Herod was devoured by Worms; and other have been eaten up with Lice. Adrian the Pope was strangled by a Fly; and therefore Hatto an Archbishop might aifwell perifh through the affliction hand of God by a multitude of Mice.

Hellogabalis that wretch, amongst other his monstrous deformities, and Tyrannical commands, Lampridius affurment, that upon a time he commanded, that there should be brought unto him thirteen thousand Mice alive, a thousand Weefils, and a thousand Scourer, or wilde Field-mice, fo base were his thoughts, that while he should have attended his Empirical calling, and heartened to the suits and complaints of poor distressfed subjects, he was busied in killing of Mice, and therefore in ancient time, a Mouife-killer was taken for an opprobrious speech, for a base, flagitious, and idle companion.

The like is reported of a Mufcovian Emperour, who to affilice his people, and to gather mony from them, commanded the Citizens of Mufco, to bring him a peck full of Fleas, wherunto the people answered, that if they could take fo many, yet could not they keep them together from leaping away. And Mice have been brought into publick peftacles, because at Lavinium they gnawed afunder the shieldes of silver; and it was afterward judged a prodigy; for there followed the Marfick war. When the Scythians underflood that Darius with his great Army, flood in need of victuals, they sent unto him a Provanc-mafter with these prefents or gifts, a Bird, a Mouse, a Frog, and five darts. At the receit whereof the Persians wondered what should be meant thereby; and demanded of the messenger the meaning of the mystery. But the Ambaffador answered, he knew not any significacion of his prefents, but only received charge to deliver them, and make halfe back again, and to bid the Persians, if they were wife, to lay their wits together, to know and understand the meaning thereof. When the Persians heard him say fo, they fell to consultation. Darius gave his opinion, that the Mouse, signified the earth; the Frog, the waters; the Bird, Horfes; and the Darts, warlike furniture and strength of forces; and that the Scythians by fending all these unto them, yeelded that the Persians should be Lords of their Land, Sea, Horfes, and themselves, and that therefore they ought to be of good courage.

But one Gobrias, a grave Counfellor, who was one of the seven that flew the Magi, or Wizards, answered otherwise, for his conjecture was more true: for said he; O Perfe, nisi effe ef fatis oves subver- voles in Calum, aut in Muris subvera terram, aut in rana infiltratis in palude, non remeobitis unde venisit his sagitis confell: O ye Persians, except ye become like Birds, to flye up into heaven; or like Mice, to creep into the earth; or like Frogs, to leap into the waters, you shall not return.
back again unto the place from whence you came, and so indeed it came to pafs. We read 1 Sam. 5, that when the Ark of God was taken by the Philistines, and they kept it in their Temple at Haz-zaah, the hand of the Lord fell upon their Princes, and he smote them with Emroids, in the bottom of their belly, that is, God punished them with Mice, for he afflicted their bodies, and the fruits of the earth, for which cause cap. 6 they advice with themselves, to send back again the Ark of the Lord with a present of Golden Mice. Ovid, Homer, and Orpheus, call Apollo Smythrus, for the Cretans in ancient time called Mice Smythre: Now the flagged caufe thereof is thus related by Aelian:

There was one Critis, which was a Priest of Apollo; who neglected his daily sacrifice, for the which through abundance of Mice he was deprived of the fruits of the earth, for they devoured all. At which losd Apollo himself was moved; and taking pity of the misery, appeared to one Hordas a Next-heard, commanding him to tell Critis, that all the caufe of that penury was, for that he had omitted his accustomed sacrifice, and that it was his duty to offer them again diligently, or else it would be far worse afterward. Critis upon the admonition amended the fault, and immediately Apollo killed all the devouring Mice with his darts, whereupon he was called Smythrus. Others again say, that among the Cretans, at Troas and Hamaxius, they worshipped Mice and Apollo both together, and that under his Altar they had meat and nourishment, and also holes to live in safely: and the reason was; because once many thousand of Mice invaded the corn fields of Aolia and Troy, cutting down the fame before it was ripe, and also frusta
ing the husbandman of fruit and hope: this evil caused them to go to Delphi, to ask counsel at the Oracle, what they should do to be delivered from that extremity; where the Oracle gave answer that they should go sacrifice to Apollo Smythrus; and afterward they had sacrificed, they were deliv ered from the Mice, and that therefore they placed a statue or figure of a Mouse in the Temple of Apollo.

When the Trojans came out of Cret, to seek a habitation for themselves, they received an Oracle, that they should there dwell, where the Inhabitants that were born of the earth should set up on them; the accomplishing whereof fell out about Hamaxius: for in the night time a great company of wild Mice set upon their bow's, quivers, and strings, leathers of their bucklers, and all such soft instruments, whereby the people knew, that that was the place, wherein the Oracle had assigned them to build the City; and therefore there they builded Ida, fo called after the name of Ida in Cret: and to conclude, we do read that Mice have been sacrificed, for the Arcadians are said first of all to have sacrificed to their Gods a Mouse; and secondly a white Horse; and laftly the leaves of an Oak.

And to conclude, Aelianus telleth one strange story of Mice in Herocles, that there is not one of them which toucheth any thing that is consecrated to Religion, or to the service of their Gods. Inso
much, that they touch not their Vines which are sacred to religious ues, but suffer them to come to their natural maturity, but depart out of the Island, to the intent that neither hunger nor folly cause them to touch that which is dedicated to divine ues. And thus much for the natural and moral hory of Mice; now followeth the medicinal.

The Medicines of the Mouse.

The flesh of a Mouse is hot and soft, and very little or nothing fat, and doth expel black and melancholy choler. A Mouse being flayed or having his skin pulled off, and afterwards cut through the middle, and put unto a wound or fore wherein there is the head of a Dart or Arrow, or any other thing whatsoever within the wound, will presently and very eafily exhale and draw them out of the fame. Mice being cut and placed unto wounds which have been bitten by Serpents, or put to places which are flung by them, do very effectually, and in short Space of time cure and perfectly heal them. Mice which do lurk and inhabit in Houses, being cut in twain, and put unto the wounds which are new made by Scorpions, doth very speedily heal them.

A young Moufe being mangled with Salt is an excellent remedy against the biting of the Moufe called a Shrew, which biting Horses and labouring Cartel, it doth venen unto it come unto the heart, and then they die, except the aforefaid remedy be used. The Shrew also himself being bruised and laid unto the place which was bitten, is an excellent and very profitable remedy against the same.

A Mouse being divided and put or laid upon Warts, will heal them and quite abolish them, of what kind soever they shall be. The fat which is diffiluted from Mice, being mixed with a little Goose-grease and boyled together, is an excellent and medicinable cure for the auffaging and mollifying of swellings and hard lumps or knots which do usually arise in the flesh. Young Mice being broken into small bits or pieces, and mixed with old Wine, and so boyled or baked, until they come unto a temperate and mollifying medicine; if it be anointed upon the eye- lids, it will very easily procure hair to grow thereon: the fame being unbeaten and roastd, and so given to little children to eat, will quickly dry up the frouth or spittle which aboundeth in their mouth. There are certain of the wife men or Magi, who think it good that a Mousf should be fed, and given to thofe which are troubled with the Tooth-ach, twice in a month to be eaten. The water where in a Mousf hath been fed or boyled, is very wholesome and profitable for thofe to drink who are troubled with the inflammation of the jaws or the disease called the Squinty. Mice, but
but especially those of Africa, having their skin pull'd off, and well steeped in Oyl, and rubbed with Salt, and so boiled, and afterwards taken in drink, are very medicinable for those which have any pain or trouble in their limbs and lungs. The same medicine used in the aforesaid manner is very profitable for those which are troubled with a filthy, matterly, and bloody spitting out with retching.

Sodon Mice are exceeding good to refrain and hold in the urine of Infants or children being too abundant, if they be given in some pleasant or delightfulsome drink. Mice also being cut in twain, and laid unto the feet or legs of those which are gowy and an excellent remedy and cure for them. Mice being dryed and beaten to powder, do very effectually heal and cure those which are felled or burned with hot water, or fire. Cupres nuts being burned and pounded, or beaten into dust, and mixed with the dust of the hoof of a male or female Moule, being dryed or flanked small, and the Oyl of Myrtle added unto the fame, with the dirt or dung of Mice being also beaten: and with the dung of a Hedge-hog new made, and with red Arfienick: and all mingled together with Vinegar, and molift or liquid Pitch, and put unto the head of any one who is troubled with the abundance and loose hanging down or over-growing of his hair, it will very speedily and without any difficulty ease him of the same.

The dust of a Moule pounded and beaten to powder, and mingled with a certain Oyl, is very good and wholesome, for those which are griev'd with a Tetter, or scab, which may over-run their whole body. The brains or tail of a Moule being dryed and beaten to powder, is very medicinable for those which are troubled with the caiting and shedding of their hair; as also for the diseafes called the Foxes evil: but this operation will work more effectually, if the shedding of the hair doth happen by any venom or poyfon. The fame in operation hath the whole body of the Moule being used in the aforesaid manner.

There is also another excellent remedy to cure and heal the aforesaid diseafe, which is this: To Galle, take Mice which inhabit in houses, and to burn or dry them in a pot, and then beat them; and being so used, to mix them with Oyl of Laurel, and to rub the hairs which are like to fall or fheid with Garlick: and to put them all together into a Frontier or fore-head cloth, and daily to keep the fame medicine or plaster unto them, until the hair do grow faft, and they be rid of that diseafe. There is also another remedy for the fame diseafe, which is this: To burn Moule, and beat him into powder, and then to mingle the same with Hony, and the greef of a Bear, and so to anoint the head, and this is accounted for a very speedy and effectual cure.

The dust or powder of Mice being mixed with Hony and Oyl of Roses, and so baked, or boiled Pliny, together, and afterward diffilled into a clear water, and so poured into the ears of any one which is deaf, or troubled with any pain in his ears, and it will quickly bring him help and remedy. The dust of a dryed Moule being also mingled with Hony, and rubbed upon the teeth of any one which is troubled with a flinking breath, will preffently take away the favour thereof. If the urine of a man or woman be too fluent and abundant, let them take the dust or powder of a dryed Moule, being beaten and flanked, and mix it with Wine or with Goats milk, and so drink it up, and he shall speedily have remedy. The grievous and violent inflammation or turning of the eye-lids, is cured after this manner: First, they take the flesh of the Moule, as afore as ever it be beaten small, and mingle it with the yolk of an Egg, and mollifie it into a falfre or plaster like unto wax, and then put it into a linnen cloth, and so wrap it upon the eye-lids in the time of sleep, and it will easilie bring help and remedy. There is an excellent remedy for the over-spreading of the eyes, or to cure the diseafe in them, called the Pin and the Web, or to help them which are altogether blinde which is this: To take the bload of a Moule, the gall of a Cock, and some part or quantity of womans milk, and to take of each of them alike, and then to mingle or mix them together, and being well wrought or kneaded until it come to an ointment, to rub or spread it upon the eyes: and this will in very short space help them unto their fight: for it hath been tried, and hath help'd many.

The skin of a Moule being burned or dryed, and beaten into powder, and so mingled with Vinegar, and then anointed upon the head of any one who is pain'd or troubled with the Head-ach, it will preffently ease and help him. The head of a Moule being also born or carried in a linnen cloth, doth cure the fame diseafe. The heads of Mice being burned, and beaten into small powder, and then mixed or mingled with Hony, and so anointed upon the legs or feet of them which are troubled with the Gout, are excellent good and wholesome for the curing of that grievous diseafe. The same vertue hath the tails or bodies of Mice, being used in the aforesaid manner in them. Some do think, that the aforesaid diseafe is more speedily and effectually cured after this manner: First, to take a Beetle or Horf-fly, and flamp it all to pieces, and then to mingle it with foift and liquid Pitch, the skin being prepared or made ready with Nitre: but there must be great care taken, that it eat not too far in the flesh: then to take the head of a Moule, and the gall and dung of a Moule, and mingle them together with Ling-wort and Pepper, and so to anoint them, and spread them upon the aforesaid eaten or lanced wounds: and this is very much commend'd for a very good and medicinable cure for the aforesaid diseafe.

The heads of Mice dryed and beaten into powder or dust, and then mixed with Hony, and so anointed upon the eyes for the space of ten days together, will carifie the eyes, and expel all pain or blemishes from them. Of the heads of Mice being burned, is made that excellent powder, for the frowning and cleansing of the teeth called Tooth-soap: unto which if Spikenard be added...
The History of Four-footed Beasts.

402

added or mingled, it will take away any filthy fent or strong favour in the mouth. The brains of a Moufe being taken and put or steeped in Wine, and stamped, and beaten small, and anointed upon the brow or fore-head of any one who is troubled with a pain or ache in the head, and he shall soon find ease and remedy. If any man shall but touch or kiss with his mouth the snout or nostrils of a Moufe, and be troubled with the diseafe called the Rhume, which falleth down and fluffeth the nostrils, he shall in very short fpace be eafed of the fame. The Magi or wife men do very much commend this medicine for the expelling of a quarrant Ague or Fever, which is thus; To take the nofe or snout of a Moufe, as also the very tops of the ears, and bruife them together, and afterward tie them in a linen cloth, which hath had Roses or Rofe-leaves in the fame, and then bind them unto the arms or wrists of him which is troubled, and they will very effectually and speedily cure and heal him. For the rottennefs and demifining of the teeth, the belt remedy is to take a living Moufe, and to take out one of her teeth, whether the greatest or the leaft it is no great matter, and hang it by the teeth of the party grieved: but firft kill the Moufe from whom you had the tooth, and he shall prcfently have eafe and help of his pain. The heart of a living Moufe being taken out, and hanged upon the left arm of any woman, is of fuch force and power, as it will caufe her never to conceive. The lapes or fillets of the liver of a Moufe, being beaten small and mingled with four drams of fowre and unpleafant Wine, is an excellent remedy for thofe which are troubled with quakings in their joints; as also for Fevers and shaking Agues. A Moufe being cut or parted in the conjunction of the Sun and the Moon, and the liver pulled out and roasted or boiled, and given to one which is troubled with the aforesaid difeafe to eat, will very speedily and without any difficulty or pain cure and heal him of the fame. The gall of a Moufe being beaten very small, and steeped or washed in Vinegar, and fo poured or diffufed into the ears of any one who is deaf or thick of hearing, or hath any ache or pain in the fame, is counted for the chiefeft, and most singular and chiefeft remedy or cure which is used for the fame.

The dung or dirt of a Moufe being new made, is very profitable for thofe which are troubled with the diseafe called the Scuticaf, or Hip-gout, anointed or rubbed upon the fame. Moufe-dung being also mingled with Vinegar and Oyf or Roles, and fo anointed or spread upon the fore-head or temples of any one who is troubled with the head-ach, will prcfently eafe and help him of the fame. The gum called Benzoin being mixed with Wine and Safron, and Pepper; as also with the dirt or dung of Mice being new made, and mixed with Vinegar, and mingled all in one medicine, and fo strained and given to one to drink, which is spare and lean, in some short fpace or time it will make him grow very fat.

The dung or dirt of a Moufe being mingled with certain other medicines, is very good and wholesome for thofe which are troubled with Tetterts, and dry feabs which over-run the whole Body.

The dung of Mice being mingled with the dust or powder of Frankincenfe, with a little red Arfencick added thereunto, is a very profitable and wholesome medicine for thofe to use which are troubled with little hard red bitches and fwellings arifing in divers and feparate parts of the body. Seven pills being taken out of the dung of a Moufe, and mingled with Vinegar, and anointed upon the fore-head and temples, of thofe which are grieved therein, will very speedily help and cure him.

The inward parts of earth mixed with Moufe-dung, white Pepper, and Myrthe, being of each of them half an ounce, and afterwards mingled with Vinegar all together; and fo anointed upon the head of any one which is troubled with the Megrim, will very effectually and speedily eafe and rid him of the fame. The herb called Struma beaten together with Moufe-dung, and afterwards mixed with Vinegar, is an excellent remedy againft the fwellings in the head, or little bitches which arifing therein become fores, and are full of matter and filthy corruption. The dung or dirt of Mice being melted, difolved, and mingled with Vinegar, and then rubbed upon the head of any one who is troubled with the fcurf or skaules thereon in a bath or stove, will prcfently expel and drive them quite away.

The dung of Mice being mingled with Frankincenfe, and fo beaten or tempered together until they come unto the likenefs or thickness of Honys, and then anointed upon the legs or feet of any one that is troubled with the Gout, he shall finde prefent help and remedy. The fame difeafe also is very effectually cured by the dung of a Moufe, and burned or scorched Barley mingled together, of each being the fame weight or quantity, and afterwards mixed with Vinegar all together, and fo spread or anointed upon the difeafe parts. There is also another excellent remedy for curing of the aforesaid difeafe, which is thus: To take Cantharides, and bruife them all to pieces, and mingle them with fof or liquid Pitch, and alo with Nitre, and fo anoint or rub them upon the skin being prepared for the purpose; but there must be great care had, that the skin be not rubbed or lanced too far. Afterward unto the wound fo made, there must be taken the heads, galls, and dung of Mice, being mixed with the herb Lingwort, and Pepper; and fo beaten all together until they come unto a temperate falt or medicine, and then anointed upon the said wounds, and they will in very short fpace cure the fame.

The hairs and dung of a Moufe, parched or dryed by the fire, and anointed upon the eye-lids of any one which are pidd or bare, will prcfently procure hair to grow thereon.

Moufe-dung being dryed in the shade is an excellent remedy againft the voiding or spitting of blood which floweth from some parts of the body, but especially from the belly. The
fame is also very good to staunch the bloud which iffeth from wounds being new made. White Sceny-feed, and the dung of a Moufe or Hare being put into broth, with the flim or flalk of Fennel, and fo boiled together, and afterwards given unto a woman who is delitute of milk in her breasts, will prefently and very speedily procure her milk in great abundance.

The dung of Mice being steeped or washed in rain water, doth eafe and refresh the swelling of womens dugs in their time of delivery. The dung of a Moufe being given in any drink or liquor to one that is troubled with the difeafe called the Colick and Stone to drink, will in very short space or time cure him of the fame. Moufe-dung being also taken in drink, doth baffle the body of either man or woman, how fast ever they be bound. There is an excellent remedy standing, from Moufe-dung against the Scelica, or Hip-glow, which is this: To take nine grains of a Moufs dung mixed or mingled with half a pinte of Wine, and given to the party grieved upon a bench or foot-broth to drink, fo that he drink it standing upon that foot only which paineth him, even at the Sun-rising; and having so drunk it, let him leap down, and afterwards let him leap three times, and let him do this but three days together, and he shall prefent help and remedy of his difeafe.

Moufe-dung mixed with Frankincence and sweet Wine, and fo drunk by any one which is troubled with the Colick and Stone, will prefently eafe him of the fame. But the dung of Mice mingled with Water, and Hony, and so boiled together, and drunk, doth not only drive away the pain of the aforefaid difeafe, but also doth break and quite diffolve the Stone. Moufe-dung also being taken in drink by it self alone, doth dissolve and melt the Stone in the Bladder. The fame being also boiled in water, is very good and profitable for thofe which cannot make water. The fame being new made and anointed upon the belly of any one who is troubled with the Colick or Stone, shall finde prefent eafe and remedy thereby.

There is yet moreover another excellent medicine proceeding from this dung, whereby the fruit in a womans womb may be brought forth either dead or putrified, without any hurt or prejudice unto the woman, which is thus; First to take Egyptian Salt, Moufe-dung, and Gourds which are fowen in Woods; and afterwards to pour in half a pinte of Hony, being half boiled, and to cast one dram of Rozen into the Hony, the Gourds, and the Moufe-dung, and beat them well and thoroughly together, and then rowl them up, and fashion them in the manner of Acorns, and put them to the belly of the party fo grieved as often as you shall think it meet and convenient, and in using this some short space or time, you shall fee the aforefaid putrified fruit to proceed and issue forth.

Moufe-dung being parched or burned, and mingled with Hony, is very good and medicinable aswell for thofe which are troubled with the swellings in their legs and feet; as also for thofe whose eye-lids are pilled and bald, to make hair to grow again upon them, being spread or anointed thereupon. The dung of Mice being dryed and beaten into small dust or powder, and put into the teeth of any one which are hollow, will prefently expel away all pain from them, and also confirm and make the teeth strong. The dust or powder which proceedeth from Moufe-dung, is also very good to cure any difeafe in the fundament of either man or woman.

The urine of a Moufe is of fuch strong force, that if it thall but touch any part of a mans body, it will eat unto the very bones. The bitings of Mice are healed by no other means but by green Figs and Garlick being mixed or mingled together, and fo anointed thereupon.

Of the RAT.

Here is no doubt that this Beall belongeth alfo to the rank of Mice, and the name thereof we have thewed already, is common both to the French, Spanish, Italian, and English, and it may seem to be derived from the Greek word Rattis, orHenex, or Ritas, for the Graecians use all those words. And this beall is four times fo big as the common Moufe, being of a blackish dusky colour, more white on the belly, having a long head, not much unlike the head of the Martin; short and round ears, a reafonable rough skin, short legs, and long claws, and exceeding great eyes, such as can see very perfectly in the dark night, and more perfectly than by candle light; with their nails they clime up steep and hard walls, their tails is very long, and almoft naked, void of hair, by reafon whereof it is not unworthily called venous; for it seemeth to partake with the nature of Serpents. The quantity of their body is much like a Weefils; and sometimes you shall fee a Rat exceeding the common stature, which the Germans call Ratzen Ku nig, the King of Rats, because of his larger and greater body; and they say that the jeffer bring him meat, and he yeeth idle. But my opinion is, that as we read of the Dor-moufe, the nouritheth her parent when she is old; so likewise the younger Rats bring food unto the elder, because through their age, they are not able to hunt for themselves, and are also grown to a great and unweedy stature of body. Sometimes you shall see white Rats, as was once seen in Germany, taken in the middle of April; having very red eyes standing forth of their head, and a rough and long beard. And at Aussieg in Germany, about the Temple called the Church of S. Huldrid, they abound in greater number then in other places. They do not lie in the earth like Mice, except in the vally of Iseubim, where for the Summer time they forfake houfes, and go into Coby holes, but

Sererer, Marcellus, Avice, Piny, Hipocrotat.
but in the Winter time they return to the houses again. They are more noylyme then the little Moufe, for they live by fleath, and feed upon the fame meat that they feed upon, and therefore as they exceed in quantity, so they devour more, and do far more harm. They are killed by the fame poyfons and means that the common Mice are killed, except Wolf-bane; for if they eat thereof, they vomit it up again, and are fafe. They are also taken in the fame traps, but three or four times fo big: Their fleath is far more hot and sharp then the fleath of the vulgar Moufe, as we have gathered by the defcription of it, and therefore in operation it is very like that it expelleth and dryeth more then the other.

The excrements are also of the fame vertue; and with the dung of Rats the Phyfitians cure the falling off the hair. And it is saide also that when they rage in luft, and follow their copulation, they are more venemous and dangerous then at other times. For if the urine do fall upon the bare place of a man, it maketh the fleath rot unto the bones, neither will it suffer any scar to be made upon the ulcer; and thus much of the vulgar Rat.

Of the Water-Rat.

Names of Water-rats.

Seeing there are two kindes of Rats, one of the earth called Rattus terrestris, and the other of the water called Rattus Pluviatilis, of which we are now to entreat, being also called of the Laiters, Mus aquaticus; by the Germans, Taffermannus, and Waferrat; by the Italians, Sorgomogange; by the French, Rat d'eau. This beast hunteth fishes in the Winter, and have certain caves in the water sides, and banks of the Rivers or Ponds: For which occa- sion it being feen in the waters, deceiveth their expectation which look for the return of it to the land. And this beast hath been forgotten by the Ancients, for they have left of it no description nor story, because it liveth partly in the water, and partly on the land, and therefore he fayd true, that Ephe of the habitation and place of abode of this beast, in this fort; Ego non in flavis, nec alis aquis magnis, sed parvis tantaq vivis etq terribus omnium ripis, hoc anim- nat frequentat num verfari audito. That is to fay; That this beast doth not keep in great Waters or Rivers, but in small and little currents and Ponds, where abundance of grafs and other weeds do grow on the sides and banks; Pliny attributeth that to the Water-rat, which is proper to the Tortoife; for indeed there is some similitude of natures bewixt these beasts, with this exception, that the females in this kind have three visible passagges, for their excrements, one for their urine, another.
Of the Alpine Mous.

The Alpine Mous taketh her name from the Alps, wherethin she is bred, and although there be many other kinde of Mice bred in the Alps, yet this being the principal thereof, receiveth denomination from the Mountains, because she is bred in the very tops of the Mountains, and seldom or never come down to the roots. The Italians call it Marmotta, and Marmint, and according to Mathurin, Marmontula; the Hebrews, Marmotta, and in some part of Italy, Vassoia; in France, Marmotte; although Marmot be also a word among them for a Monkey. The Germans, and especially the Helvetians, by a corrupt word drawn from a Mouse of the Mountain, Marmelthier, and Marmelle, and some Frisbeiler, by reason of his sharp whining voyce like a little Dog. In Latin it is called aliis Emitteres, which leemeth to be composed of Emuler, and this is the least kinde of Alpine Mice, which is found in all the German Regions; of which we will speake in the end of this story. Some take this to be called Taurus, amongst whom Brasseninus is one, yet it hath no property with the Alpine Mouse, except lying in a Cave; for it doth not sleep in the Winter, nor hath no outward resemblance with Mice, neither can have any affinity in disposition or manner of living, and therefore I cannot afford theteto, Grapalus & Alnus, both learned Italians, say, that the Armitians are called Alpine Mice, whereunto they are led, because they sleep all the Winter long, like the Alpine Mous; but we shall shew in their due place, that these belong to the Weeds, and not to the Mice, which living in cold Countries, grow white in the Winter time: the Hebrew word is Saphan, according to some Authors, and is translated Achtemuin, but we will shew in due place, that the Arkemyn is the Cycetus, or Gryet Moufe, and the Saphan we have shewed already to be the Cony.

These Alpine Mice are in the tops of the Alpina hills, and none of the Ancients except Pliny make mention thereof, and it is doubted whether he doth describe it or no. For his words are, Sunt his Marmibus Alpina pares & in Egypto, similisres in cubibus & hinis pedibus gradantur, simpliciter ut manus utatur, that is to say, there are Mice in Egypt like to the Alpine Mice; for they fit upon their buttocks, and go with their fore-molt two feet, which also they use instead of hands, by which we collect, that they are not the same, but like the Alpine Mice.

The Alpine Mous is in quantity like a Hare, or at the least betwixt a Hare and a Cony, being more fat, and of a thicker body than a Cat, but shorter legs, in outward appearance more mild like Mause, and therefore it is called an Alpine Moule. The back of it is very broad, and the hair harder and sharper than a Comes. The colour for the most part is yellow, which in some is more clear, and in others more obscure and brown. Their eyes of a reasonable quantity, standing far out of their heads. Their ears very short like crooke ears. The head like a Hares, and their feet with long nails; his fore-teeth like a Squirrels, two above, and two beneath, but long and sharp like a Beavers, in colour yellow; about the nose and upper lips he hath long black bristle hairs like a Cat. The tail is half a cubit long, according to Stumpfius, but two palms according to Agricola. His legs very short and thick, covered with long deep thick hair, like to the bottom of his belly. The toes of his feet are like a Bears, and his claws long and black, wherewithall he diggeth the earth to make his den; he goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his fore-feet he taketh his meat like a Squirrel and an Ape, fitting in the mean time upon his buttocks. His back is also very fat, although all the other parts of his body be lean, and yet that on his back cannot be said to be fat, but rather like a Cows udder, neither fat nor fleith, and they encrease or grow more in breadth then in length.

Secker describeth them in this manner, a Marmot (faith he, for so he termeth an Alpine Moule) The description in French is a Bear about the bigness of a Badger, having hair and tail much like it, and after the
The History of Four-footed Beasts.

the same manner short legs, and little or no ears, long, sharp, firm, crooked, strong and black claws, which is numbred amongst the kindes of Mice, with whom it holdeth little correspondence, except that like a Squirrel it taketh his meat in the fore-feet as with hands, and eateth fitting upon his tail. They agree also with the Dog-mouse in their sleep, for they pass over Winter sleeping. Their teeth are like to the teeth of Hares and Mice; after that they are made tame, they are not hurtful to men or children, except they be provoked. Being kept in houses, they will eat and gnaw all linen and woollen cloth; thus far Scaliger. But we have shewed already, that the outward appearance of it is like a Mouse, and that therefore it is fitter to follow Pliny, Albertus, Mathæus, Stumpfius, and others, then his sole and singular opinion; they keep as we have laid already, in the tops of the Mountains, wherein they make their cave with wonderful art and circumpection, making two different passages into their Den, one above another a poles length, which meet in the middle like a fork, or the conjunction of two Rivers or Path-ways, making the seat of their rest to be very deep in the Mountain, and therein they remain five, seven, nine, or eleven of them together.

They play many times before the mouth of their Den together, and in their sport or pastime, bark like little Dogs. When they go out of their cave into the Mountains to gather food, or to play, or to fetch in grafts; always one of them remaineth like a Watchman near the mouth of the cave upon some high place, looking moit diligently and vigilantly, both far and near; and if he see either a man or wilde beast coming towards them, then he suddenly cryeth out, and with his voyce giveth the warning word, whining like the whistling of a pipe, if his fellows be far off; or else barking like a Dog, if they be near at hand. When the residue hear it, they presently repair home, and he which kept the watch, entereth into the Den laft of all. And it is reported by a certain Greek Writer, that if their speculator do not give them the watch-word, but that they are endanger'd by any man or beast through his negligence, they tear him in pieces with their teeth. There is no beast so strong as this, considering the quantity; for it hath been seen, that when a lufty young man took one of them by the hinder-leg,...
Of the Alpine Mouse.

As it ran into the Den, he could not with all his might pluck it back again. The claws of it are exceeding sharp, and fit to dig; so that it is thought if a man finde them in the earth, and seek to take them by digging unto them, he shall labour in vain, because the Beast diggeth fatter from him then he can follow her; they cannot run very fast in the plain ground, but are easily killed by a man, except they get into the earth: with their teeth they bite deep, for they can shear alender wood with them like Beavers, they eat or live upon fruits, and especially being tamed when they are young; they refuse not bread, flesh, fish, or poogage, and above all they desire milk, butter, and cheese; for in the Alps they will break into the little Cottages where milk is kept, and are oftentimes taken in the manner fucking up the milk, for they make a noise in fucking of milk like the pig. In the month of May they are much delighted to eat Hornets, or Horde-flies, also they feed upon wile Sagepan of the meddow, and seeded Cabbage, and while they are wilde in the Mountains, they never drink; the reason is, as I suppose, because in the Summer time they eat mostly green herbs, and in all the Winter time they sleep.

Towards the feast of Saint Michael, the Archangel, and of Gospul, they enter into their Caves; and as Play faith, they first of all carry provision of Hay, and green Herbs into their Den to rell upon, wherein their wit and understanding is to be admired; for like Beavers one of them falleth on the back, and the residue load his belly with the carriage, and when they have laid upon him sufficient, he geteth it fast by taking his tail in his mouth, and lo the residue draw him to the Cave; but I cannot affirm certainly, whether this be a truth or a falsehood. For there is no reason that leadeth the Author thereunto, but that some of them have been found beld on the back. But this is certain, when the Snow begins to cover the Mountains, then do they enter into their Dens, and shut up close the passages, with ficks, graves, and earth, both so hard and so thick, that it is easier to break the solid ground, then the mouths of their Caves, and so being safely included both from the fear of the Hunters, from snow, snow, and cold, there live they until the Spring, without all manner of meat and drink, gathered round together like a Hedgehog, sleeping continually; and thereby the people inhabiting the Alps have a common proverbe, to express a drofllie and sleepy fellow in the German tongue thus: Er mufje zuwege geblaffen haben wie ein muscheltier in Latinu, Accefe babet certum, dormiendo, tempesti conjurare, infkr muria Alpini. He must needs sleep a little, like the Moule of the Alps. They sleep also when they are tamed, but it hath been found by experience, that when a tame one hath been taken a sleep, and laid in a warm barrel upon Hay, the mouth being shut and cloed to keep out rain and snow, at the opening thereof it was found dead; and the reason was, because it lacked breath, and therefore this is most wonderful, that in the Mountains, notwithstanding the close breathing of the mouth of their Caves, yet they should not be deprived of refrigeration, that is, freth air, for expiration, and respiration.

But this is to be considered, that after they have been long tamed, they sleep not so much as when they are wilde; for I think that their continual eating of raw and green herbes, ingendereth in them to many humors as cannot be dispersd without a long continuing sleep; but afterwards when they are diered with such meat as is provided for the nourishment of man, they are caded of the cause, and to the effect ceaseth. During the time that they sleep, they grow very fat, and they are not awakened very easily, except with the heat of the Sun or fire, or a Hot-house. Now the manner of their taking while they are wilde, is thus:

In the Summer time when they go in and out of their Caves, they are taken with snakes set at the mouth thereof; but in the Winter time, when they go not abroad, there also are Inhabitants forced to another device, for then in the Summer time, they set up certain pillars or perches near the mouth of their Den, whereby they may be directed, when the snow doth cover the Mountains. For the pillars or poles stand up above the snow, although the snow be very deep. Then come the Inhabitants upon round pieces of wood in the midst of the Winter, fastned to their shooe-foles over the deep snow with their pyrones and diggers, and carry away the snow from the den, and fo dig up the earth, and not only take the beasts, but carry them away sleeping, and while they dig, they diligently observe the frame and manner of the blossing of the Moues den. For if it be long and deep, if is a sign of a long and a hard Winter, but if they be shallow and thin, of the contrary: so coming upon them as we have said, they take them and carry them away asleep, finding always an odd number among them; and they diligently observe, that whilst they dig, there be no great noise, or that they bring not their fire too near them. For as Stumpyus faith, Esperrelli enim capi non passiunt, non sumant; lorem sicut venatum, ipsa solutum solumiter et retrocedunt et pedibus quum effodientes, terram recipiendo fessero impedit. That is to say, If they be once awakened, they cannot be taken, for howsoever the Hunter dig never so manfully, yet they together with him, dig inward into the Mountains, and call the earth backward with their feet to hinder his work.

Being taken as we have said, they grow very tame, and especially in the presence of their keepers, before whom they will play and sport, and take lie out of their heads with their fore-feets like an Ape. Infomuch as there is no beast that was ever wilde in this part of the world, that becometh so tame and familiar to man as they; yet do they always live in the hatred of Dogs and oftentimes bite them deepily, having them at any advantage, especially in the presence of men, where the Dogs dare not resist or defend themselves. When they are wilde, they are also killed alive, by putting of a knife into their throat, whereas their fore-feets fir a little, but they die before they can be awaked.
Their blood is laved in a vessel, and afterwards the Mouse it self is dressed in hot scalding water, like a Pig, and the hair thereof plucked off, and then do they appear bald and white; next to that, they bowl them, and take out their intestines: afterwards put in the blood again into their bellies, and so feethe them, or else salt them, and hang them up in smoke, and being dressed after they are dryed, they are commonly eaten in the Alpine Regions with Rapes and Cabbage, and their flesh is very fat, not a fluxible or loose fat like the fat of Lambs, but a solid fat, like the fat of Hogs and Oxen. And the flesh hereof is commended to be profitable for Women with childe; and also for all wounding and g roaring in the belly, not only the flesh to be eaten in meat, but also the fat to be anointed upon the belly or navil: And for this caufe it is used to procure sleep, and to strengthen decayed and weak fisneys: the flesh is always better salted then fresh, because the fat drieth up the overmuch humidity, and also amendeth the gravity and rankness of the favour: but whether it be fat, or whether fresh, it is always hard to be digested, opprefling the stomacks, and heating the body overmuch.

The ventricles or maw of the Mouse Alpine, is prescrib'd to be laid upon the belly against the Collick. If the hands of a man be anointed with the fat of this beast, it is said he shall be the better able to endure cold all that day after: Also the same fat being drunk up in warm broth by a woman in travall, are believed to accelerate and haften her delivery.

Certain Horse-leeches, in the cure of that disease which they call the Worms, which are certain ulcers rising in the body, do mingle this fat with other medicines which are very drying or fitprik.

And Mathesius doth prescribe it for the softing and mollifying of contracted nerves and joynts in the body.

By the discourse aforefaid, it doth appear, that of these Alpine Mice there are two kindes, one great like a Badger, and the other in stature of a Hare or Coney: This latter feemeth to be proper to Germany, which there they call Embodor, of the Latin word Emptura, a Mouse of the Mountain.

The story whereof I thought good to express, being short, out of Stumpfam and Agriculta. The males and females say this of their kindes, do gather together wide corn which growth among the Rocks in the Summer time against the Winter, and carry the same into the holes of the earth, where their lodging is.

Now the female in this kinde is crafty, and more apt to devour; the male on the other side more thristy and sparing, wherefore he driveth his female out of the Den in the Winter time, and toppeth the mouth of his Cave, to forbid her entrance, but the geteth behinde the same, and diggeth a secret hole, whilest the male lyeth at the mouth asleep, the consumeth the whole flore behinde him: wherefore in the Spring time he cometh forth very fat and comely, and he very lean.

And therefore in my opinion, the makers of emblems may very well describe an unthrifty Wife, that consumeth her Husbands wealth, by the picture of this female, as by the picture of the As behind Omen, biting atunder the cord that he weareth, as we have shewed before in the History of the As. These beafts give them selves much to sleep, and when they are awake they are never idle, but always carrying into their Den straw, hay, flacks, rags, or pieces of cloth, whereby they fill their mouth so full, that it may receive no more, and if they meet with any thing which is too big for their mouth, by the help of their feet they draw and rowl it to their own Den.

Whereas they are nourished tame in houses, it is observed, that they are a neat and cleanly kinde of beast, for they never defile their lodgements with their excrements, but seek out some secret corner, wherein they both render urine, and empty their bellies. With their teeth the gnaw wood, and make holes in bords, so large as their bodies may pass through; and while they live, they have a very rank and strong favour like a Mouse, especially in the Summer time while they are lean, and before they grow fat; for such is the nature of this beaft, that in the Summer time they labour and grow lean; but in the Winter time they sleep and grow fat. And thus much for the Alpine Mouse.

Of the DORMOUSE.

The Dormouse is called in Latin, Gisus; and in Greek, Myoxos; the reason of the Latin name Gius, is taken from glisere, which signifieth to grow fat, according to the saying of Columella, Palin vero glisere fere omnes regiones abundant Asinus glisere; that is to say, an As's growth fat by eating chaffe which aboundeth in all Countries. This word Gius, signifieth not only a beast, but a piece of fat earth, and also a Thistle; whereupon Svetovoc at made this verse:

Gius animal, glis terra tenax, glis lappa vocatur.

The Italians call it Lo Galero, Lo Giler, or Giero; the Spaniards, Liron; the French likewise Liron, and Rat, Lioren, and Vignoyer, and Vignaret; the Germans, Ein greut; the Helvetians, Ein rel, or Rel mut, or Geras biselemus; but our English, Dormouse, seemeth to be a compounded word of Dormans mur, that is, a sleeping Mouse. The Polonians call him Sowres. But concerning his name Myoxus, there is some question among the Authors. For Saint Jerom writing upon the eleventh chapter of Leviticus
Of the Dormouse.

409

Of the Dormouse.

The Philosophers which are cunning in the nature of things do write, that the Dormoufe doth lie hid, and bring forth many young ones in the same place where he lyeth, five or more at a time, and the Vipers do hunt these to destroy them: now if the Viper finde their self, because she cannot eat them all at one time at the first, she filleth her self with one or two, and putteth out the eyes of the residuum, and afterwards bringeth them meat and nourisheth them, being blinde, until the time that her stomack serveth her to eat them everyone. But if it happen that in the mean time, any man chance to light upon these Viper-nourished blinde-Dormoufe, and to kill and eat them, they pouyon themselves through the venom which the Viper hath left in them: so faireth it with thee O Origen, for thou art blinde with the Gracians doctrine, and doth vomit out that pouyon into their hearts which do believe thee, that thou art made unto them a venemous meat, whereby thou doest wrong others, as thou hast been wronged thy self.

Py which is manifest, that Myoxus is neither a Toad nor a Frog, but the Dormoufe. And the charm which is made for the Ailes urine, as we have showed already in his story, Gallus hibit, & non meit, Myoxus meit, & non hibit. The Cock drinketh, and maketh not water, the Dormoufe maketh water, and never drinketh. But whether it be true or no that the never drinketh, I dare not affirm: But this is certain, that the drinketh but very seldom; and it ought to be no wonder that she should make water, for tame Conies, as long as they can feed upon green herbs, do render abundance of urine, and yet never drink.

The Gracians also do call this Beast Elyos, although that word do likewise signifie a Squirrel. In Media a Wood of Italy, there is never found Dormoufe, except at the time of their littering.

They are bigger in quantity then a Squirrel, the colour variable, sometimes black, sometimes grizzle, sometimes yellow on the back, but always a white belly, having a short hair, and a thinner skin then the Pontique Moufe. They are also to be found in Helsitius, about Clarona. It is a biting and an angry Beast, and therefore seldom taken alive. The bear or snowt is long; the ears short and pricked; the tail short, and not very hairy at the end; the middle of the belly swelleth down betwixt the breast and the loins, which are more narrow and trussed up together, they are always very fat, and for that caufe they are called Lardiroi.

Buck-meat is very acceptable meat unto them, and doth greatly fatten them, they are much delighted with Walnuts, they clime trees, and eat Apples, according to some: but Albertus faith more truly, that they are more delighted with the juice then with the Apple. For it hath been of tentimes

The description of the Dormoufe out of Epiphanius.
The History of Four-footed Beasts.

The means to take the Dormice.

They nourish their parents in their old age, with singular piety. We have shewed already, how they are destroyed by the Viper, and it is certain, that all Serpents lie in wait for them. Their old age doth end every Winter. They are exceeding sleepy, and therefore Martial faith:

Somnificus illi portigris glires.

They grow fat by sleeping, and therefore Aesopus hath an elegant verse:

Dic, essente cibo, somnis quis operin est? glia.

Because it draweth the hinder-legs after it like a Hare, it is called Animal tralibis, for it goeth by jumps and little leaps. In the Winter time they are taken in deep ditches that are made in the Woods, covered over with small flicks, straw, and earth, which the Countrymen devise to take them when they are asleep. At other times they leap from tree to tree like Squirrels, and that they are killed with Arrows as they go from bough to bough, especially in hollow trees: for when the Hunters finde their haunt wherein they lodge, they stop the hole in the absence of the Dormouse, and watch her turn back again; the sly Beast finding her passage closed, is bufied hand and foot to open it for entrance, and in the mean season cometh the Hunter behind her, and killeth her. In Tellus they are taken by this means: The Countrymen go into the fields, carry in their hands burning Torches in the night time, which when the sly Beast perceiveth, with admiration thereof, fleapeth to the lights, whereunto they were come, they were so dazled with the brightness that they were falk blinde, and might so be taken with mens hands.

The use of them, being taken, was to eat their flesh, for in Rhettia at this day they eat it and eat it, because it is sweet and fat like Swine's flesh. Antistius Marcellinus wondereth at the delicacy of his age, because when they were at their Tables, they called for ballances to weigh their flesh, and the members of the Dormouse, which was not done (faith lie) without any dislike of some present, and things not heretofore used, are now commended daily. Apisim also prescribes the muscles and flesh inclosed in them, taken out of every member of a Dormouse, beaten with Pepper, Nut-kernels, Parsely, and Butter, fluffed all together into the belly of a Dormouse, and fewed up with thread, and so baked in an Oven, or sodde in a Kettle, to be an excellent and delicate dish. And in Italy at this day, they eat Dormice (faith Calpurn. i.) yet there were ancient laws among the Romans, called Leges confide, whereby they were forbidden to eat Dormice, strange birds, Sheil-fish, the necks of Beasts, and divers such other things. And thus much shall suffice for the description of the Dormouse.

The Medicines of the Dormouse.

Dormice being taken in meat, do much profit against the Bullimond; The powder of Dormice mixed with Oyl, doth heal tho' which are seared with any hot liquor. A live Dormouse doth presently take away all Warts being bound thereupon. Dormice, and Field-mice being burnt, and their dust mingled with Honey, will profit those which desire the cleanliness of the eyes, if they do take thereof some small quantity every morning. The powder of a Dormouse, or field Mouse rubbed upon the eyes helpeth the aforefaide disease. A Dormouse being fried, roasted and anointed with Oyl and Salt, being given in meat, is an excellent cure for those that are short winded. The fame also doth very effectually heal those that spit out filthy matter or corruption. Powder of Dormice or field Mice, or young Worms, being mixed with Oyl doth heal those that have Kibles on their heels, or Chiiblains on their hands. The fat of a Dormouse, the fat of a Hen, and the marrow of an Ox melted together, and being hot,
not infused into the Ears, doth very much profit both the pains and deafness thereof.

The fat of Dormice being boiled, as also of field-mice, are delivered to be most profitable for the elchewing of the Pallie. The fat of a Dormoufe is also very excellent for those which are troubled with a Pallie, or fencing of the joints. The skins and inward part of a Dormoufe being taken forth, and boiled with Hony in a new vefsel, and afterwards poured into another vefsel, will very effectually heal all diseases which are incident to the ears, being anointed thereupon. The skin of a Dormoufe, or a Silkworm being pulled off, and the inward parts thereof being boiled in a new brazen vefsel with Hony, from the quantity of twenty seven ounces, even to three, and so kept, that when there is need of a certain bathing vefsel, the medicine being made warm and poured into the ears, doth help all pains, deafness, or inflammation of the ears. The fat of a Dormoufe is commended to be very medicinable for the aforenamed diseases. The fame is profitable for all pains, aches, or griefs in the belly. The urine of a Dormoufe is an excellent remedy against the Pallie. And thus much shall suffice concerning the medicinal vertues of the Dormoufe.

of the Hamster or Cricetus, the first figure taken by
Michael Horus.

The second picture taken by John Kentman, and it is her fashion and and protractions to live thus when she is angry, for so doth her colour appear both on the back and belly.

This Beast is called in Lateine, Cricetus, and in the German tongue Hamfer, Tran, and the names, Carnfaerla, that is, Figs of the corn. It is a little Beast, not much bigger then a Rat, dwelling in the earth of the roots of corn, she is not drawn against her will out of her Cave at any time, but by pouring hot water or some other liquor. The head of it is of divers colour, the back red, the belly white, and the hair sticketh so fast to the skin, that it is easier to pull the skin from the flesh, then any part of the hair from the skin. It is but a little Beast as we have said, but very apt to bite and fight, and full of courage, and therefore hath received from nature this ornament and defence, that it hath a bony helmet, covering the head and the brain when it standeth up upon the hinder-legs: It resembelth both in colour and proportion a Bear. And for this cause some Writers have interpreted it
The History of Four-footed Beasts.

Of the Ant-Cat

His meat and food.

Hamster is cum sua

Prudens coniugi conjuge,
Sabat pressaenum pluribus
Per tona pectorant remissibus
Pugilique fuit sa frui
Lettis acretis bordel
Aerat in terris creadam
Extrudit arte coniuge,
Serva, inquit, extensit saras,
Calit eere et plebisc.
Sed faminum qui inflam,
Vincent dolis affluant 

Novum parant curriculum,
Furatur omne trichum.
Egena maritus persidem
Squit et anta coniugem.
Nec se repellat blandum
Demulcit inventam sanum,
Ille esse jam communia
Servat dum finit bonum.
At persifitor multiplices
Opponit inimic obsides.
Barbatissent mentis
Antius, eibus, amplexibus.

This Beast doth devour all kinds of fruit, and if be nourished in a house he eateth bread and flesh: he also hunteth the field Mice. When he taketh his meal, he raiseth himself upon his fore-feet: he is also wont with his fore-feet to stroke his head, ears, and mouth; which thing the Squirrel and the Cat do also, and as the Beaver amongst those creatures which live as well by water, as by land: but although in his body he seemeth but small, notwithstanding he is by nature apt to fight, and very furious being provoked, with his carriage in his mouth: he beateth away
Of the Norician Mouse. 413

away with both his feet that which refiilth him, directly invading his enemy: In the spirit and af-
faulting of his mouth he is wayward and threatening, from whence our Countrymen were accustomed to say of any one which was angry; he breatheth his wrath out of his mouth like a Hamfler: Du

The anger and fury of this beaff.
ofreift wuie ein Hamfler: neither is he easily affrighted, although he be far unequal unto those in

strength with whom he is in combate.

Wherefore some do give in the place of a Proverb, that our Countrymen do call a man which is

madly raff, Ein tiven Hamfler, as fool-hardy as a Hamfler. He flieith from any one that doth sharply

refiil him, and doth greedily follow after them that flie from him. I my felf faw one of thefe, who

by afaulting a Horfe get him by the nofe, and would never leave his hold until he was killed with a

fword: He is taken by divers means, for he is expelled either by hot water poured into his den, or

is choaked within; or being dug up with a matchock or fpade he is killed; or by Dogs. He is fometi-
times pulled out by the Fox, or hurt: or opprefled by some fnares, a great weight being put about it:

or to conclude, he is taken by Act alive, and that in the night time, when he goeth to seek his prey,

for in the day time for the maff part he lyeth hid.

Before his usual Cave (as I have faid) he is taken by the path which is worn, by a pot which is put

into the earth, and afterward made plain about it like other places of the field; there is earth call

in the bottom of the pot to the deepnefs of two fingers, above every where covering the pot where

there is placed a flone, which is held up by a piece of wood, to which there is bound below a fragment

of bread: In the space between the Cave and the pot there are crums of bread scattered, which he

following and leaping into the pot, the wood falling, he is taken. Being taken after the manner of

other beafts, he toucheth no food: If a broad flone, fuch as one with which they cover pavements, or

of which they make roof tiles, fhall be joined unto the pot, and the beaff be taken, he will be very

hardly known in the morning; for the spirit of the beaff being flue in, and waxing wrot, piercing

for thimefl doth moilten the flone. The skins of Hamflers are very durable, of which there are cer-
tain long coats which come down unto the heels, and divers coloured cloaks made, which the wo-

men of Mifena and Silfja do ufe, and account them very honorable, of a black and red colour, with

broad guidens or edges of the skins of Orters: the fame coats are for the maff part valued at the price

of fifteen or twenty Renemfan crowns: for it doth out-wear in length three or four garments made

either of linnen or woollen cloath.

In Turingia and Mifena this beaff is frequent, notwithstanding not in all places, for in Turingia his

chiefest abode is about Efardunum, and Salcenfis in Mifena, about Lipfia, and the field Pegenfis, the

plentifull and moft fertile places of both thefe Regions. In Luvatica about Radeberge, he is dig-

ged out of those places where Painick groweth. At Mulberge and Albis, he is found in the Vineyards,

for he is alfo fed with ripe Grapes. Our Country men are wont to burn a living Hamfler in a pot,

being flue, for the medicines of Horfe. It hath been feen that one of thefe hath leaped up

cought a Horfle by the nofe, never letting go his hold until he was cut off with a fword. The skin

is of three or four different colours, besides the spotted sides, and therefore the skin is

very precious. They abound in Turingia where the foil is good, and there is alfo great store of

grain.

Of the NORICIAN MOUSE.

The Norician Mouse is called in Latin, Citellus, and it keepeth like the wilde Mice in the caves

dens of the eartb. The bodye is like to a domestical Wefelins, long and fender, the tail very

short, the colour of the hair like to a gray Conies, but more bright. It wanteth ears like a

Mole, but it hath open paffages in head of ears, wherewithal it hear eth the found, as you shall

fee in many birds. The teeth are like the teeth of Mice, and of their skins (although they be not

very precious) they ufe to make garments. In Germany they call it Pile and Zifel, and of this Ger-

man word was the Latinus Citellus leigned; and it appeareth by Agricola, that there are two kindes

of thefe: one greater, which are call'd Zifell and Zefelle, and another leffer (call'd Pile) which may

be the fame that is also called Bithmell, and differeth from other, because it is used for meat. These are

bred in Croatica, and in the Country about Venice. They have a strange smell or favour, which is faid

to be hurtful to the head: They eat both falted and hung in the fmoke, and alfo fresh and new kil-

led. With their skins they edge the skirts of garments, for it is as foft as the skin of a Hare: and be-

side the common nature of Mice they are tamed. They alfo have very large cheeks, wherewith they

gather an innumerable quanti?ty of grain, and carry it into their den, as it were in bags againft the

Winter. They live thirty and forty together in a Cave, and are not driven forth but by infufion of

hot water. They gather great store of Nuts into their Caves, and therefore as well as for their

fieth do men hunt and feek after them.

Of the MOUSE PONTIQUE.

The name, de-

cription, and

dispofition.

Agricola.

The name of this Moufe is given unto it from the Ifland out of which it was firft brought, Oldus mag-
named Pontus, and for this caufe it is alfo called Venetum, because it was firft of all brought into

Germany from Venice. It is called alfo Varus by Laurus, from whence cometh the German
